1. Introduction

In 2006, the Federal Highway Administration (FHWA), the lead federal agency for the project, completed its environmental review of the Juneau Access Improvements (JAI) Project in accordance with the National Environmental Policy Act (NEPA) by issuing a Final Environmental Impact Statement (FEIS) and Record of Decision (ROD), selecting the East Lynn Canal Highway to Katzehin with shuttle ferries to Haines and Skagway for design and construction. A 2009 District Court decision ruled that the 2006 FEIS was not valid because it did not consider an alternative that would improve surface transportation in Lynn Canal using existing Alaska Marine Highway System (AMHS) assets. In 2011, a Ninth U.S. Circuit Court of Appeals panel upheld the lower court ruling. In direct response to the court ruling, FHWA determined that a Supplemental Environmental Impact Statement (SEIS) should be prepared for the JAI Project and include an evaluation of an alternative that improves service in Lynn Canal using existing AMHS assets.

On September 14, 2011, the Alaska Department of Transportation and Public Facilities (DOT&PF) announced that it would begin the process with FHWA to complete an SEIS for the JAI Project. The SEIS evaluates an alternative of enhanced service in Lynn Canal using existing AMHS assets (Alternative 1B). The SEIS also updates the evaluation of the reasonable alternatives in the FEIS and addresses changes in applicable laws, regulations, and approvals. FHWA's Notice of Intent to prepare an SEIS was published in the *Federal Register* on January 12, 2012.

1.1 2014 Draft SEIS Comment Period

On September 19, 2014, DOT&PF announced the release of the JAI Project Draft SEIS for review and comment (the public comment period ended November 25, 2014). Copies of the Draft SEIS were made available at the Juneau, Mendenhall, Douglas, Haines, and Skagway public libraries, as well as the State Public Library. Printed copies of the document were also distributed to the cooperating agencies and other interested agencies. Chapter 9 of the Draft SEIS includes a list of federal agencies, State agencies, local governments, and Native organizations that received copies of the document.

Compact disks (CDs) were distributed to interested organizations and individuals that requested to be on the JAI Project mailing list. CDs or hard copies of the Draft SEIS were available by request from the DOT&PF Southeast (now Southcoast) region office. The Draft SEIS and all of the appendices were also available for review or download from the JAI Project website: www.juneauaccess.alaska.gov. Public notices announcing the 2014 Draft SEIS availability, as well as dates of public hearing sessions and locations, were placed in the *Juneau Empire*, *Chilkat Valley News*, and *Skagway News*.

During the review period, public input was solicited and public testimony was recorded at three public hearing sessions held in Juneau on October 14, Haines on October 15, and Skagway on October 23, 2014. An open house session before each public hearing session provided the public an opportunity to review the 2014 Draft SEIS and display boards, ask questions of project staff, and provide oral or written comments. A court reporter was available during the public open house to record private oral testimony. Comments were also submitted by the public,

organizations, and governmental agencies through the JAI Project website or by e-mail, mail, hand delivery, or fax to DOT&PF.

The public review and comment period, initially scheduled to end November 10 (provided a 52-day comment period, exceeding the 45-day minimum), was extended by 15 days (67 days total) to November 25, 2014. The FHWA Division Administrator extended the comment period due to requests from multiple parties. All communications received or postmarked by or on November 25, 2014, were entered into a comment tracking database developed for the JAI Project and analyzed. See Section 2 for a description of the comment analysis process.

1.2 Report Overview

The regulations implementing NEPA require that substantive comments received on a Draft EIS be included in an FEIS. An FEIS includes responses to these comments and may include such things as modification to the alternatives or analyses, or factual corrections. The regulations state that summaries may be attached to the FEIS if the substantive comments are “exceptionally voluminous” and for similar comments to be grouped together and addressed in a single response (40 Code of Federal Regulations [CFR] 1503.4).¹

This *Responses to Draft Supplemental Environmental Impact Statement Comments* documents the public and agency comments received on the Draft SEIS during the comment period and the responses to these comments. Section 2 describes the process and methodology used to track and code comments; Section 3 provides a summary of Cooperating Agency coordination; and Section 4 presents a brief overview of the comments, such as the number of communications and comments received, as well as the topics and subtopics of the comments. As allowed under NEPA regulations, similar comments have been summarized in comment groups or grouped comments (called statements of issue [SOIs] in Appendix V of the 2006 FEIS).

Sections 5 and 6 in this report provide indices for the comments. Section 5 provides an index of commenters, alphabetically by last name or organization name, and their associated comment group(s). Section 6 provides an alphabetical list of topics/subtopics and the comment group(s) associated with those topics. The indices in Sections 5 and 6 provide a means for commenters to locate responses associated with their comments in Section 7.

Section 7 includes responses to comments on the Draft SEIS. All comment groups are listed alphabetically by topic in Section 6 (e.g., Air Quality, Alternatives, and Avalanches). FHWA’s and DOT&PF’s responses immediately follow each comment group summary.

¹ Per American Association of State Highway and Transportation Officials (AASHTO) Practitioner’s Handbook 02, Responding to Comments on an Environmental Impact Statement, “Individual vs. Group Responses. Section 1503.4 of the CEQ regulations state that comments should be assessed and considered “individually and collectively.” It also states that all substantive comments should be attached to the FEIS, except that summaries may be attached if the substantive comments are “exceptionally voluminous.” These regulations allow for similar comments to be “grouped together and addressed in a single response.”

Attachment A includes correspondence from and responses to Cooperating Agencies since the Draft SEIS. Attachment B includes correspondence from and responses to local, State, and federal agencies and Tribal entities since the Draft SEIS. Attachment C includes correspondence with detailed comments from organizations since the Draft SEIS, along with embedded responses. Attachment D includes the text of form letters received and an index of form letter commenters, alphabetically by last name or organization name, and their associated comment group(s).

This page intentionally left blank.

2. Comment Analysis Process

The analysis of public comments on the Draft SEIS was a multi-stage process that included coding, sorting, and summarizing all public communications received on the Draft SEIS. Each step of the process included multilevel quality reviews (project team, DOT&PF, and FHWA). The process is described in detail below.

2.1 Submission Tracking

All communication submittals (e.g., via website, hearing transcript, form letter, and e-mail) were assigned unique identifying numbers as they were processed or received into the database. The communication type; date the communication was received; and the commenter's name, organization/affiliation, and contact information were documented, either automatically (in the case of website submissions) or by the Project team.

2.2 Coding

After being assigned a numeric identifier, each communication was reviewed to identify the substantive comments within it and record statements of opinion in support of or opposition to the project or a particular alternative (see Table 2-1). Communications could include multiple opinions and multiple comments. Each comment was assigned a unique number, which included the numeric identifier for the communication and a numeric identifier for the comment. This ensured that each comment had a unique numeric description that could be readily referenced back to the communication and commenter. Once comments were identified, they were assigned to a primary topic and subtopic that reflected the content of the comment (see Table 2-2).

For example, a comment that discusses the need for noise monitoring for Steller sea lions during construction could be assigned to the Threatened and Endangered Species topic, and the Mitigation subtopic.

Coding Definitions:

Communication: All methods for submitting comments: mail, e-mail, website, comment form, fax, public testimony at the public hearing, or private testimony to a court reporter at the public open house.

Comments: Statements or questions with a factual basis that addressed the accuracy of the information, offered new information, provided additional data for consideration, or requested clarification.

Opinions: General statements of support or opposition to the project or a particular alternative.

Topic: All comments were coded based on a primary topic area, such as Alternatives, Avalanches, Wildlife, Visual Impacts, Transportation, or other topic.

Group: Similar comments within a topic area were grouped together as a Statement of Issue (SOI) for response.

Table 2-1: Opinions Coding

Opinion Alternatives	Opinion Topics
No Opinion	Air Quality
Support Alternative 1 – No Action	Avalanche

2.3 Development of Comment Groups/Statements of Issue (SOI)

The coded comments in each topic and subtopic area were reviewed to identify similarities among comments. Similar comments in a topic and subtopic area were grouped together and summarized in an SOI (i.e., a comment group summary statement). In some cases, a simple statement sufficiently captured the meaning of all the comments attributed to the comment group. In other cases, multiple statements were needed (identified by letters [e.g., A, B, and C]) to ensure that all facets of the comments were addressed.

2.4 Responding to Comments

Responses to all comment group summary statements were written by subject matter experts who had worked on the development of the Draft SEIS. See Section 7 for all comment group summaries and associated responses.

3. Cooperating Agency Comment Overview

The preliminary Draft SEIS was provided to Cooperating Agencies—U.S. Environmental Protection Agency (EPA), U.S. Army Corps of Engineers (USACE), U.S. Coast Guard (USCG), U.S. Forest Service (USFS)—in January 2014. Their comments and FHWA responses on the preliminary Draft SEIS were included in Chapter 7 of the 2014 Draft SEIS and are not included in this document.

A Notice of Availability of the 2014 Draft SEIS for the JAI Project was published in the *Federal Register* on September 19, 2014. Printed copies were distributed to cooperating agencies. EPA, USACE, and USFS provided comments on the Draft SEIS. These communications and FHWA’s responses are included in Attachment A.

The Preliminary Final SEIS, along with FHWA’s responses to comments on the Draft SEIS, was provided to the Cooperating Agencies for review on August 31, 2017. Of these Cooperating Agencies, only EPA provided a response. This letter is provided in Attachment A. USACE, USCG, and USFS provided no comments on the Preliminary Final SEIS.

4. Public Comment Overview

DOT&PF received a total of 42,214 written and oral submissions during the public review period as well as oral testimony from a total of 118 individuals who attended the three public hearing sessions held in Juneau, Haines, and Skagway. Of these communications, 41,012 were form letters.

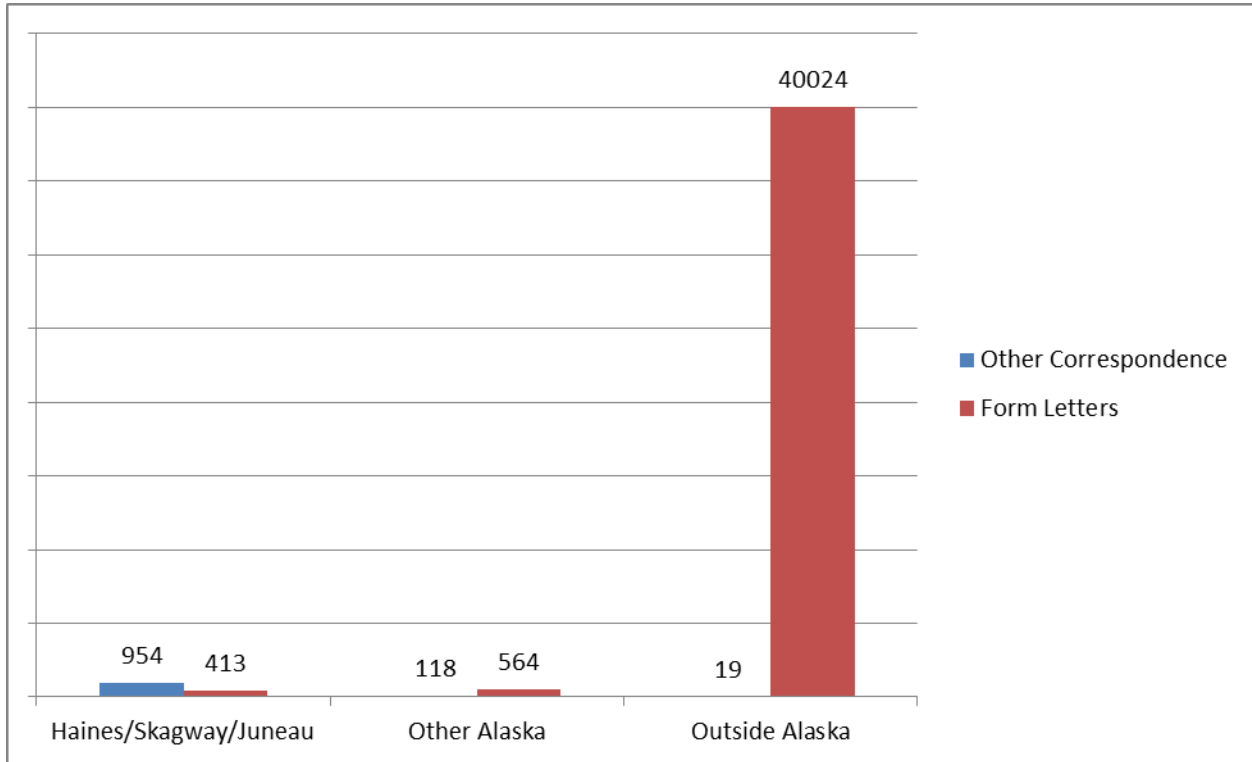

Individuals, agencies, or organizations could submit more than one set of comments. Of the 1,202 non-form letter submissions or individual testimony, 36 were duplicates. Approximately 1,429 individuals sent in multiple submissions or submitted written comments in addition to oral testimony. There were also 27 joint submissions, with multiple signatures or multiple people listed in a single submission.

Communications often contained comments and/or opinions addressing more than one issue. For example, a communication may state opposition to one alternative, support for another alternative, and reasons for that choice. A total of 10,749 opinions and 2,207 comments were identified. Comments within each communication were identified and coded as described in Section 2.2. These comments were divided into 258 comment groups based on topic and subtopic (see Section 2.3).

The following figures provide a general overview of the comments received. Figure 4-1 illustrates the geographic distribution of communications received. Figure 4-2 groups all non-form letter comments into broad topic areas. Figure 4-3 groups all comments (including form letters) into broad topic areas. Figure 4-4 breaks down non-form letter comments by most-mentioned topic/subtopic areas. Figure 4-5 shows all comments (including form letters) by most-mentioned topic/subtopic areas.

Figure 4-6 is a comparison of non-form letter² communications in support of individual alternatives. Not all commenters identified a preference for a specific alternative; some indicated a general preference for a road alternative or a marine alternative, or no preference at all. Because these general preferences are of interest to decision makers, as well as the public, they have been identified in addition to the specific alternative preferences.

Figure 4-1: Distribution of Communications by Location

Note: This figure includes locations of all commenters (as reported), including form letters. Comments are summarized by geographic location of the submitter. Juneau-Douglas includes the City and Borough of Juneau; Haines includes the surrounding Haines Borough. Most of the comments included under “Other Alaska” were received from the Anchorage Bowl area. It should also be noted that location was self-reported by commenters, and was not a requirement for submitting a communication.

² The form letters are not included as they did not indicate support of a specific alternative, rather support for marine transportation in general.

Figure 4-2: Comments Received by Topic Area (without form letters)

Note: This figure identifies issues (topics) raised in comments coded in communications received on the Draft SEIS. This figure includes totals that do not include form letters. It should be noted that not all communications included coded comments.

Figure 4-3: Comments Received by Topic Area (all comments)

Figure 4-4: Top Five Comment Topic Areas (without form letters)

Note: This figure identifies the top five issues (topics) raised in comments (except form letters) coded in communications received on the Draft SEIS. It includes totals that do not include form letters. It should be noted that not all communications included coded comments.

Figure 4-5: Top Five Comment Topic Areas (all comments)

Note: This figure identifies the top five issues (topics) raised in comments (including form letters) coded in communications received on the Draft SEIS. It should be noted that not all communications included coded comments.

Figure 4-6: Communications Received in Support of Alternatives

Note: This figure includes total communications in which the commenters (non-form letters) indicated support of alternatives. The form letters are not included as they did not indicate support of a specific alternative, rather support for marine transportation in general. It should be noted that not all communications included opinions on alternatives.

4.1 Local, State, and Federal Agencies and Tribal Entities

In addition to the Cooperating Agencies and the public, multiple local, State, and federal agencies as well as Tribal entities submitted comments on the Draft SEIS (see Table 5-1). These entities/organizations included:

- Alaska Department of Fish and Game (ADF&G)
- Alaska Department of Natural Resources (DNR)
- Douglas Indian Association
- Haines Borough
- Municipality of Skagway
- National Marine Fisheries Service (NMFS)
- Sealaska
- Skagway Port Commission

In addition, organizations provided extensive comments on multiple topics regarding the Draft SEIS, including:

- Alaska Public Interest Research Group (AkPIRG)
- Lynn Canal Conservation (LCC)
- Southeast Alaska Conservation Council (SEACC)
- Skagway Marine Access Commission (SMAC)
- Tongass Group of the Sierra Club (TGCS)

These comments are included in the Comment Groups. In addition, FHWA responded individually to these comments (see Attachments B and C).

4.2 Form Letters

The JAI Project Draft SEIS received 41,102 form letters from the following non-governmental organizations:

- SEACC (three versions of this letter were circulated):
 - Version 1: 360 letters
 - Version 2: 58 letters
 - Version 3: 77 letters
- Earthjustice: 36,302 letters
- Care2: 73 letters
- Sierra Club: 257 letters
- Alaska Wilderness League: 3,885 letters

These form letters were entered into the comment database and processed like the non-form letter communications. However, they were processed together by submitting organization (and in the case of SEACC, by letter version). As such, identical opinions and comments were coded only once per organization/letter version. Coded comments were then included in groups by topic/subtopic for response.

The base text from these form letters, an index of form letter commenters (alphabetically by last name), and their associated comment group(s) are included in Attachment D.

5. Index of Commenters and Organizations

This section presents a list of commenters and associated organizations who provided communications on the JAI Project Draft SEIS. It should be noted that complete self-identification was not a requirement for submitting a communication regarding the Draft SEIS. In addition, it should be noted that not all communications contain coded comments (i.e., only statements or questions with a factual basis that addressed the accuracy of the information, offered new information, provided additional data for consideration, or requested clarification were coded as comments); therefore, not all commenters will see a group number associated with their entry.

Commenters (not including those commenters who submitted form letters) can find their names in Table 5-1, and then find the group number(s) and response(s) that are associated with their entry in Section 7. Commenters who submitted comments in association with form letters (see Section 4.2) can find their names and group numbers listed in Attachment D.

Table 5-1: Index of Commenters/Organizations (Non-form Letters)

6. Index of Topics/Subtopics

This section presents a list of topics and subtopics coded in comments from all communications received on the JAI Project Draft SEIS. All coded comments were assigned a topic and subtopic. This assignment facilitated organizing comments into comment groups for response. See Table 6-1.

Readers can find the topic/subtopic of interest (e.g., Air Quality/Method of Analysis, Alternatives/Alternative 1B, or Avalanche/Avalanche Hazards) and then look up the group number(s) and response(s) that are associated with that entry in Section 7.

Table 6-1: Index of Topics/Subtopics

Topic	Subtopic	Comment Group ID
Air Quality	Method of Analysis	167, 168

7. Responses to Draft SEIS Comments by Topic

This section presents comment groups and associated responses by topic. Entries in this section are organized alphabetically by topic and subtopic, and then group number.

Commenters can find their names in Section 5, and then look up the group number(s) and response(s) that are associated with their entry in this section. In addition, readers can find a topic/subtopic in Section 6, and then look up the group number and responses associated with that entry in this section.

7.1 Air Quality

Group 167

Topic/Subtopic: Air Quality/Method of Analysis

Group Comment Text

A) The Draft SEIS did not evaluate air quality effects, including spatial and temporal identification factors; listed targeted pollutants; method of monitoring; and a table of locations, dates/times, and sampling methods.

B) The analysis did not establish a baseline from which to compare alternatives.

Group Comment Response

A) The evaluation of air quality effects in the Draft SEIS was of appropriate scope and scale relative to the anticipated impacts of the proposed alternatives. Previous studies of air quality impacts associated with the project alternatives, including modeling of carbon monoxide emissions, were reviewed and updated to reflect new regulatory requirements and revised traffic volumes in the *2014 Update to Appendix T - Air Quality Modeling Memorandum* found in Appendix Z of the Draft SEIS. The analysis used available data, input from agencies, and reasonable assumptions to evaluate air quality effects.

B) The characterization of the existing conditions, or baseline, was provided in Section 3.2.5 of the Draft SEIS. The region where the project is located has been designated an air quality attainment area or unclassifiable. Section 3.2.5 outlined a description of the pollutants and National Ambient Air Quality Standards (NAAQS; Table 3-2). As stated in Section 3.2.5, air quality within the corridor of the proposed alternatives was estimated to be very good based on input from the Alaska Department of Environmental Conservation (ADEC) and due to the absence of air pollution sources. Pollutant levels were estimated to be well below the NAAQS, even at the more urban port locations of Auke Bay, Haines, and Skagway. This determination was supported by data accumulated for the Kensington Gold Project, which showed background concentrations of air pollutants were significantly below NAAQS (see Section 3.2.5.3). This is a suitable assessment of baseline air quality from which to compare potential impacts of the alternatives.

Group 168

Topic/Subtopic: Air Quality/Method of Analysis

Group Comment Text

A) The air quality analysis in the Draft SEIS was inadequate because it relied on the modeling done in 2004 for Alternative 2, which is no longer being considered, and did not include a shuttle ferry between Haines and Skagway. The air quality analysis suggested that marine vessel emissions at Haines, Skagway, Katzehin, and Auke Bay did not need to be evaluated because Juneau, a much larger port facility, did not have exceedances of carbon monoxide (CO). It did not account for more ferry operations and fuel consumption under Alternative 2B, which would result in greater emissions of CO, carbon dioxide (CO₂), nitrogen oxides, sulfur oxides, and particulate matter.

B) An analysis of ferry emissions should be conducted to explain how air quality in the Haines, Skagway, and Katzehin areas will be affected, taking into consideration the relatively low dispersion of airborne pollutants in the project area. Increased marine vessel emissions in the Skagway area is of particular concern because the Port of Skagway serves ferries, cruise ships, and freight in one facility.

C) A decrease in air quality in the Haines, Skagway, and Katzehin areas could potentially be harmful to residents' health, reduce visibility, and deter tourists from visiting. FHWA and DOT&PF should conduct new air quality modeling for each alternative to better inform the decision makers about potential environmental and human health consequences.

Group Comment Response

A) The Draft SEIS relied on the modeled vehicle emissions for Alternative 2 from the 2004 analysis because the traffic projections of that alternative were higher than, but comparable to, the 2014 projections for Alternative 2B. DOT&PF conducted additional air quality analysis to determine the effects of ferry and marine vessel emissions on air quality in the general study area and at ferry terminals associated with each alternative. The Final SEIS included the effects of ferry emissions in the evaluation of air quality for all alternatives.

B) The Ferry Vessel Air Quality Analysis (see Attachment 1 to the *2017 Update to Appendix T - Air Quality Modeling Memorandum* in Appendix Z of the Final SEIS) considered how air quality in the Haines-Skagway-Katzehin area would be affected by the alternatives. The analysis identified that the largest increases of air pollutants in Skagway would be 3 percent greater than existing conditions for CO, 6 percent greater for nitrogen dioxide, and 2 percent greater for particulate matter (Alternatives 2B and 4A), without accounting for project ferry activity displacing any existing vessel traffic. Because the percent change under any alternative would have been low and because the air quality in the area is generally good, dispersion modeling was not conducted.

Environmental Protection Agency (EPA) regulations indicate that dispersion modeling has least uncertainty in areas with good long-term data and relatively flat terrain: "Areas subject to major topographic influences experience meteorological complexities that are extremely difficult to simulate. Although models are available for such circumstances, they are frequently site-specific and resource intensive." The project area is an attainment area for air quality, and the emissions for ferry vessel traffic would be below the EPA *de*

minimis levels; therefore, general conformity does not apply. Given good existing conditions and low projected increases, dispersion modeling is not warranted. The Final SEIS evaluated the potential cumulative effects of ferry vessel emissions on air quality in Skagway, where it would contribute to the emissions associated with existing marine vessel activity at the port.

C) Changes to air quality that would have resulted from the project alternatives have been updated to include emissions associated with ferry vessels. These emissions were compared to existing emissions for rural areas, such as Haines, to ascertain the net change with each alternative. An updated discussion of air quality for each alternative as it relates to human health consequences has been provided in the Final SEIS. The analysis demonstrates that no harm to human health or the environment would result from project-related emissions.

7.2 Alternatives

Group 345

Topic/Subtopic: Alternatives/Alternative 1B

Group Comment Text

Comments received on the Draft SEIS offered the following possible changes to Alternative 1B:

A) Deploying the *M/V Malaspina* on the Juneau-Skagway run is not an efficient use of assets (e.g., mainliners with their large crews and 24 hours per day/7 days per week crewing requirements are very expensive to operate and have more capacity than is needed); however, the *M/V Malaspina* could run between Skagway and Haines daily as a true day boat.

B) The *M/V Malaspina* cannot operate 7 days per week; it can only operate 6 days per week since 1 day is needed for drills and testing. Therefore, Alternative 1B should be modified.

C) The ferries could profitably accommodate more cars per day during summer tourist season than stated for Alternative 1B (e.g., more runs or more ferries).

D) DOT&PF should consider a real/better Transportation System Management (TSM) alternative and/or consider revising Alternative 1B to use the *M/V Fairweather* on a twice-daily Haines-Juneau route; use one Alaska Class Ferry (ACF) for the Skagway-Juneau route; and use the other ACF (or perhaps a different, more optimal vessel) for the Haines-Skagway route.

E) DOT&PF should modify Alternative 1B to eliminate mainliner connections north of Auke Bay because the new ACF vessels are more cost effective.

Group Comment Response

As a general response to the comments in this group, an SEIS prepared under NEPA is meant to analyze a range of reasonable alternatives representing the full spectrum of alternatives. While there are practically an infinite number of possibilities for alternatives,

it is not necessary to evaluate them all. The Court ruling on the previous EIS required an alternative based on more efficient use of existing assets. Alternative 1B was created in response and was evaluated as a competing alternative to solve the problems expressed in the purpose and need statement in Chapter 1. It is not necessary to examine every permutation of every option. That said, DOT&PF and FHWA examined suggestions to “optimize” Alternative 1B, and a discussion of the results are included in Appendix CC, *Development of Alternative 1B – Enhanced Service with Existing Alaska Marine Highway (AMHS) Assets*, of the Draft and Final SEIS and Appendix II, *Alternative 1B Optimized and Alternative 5 Evaluation*, of the Final SEIS.

A) The *M/V Malaspina* was placed on the Juneau-Skagway run primarily because the ACF cannot make the 12.3-hour run with a 12-hour day crew. A contributing complication is that the ACF side loads from a door close to the stern of the vessel. In Auke Bay, the vehicles would be stern loaded and facing forward. Off-loading in Skagway would be time consuming (i.e., backing vehicles out and up the ramp until enough room can be created to turn vehicles around on board).

B) It is incorrect to state that the *M/V Malaspina* cannot operate 7 days per week due to 1 day needed for drills and testing. The *M/V Malaspina* can, and often does, run 7 days per week. In Lynn Canal, it typically does not run on days it would compete directly with a through mainliner.

C) Alternative 1B was mandated by the Court to only use existing AMHS assets. This new alternative accounted for changes that had occurred to the “existing assets” in the AMHS fleet since the 2006 Final EIS, the capabilities of the vessels in the fleet, and the needs and mission of the fleet to the numerous communities served by AMHS. DOT&PF determined that given the speed of the vessels, additional runs per day are not feasible. Absent the construction of new ferries, an increase in capacity in Lynn Canal substantially greater than that provided in Alternative 1B would require a reduction in service outside of Lynn Canal. In other words, adding more ferries means other communities in the system would get less service.

D) DOT&PF and FHWA examined commenter suggestions to improve Alternative 1B, and discussion of the results were included in Appendix CC, *Development of Alternative 1B – Enhanced Service with Existing Alaska Marine Highway (AMHS) Assets*, of the Draft SEIS. DOT&PF considered using the *Fast Vehicle Ferry (FVF) Fairweather*; however, it is one of two ferries in the AMHS fleet that is capable of providing same-time-of-day service to Sitka (the other ferry is the *FVF Chenega*, which is in indefinite layup status). Same day service to/from Sitka is provided less than 7 days per week, which leaves the *FVF Fairweather* potentially available for several Lynn Canal weekly sailings. This would be a small increase in capacity and frequency, and would not eliminate the need for another Lynn Canal dedicated vessel. Using the *FVF Fairweather* on a twice-daily Haines-Juneau route was not considered reasonable.

The ACF cannot be reasonably scheduled for the Auke Bay-Skagway route using the existing ferry terminals because it cannot make this trip and comply with United States Coast Guard (USCG) crew rest requirements. As Alternative 1B was expected to enhance service using existing AMHS assets without major initial capital expenditures, using the

ACF on the Auke Bay-Skagway route was not considered reasonable because it would require capital improvements to the Skagway Ferry Terminals.

DOT&PF and FHWA fully disclosed the thought process and evaluation process for Alternative 1B in the Draft SEIS. Appendix CC of the Draft and Final SEIS describes all the efforts undertaken to develop Alternative 1B, and documents the data and analysis relied on to create a reasonable alternative solving the transportation problems in the corridor using only existing assets.

E) Elimination of “through” mainliners was considered during the development of Alternative 1B. The mainliners were included in Alternative 1B, as well as other alternatives that provided a primarily marine solution, for many reasons, such as increasing frequency (number of trips per week) and providing additional capacity in Lynn Canal in keeping with the purpose and need for the Project. Discontinuing mainline service would have multiple challenges.

First, the Day Boat ACF could not make a daily Auke Bay-Skagway run and meet USCG crew work/rest requirements. Second, it would create congestion issues at Auke Bay. To fully unload, transfer, and then load northbound and southbound connecting travelers from the mainline vessel, the mainliner ferry must remain docked in Auke Bay long enough for each of the three proposed Lynn Canal ferries to come and go. Unfortunately, Auke Bay has limited berth space and vehicle staging areas. The staging area is insufficiently sized and configured to accommodate all disembarking and embarking vehicles. The vehicle staging area was not designed to handle the volume of transferring vehicles expected with the large mainliners unloading and loading in a limited space. Eliminating the mainliners in Alternative 1B would result in vehicle congestion and delay.

Thirdly, vessel capacity in Lynn Canal might prevent some travelers from reaching their final destination via a direct ferry connection. Vehicles traveling through Juneau in either direction on mainliners would be required to transfer vessels at Auke Bay. Mainline vessels hold between 88 and 134 vehicles, while Day Boat ACFs hold 53. When local traffic is added, capacity would be taxed even more. Travelers might have had to use the Haines-Skagway shuttle and travel via Haines or Skagway to reach their final destination, potentially increasing their travel time and costs. Therefore, discontinuing mainliner service in Lynn Canal was not considered to be a reasonable component of Alternative 1B.

Group 348

Topic/Subtopic: Alternatives/Alternative 1B

Group Comment Text

A) Alternative 1B does not withstand scrutiny in the context of designing marine options that best meet purpose and need “while not inflating costs.” Reducing fares by 20 percent and adding staff for the call center does not reflect the intent of this alternative. These measures would only add cost and have not proven effective in the past.

B) The Draft SEIS does not include a system-wide analysis of traffic, fares, needs, and capacity that is necessary to optimize the use of the existing ferry system assets.

C) Results of the fare study should be incorporated into the Draft SEIS analysis.

D) The Draft SEIS fails to explain why the *M/V Taku*, *Matanuska*, and *Kennicott* are required elsewhere in the AMHS. None of the descriptions of vessels used in Southeast Alaska provide information concerning relative need or demand on the routes each serve. The discussion of rerouting existing ferries lacks the rigor necessary to explore a reasonable version of Alternative 1B, and results in almost insignificant differences between Alternative 1 – No Action and Alternative 1B.

E) Alternative 1B fails the Court’s mandate to “rigorously explore an alternative aimed at providing improved and more efficient ferry service.”

F) Alternative 1B was presented to DOT&PF's marine consultant as-is; therefore, they did not look for or evaluate a better option. If the State were to make a good faith effort to comply with the Court order, it would have asked its consultant to configure a true TSM alternative.

Group Comment Response

A) DOT&PF and FHWA considered fare reductions and enhancements in the call center because the 2006 lawsuit suggested those very kinds of improvements were needed to help maximize ridership. These considerations were evaluated and included as components of Alternative 1B in the Draft SEIS only to the extent they made the alternative more competitive.

B) The purpose and need for the Project is not to maximize the efficiency of the AMHS operations system-wide. That said, the Draft SEIS did not fail to address the comparative needs and capabilities of the vessels across the AMHS system. Appendix CC, *Development of Alternative 1B – Enhanced Service with Existing Alaska Marine Highway (AMHS) Assets*, explains how Alternative 1B was developed and described why certain vessels are needed on certain routes. DOT&PF established as a goal that the new alternative would need to meet the purpose and need in Lynn Canal but not by substantially diminishing service elsewhere in the system. As explained in Appendix CC, DOT&PF considered technical capabilities of the vessels, vessel size, operating conditions, and the effect on the AMHS mission (i.e., whether a vessel could be moved or shared with other routes such that it could provide Lynn Canal service while also maintaining the level of service committed to the other communities).

In part, certain vessels were rejected as being reasonable for Lynn Canal service because it was found that reassigning these vessels to Lynn Canal would be at the expense of reduced service elsewhere. To this extent, DOT&PF considered demand and capacity on the other routes in the system. As explained in Appendix CC of the Draft SEIS, 7 of the 11 existing AMHS ferries are not suitable for use in Lynn Canal because relocating/diverting the ferry to Lynn Canal would jeopardize the AMHS mission, including impacts on demand, level of service, and schedule considerations.

DOT&PF evaluated every vessel in its fleet to try to identify those that could reasonably be relocated or share service within Lynn Canal. It is important to note that DOT&PF and AMHS professionals regularly evaluate the demand, capacity, and efficiency of the overall

system. Schedule changes are made, based on a system analysis of demand and community needs. In particular, because the operation and maintenance of the AMHS system is funded out of the State's general fund, there is great scrutiny and pressure to optimize the efficiency of the service and minimize the costs. The planning that is undertaken, as well as annual schedule and funding discussions, occurs with much involvement from the public and elected officials. DOT&PF contends that this regular planning process, operational funding scrutiny, and annual scheduling process results in a system that is already highly optimized. Despite this, DOT&PF took a hard look at each of the vessels in the fleet and identified and disclosed the reasons vessels were or were not reasonable to consider for Lynn Canal Service. DOT&PF then identified a reasonable "system management" alternative and fully evaluated it in the Draft SEIS.

C) The AMHS Tariff Analysis was completed in January 2015 and was made publicly available on the AMHS website. The fare study examined AMHS tariff rates and tariff rates for similar ferry systems. The study looked at changes in fares made since the previous rate study was completed in 2008. It also looked for anomalies on routes of similar length within the AMHS system. It considered the development and implementation of a changes in tariff policy with the goal of creating a fair and equitable tariff structure. The study did not analyze demand or service to identify inefficiencies. DOT&PF and FHWA reviewed the study and concluded that the analysis and recommendations do not impact the methodology used for the SEIS.

D) As is explained in Appendix CC, *Development of Alternative 1B – Enhanced Service with Existing Alaska Marine Highway (AMHS) Assets*, vessels built for specific functions cannot be relocated to Lynn Canal without jeopardizing AMHS's mission/function that those vessels are providing in other parts of the system. The analysis considered *M/Vs Taku, Matanuska, and Kennicott* for use in Lynn Canal. As explained in Appendix CC, of the three vessels, the *M/V Kennicott* was specifically designed and commissioned to safely make the ocean-going crossing of the Gulf of Alaska. This is a potentially dangerous endeavor and requires a ship built for such a function and sea conditions. Regardless of the demand or capacity on that vessel, moving it to serve Lynn Canal would mean cross gulf trips would not be served. This is an unsafe, impractical, and unreasonable proposal. Reassigning the *M/V Kennicott* to Lynn Canal would eliminate the cross-gulf service, leaving Yakutat without surface access. Yakutat has no road connection, while other communities on the cross-gulf route have road access.

DOT&PF and FHWA considered the *M/V Taku* during development of Alternative 1B for the 2014 Draft SEIS. Since that time, due to funding levels and the condition of the vessel, AMHS sold the *M/V Taku*.

Per the Court's direction, the SEIS must evaluate an alternative that relies on existing ferry assets and terminals without new construction. Upgrading an existing AMHS ferry to be Safety of Life at Sea (SOLAS) compliant would be a major capital investment, inconsistent with the Court's direction. The *M/V Matanuska* is SOLAS compliant, which its sister ship the *M/V Malaspina* is not. Using the *M/V Matanuska* in Lynn Canal makes it unavailable for runs that require a SOLAS-compliant vessel. It also would leave AMHS unable to meet the schedule and demand to Prince Rupert as AMHS has no other SOLAS-compliant replacement with sufficient range and capacity. As sister ships, they have very similar

operating costs, speeds, etc. In other words, there would be no advantage in considering the *M/V Matanuska* over the *M/V Malaspina* in terms of costs, speeds, etc. DOT&PF and FHWA explained these reasons in Appendix CC.

E) DOT&PF and AMHS staff developed a new alternative based on direction from the Court, shared a draft of that alternative with the public during a new scoping effort, took input on the new alternative, and revised that alternative based on the scoping comments received. Alternative 1B complies with NEPA and the Court’s order. Development of the new alternative accounted for changes that had occurred to the “existing assets” in the AMHS fleet since the 2006 Record of Decision (ROD), the capabilities of the vessels in the fleet, and the needs and mission of the fleet to the numerous communities served by AMHS. DOT&PF and FHWA fully disclosed the thought process and evaluation in the Draft SEIS.

Appendix CC, *Development of Alternative 1B – Enhanced Service with Existing Alaska Marine Highway (AMHS) Assets*, of the Draft SEIS described the efforts undertaken to develop Alternative 1B, and documented the data and analysis used to create as reasonable an alternative as possible toward solving the transportation problems in the corridor using only existing assets. AMHS and other DOT&PF professionals, who have years of optimization experience, developed Alternative 1B. They were able to develop a system management alternative that made improvements over and above Alternative 1 – No Action. DOT&PF identified and evaluated Alternative 1B as a competing NEPA alternative in the SEIS. Alternative 1B uses existing assets, and results in an increase in AMHS service in Lynn Canal that would not have required a reduction in service outside Lynn Canal.

F) AMHS and other DOT&PF professionals, who have years of optimization experience, developed Alternative 1B. They were able to develop a system management alternative that made improvements over and above Alternative 1 – No Action without jeopardizing service elsewhere. AMHS staff have considerably more experience with running and optimizing the existing AMHS service than Coastwise Corporation. Coastwise Corporation is a naval architecture and marine engineering firm primarily offering vessel design, marine structural and systems analysis, and port engineering services.

Group 474

Topic/Subtopic: Alternatives/Alternative 2B

Group Comment Text

A) The SEIS proposal for the Katzechin Ferry Terminal does not include sufficient support facilities. The terminal is remote and should be staffed for operations, maintenance, and security. The terminal will need electrical power, restrooms, shelter and heat for stranded travelers, accommodations for staff, food and water, communications, fuel, and parking.

B) What support facilities will be available at the Katzechin Ferry Terminal?

C) Will the Katzechin Ferry Terminal be Americans with Disabilities Act (ADA) compliant?

D) The SEIS needs to provide detail about logistics associated with the Katzehin Ferry Terminal (e.g., location of the terminal, plans for stranded passengers, security, maintenance, staffing, parking, staging of vehicles, communication, utilities, ticketing, etc.).

E) Will the Department of Homeland Security (DHS) and USCG approve the plan for the terminal?

F) Will travelers be required to pay for tickets with a credit card, something not all travelers have? How will ticket payments be secured if cash is accepted, and how will ticketing machines be serviced if they break down?

Group Comment Response

A) The Katzehin Ferry Terminal includes the support facilities necessary to meet AMHS operational requirements, including a heated shelter with rest rooms for the public. There would not be public communication service provided. Staffing the Katzehin Ferry Terminal was a consideration. However, staffing of this remote terminal site is not necessary for ferry operations of the terminal and adds unnecessary operational expense. Shuttle docking and managing traffic loading/unloading would have been accomplished by the shuttle crew.

B) Public support facilities include a heated terminal building with waiting area and public restrooms.

C) All terminal public facilities would have been constructed to current ADA accessibility requirements.

D) The purpose of the SEIS is to evaluate the proposed project's environmental impacts to meet the requirements of NEPA. To the extent operational details are known at this time (e.g., the availability of public restrooms, terminal staffing and public communication), they are identified in the Final SEIS (see Section 3.5 of the *2017 Update to Appendix D - Technical Alignment Report* in Appendix Z and alternative descriptions in Chapter 2 of the Final SEIS). However, operational details (e.g., security, ticketing, vehicle staging, and specific plans for stranded passengers) are developed during the final design phase of the project. Terminal configuration (e.g., location and general site plan, including structures and parking) are included in the *2017 Update to Appendix D - Technical Alignment Report* in Appendix Z of the Final SEIS. Facility maintenance is performed by DOT&PF and not an operational detail developed during project design and construction.

E) Staffing the proposed remote terminal sites was considered. However, staffing the remote terminal sites is not necessary for the operations of the terminal and adds unnecessary operational expense. Security for vessel operations is the responsibility of the shuttle crew. DHS and USCG do not require a separate security plan for unmanned terminals. The security for unmanned terminals is covered by the individual vessel security plans that are approved by the USCG. Receiving approval for vessel security plans for vessels servicing Haines, Skagway, and Katzehin is not anticipated to be an issue. AMHS currently has several unmanned terminals in service.

F) Means of payment and its necessary support is an operational detail that would have been determined during the final design of the ferry terminal. Considerations include payment on board, payment at a kiosk, and payment one way only at Haines and Skagway.

Group 475

Topic/Subtopic: Alternatives/Alternative 2B

Group Comment Text

What is the logic behind building a ferry terminal 90 miles from downtown Juneau—making travel more expensive, time consuming, and dangerous—when current ferry service is safer and more economical?

Group Comment Response

Chapter 1, in general, and Section 1.4, more specifically, provides the purpose and need for the project. The project is intended to provide greater capacity to meet transportation demand, provide greater flexibility and improve opportunity for travel, reduce travel time between communities, and reduce State and user costs. As described in the Draft SEIS, Alternative 2B accomplished this combination of objectives better than the other alternatives.

Both marine ferry vessels and highways have engineering standards designed for safety and efficiency of operation, and the road and marine portions of each alternative would meet current standards for safety. Current ferry service is not more economical than a road for most users. Travel time under Alternative 2B would be improved, and the short connecting ferry link would operate much more frequently.

The road alternatives (2B and 3) represent a shift in the way transportation would be provided in the corridor—away from a primarily public transportation mode that operates more like a public transit service, to a highway system where private vehicles provide most of the transportation (with shorter-distanced, publicly-owned shuttle ferries providing links connecting the roadways). The road would not “dead-end.” It would function much like the one-way Anton Anderson Tunnel that connects the Seward Highway to Whittier in Southcentral Alaska, where there would be a relatively short wait, a modest payment, and then a relatively quick passage before getting back onto a standard two-lane highway.

Maintenance of the new road would be by DOT&PF from State transportation funds (there would not be maintenance costs for the cities in the region). Table 2-26 in Chapter 2 (Alternatives) of the Draft SEIS and various tables in Chapters 2 and 4 of the Final SEIS summarize operating and maintenance costs, user costs, capacities, ferry sailing frequencies, and other measures. While the cost to the State would rise overall, the cost per vehicle served would drop dramatically.

Group 476

Topic/Subtopic: Alternatives/Alternative 2B

Group Comment Text

A) The Draft SEIS lacks an explanation of the criteria that selected Alternative 2B as the preferred alternative (e.g., costs, need/demand, impacts, etc.).

B) The Draft SEIS did not incorporate modifications to alternatives that would have made them more practicable.

C) Why are Alternatives 2B and 3 the only alternatives not burdened with the cost of mainliners?

Group Comment Response

A) Section 2.5, Identification of the Preferred Alternative, explains the identification of the preferred alternative. As a supplemental EIS, the Draft SEIS referenced the 2006 ROD for additional information. DOT&PF and FHWA reviewed the previous information, and the updated information in the Draft SEIS, and reconfirmed Alternative 2B as the preferred alternative in that document. Table ES-1 of the Draft SEIS presented a comparison of the criteria underlying the decision. As presented in the table, Alternative 2B accommodates the highest demand, provides the greatest capacity, has the shortest travel times, provides the greatest frequency of service, has the lowest cost per vehicle transported, and has the second lowest operations and maintenance costs of any of the build alternatives. The decision in the Draft SEIS balanced these benefits, taking into consideration the impacts described throughout the document and appendices.

B) The Draft SEIS did not make drastic changes to the reasonable alternatives identified in the 2006 FEIS. However, each alternative was evaluated by considering the most current available information, and some alternatives were adjusted to reflect new information. For example, many alternatives included the two soon-to-be-available ACFs. Additionally, forecasted demand levels also changed, leading to changes in vessel designs and sailing frequencies. In making these modifications, DOT&PF refined the alternatives to make them better in terms of resolving the problems identified in Chapter 1, Purpose and Need. In addition, the Draft SEIS explained that Alternative 2B included minor re-alignments as a result of consultation with resource agencies to attempt to minimize environmental impacts.

C) DOT&PF kept mainliner service in the alternatives that provide a primarily marine solution for several reasons. First, it provides additional capacity and frequency, which is necessary to help achieve the purpose and need for the Project. Second, for vehicles and passengers that are already on the mainline vessel, needing to disembark in Auke Bay and drive across the dock and board another AMHS vessel would add considerable delay and travel time to their trip with minimal to no speed advantage on the vessel to which they are transferring. For Alternatives 2B and 3, the improved travel speed those travelers would have realized by driving, and the relatively short wait and loading time of the drive through loading and unloading service of the short shuttle trip, would have made it advantageous for them to disembark at Auke Bay. Moreover, Alternatives 2B and 3 do not have the disadvantages associated with more limited capacity and frequency that the non-road

alternatives have. Note, Alternatives 1B and 4C capacities were analyzed to consider the removal of mainliner service in Lynn Canal. See Alternatives 1B Optimized and 5 under Appendix II, *Alternative 1B Optimized and Alternative 5 Evaluation*.

Group 477

Topic/Subtopic: Alternatives/Alternative 2B

Group Comment Text:

A) Given the historic traffic between Haines and Skagway, the proposed shuttle appears to not provide adequate capacity. In particular, it would be inadequate for transporting Recreational Vehicles (RVs).

B) The shuttle will be taken out of service in winter, and there is no direct connection between Skagway and Haines.

Group Comment Response:

A) The Haines-Skagway shuttle is sized to meet the projected induced traffic resulting from improved service in addition to existing traffic levels. The sizing of the shuttle was addressed in Chapter 4 and Appendix GG, *2017 Updated Marine Segments Technical Report*.

B) Alternative 2B would not have direct service between Haines and Skagway during winter. Traveling between the two communities, the traveler would have ridden a ferry to the Katzechin Ferry Terminal and catch a second ferry to their destination. During winter, only two of the three vessels would have operated at one time. One vessel would have serviced Skagway-Katzechin and the second vessel would have serviced Haines-Katzechin. This is due to 1) reduced traffic demand and 2) the need to perform annual maintenance. Each winter, each of the three vessels would have been serviced while the remaining two would have continued to operate. Even with just two vessels operational in winter, there would have been multiple trips per day versus the few trips per week currently provided.

Group 479

Topic/Subtopic: Alternatives/Alternative 2B

Group Comment Text:

A) Why has the proposed plan been divided into a two-phase construction schedule?

B) Is it possible that the second phase might never be completed?

Group Comment Response:

A) Anticipated construction duration for Alternative 2B is 6 years. The Draft SEIS did not present a construction phasing plan for Alternative 2B.

B) FHWA approval of a Financial Plan detailing full funding for the JAI Project would be required before initial construction was implemented. DOT&PF's ability and commitment to completing the entire project would be documented in the Project Management Plan and the Financial Plan.

Group 630

Topic/Subtopic: Alternatives/Alternative 2B

Group Comment Text:

A) Having the Day Boat ACFs running constantly between Haines and Skagway is inefficient. They will run empty, especially in winter.

B) For Alternative 2B, DOT&PF should reconsider dropping the direct Haines-Skagway ferry in winter. An efficient, nonstop service between Haines and Skagway is needed.

C) Will the mainliners still go up Lynn Canal, or will all sailings stop at Auke Bay?

Group Comment Response:

A) The design of the Day Boat ACFs is completely outside the purview of the JAI Project. That decision was made previously, and the ships are under construction. The question for the JAI Project is whether to use them and if so, how best to use them to meet the purpose and need for the project. The Draft and Final SEIS present different options for their use in the alternatives. The frequency proposed for the ferries under these alternatives was designed based on the anticipated demand and need to improve travel flexibility. The frequency was planned with costs and demand as a consideration, which is why the schedule was proposed to be reduced during winter.

B) During winter, only two of the three vessels would have been operating at one time. One vessel would have served Skagway-Katzehin, and one vessel would have served Haines-Katzehin. This is due to 1) reduced traffic, and 2) the need to perform annual vessel maintenance. Even with just the two vessels operational in winter, there would have been multiple trips per day versus the few trips per week currently provided.

C) Under Alternatives 2B and 3, the northern terminus of the mainliners would have been Auke Bay/Juneau. Mainliners would not have continued in Lynn Canal. Alternatives 1B, 4A, 4B, 4C, and 4D would have maintained ferry service, including mainliner service, from Juneau northward.

Group 642

Topic/Subtopic: Alternatives/Alternative 2B

Group Comment Text:

How can Alternative 2B transport 742 cars per day on the ferry under the same assumptions and criteria used for Alternative 1 - No Action and Alternative 1B?

Group Comment Response:

Alternatives 1 (No Action), 1B, and 2B all use the same Day Boat ACFs. Using a Day Boat ACF, and leaving from Auke Bay, only one round trip can be made per day. This limits the amount of capacity and travel frequency that can be accommodated under Alternatives 1 and 1B. Alternative 2B, which leaves from Katzehin has a much shorter run to Haines or Skagway. Under Alternative 2B, the Day Boat ACFs are able to make eight round trips per day on the Katzehin-Haines run and six round trips on the Katzehin-Skagway run. This shorter run allows more capacity and frequency of travel, accounting for the difference.

Group 644

Topic/Subtopic: Alternatives/Alternative 2B

Group Comment Text:

Commenters identified concerns regarding geologic hazards in the design of Alternative 2B (e.g., bridges, shoulders, and culverts).

Group Comment Response:

The *2017 Update to Appendix D - Technical Alignment Report* in Appendix Z of the Final SEIS includes a discussion regarding the geologic hazards and hazard mitigation for Alternative 2B. The report also includes a tabulated summary of proposed bridges, tunnels, snow sheds, and highway lengths. The costs related to proposed structures for each road alternative are reflected in Attachment E to the *2017 Update to Appendix D - Technical Alignment Report*. Chapter 4 of the Final SEIS has been updated to include additional relevant information from the updated Appendix D.

Group 686

Topic/Subtopic: Alternatives/Alternative 2B

Group Comment Text:

Without separate moorings for the two shuttle ferries at the Katzehin Ferry Terminal, there is the possibility of forcing one vessel to wait in the channel due to departure delays of the other vessel caused by loading/unloading or mechanical problems.

Group Comment Response:

While there is the possibility of a vessel having to stand by in Lynn Canal, the possibility would be mitigated by delaying departures and adjusting travel speed.

Group 350

Topic/Subtopic: Alternatives/Alternative 3

Group Comment Text:

A) Why did FHWA and DOT&PF dismiss Alternative 3?

B) Alternative 3 was not analyzed sufficiently for a comparison of alternatives (e.g., safety, avalanche, geologic hazards, etc.) in the Draft SEIS.

C) Alternatives 2B and 3 were not treated equally in the Draft SEIS (i.e., logistical problems were discussed for Alternative 3 but the same problems were not discussed for Alternative 2B).

D) The Draft SEIS ignored the *Haines Borough Comprehensive Plan*, which states that the road should be built on the west side of Lynn Canal.

E) Alternative 3 makes more sense for the future of the multi-modal transportation system being developed by DOT&PF.

Group Comment Response:

A) Alternative 3 was not dismissed; it was developed and analyzed to a similar level as the other alternatives. It was carried forward as a reasonable alternative for full analysis in the Draft and Final SEIS. It was not identified in the Draft SEIS as the preferred alternative for reasons described in Section 2.5, Identification of the Preferred Alternative, and Section ES-7, Executive Summary, of that document. This explanation has been revised in the Final SEIS (see Section 2.5). Table ES-1 shows side-by-side comparison of Alternatives 2B and 3 and other alternatives. While it shows higher construction costs, it indicates better transportation performance by Alternative 2B than Alternative 3 or the other alternatives.

B) All the reasonable alternatives evaluated in detail in the Draft and Final SEIS were developed to a sufficient level of detail to evaluate and compare potential impacts on area resources. Alternative 2B had advanced to detailed design and permitting after it was selected in the 2006 ROD, and DOT&PF initiated some of the mitigation proposals, which resulted in additional collection of data for resources in the project area. For these reasons, there is more information on the resources potentially affected by Alternative 2B than for the other alternatives. The amount of information on any one topic for an alternative represents the amount of information available and its relevance to the impact statement.

C) The Draft and Final SEIS treat alternatives equally. The "logistics" question is related to the Clean Water Act and the Draft Section 404(b)(1) Analysis (see Appendix Z, *Update to Appendix X – Draft 404/10 Permit Application and Draft 404(b)(1) Analysis*). It is not part of NEPA requirements; rather, it is provided for U.S. Army Corps of Engineers (USACE) consideration in its decision related to a Section 404 wetlands permit for the JAI Project.

D) The Draft and Final SEIS do not ignore the *Haines Borough Comprehensive Plan* (see Sections 3.1.1.4 and Consistency with Land Use and Management Plans sections under each alternative in Chapter 4 [e.g., Sections 4.3.1.2, 4.4.1.2, etc.]). The *Haines Borough Comprehensive Plan* (2012) does not legislate a requirement regarding the JAI Project. It cites a Haines Borough resolution that favored improved ferry service. It makes reference to a preference for a west-side road over an east-side road, if there must be a road. There are no goals and objectives related to the road but there are several related to maintaining and enhancing ferry service.

E) The suggestions made by the commenter are not consistent with the planning that has been completed by DOT&PF in the Southeast Alaska Transportation Plan (SATP). The adopted plan (2004) does not recommend a multimodal solution with a ferry terminal at Point Couverden or a road link along the west side of Lynn Canal south of William Henry Bay. Similarly, the 2014 draft SATP update also did not recommend such a concept. The SEIS evaluates consistency with adopted plans.

Group 623

Topic/Subtopic: Alternatives/Alternative 3

Group Comment Text:

In the event of a catastrophic failure of the road under Alternative 3, DOT&PF needs an emergency ferry service plan between Juneau and Haines.

Group Comment Response:

Catastrophic failure of the road as an engineered structure is not considered likely. Only a severe earthquake might have such an effect. A road on either the west side (Alternative 3) or east side (Alternative 2B) of Lynn Canal could temporarily be closed due to a severe automobile crash, extraordinary winter conditions, avalanche (purposefully or naturally triggered), or rockfall. As discussed in the SEIS, day boat ferries (or other vessels in the AMHS fleet) would be deployed to provide service in Lynn Canal if the road were temporarily closed. The SEIS addresses this topic under the “Transportation” heading and under the “Travel Flexibility and Opportunity” subheading for each alternative in Chapter 4.

Group 365

Topic/Subtopic: Alternatives/Eliminated Alternatives

Group Comment Text:

A) FHWA and DOT&PF should consider a road to Atlin, British Columbia, along the Taku River as an alternative to provide access to Juneau. This road could link to the Canadian highway, providing access to the rest of Alaska or the Lower 48 states.

B) This road could increase access for mining and result in impacts to fish and fish habitat.

Group Comment Response:

A) Section 2.2.1 of the Draft SEIS addressed a Taku River Valley Highway alternative. It was considered but found to not be reasonable based on consultation with the Government of British Columbia. As stated in the Draft SEIS, it also would not address the purpose and need elements related to improving transportation in the Lynn Canal corridor. In other words, even if the Government of British Columbia had been receptive to the project, a Taku corridor would not satisfy the project purpose and need of the JAI Project.

B) The purpose of this project is not to increase access for mining in the Taku River region. Fish impacts in that area are not the subject of this SEIS because no alternatives carried forward for full evaluation in the SEIS would enter the Taku River region.

Group 366

Topic/Subtopic: Alternatives/Eliminated Alternatives

Group Comment Text:

A) DOT&PF should reconsider building a road from Haines to Skagway either as a stand-alone road or in conjunction with a road from Juneau to Skagway. If a road was built between Haines and Skagway, it would eliminate a ferry and its associated terminal.

B) DOT&PF should build the road from Katzechin to Skagway and connect with the Klondike Highway.

C) DOT&PF should consider building a bridge across Lynn Canal from Katzechin to Haines.

D) Has DOT&PF thought about creating a hard link road by going up the Katzechin River and then cutting through one of the northern side streams, connecting to the road between Skagway and Whitehorse?

Group Comment Response:

A) The Draft and Final SEIS addressed a Haines-Skagway Intertie Alternative in Section 2.2.3 as part of a broader road and ferry alternative. DOT&PF and FHWA found the Haines-Skagway segment of road to be very expensive; the Haines/Skagway road connection does little to address the project purpose of providing access to/from Juneau. While there could be advantages of a road between Haines and Skagway in terms of reducing ferry operations in northern Lynn Canal, it is not needed to address this project's purpose and need.

B) A road connecting Juneau and Skagway is discussed in Section 2.2.9 of the SEIS as an alternative determined not reasonable by the FHWA in the 2006 SEIS. The road into Skagway impacts the Skagway and White Pass National Historic Landmark. Section 4(f) of the U.S. Department of Transportation Act forbids use of National Historic Landmarks and certain other protected lands for Federal-aid funded transportation projects when other feasible and prudent alternatives are available.

C) Section 2.2.4 of the Draft and Final SEIS discuss an alternative called East Lynn Canal Highway with Bridge to Haines. The extraordinary costs of a very long bridge over very deep water with a need to pass large vessels (e.g., cruise ships) on a regular basis meant extremely high costs. The alternative was found unreasonable primarily on the basis of cost.

D) A surface road route northward up a Katzechin River tributary and connecting to the Klondike Highway north of Skagway would not be feasible because the valleys in question are narrow and steep sided and terminate in high peaks and icefields, with a crossing in excess of 6,000 feet elevation. The best case scenario would be a tunnel beginning at about 2,500 feet in elevation under the peaks and icefields and more than 5 miles long. Grade, snowpack, unavoidable glaciers, and/or extraordinary costs of building and operating a tunnel resulted in a professional judgment regarding technical feasibility, cost, and a common sense approach to this route (screening criterion I) that indicated this route would

not be a reasonable alternative.

Group 368

Topic/Subtopic: Alternatives/Eliminated Alternatives

Group Comment Text:

DOT&PF should consider alternatives to roads and ferries, including a railroad and a means to increase affordability of in-state air transportation.

Group Comment Response:

Section 2.2.9 of the Draft and Final SEIS address multiple alternatives, including rail alternatives, and reasons these alternatives were determined not reasonable. The purpose and need of this project relates specifically to surface transportation in the Lynn Canal Corridor, and air service from Lynn Canal communities to other points would not address these needs.

Group 377

Topic/Subtopic: Alternatives/Funding

Group Comment Text:

The State should create a Permanent Fund for the existing ferry system that provides a rebate to ferry users.

Group Comment Response:

The proposal within this comment is creative but is not a transportation alternative and would not satisfy the project purpose and need (see Chapter 1, specifically Section 1.4). While a proposed Permanent Fund or “endowment” for the ferry could theoretically be used to reduce costs for users, it would not satisfy the other elements of the project purpose and need. A key element of the project purpose and need is to better satisfy demand for access. A Permanent Fund would not provide additional capacity to help meet travel demand in the corridor. Similarly, it would not provide flexibility or improve opportunity to travel, reduce travel time, or reduce costs to the State—in fact, it would appear to add costs to administer a new program and to establish the base principal—all of which are important components of the project purpose and need.

Group 421

Topic/Subtopic: Alternatives/Funding

Group Comment Text:

A) The SEIS needs to explain the funding sources for the project.

B) The project is not fully funded and is at risk of not being completed. How is DOT&PF planning to fully fund the project?

C) The funding plan in the Draft SEIS is unrealistic because equity bonus funds are no longer available (the term has expired).

D) How can FHWA obligate National Highway Performance Program (NHPP) funding for the project since:

- (1) The project is not on the National Highway System (NHS);
- (2) The State must first cooperate with local and regional officials;
- (3) The project is not consistent with the State's asset management plan for the NHS, nor does it meet the goals for the SATP; and
- (4) The project is not fully funded in the Statewide Transportation Improvement Program (STIP); therefore, the project is segmented.

E) Will the Lynn Canal portion of AMHS ferry service under Alternative 2B still be eligible for federal transit funds?

F) Commenters expressed general concern for the availability of future Federal-aid funds to pay for this project.

G) The project intends to only construct a road to Kensington Mine.

H) Shakwak funds cannot be used on this project.

Group Comment Response:

A) The funding sources for a build alternative are explained at the end of Chapter 2 in the Draft SEIS, and the Final SEIS explains that no funding is necessary because Alternative 1 – No Action was selected.

B) If a build alternative had been selected, it would have been fully funded with a mix of federal transportation dollars administered by FHWA and State matching funds. This is identified in the relevant Statewide Transportation Program (STIP). (See <http://dot.alaska.gov/stwdplng/cip/stip/index.shtml> for full details on the STIP.) The ratio of federal to State funds is approximately 9:1. State match funds are identified annually in the State's capital budget. These funds are unrestricted general funds (UGF).

C) The 2011 and 2013 Equity Bonus Funding identified in the Draft SEIS was available at the time the Draft SEIS was released, but now is no longer available to this project. Those funds had to be used within a certain period or else they would be lost. Those funds have been used on other projects.

D) All build alternatives can use NHPP dollars because:

- (1) The current surface transportation system in northern Lynn Canal is eligible for NHPP funding. New roads as proposed under Alternatives 2B and 3 can be designated as NHS intermodal connectors and would thus be eligible to receive NHPP funds. Approval of a modification to the NHS system is independent of an FHWA Final SEIS/ROD. An NHS modification would have occurred prior to requesting construction funding.

(2) In the process of modifying the NHS system, DOT&PF would have cooperated with local community officials.

(3) DOT&PF plans to submit an asset management plan to FHWA. DOT&PF and FHWA disagree with the commenter's suggestion that the project is not consistent with the goals of the state's Long Range Transportation Plan. The SATP is an element of the Statewide Plan and it includes the JAI Project. The goal language cited by the commenter is still "preliminary" and has not been adopted. Nonetheless, it is consistent with the purpose and need for the JAI Project. Like the goal language, the alternatives under consideration seek to develop new capacity to meet demand. Similarly, consideration of State costs and the return on investment are defined in Chapter 2 of the Draft SEIS. Alternative 2B, the preferred alternative in the Draft SEIS, was found to best satisfy the overall corridor demand at the lowest cost per trip—in other words, it had the best return on investment. Finally, efficiency is an important consideration and need for the project. As documented in Chapter 2 of the Draft SEIS, the current system is not efficient, characterized by long travel times and high user costs. Alternative 2B performs best at in terms of efficiency, making the most improvement over current travel times and trip costs.

(4) Currently, there are no funds shown in the STIP, since the preferred alternative has been changed to Alternative 1 – No Action; however, during the period between the release of the 2014 Draft SEIS and prior to the change of the preferred alternative to Alternative 1 – No Action, the completion of the design phase was shown in the 2016–2019 STIP. The funding for construction was after Federal Fiscal Year (FFY) 2019. A build alternative would have been constructed in stages, which is not segmentation. The initial construction stage would have occurred after the time frame presented in the current STIP (after 2019). Showing the intent to fully fund the JAI Project in the years beyond the current STIP shows intent by DOT&PF to fund the project in its entirety and was accepted by FHWA. (See <http://dot.alaska.gov/stwdplng/cip/stip/index.shtml> for full details on the STIP.)

E) The Federal Transit Administration (FTA) Section 5309 New Starts program was an annual allocation to the State of Alaska for the AMHS under Safe, Accountable, Flexible, Efficient Transportation Equity Act (SAFETEA-LU) and was discontinued under Moving Ahead for Progress in the 21st Century Act (MAP-21).

Under MAP-21 and continued under the Fixing America's Surface Transportation (FAST) Act, FTA made available Section 5307 Urbanized Area Formula Grant program funds in support of the Discretionary (competitive selection) Passenger Ferry Grant program. The AMHS does not qualify for urbanized area funds.

AMHS is potentially eligible for 5311 Rural Transit Formula funds for non-urbanized areas. This is a small program, approximately \$8 million annually, and AMHS's participation in this program would generate little funding for the AMHS program and would divert federal funds away from rural community transit systems that depend on these funds for continued operation. As such, AMHS has not competed for 5311 funding due to the limited amount of funds available to the State of Alaska.

F) On December 4, 2015, the FAST Act, a 5-year transportation bill that will provide stability in federal funding over the life of the bill, was signed into law. The FAST Act

slightly increased annual highway funding for Alaska.

G) The suggestion that FHWA or DOT&PF intend to build a road only to Kensington Mine is unfounded and not supported by any information in the Draft and Final SEIS.

H) The Draft SEIS does not identify Shakwak funds as a potential source of funding for the project.

Group 436

Topic/Subtopic: Alternatives/Funding

Group Comment Text:

To obtain federal funding, the DHS and USCG must approve the planning action.

Group Comment Response:

Approval of project components or actions by DHS would not be required to obtain FHWA funding. USCG involvement/approval in advance of receiving FHWA construction funding would only be required in the event that a permit for a bridge over navigable U.S. waters is required. USCG bridge permits would be obtained during final design if a build alternative were selected.

Receiving FHWA funding would not be contingent on the USCG review/approval of AMHS vessel security plans.

Group 458

Topic/Subtopic: Alternatives/Funding

Group Comment Text:

DOT&PF should consider using military engineering units, such as the Seabees, as a way to reduce construction costs.

Group Comment Response:

The Metlakatla road project referenced in the comment was undertaken as a training program for multiple branches of the military, including the Navy's Construction Battalion (CB, or Seabees) in the early 2000s, and was not a normal construction program. Seabees typically work on military projects or goodwill projects overseas. While any government effort may be possible at the direction of the Congress, this has not occurred on the JAI Project and is considered unlikely. The JAI Project would proceed as a typical construction project funded by FHWA if a build alternative were selected.

Group 473

Topic/Subtopic: Alternatives/General

Group Comment Text:

The Draft SEIS did not incorporate established infrastructure of State roads.

Group Comment Response:

The Draft SEIS did consider and incorporate the established State road infrastructure into the alternatives to the extent the infrastructure was a component of the alternative. In each of the alternatives, existing roads are used to connect to the alternatives. In some instances, improvements or extensions of the existing road infrastructure are proposed. Details of the alternatives, including information on how existing road and ferry infrastructure have been incorporated, can be found in Chapter 2 of the Draft and Final SEIS.

Group 645

Topic/Subtopic: Alternatives/General

Group Comment Text:

A) DOT&PF should analyze each alternative’s ability to improve surface transportation relative to Alternative 1 - No Action.

B) The extent to which each alternative meets demand should be given less weight due to the inexact science of traffic projections.

Group Comment Response:

A) The Draft SEIS analyzed each alternative’s ability to meet the project purpose and need, allowing for a comparison of each alternative against Alternative 1 – No Action. All reasonable alternatives satisfy the purpose and need to varying degrees. Some alternatives, however, do this better than others. Making a decision based primarily on comparing alternatives to Alternative 1 – No Action provides limited information (as any increase in travel would qualify as an increase in capacity). Doing better than Alternative 1 – No Action is not the overall purpose of the JAI Project. The overall purpose is meeting the demand for travel.

The unconstrained traffic model represents the number of trips desired to be made by the traveling public. Only by evaluating alternatives against this measure, can FHWA determine how well an alternative does in meeting the purpose and need. Comparing alternatives to the unconstrained travel demand not only identifies how well the alternatives meet demand, but also identifies the number of trips not occurring due to operational and logistical constraints. The comparison can be made directly in Table ES-1 of the Executive Summary, where each alternative is characterized quantitatively with 12 purpose and need factors. Figure ES-1 presents the travel demand and capacity associated with each alternative in a chart that allows comparison of each alternative relative to Alternative 1 – No Action. The chart also allows comparison of the alternatives to the unconstrained demand.

B) All traffic demand models attempt to predict future demand based on assumptions and data available in the present. To the extent that they are predicting a future, unknown

condition, all demand models have uncertainty. The demand model used for the JAI Project was developed based on empirical data derived from actual travel conditions observed in Alaska and Western Canada from communities with similar geographic characteristics as Juneau. The modeling was developed by travel modelers at Fehr & Peers. This firm was specifically identified and hired for its expertise in the travel modeling field, and the approach and results were peer reviewed by an independent university professor with expertise in travel modeling and travel behavior prior to the results being accepted for use in the Draft SEIS. No particular weight was given to any element of the project purpose and need. In making its decision for the Draft SEIS, FHWA examined how each of the alternatives meets each of the elements of the overall purpose and need for the project. FHWA balanced that information with the potential impacts to the natural and human environment to identify a preferred alternative. Identification of the preferred alternative in the Draft SEIS was addressed in Section 2.5, which indicates that DOT&PF and FHWA considered multiple factors.

Group 357

Topic/Subtopic: Alternatives/General Marine Alternatives

Group Comment Text:

It is imperative that any proposed modifications of the Skagway Ferry Float be coordinated with the Municipality of Skagway to ensure compatibility with the Municipality's uses. The Municipality should be consulted in the design, replacement, and implementation process of any additional infrastructure or changes to the existing facility to allow for the docking of the proposed shuttle ferries.

Group Comment Response:

If an alternative is selected that requires modifications to the Skagway Ferry Terminal floating dock, DOT&PF has committed to coordinating changes to the floating dock with the Municipality of Skagway during design.

Group 359

Topic/Subtopic: Alternatives/General Marine Alternatives

Group Comment Text:

DOT&PF should not use the existing ferry system as a baseline for comparison of alternatives. The ferry system has been poorly managed (e.g., ships were used past their useful lives, schedules and fares were not established to provide more ridership and revenue, etc.).

Group Comment Response:

NEPA requires consideration and evaluation of a No Action Alternative. The No Action Alternative is intended to serve as a baseline of existing conditions and trends to compare against the other ("build" or "action") alternatives. Making changes suggested by the commenter (management changes, schedule changes, fare changes) would not constitute a "No Action Alternative."

Group 364

Topic/Subtopic: Alternatives/General Marine Alternatives

Group Comment Text:

Alternatives 4A and 4B did not receive a fair evaluation in the Draft SEIS analysis. These alternatives were penalized with the purchase of new ferries. The other alternatives do not include the construction cost of the Day Boat ACFs, prejudicing the decision away from selecting either of these fast ferry alternatives.

Group Comment Response:

Alternatives 4A and 4B received full and fair evaluation in the SEIS. The process required by NEPA and associated regulations is to evaluate a range of alternatives. In this case, there are alternatives that include a large road component and small ferry component, used existing ferry assets only, and mixed existing (or already programmed) and new ferry assets. In this case, the Day Boat ACFs had already been programmed (i.e., a decision had already been made to fund them) separately from the JAI Project, while the fast vehicle ferries (FVFs) under Alternatives 4A and 4B were proposed as a part of this project only (i.e., they are not programmed) and therefore would have needed to be funded by this project. This is no different than the aspects of other alternatives (e.g., road or docking facilities) that would have needed capital improvements to make them functional. These are realities that the Draft and Final SEIS draws into focus by presenting information on each alternative.

Group 383

Topic/Subtopic: Alternatives/Modification of Alternative Recommended

Group Comment Text:

DOT&PF should modify the ferry service proposed in the alternatives presented in the Draft SEIS. Changes could include:

- A) DOT&PF should optimize/improve vessel deployment, routing, and scheduling, taking into consideration capacity and demand (e.g., discontinuing service to Washington State).
- B) DOT&PF should replace aging ferries with new ferries.
- C) DOT&PF should add public transportation from Juneau to the Auke Bay Terminal and from Auke Bay Terminal to the airport.
- D) DOT&PF should optimize/modify Day Boat ACF vessel design.
- E) DOT&PF should remove mainliner service in Lynn Canal for the marine alternatives.

Group Comment Response:

General Response: A number of comments suggested general modifications to the ferry schedule, vessel designs, or routing that do not address the specific purpose and need identified for Juneau access in Lynn Canal and are outside the scope of this project. Specific responses follow below:

A) Wholesale changes to the AMHS ferry system are beyond the scope for this project. Alternative 1B does provide enhanced ferry service with existing assets primarily by increasing capacity and frequency of service through the deployment and routing of vessels in Lynn Canal. Vessel selection for use in Alternative 1B was done with the intent not to diminish service elsewhere in the system. Optimizing AMHS deployment and scheduling throughout the system are AMHS operational decisions. AMHS schedules are published in draft twice per year and comments are considered before schedules, including what vessels are assigned to a given route, are finalized. AMHS is continually making changes to vessel deployment based on budget, amount of demand, and vessel availability.

B) As mentioned above, the replacement of aging ferries does not address the project's purpose and need. The issue is relevant to AMHS long range planning addressed in the SATP. The SATP is in the process of being updated—these comments have been forwarded to the SATP planner.

C) As mentioned above, providing public transportation between the Auke Bay Terminal, downtown Juneau, and the Juneau Airport does not address the purpose and need for this project. In addition, providing public bus service is not a State responsibility and therefore is not an element that can be added to JAI Project alternatives.

D) The two Day Boat ACFs are under construction at the time of this Final SEIS. The plan to construct two bow door Day Boat ACFs without crew quarters was made independent of the JAI Project SEIS. The State concluded the cost savings of 12-hour, no crew quarter vessels outweighed the greater versatility the crew quarters would provide. Because design and construction of the ACFs were previously approved through an independent decision, the JAI Project SEIS has incorporated them “as is” into the project alternatives to the extent reasonable. The two Day Boat ACFs are incorporated into all alternatives except Alternatives 4A and 4B. A consideration in incorporating the Day Boat ACFs is that the vessel cannot make the Auke Bay-Skagway-Haines-Auke Bay loop in 12 hours.

E) AMHS intends to continue providing direct uninterrupted service between Haines-Skagway and Prince Rupert-Bellingham. This operational decision applies to marine Alternatives 1 (No Action), 1B, and 4A through 4D. The mainliner service in Lynn Canal provides additional necessary capacity (to best meet the purpose and need) for the marine alternatives and provides uninterrupted service for passengers passing through Juneau. Note the Skagway Marine Access Commission (SMAC) suggested two alternatives that they refer to as “Alternatives 1B optimized” and “Alternative 5;” both of which would remove mainliner service from Lynn Canal. See Appendix II, *Alternative 1B Optimized and Alternative 5 Evaluation*, of the Final SEIS for discussion.

Group 388

Topic/Subtopic: Alternatives/Modification of Alternative Recommended

Group Comment Text:

A) DOT&PF should consider relocating the ferry terminal at William Henry Bay to Boat Harbor.

B) Ferry alternatives should be modified to avoid constructing a ferry terminal in Berners Bay, possibly continuing to use the Auke Bay terminal.

C) DOT&PF should consider building the ferry terminal at Cascade Point or other sites along the Juneau road system.

Group Comment Response:

A) Relocating the ferry terminal south from William Henry Bay to Boat Harbor consists of an additional 8 to 10 miles of road construction and extensive site work at Boat Harbor. This work results in an increase to project cost and environmental impacts, such as waters of the U.S. and terrestrial habitat.

B) Eliminating the ferry terminal in Berners Bay and continuing to operate from Auke Bay:

(1) Eliminates Alternatives 4B and 4D from consideration, and

(2) Significantly reduces the capacity of Alternative 3.

The distance from Auke Bay to William Henry Bay (31 nautical miles) is over two and a half times the distance between Sawmill Cove and William Henry Bay (12 nautical miles). This increase in ferry travel time results in a reduction of four to two winter round trips and six to four summer round trips. The increase in travel time and reduced capacity would result in additional cost to the user and adds net operating cost to the State.

C) Sites along the road system south of Berners Bay were dismissed during alternative screening due to basin characteristics and exposure to the weather. If the selected Final SEIS preferred alternative would have involved a ferry terminal in Berners Bay, DOT&PF would have investigated the suitability and availability of siting the ferry terminal at Cascade Point.

Group 400

Topic/Subtopic: Alternatives/Modification of Alternative Recommended

Group Comment Text:

Suggested changes to Alternative 2B include:

- A) DOT&PF should provide ferry service in Lynn Canal in winter to keep travelers safe.
- B) DOT&PF should consider a summer-only road.
- C) DOT&PF should consider putting the ferry terminal south of the Katzehin River, eliminating the need to build a bridge.

Group Comment Response:

Regulations under NEPA indicate that an EIS must cover a full range of reasonable alternatives, but an EIS is not required to address every possible option or alteration within a virtually infinite number of possibilities. The alternatives were designed to best meet engineering objectives and environmental considerations.

A) Section 2.3.3 of the Draft and Final SEIS state that ferries would be available to provide transportation in winter from Auke Bay to Haines-Skagway when needed because of road closures. For the Final SEIS, similar language has been added for Alternative 3 (Section 2.3.4), although winter closures are anticipated to be somewhat less likely under Alternative 3.

B) DOT&PF examined the maintenance issues and risk associated with avalanches and included avalanche risk mitigation in its design and in its operating plan for Alternatives 2B and 3. With mitigation, including the ability to employ ferries if the road is closed for avalanche maintenance work or other weather-related issues, DOT&PF believes it will be less expensive and would serve the traveling public better (more frequency, and less time and cost of travel) to maintain the road year round rather than offer a summer-only road.

C) Engineers sited the Katzehin Ferry Terminal considering such factors as depth of water off-shore at all tide levels, ability to protect the mooring area from heavy seas, terrain on-shore suitable for the road approach and for parking and circulation, and running time of the ferry. A ferry terminal directly south of the Katzehin River was considered but determined not practicable. Considerations included:

- (1) The prevalent storm wind and wave direction is from the southeast. The shoreline south of Katzehin is completely exposed to the southeast;
- (2) The five fathom contour extends more than one mile off shore south of the river. To construct a terminal would require extensive dredging initially and maintenance dredging periodically due to the continuing deposition of glacier silt from the Katzehin River; and
- (3) The upland terrain is steep. As the ferry terminal is currently sited, the delta uplands provide protection from the weather and a degree of protection from the constant deposition of glacier silt.

Group 627

Topic/Subtopic: Alternatives/Modification of Alternative Recommended

Group Comment Text:

A) DOT&PF should consider SMAC’s proposed optimization of Alternative 1B.

B) This information can be used to improve Alternatives 4A, 4B, 4C, and 4D.

Group Comment Response:

A) DOT&PF considered SMAC’s proposed Alternative 1B optimized; an analysis of the alternative was developed and can be found in Appendix II, *Alternative 1B Optimized and Alternative 5 Evaluation*, of the Final SEIS. The proposed alternative would have been very similar to Alternative 1B. The analysis identified three primary inadequacies of the proposed variation: 1) given the USCG single crew 12 hour work limitation, AMHS would not schedule the Day Boat ACF on the Auke Bay-Skagway link; 2) by removing the mainliners from Lynn Canal, typically there would not be sufficient capacity to manage same day traffic; and 3) there is insufficient berth space and vehicle staging areas in Auke Bay to have the mainline vessels in port while accommodating all the transferring vehicles without vessel and vehicle congestion and delays. Based on these considerations, FHWA and DOT&PF have determined that this variation is not reasonable.

B) The primary component of the proposed Alternative 1B optimized that would be relevant to Alternatives 4A through 4D, would be turning the mainliners around at Auke Bay. This concept was reviewed and rejected since the capacity provided by the mainliners is required to meet the projected traffic demand for Alternatives 4A through 4D in Lynn Canal.

Group 628

Topic/Subtopic: Alternatives/Modification of Alternative Recommended

Group Comment Text:

DOT&PF should consider redeveloping the Juneau Ferry Terminal to be a parking structure. Currently, the State makes no money on parking, and the parking lot is always full.

Group Comment Response:

This proposed alternative, modifying the Juneau Ferry Terminal and generating revenue from a parking structure, does not address the purpose and need of the project.

Group 682

Topic/Subtopic: Alternatives/Modification of Alternative Recommended

Group Comment Text:

DOT&PF should consider SMAC's proposed Alternative 5.

Group Comment Response:

DOT&PF considered SMAC's proposed Alternative 5; an analysis of the alternative was developed and can be found in Appendix II, *Alternative 1B Optimized and Alternative 5 Evaluation*, as well as Section 2.4.2, All Day Boat ACF Alternative, in the Final SEIS. FHWA and DOT&PF determined that Alternative 5 is a variation of existing alternatives and therefore would be an unnecessary addition to the range of reasonable alternatives. It would attract fewer trips than Alternative 1B, provide similar capacity to Haines (and less to Skagway), and would have similar travel time as other alternatives studied (Alternatives 1 (No Action), 1B, and 4C). It falls within the range of capital and operational costs of the other alternatives. In addition, discontinuing mainline ferry service under this alternative could create capacity issues, preventing some travelers from reaching their final destination via a direct ferry connection. This could increase travel time and user costs. In summary, it is not unique enough to constitute consideration outside the alternatives already considered, and analysis to date confirms it is inferior to these alternatives.

Group 373

Topic/Subtopic: Alternatives/New Alternative Recommended

Group Comment Text:

A) Has DOT&PF researched alternate routes on the west side of Lynn Canal?

B) The Draft SEIS should consider a west side alternative consisting of a terminal in Saint James Bay with ferries originating from Auke Bay.

Group Comment Response:

Regulations for implementing NEPA require that a full range of reasonable alternatives be considered; however, the regulations do not require an examination of every permutation or possibility when there is a virtually infinite number of possibilities.

A) The alternatives were developed to try and address the purpose and need identified in the JAI Project SEIS. Alternative 3, located on the west side, represents a realistic, feasible road alignment that took into account engineering and environmental consideration in attempting to meet the project purpose and need. Some of the suggestions in this comment group, such as those that suggest access to Gustavus and Sitka, would not address the purpose and need of this project, but would be entirely different projects with different purpose and need statements.

B) During the project reconnaissance effort, engineers examined the best way to create alternatives that would have function well and identified the ferry terminal locations based on such factors as depth of water, protection from large waves, ability to protect the mooring, terrain on shore for the approach roads, parking, circulation, and the operational needs of the ferry, including the length of the ferry run. A ferry route from Auke Bay

Terminal to St. James Bay would be much longer than the route identified for Alternative 3 (Berners Bay to William Henry Bay), which would result in longer travel times, higher user costs, and less frequency in sailings. In combination, these impacts would reduce the traffic demand the West Lynn Canal Highway would generate.

Group 374

Topic/Subtopic: Alternatives/New Alternative Recommended

Group Comment Text:

A) Is there a more creative approach to transportation access that is less intrusive and destructive to the environment?

B) DOT&PF should consider different designs than what was presented in the Draft SEIS:

- (1) A floating road;
- (2) Extended tunneling through the mountains; and
- (3) Surface road the full length of Lynn Canal.

Group Comment Response:

A) DOT&PF and FHWA undertook an exhaustive and thorough alternative development process. Alternatives were developed, shared with the public during scoping, and revised based on public comments. Alternatives that were not feasible or had unacceptable impacts were eliminated. Reasonable alternatives were refined and the environmental impacts evaluated. That evaluation process further refined the alternatives to avoid and minimize impacts.

B) A number of design concepts were suggested and are either not reasonable or not feasible, and would have extraordinary costs well beyond the realm of the alternatives under consideration.

(1) Floating bridges would be the longest in the world and would not be feasible from an engineering perspective. A floating bridge would be a structure in excess of 50 miles long. For a short stretch, such a structure may be possible, especially in places with very high traffic volumes. Lynn Canal would neither be short nor would have high traffic volumes. Section 2.2.9 of the Draft SEIS addressed a potential floating bridge of only 7,000 feet from Katzechin River to Haines and found it cost prohibitive. Among the issues would be anchoring to withstand all tidal, wind, and wave conditions, and design issues would include providing for access by boats across the structure at many points, including at least one passage for large cruise ships.

(2) Tunnels similarly may make sense for relatively short segments but not over long distances. Tunnels are very expensive to build, many times greater than road construction. Long tunnels over a few hundred feet require mechanical ventilation, escape routes for fire, safe houses with dedicated air supply, and other extraordinary maintenance and operation costs. Tunnel boring machines exist to bore tunnels through principally loose soils, not rock. Rock tunneling requires blasting.

(3) A standard road extending from Katzehin River to the northern end of Lynn Canal corridor at Skagway is achievable without tunnels and was represented among reasonable alternatives in the original EIS. However, it was determined that natural areas that are part of Skagway's National Historic Landmark are protected under Section 4(f), which prohibits use of such lands when other prudent and feasible alternatives exist. Section 2.2.9 of the Draft SEIS addressed multiple alternatives considered and found not to be reasonable.

Group 380

Topic/Subtopic: Alternatives/New Alternative Recommended

Group Comment Text:

A) The AMHS should be managed to maximize revenues in northern Lynn Canal and should focus on improving the economics of the unprofitable areas of the system.

B) The SEIS should evaluate an alternative that incorporates an Inter-island Ferry Authority (IFA) style business plan (a non-profit community collaborative), private industry, or public-private partnership to improve ferry service and reduce State costs.

Group Comment Response:

A) Some of the comments in this group of comments address system-wide operational costs for the AMHS. While this is an important topic, the JAI Project is about access to and from Juneau and making that component of the NHS function better and at lower cost to the users and to the State. The federal action under consideration is funding for capital construction (note: no funding is necessary with selection of Alternative 1 – No Action as the preferred alternative). The federal portion of project funding would not cover maintenance and operations costs. The resulting maintenance and operation costs of any selected alternative would be impacts to the State of Alaska, to be covered by a combination of fares and appropriations from the General Fund. System-wide reductions in State cost could be a benefit of the project, but system-wide reduction in cost is not the purpose of the JAI project.

There is a misconception that in the past, the Lynn Canal Service covered its costs and generated excess revenue that helped to subsidize other less profitable runs in the system. While traffic and revenue studies indicate higher demand in Lynn Canal, and therefore higher revenues, the current ferry system in Lynn Canal still requires a substantial State subsidy. While Lynn Canal service came somewhat closer to covering its costs in the past than some other routes, it still requires State funds each year to subsidize that service. The Draft and Final SEIS address this topic, with discussion of both statewide and Lynn Canal costs. For example, Section 1.4.4 of the Draft SEIS described the costs, revenues, and subsidy necessary to run the AMHS system.

B) The AMHS link between Juneau and Haines-Skagway connects the NHS in northern Lynn Canal. Due to the importance of this link, DOT&PF has historically held the position that the link needed to be State owned and operated.

7.3 Avalanche

Group 13

Topic/Subtopic: Avalanche/Avalanche Hazards

Group Comment Text:

Commenters characterized the assessment of avalanche risk as inadequate or poorly explained in the Draft SEIS. Some questioned the calculations and applicability of an Avalanche Hazard Index (AHI). These comments can be summarized as follows:

- A) The risk evaluation is inadequate.
- B) The AHI is not the appropriate tool for characterizing the avalanche hazard for this project because the quality and amount of data being used does not meet the standards of AHI applicability. Periods of record and frequency of observation are too short. Comparisons to other roads (e.g., Rogers Pass and Seward Highway) may not be valid.
- C) Factors and assumptions used in developing AHI and calculations of mitigated AHI should be clearly explained.
- D) The analysis does not address avalanche hazard associated with cars trapped by an avalanche and in the path of other (unreleased) avalanches (Waiting AHI). Such an analysis should consider the remoteness of the highway and lack of communication infrastructure, which would make response times over an hour and include avalanche detection systems.
- E) The Draft SEIS did not describe the consequence of being caught in an avalanche. There will likely be fatalities.
- F) How will construction personnel and road clearing crews stay safe? The SEIS should account for the number of avalanche fatalities of travelers and highway operators. This could be calculated as part of the Waiting AHI.
- G) The SEIS should explain that Alternative 2B would dismantle a safe, reliable ferry service and replace it with a road where human error, malfunctioning weather stations, and/or rapidly changing weather conditions could cause human fatalities from avalanches.
- H) How would the AHI account for the risks associated with paths having multiple start zones?
- I) Calculations of "Encounter Probability" should include the Q Factor, which accounts for the consequences of a particular vehicle getting hit by an avalanche.
- J) The analysis should have been subject to a peer review.
- K) The analysis should include a review and discussion of close calls with mitigated AHI over 40.
- L) Was only one vehicle type used for computation of AHI levels?

M) There are no provisions in the AHI calculations for annual avalanche debris volumes.

N) The SEIS needs to include worst case analysis of the potential impacts from plunging avalanches and the encounter probability of such.

Group Comment Response:

A) The level of specificity for risk evaluation of *the 2013 Update to Appendix J – Snow Avalanche Report* is more than adequate for EIS-level evaluation, and the experience of the authors and reviewers is backed up by the resumes that are now included in *the 2017 Update to Appendix J – Snow Avalanche Report*. Please refer to that appendix for the details of the studies done.

B) The *2013 Update to Appendix J – Snow Avalanche Report*, Section 6 Avalanche Mitigation includes using AHI, the most widely accepted industry standard for comparison, with other highways and with AHI target values that are accepted within the industry. It also analyzes the effectiveness of avalanche programs and compares Alaskan highway avalanche risk with other common risks. These discussions cover worst cases, and the analyses can be done on a factual, data-driven basis, without speculation.

Historical records longer than a few years are usually not available for Alaska projects, so the best available data must be used. The period of study was prepared by professionals in the field of avalanche study and is adequate for EIS-level evaluation. For information on how representative the years studied were, and on corrections applied, please refer to the *2017 Update to Appendix J – Snow Avalanche Report*, Sections 12.2 Appendix 2: AHI Data Collection and Reliability and 12.3 Appendix 3: AHI Input Data Analysis, and the raw data and calculation spreadsheets available online in pdf format at www.juneauaccess.alaska.gov.

Figure 2, from Section 3.1 Avalanche Hazard of the *2017 Update to Appendix J – Snow Avalanche Report* shows that the unmitigated AHI for the East Lynn route is less than one-third that of the Rogers Pass or Little Cottonwood Highways. Each of the highways compared has its own unique circumstances. The only objective way to compare them is to simply list their values without prejudicial comment. All these highways are operated with acceptable records. It is accurate to describe it as in the middle of this range, and it is well-supported by the figures in the table and by the accompanying discussion.

Highway Methods	Unmitigated AHI	Daily Observations & Forecasts	Forecasting, Closure, & Explosives	Structural Mitigation	Special Explosives
Little Cottonwood, UT	1045	x	x		x
Rogers Pass, BC	1004	x	x	x	x
Red Mtn. Pass, CO	335	x	x	x	
* Seward Highway, AK (Anchorage-Seward, old alignment)	331	x	x	x	
East Lynn, AK	288	x	x	x	
* Seward Highway, AK (Anchorage-Girdwood, old alignment)	188	x	x	x	
Coal Bank/Molas, CO	108	x	x		

Highway Methods	Unmitigated AHI	Daily Observations & Forecasts	Forecasting, Closure, & Explosives	Structural Mitigation	Special Explosives
West Lynn, AK	101	x	x	x	
Berthoud Pass, CO	93	x	x		
Coquihalla, BC	90	x	x	x	x
Loveland Pass, CO	80	x	x		
Wolf Creek Pass, CO	54	x	x	x	
Silverton-Gladstone, CO	49	x	x		
Teton Pass, WY	47	x	x		x
Lizard Head Pass, CO	39	x	x		
I-70 Tunnel Approaches, CO	27	x	x	x	
Thane Road, AK	21		x	x	

Both Rogers Pass and the East Lynn Canal routes use snowsheds to drop their AHI substantially—to 167 in the case of East Lynn Canal, and to 214 in the case of Rogers Pass, with mitigation to further lower those numbers to acceptable levels. These similarities suggest that there is good basis for comparison.

The statement that the original route of the Seward Highway had such a great potential for mass casualties is not supported by its unmitigated AHI of 331 from Anchorage to Seward and 188 from Anchorage to Girdwood, unless the avalanche mitigation program was ineffective or nonexistent. The AHI figures, calculated from DOT&PF records, would appear a more accurate basis for comparison than an anecdotal statement unsupported by evidence, even one attributed to a distinguished and acknowledged expert in the field.

Editing the list of highways compared reduces objectivity, and can be used to reach any predetermined conclusion. A broad-based sample was used to minimize bias.

The Chugach Range’s avalanche climate is very different from that of Southeast Alaska. While Lynn Canal’s mountains are higher, steeper, and wetter; they are also warmer and have more-frequent high-friction snow or bare ground conditions that limit runout distances. The comparison is based on actual avalanche activity in both locations.

Mitigation measures for the proposed Alternative 2B include snowsheds, preventive closures with shuttle ferries as an alternative, and fixed exploders, none of which are used on the Seward Highway.

C) The raw data and calculation spreadsheets are available in pdf format online at www.juneauaccess.alaska.gov. For information on how representative the years studied were, and one correction applied, please refer to the *2017 Update to Appendix J, Snow Avalanche Report*, Section 12.2 Appendix 2: AHI Data Collection and Reliability and Section 12.3 Appendix 3: AHI Input Data Analysis.

D) For Waiting and Moving AHI figures, please refer to the raw data and calculation spreadsheets available online in pdf format at www.juneauaccess.alaska.gov.

The calculation of the Waiting AHI was not actually based on a waiting period. All paths with multiple starting zones or in groups where they are close to other paths were instead assigned increased probabilities of secondary avalanches, as detailed in the calculation spreadsheets.

It is optional rather than standard practice to include Waiting AHI figures in published reports, particularly at the EIS level.

A traffic speed of 40 miles per hour (64 kilometers per hour) was used as a storm conditions traffic speed for AHI calculations. With a relatively low winter traffic count of 460 vehicles per day, even if all those vehicles traveled during an 8-hour period and response took 2 hours, the queue length of less than 1.2 miles (2 kilometers) is not sufficient to put travelers at risk from paths in other groups.

Stopping distance is not used in queue length; that error has been edited out. Please refer to the *2017 Update to Appendix J, Snow Avalanche Report*, Section 12 Appendix 1: Avalanche Hazard Index (AHI) Calculation for details of the AHI calculation.

Avalanche detection systems were among the many mitigation options considered but rejected early in the analysis. Detection systems sound like a good idea, and would be if they were more reliable, but in their present state of development, they fail to detect some slides, and produce too many false alarms. They did not make the first cut of EIS-level budgeting and evaluation.

E) The Draft SEIS addresses avalanches in Chapter 4 in the eighth section under each alternative (e.g., Section 4.3.8.2 for Alternative 2B). While avalanche risk and hazard are addressed in the Draft SEIS, the text was revised to clarify that avalanche hazard includes the risks of property damage, injury, and death. However, the SEIS addresses how to mitigate these risks by forecasting, road closures, use of explosives, bridges, snow sheds, etc.

F) The *2013 Update to Appendix J – Snow Avalanche Report*, Section 6.4 Operational Avalanche Risk Management Program, outlines the considerations for developing worker risk reduction programs for construction and operations. Section 12.4 Appendix 4: Highway Closures, Section 13 Appendix 5: Transportation Avalanche Danger Scale, and Section 13.1 Appendix 6: Highway Closure and Operation Criteria, outline the need for operational worker risk reduction programs, contain examples of the material in such operational plans, and clearly state that “These guidelines are a sample of the kind of material that is part of a project-specific operational avalanche plan and are not a substitute for such a detailed plan. A project-specific plan is required under Alaska case law for worker safety before construction or operation of an avalanche-exposed facility may proceed.” A project-specific operational avalanche plan would have been developed during final design should a build alternative be selected.

Section 6.2 AHI Values and Risk to Travelers and Workers compared public and worker deaths on high-AHI highways and noted that “The higher risk to highway workers underscores the need for strict adherence to the avalanche program and risk management protocols presented in this study, particularly when reopening the highway after avalanches have occurred.” While development of an operations plan would be required during final design phase if a build alternative was selected, key concerns and typical risk mitigation measures detailed in Section 6.4 Operational Avalanche Risk Management Program include forecasting, closures, allowing debris removal only with the approval of the

avalanche forecaster, and specific provisions for clearing debris. Sample protocols with specifics for risk reduction at various avalanche danger levels are provided in Appendix 6: Highway Closure and Operation Criteria.

There is not an accepted method for calculating absolute risk of avalanche deaths on transportation corridors. The established standard for evaluating risk is comparison of Avalanche Hazard Indices, as is presented in the *2013 Update to Appendix J, Snow Avalanche Report*. The standard practice for avalanche mitigation work is that all multiple starting zones are dealt with before anyone is allowed into their runout zones; therefore, multiple starting zones do not represent an increased risk to workers or the traveling public. Risk management for maintenance crews is part of an operations plan, which is not done until the design and pre-operations stage, but the program outlined in Section 6.4.6, Highway Operations Procedures, nonetheless stated that “No avalanche debris should be cleared without approval from the on-duty avalanche specialist. The specialist should consider visibility, presence of residual snow in avalanche starting zones, terrain hazards, availability of spotters and equipment and other risk factors. No avalanche debris should be cleared when visibility is poor due to darkness or conditions such as fog.”

G) The existing AMHS system has had no fatalities since 1975, making the road alternatives appear to be less safe than the ferry alternatives. While the AMHS is safe, it does have the potential for catastrophic incidents due to the high number of people on a ferry and the hazards of ocean travel in Alaska’s environment. Ferry incidents tend to occur less frequently, but if they do they can be severe, which makes it difficult to compare the safety of highway and ferry alternatives. While travel in private vehicles tends to be less safe than some other modes of travel, Americans routinely select that mode of travel because of the advantages of convenience, cost, and travel time. Alternatives 2B and 3 would create a transportation system in Lynn Canal that provides these same advantages, but that also comes with a safety risk inherent in private automobile travel. Each mode of modern transportation is designed and operated to current standards to protect human health and safety to the extent possible. The “Avalanches” sections of the Draft SEIS describe how this would be accomplished for this project, including construction of snowsheds and berms, explosives, forecasting, and road closures. For Alternative 2B, the mitigated AHI score would be 28, down from an unmitigated score of 288. This is achieved through an Avalanche Management Program that allows for a safe traveling road system.

H) All paths with multiple starting zones or in groups where they are close to other paths were assigned increased probabilities of secondary avalanches. Please refer to the *2017 Update to Appendix J – Snow Avalanche Report*, Section 12 Appendix 1: Avalanche Hazard Index (AHI) Calculation for updated details of the AHI calculation.

For further details, please refer to the raw data and calculation spreadsheets available online in pdf format at www.juneauaccess.alaska.gov.

I) While it is possible to calculate societal cost values for economic losses, injury, and death as suggested, using a “Q factor” for the economic losses, using the numbers thus obtained would be of questionable accuracy. There is an international group working on the problem of assigning risk of death, but there is no accepted, accurate method for

calculating probability of avalanche death on transportation corridors or the number of vehicles impacted. Additionally, calculations for financial loss have not been applied widely enough for comparison with other highways.

The encounter probability term as calculated for the AHI is an oversimplified calculation. Using it as a basis for calculation of potential deaths does not result in numbers that agree with actual highway avalanche death records, as noted in Hendrikx and Owens 2008, “Modified avalanche risk equations to account for waiting traffic on avalanche prone roads,” in *Cold Regions Science and Technology* 51 (2008) 214–218. This document quotes Peter Scherer, the originator of the AHI method: “Furthermore, while the individual and collective risk enumerated in deaths year⁻¹ may still seem high, Schaerer (1989) noted that the theoretical frequency of encounters has been found to be far greater than the observed number, providing the example of Rogers Pass, where the expected encounter frequency was calculated at 0.3 vehicles year⁻¹ for a 25 year period, but no encounters actually occurred during this period.”

The one method of assessing risk on transportation corridors that has a historical record of being a useful working basis for comparison of one route to another is the AHI, without the addition of socioeconomic factors. It is the most widely-used, most-accepted, and thus has the greatest comparative value, of all methods.

The *2013 Update to Appendix J – Snow Avalanche Report*, 6.2.1 Risk Management Analysis of Three Very High AHI Highways, provides a detailed comparison of death rates on highways with similar AHIs.

J) The *2013 Update to Appendix J, Snow Avalanche Report* was peer reviewed. Please refer to the *2017 Update to Appendix J – Snow Avalanche Report*, Section 13.11 Appendix 16 Peer Review, for details.

Resumes for those who worked on and reviewed the study have been added to the *2017 Update to Appendix J – Snow Avalanche Report* as Section 13.12, Appendix 17, Resumes. These resumes demonstrate that the authors and peer reviewers have extensive real life experience with avalanche control programs.

K) Figures are not generally or consistently kept for close calls on avalanche incidents. There is not enough quality data available for comparison or analysis. Death rates are still the most reliable figures available. The *2017 Update to Appendix J – Snow Avalanche Report*, Section 6.2.1 Risk Management Analysis of Three Very High AHI Highways, provides a detailed comparison of death rates on highways with similar AHIs.

L) Vehicle types were not used in most of the highways compared, so no shape factor was used. Shape factor is more useful for railroad than for highway work.

M) While it is true that calculation of debris volumes is not normally a part of the AHI calculation, a method was developed to plug an estimation method into that spreadsheet. Please refer to the AHI calculation spreadsheets available online in pdf format at www.juneauaccess.alaska.gov.

N) Worst case scenarios are addressed throughout *Appendix J – Snow Avalanche Report* by using actual avalanche occurrence and weather data comparison with operating avalanche programs, and are further addressed in Section 4.1, Avalanche Event Variability. The AHI calculations included an increased risk factor for plunging avalanches, which was applied to vehicles that might be carried into the water, as detailed in the *2017 Update to Appendix J – Snow Avalanche Report*, Appendix 1: Avalanche Hazard Index (AHI) Calculation.

Group 14

Topic/Subtopic: Avalanche/Avalanche Hazards

Group Comment Text:

The 2014 Draft SEIS, *2013 Update to Appendix J – Snow Avalanche Report*, should be revised as follows:

- A) Discuss wet snow climax avalanches, which occur in the spring.
- B) Provide the period of record for regional snowfall amounts.
- C) Consider microclimates and how they affect snowfall.
- D) Why did the Draft SEIS use sea level snowfall data at the Juneau International Airport?
- E) Discuss why there are lower snowfall estimates north of Berners Bay given the recorded snowfall records at the Haines Airport.
- F) Address seemingly problematic forecasting for avalanche programs.

Group Comment Response:

The *2013 Update to Appendix J – Snow Avalanche Report*, Section 5 Regional Snowfall, stated that these are estimates based on limited data. As with all projects in Alaska, the available weather data is regional rather than project-specific, and period of record is variable and usually not very long, as climate records go. Different data sets over different periods inevitably yield a range of values, and quality of the data is variable.

This is why avalanche hazard evaluation and program design are based on actual observed and recorded avalanche activity; not on snowfall estimates or weather records. No greater level of accuracy is available or necessary for avalanche evaluation at the EIS level. In addition, further weather measurements are not needed for the final design, construction, and operations phases.

A) Please refer to the raw data and calculation spreadsheets available online in pdf format at www.juneauaccess.alaska.gov. All avalanches, including those in late spring and wet snow, were recorded and factored into the calculations. There was nothing about any particular type of avalanche that merited separate discussion.

B) In the Draft SEIS, the weather figures were not updated from the original 2005 studies. These figures were updated in the Final SEIS with what is currently available online, including their periods of record, from the Juneau office of the National Weather Service:

Juneau International Airport (1981 to 2010): 87 inches (2.2 meters)
Lena Point (1983 to 2015): 80 inches (2.0 meters)
Tee Harbor area (station no longer exists): 145 inches (3.7 meters)
Haines downtown (2000-2015): 165 inches (4.2 meters)
Haines Airport (1972-2013; no longer records snowfall): 133 inches (3.4 meters)
Haines Highway, Pleasant Camp (2001-2015): 236 inches (6.0 meters)
Skagway Airport (1965 to 2010; no longer records snowfall): 49 inches (1.2 meters)
Skagway (harbor; no longer records snowfall): 37 inches (0.9 meters)
Skagway Power (downtown; 2001-2015): 52 inches (1.3 meters)

The estimates presented in the original 2005 study are unchanged by the new data, and the estimated average snowfall at starting zone elevations along the East Lynn Canal route from Berners Bay to the Katzehin River can be best described as ranging from about 150 inches (3.8 meters) to 210 inches (5.3 meters). This is less than 200 inches (5.1 meters) overall average. The figure for all of Lynn Canal, from Berners Bay to Skagway, is useful as regional climate information along the entire route, including those portions served by ferries.

A paragraph was added to clarify the rough nature of the snowfall estimates: “Snowfall is not calculated into avalanche hazard evaluation or used to develop mitigation measures. Avalanche studies are based on hard data from actual avalanche occurrences, rather than indirect calculation from snowfall figures. Snowfall for Alaska projects must always be estimated from the records that are available in the region. These observations are usually incomplete, and taken over a relatively short period of record, so the snowfall estimates are necessarily rough estimates only.”

C) The microclimatic zones as identified were considered and observed consistently over a six-year period of aerial avalanche observations. The estimates of microclimatic variability along Lynn Canal were based on aerial observations, consistent with ballpark estimation (i.e., enough snow to cover and smooth topography, enough snow to cover but still show the topography, and not enough to consistently cover the topography). Haines is a higher-snowfall microclimate due to the frequent presence of the Arctic front there, while upper Lynn Canal as it heads into Taiya Inlet is much drier.

D) The Juneau Airport weather record is the only long-term historical record in the region. Snowfall there was chosen by lifetime National Weather Service climatologist Robert A. Kanan as the most useful parameter for evaluating long-term climate trends and distinguishing between the warm and cold periods, which correlate strongly with the frequency of large avalanches.

E) Haines Airport snowfall is not indicative of snowfall on the east side of Lynn Canal. Snowfall on the east side of Lynn Canal is markedly different from that on the west side. Based on aerial observations of snowcover, there is a marked decrease in snowfall north of Yeldagalga Creek, and another decrease up Taiya Inlet.

F) Operational avalanche programs in coastal Alaska always face difficult forecasting conditions, but operate successfully on Alaska highways—at the Alyeska and Eaglecrest ski areas, Kensington Mine, Alaska Electric Light and Power, the Alaska Railroad, and the White Pass and Yukon Route. Forecasters use all available data, including weather models, to supplement National Weather Service products and produce custom forecasts.

Group 2

Topic/Subtopic: Avalanche/Avalanche Mitigation

Group Comment Text:

A) The avalanche control methods described in the Draft SEIS will be difficult to implement because:

- (1) It relies on helicopter use, which may be impractical during winter storm conditions (i.e., snow builds up during stormy weather when low ceilings and high winds make it difficult to fly helicopters);
- (2) The maritime weather conditions could cause ice build-up on blaster boxes and weather stations, making them inoperable;
- (3) The number of masts and blaster boxes required is unprecedented anywhere in the world;
- (4) Using howitzers to trigger deep slab avalanches of 10 feet (3 meters) or greater have a success rate of just over 50 percent; and
- (5) The State has never preemptively closed a road due to avalanche danger, so this cannot be a mitigation strategy.

B) A detailed avalanche control plan should be developed, consistent with Alaska Statute 19.05.030(7) wherein DOT&PF is tasked to “develop and implement an avalanche control plan to protect persons who use public highways.”

C) The analysis should include who would perform avalanche control work and who would pay for avalanche control and winter maintenance.

D) The analysis should note that avalanche frequency actually increases with explosives mitigation.

E) The analysis should use Power Law data from the Chugach Range.

F) Avalanche mitigation should be part of the requirements for federal approval and funding.

G) Alternative 2B should include infrastructure to accommodate a highway information management system that can identify hazards in real time (e.g., cameras, communications, electronic-real time avalanche warning signs) and notify highway response teams (e.g., maintenance and emergency responders) of pending or actual avalanches. Including them

in the infrastructure now will save time, money, and effort later or after the fact.

H) The range scatter effects of shooting at long distances should be included.

I) Section 3.7.3 of the Draft SEIS mentioned “expensive howitzer” ammunition; is this correct?

J) The analysis should include how avalanche control devices would be powered.

Group Comment Response:

A) (1) The effects of bad weather on helicopter use were anticipated, which is why remote exploders were proposed to reduce reliance on helicopter flight limitations due to bad weather and darkness. Remote exploders can be loaded and serviced between storms during daylight hours.

(2) Rime ice buildup is common to all weather stations and avalanche mitigation systems used at altitude in coastal Alaska. All programs in the region operate successfully despite rime buildup affecting such high-elevation installations as weather instruments and remote exploders. Rime ice buildup was factored into all risk, closure, and budget estimates.

(3) DOT&PF recognizes that there are many mast and blaster boxes planned for this project—an estimated 27 blaster boxes. As an example, the KSM Project (KSM Mining Project) in British Columbia plans to use approximately 84 gas exploders as is outlined in their *Active Avalanche Management Plan* by Alpine Solutions Avalanche Services. As with any other avalanche mitigation program in the world, it is designed to reduce the risk in the area. With proper installation and testing, the quantity of exploders should not make any difference in operations, beyond achieving economies of scale. The remote exploders used would not be limited to just one type, but would draw from those most suited to each site. As noted in the Draft SEIS, *2013 Update to Appendix J – Snow Avalanche Report*, Section 3.5 Explosive Delivery, “Blaster boxes are one of several special explosive delivery methods using a fixed, remotely-operated installation. They are evaluated here as a representative sample of the fixed installation methods currently available.”

(4) The effectiveness of all avalanche mitigation programs was calculated based on the proven and documented records of other highway avalanche programs. No explosive works on deep snow instability. A program that waits until 10 feet (3 meters) of snow accumulates before blasting is not doing its job; blasting must be frequent if it is to be effective. As a general rule, forecasters would be preparing to blast with a storm accumulation of 30 – 50 centimeters.

(5) Preemptive closures have been used on Alaska highways. Examples include the Klondike Highway out of Skagway in the winter of 2015-16, and the Seward Highway on two occasions in the last five years—January 10 and February 20, 2012. DOT&PF avalanche staff indicate that there were earlier uses of preventive closures on the Seward Highway and other highways as well. If weather prevents howitzer usage, the State can and will preemptively close the road, which is why road closures have been calculated for every mitigation option.

B) If Alternative 2B or 3 were to be selected for the ROD, development of a final avalanche operations plan would occur during the final design phase of the project. Final avalanche operation plans are not typically done at the time of the EIS. The Draft SEIS, *2013 Update to Appendix J – Snow Avalanche Report*, Section 6.4 Operational Avalanche Risk Management Program, outlined the considerations for developing risk reduction programs for construction and operations. In addition see:

- Sections 12.4, Appendix 4: Highway Closures
- Section 13, Appendix 5: Transportation Avalanche Danger Scale
- Section 13.1, Appendix 6: Highway Closure and Operation Criteria, which outlined the need for operational risk reduction programs, contained examples of the material in such operational plans, and stated that, “These guidelines are a sample of the kind of material that is part of a project-specific operational avalanche plan and are not a substitute for such a detailed plan.”

C) Avalanche control and winter maintenance would be performed by DOT&PF, funded through State General Funds, just as any other routine state highway maintenance in Alaska.

D) The purpose of explosive avalanche mitigation is to influence timing of avalanches so they run when the road is closed, rather than waiting for them to release naturally when the public is traveling. While use of explosives may increase the absolute number of avalanches, the result is an increase of generally smaller avalanches during road closures and a decrease of possible larger avalanches occurring when the public is traveling. Language of such was added to the *2017 Update to Appendix J – Snow Avalanche Report*, Section 3.4. Frequency of avalanches when the road is closed affects only snow removal.

E) The Chugach Range in Southcentral Alaska is a very different snow climate from the Coast Range in Southeast Alaska; using data from it would produce unreliable results. Power law distribution studies use a curve drawn through a plot of avalanche occurrences to derive an estimate of avalanche sizes and frequencies beyond what has been observed. They are interesting theoretically and can be useful, but there are no databases for the northern Coast Range from which to derive power law relationships. Actual avalanche occurrences were chosen as a simpler, more reliable, and more accurate methodology.

F) There are two components of federal avalanche mitigation approval and funding: 1) annual maintenance and operation and 2) structural mitigation, such as snow sheds.

(1) FHWA regulation does require maintenance on all federally funded highways. Avalanche mitigation costs are included in the maintenance and operation estimate. There is no reason to believe that avalanche mitigation would not be funded, just as AMHS maintenance needs in all the other alternatives. Please refer to the *2017 Update to Appendix J – Snow Avalanche Report*, Section 13.6, Appendix 11, Operating Budget Spreadsheets, and Section 13.7, Appendix 12, Capital Budget Spreadsheets, for updated budget spreadsheets.

(2) Mitigation efforts that are part of capital costs (tunnels, elevated embankments, etc.) were included in the document. The NEPA process, required under federal law, includes preliminary investigation into the effects of development on the environment, which includes engineering considerations such as avalanche risk. FHWA's concurrence with DOT&PF's NEPA document will signify federal approval of the investigatory process. Final design of the project cannot begin until this federal action occurs.

G) Avalanches have been effectively mitigated such that the need for real time cameras and communication is not necessary. During avalanche mitigation control, the road would be closed to safely initiate avalanches and clear the roadway. DOT&PF would use several means to announce road closures and re-openings. Planned and unplanned closures would be posted on the 511 website and phone, as well as the DOT&PF's Facebook page and other social media.

H) The howitzer solutions for the East Lynn Canal route were discarded from consideration early in the evaluation process for reasons of range and cost, and are included in the report only to show that they were evaluated in detail. It is not necessary to give them further attention.

A statement was added to the *2017 Update to Appendix J – Snow Avalanche Report*, Section 3.6.3 Option C, East Lynn Canal, Howitzer Delivery Supplemented By Blaster Box and Helicopter Delivery, to clarify this.

The range figures originally used were verified by DOT&PF personnel familiar with howitzer capabilities at the time. In consultation with current DOT&PF avalanche program staff, the avalanche program for the West Lynn Canal route has revised the howitzer limit ranges, and uses fixed exploders where howitzer shots are long or oblique.

I) This is an editing error; the mention of howitzer ammunition being more expensive is outdated and was deleted from the *2017 Update to Appendix J – Snow Avalanche Report*. Relative pricing changes constantly; please refer to the *2017 Update to Appendix J – Snow Avalanche Report*, Section 13.6, Appendix 11, Operating Budget Spreadsheets, for details on current ammunition costs.

J) Remote exploders and weather stations do not use line power, but are powered by a combination of solar panels, wind generators, and propane-powered generators. Communications are by telemetry. None of these installations are at elevations that could be served by line power running near the roadway.

Snow shed design would either use openings on the downhill side for light and ventilation, or locally generated power. The choice would be made in the final design stage if a build alternative was selected.

Group 5

Topic/Subtopic: Avalanche/Avalanche Mitigation

Group Comment Text:

The *2013 Update to Appendix J - Snow Avalanche Report* should be revised as follows:

A) Factors used to calculate mitigated AHI are not disclosed or rely on data that may not be representative of the project area. Without understanding the precise factors plugged into the formulas, this numerical expression of hazard risk remains “dimensionless” and the public has no way of evaluating the results.

B) The estimated 90 percent reduction in AHI with the proposed avalanche mitigation program (see Figure 4B in the *2013 Update to Appendix J*) seems optimistic compared with the Seward Highway/Alaska Railroad corridor where, even with a long-standing mitigation program and lower terrain and precipitation, the risk has only been reduced to 50 percent.

Group Comment Response:

A) All the factors, raw data, and mitigation calculation spreadsheets used to calculate the mitigated AHI (risk reduction) are available in pdf format online at www.juneauaccess.alaska.gov.

The discussion in the *2013 Update to Appendix J, Snow Avalanche Report*, Section 6.1 Mitigated AHI Target Calculations, is an analysis of how well the goals were achieved, rather than the calculation of the risk reduction. The risk reduction factors for each path and for the overall avalanche program are listed in Section 6.3, Lynn Canal Avalanche Hazard Reduction Methods.

The level of specificity of the *2013 Update to Appendix J – Snow Avalanche Report* is more than adequate for EIS-level evaluation. The experience of the authors and peer reviewers has been updated with resumes in the *2017 Update to Appendix J – Snow Avalanche Report*.

B) The risk reduction factors are consistent with those routinely achieved by modern avalanche programs worldwide. The program proposed for Lynn Canal follows current best practices, with multiple full-time forecasters for daily field presence.

There are no “geotechnical and design uncertainties” associated with snowsheds or their mitigation capabilities; they are in common use around the world, and their effectiveness is well-proven. All other mitigation factors applied are consistent with best engineering practices worldwide.

Please refer to the *2017 Update to Appendix J – Snow Avalanche Report*, Section 3.1, Figure 2, for methods used on various highways worldwide, and to the remainder of Section 3, and to Section 6, Avalanche Mitigation, where the reduction factors are discussed specifically and in detail, especially Figure 4a, where mitigation factors achieved in other locations are listed.

DOT&PF avalanche programs have only been upgraded within the past few years. For example, recently preventive blasting has replaced waiting for slides to hit the road along such routes as the Richardson Highway to Valdez. In the 2014-2015 season, DOT&PF added an avalanche specialist for the Southeast (Southcoast) region. DOT&PF recognizes the seriousness of the need for adequate funding of avalanche programs.

Alaska Railroad programs have also been upgraded within the past 20 years. They face problems unique to railroad operations in extremely difficult terrain and snow conditions that do not apply to highway operations in the very different terrain, snowpack, and weather conditions along Lynn Canal.

Group 7

Topic/Subtopic: Avalanche/Avalanche Mitigation

Group Comment Text:

A) DOT&PF's current statewide avalanche control programs are inadequate.

B) The proposed mitigation measures are insufficient. Additional measures should be considered to adequately reduce the risk. See David Hamre (1996) for a discussion of avalanche mitigation technologies that have worked well in the Alaskan landscape (Frequency/magnitude relationship of avalanches in the Chugach Range, Alaska, International Snow Science Workshop [Hamre and McCarty 1996]).

C) It is not clear if the snow shed cost estimate is reasonable given that the Draft SEIS does not discuss the details of the snow sheds. It is hard to evaluate the efficacy of snow sheds.

D) The costs for avalanche mitigation associated with Alternative 3 appear to have been inflated relative to Alternative 2B, making Alternative 2B appear more cost effective.

E) The State should address spending a considerable sum to mitigate the risk of avalanche on the Juneau Access highway while skimping on resources applied to highways elsewhere in the State that may or may not have a similar AHI level.

F) Construction cost of essential avalanche mitigation safety features was left out of the previous EIS in an attempt to low-ball cost estimates.

G) The increase of cost estimates are attributed to lawsuit delays.

Group Comment Response:

A) DOT&PF is well aware of the deficiencies in past avalanche programs, and added their first avalanche program staffer for the region in the 2014-15 season as part of an ongoing effort to upgrade avalanche operations.

Preemptive avalanche closures have been in use on Alaska highways, for example in Skagway in the winter of 2015-16, and the ability to use the shuttle ferries during road closures would encourage the use of preventive closures along Lynn Canal.

Staffing for the program includes two full-time avalanche specialists plus one seasonal avalanche specialist, or three people during avalanche season. Staffing at this level is comparable to other transportation and industrial avalanche programs, with two people on duty daily, and the capability to operate 24/7 in shifts when conditions dictate. Please refer to the *2017 Update to Appendix J – Snow Avalanche Report*, Section 13.6, Appendix 11, Operating Budget Spreadsheets, for updated details on staffing.

B) The mitigation measures in the Draft SEIS were properly investigated by professionals in the field of avalanche study and deemed sufficient. The authors of the *2013* and *2017 Update to Appendix J – Snow Avalanche Report*, are quite familiar with Mr. Hamre’s work and its results. It has been added to the Updates to the *2017 Update to Appendix J – Snow Avalanche Report*, Section 13.10, Appendix 15, References.

The frequency-magnitude studies, while useful in some cases, are more theoretical and less accurate than the actual avalanche observations used for this study, and it should be noted such data is not available for the Coast Range of Southeast Alaska.

C) DOT&PF engineers developed cost estimates for the snowsheds based on standard Alaska construction costs. Avalanche engineers Art Mears and Associates, of Gunnison, CO, independently developed the cost estimates, which are in substantial agreement and have been added to the *2017 Update to Appendix J, Snow Avalanche Report*, Section 6.3, Lynn Canal Avalanche Hazard Reduction Methods.

Snowshed effectiveness is well documented from the design and implementation of snowsheds around the world. Through proper design, snowsheds have proven effective and provide protection for the entire width of the path that they cover. Specifics of detailed design are not typically available at the EIS stage, and the details would be determined further in the final design stage should a build alternative be selected.

The requirements for ventilation for snowsheds were accounted for in the design (open-side ventilation), and requirements for lighting were identified and factored into the estimates.

Snowshed issues on Snoqualmie Pass, and the problems with snowsheds, are known and are similar to challenges for overpasses, bridge abutments, and other similar structures along highways. Where alternatives to snowsheds are possible, those alternatives can be used. In the case of the East Lynn Canal route, alternatives are not available, and snowsheds appear to be the best design solution.

D) The potential for avalanche effects to roadways has been fairly evaluated and appropriate mitigation has been proposed for Alternative 2B and 3.

Please refer to the *2017 Update to Appendix J – Snow Avalanche Report*, Section 13.6, Appendix 11, Operating Budget Spreadsheets, and Section 13.7, Appendix 12, Capital Budget Spreadsheets, for updated budget spreadsheets. Operating budgets are currently \$1,458,719 for East Lynn Canal and \$1,257,483 for West Lynn Canal. Avalanche programs for all alternatives involve many of the same staffing, office, weather station, field equipment, and materials costs.

Alternative 3 options have been updated to avoid long howitzer shots, adding some blaster boxes or other fixed exploders. Current capital costs are \$11,185,325 for the preferred Alternative 2B option that minimizes closure time and maximizes risk reduction, and \$6,199,259 for the preferred Alternative 3 option. Capital costs include items such as blaster boxes, loaders, bulldozers, and signage to name a few of the items. Closure estimates are 12.1 days for Alternative 2B and 5.5 days for Alternative 3. The budget sheets, as updated in Appendix 11: Operating Budget Spreadsheets, contain all the details for how costs were calculated. The budgets were developed by the staff of the Alaska Budget Report, a source known for careful objective budget analyses, and they were instructed to consider the options as objectively and carefully as possible. Staff of the Alaska Budget Report have been added to the references in the *2017 Update to Appendix J, Snow Avalanche Report*.

The key variables are explosive type and delivery method. The study presents the options and choices that would be made by DOT&PF.

E) The purpose of this SEIS is evaluating options that provide improved transportation to and from Juneau within the Lynn Canal corridor that will reduce travel times and State and user costs while providing capacity to meet demand and improved opportunity to travel, not for evaluating other DOT&PF projects and/or functions. That said, the JAI maintenance plan includes resources necessary to perform avalanche hazard mitigation and clean-up. It includes costs for all specialized personnel and equipment that would be assigned these duties, and would not take away any resources from other areas of the State.

F) Additional avalanche mitigation features, such as snow sheds, were added due to refining the alignment and the additional information that was available since final design had begun on Alternative 2B following the 2006 ROD.

The *2014 Update to Appendix D - Technical Alignment Report* engineer's estimates for Alternatives 2B, 3, 4B, and 4D highway segments were updated to reflect current layouts, quantities, and unit prices for construction year 2012, as stated in that report (see Attachment E of that appendix). The estimates for Alternatives 2B and 3 were also updated to include camp costs, which were not included in the original estimates in the 2006 FEIS but were identified as necessary in the subsequent 2009 cost report. Adjustments were also made to costs related to preliminary development, mitigation, right-of-way, a maintenance building, and avalanche control Capital Improvement Plan (CIP). Right-of-way, the maintenance building, and avalanche control CIP only apply to Alternatives 2B and 3. The M&O building estimates are based on costs for similar recently constructed facilities. The Indirect Cost Allocation Plan (ICAP) rate has also increased from 4.66 percent used in the 2009 cost report to 4.79 percent for Alternative 2B, and from 4.3 percent used in the 2006 FEIS to 4.79 percent for Alternatives 3, 4B, and 4D.

G) The SEIS does not mention or attribute any increase in costs relating to lawsuit delays.

Group 615

Topic/Subtopic: Avalanche/Avalanche Mitigation

Group Comment Text:

The list of federal actions required (Section ES-10) should include a waiver from the Bureau of Alcohol, Tobacco, Firearms, and Explosives (ATF) for the use of blaster boxes because they have primed explosives stored in them.

Group Comment Response:

The *2013 Update to Appendix J – Snow Avalanche Report*, Section 3.6, Permits for Avalanche Program, was intended to be a list of land use permits. ATF permits are required for all explosive operations, and have been added to that section.

ATF has permitted blaster boxes in the past, and there is no reason to expect that policy to change. All such units delivered now have magazines that conform to ATF requirements.

There is no requirement for ATF permits for gas-based alternatives such as MND's GazEx or the O'Bellx, which use propane and hydrogen, respectively, combined with oxygen to produce their explosions.

Group 1

Topic/Subtopic: Avalanche/Emergency Response

Group Comment Text:

Commenters posed multiple questions regarding the response to an avalanche event:

A) If travelers are stranded at the Katzehin Ferry Terminal by an avalanche or between avalanches, how will rescue services reach them?

B) How long will it take for DOT&PF to clear the road after a slide?

C) Where will travelers find refuge while waiting for rescue? The unmanned Katzehin Ferry Terminal will not have services for stranded travelers. A 24-hour rest facility should be built for stranded travelers.

D) Will the ferries run if the road is closed? How will shuttle ferries provide access across the closed section? How quickly could ferries and crews be mobilized to restore access in Lynn Canal? Which ferries would be used? The Day Boat ACFs would not have the capacity to pick up the anticipated number of stranded vehicles.

E) How will road maintenance priorities be established?

Group Comment Response:

A) People who are stopped at the Katzehin Ferry Terminal due to road closures would have the option of returning to Haines or Skagway on the Day Boat ACFs to await the road re-opening or stay at the Katzehin Ferry Terminal for the road re-opening. Careful monitoring of avalanche conditions and preventative closures of the highway should prevent people from being stopped at the Katzehin Ferry Terminal or being trapped between slides. In the

unlikely event that people were trapped between slides, and depending on the situation and length of closure, emergency services from Juneau would be deployed. Traveling on any Alaskan road in winter, travelers should be prepared for unexpected stops and delays.

B) The JAI Project highways would be part of the NHS, a high priority highway. The JAI Project would provide for equipment operators and heavy equipment to be available to clear slides quickly. The avalanche control plan calls for frequent triggering of small avalanches under controlled conditions to reduce the risk of larger avalanches. It is not possible to forecast exact response times to all of the potential scenarios; however, in many cases, slides would be cleaned up and the road re-opened within hours.

C) The Katzechin Ferry Terminal would be available for use, should travelers be stranded and decide not to return to Haines or Skagway on a ferry, as stated above. The Katzechin Ferry Terminal would be heated and have restrooms. The Katzechin Ferry Terminal would be available as a temporary 24-hour emergency refuge.

D) The JAI Project provides for alternative ferry transportation between Haines, Skagway, and Juneau in the event of a road closure of more than one day. The maximum anticipated duration of any avalanche related road closure is two days. The ACFs would be used and have a capacity of 53 vehicles, which through modeling shows to have enough capacity for the route. If during these closures, more vehicles need to be transported, then additional sailings would be made. This was clarified in Section 4.3.8.2 of the Final SEIS.

E) According to the DOT&PF highway maintenance priority system, the JAI Project highway would be a high priority, more than likely a priority 2. This classification is primarily due to its functioning class of being a road used to connect communities. Crews of maintenance personnel and equipment would be designated to maintain the Lynn Canal Highway at a high level, with an updated estimated cost of \$2.4 million per year.

Group 19

Topic/Subtopic: Avalanche/General

Group Comment Text:

The following comments concern Alternative 2B road closures due to avalanche or rock slide:

A) The road would be closed more often than what is predicted in the Draft SEIS due to heavy snowfall or avalanches. The number of events may increase over time due to the dynamic nature of the environment.

B) The Draft SEIS did not account for closures resulting from delayed mitigation due to weather. There will be many days when avalanche blasting cannot occur due to weather conditions, and the road will have to be closed as a result. Proposed mitigation would not reduce the risk of avalanche to acceptable levels.

C) The Draft SEIS did not account for the number of days the road would be posted for “very difficult” or “difficult” driving conditions.

- D) Avalanche/debris removal may take longer than anticipated or be cost prohibitive.
- E) How will it be decided when the road will be closed because of avalanche danger?
- F) How will people be informed of road closures due to avalanche, slides, or poor weather conditions, and how will they be informed of reopenings?
- G) The numerous avalanche and rockslide events over the years could damage the road so it is no longer usable. The cost associated with such damage is a project risk. Who is responsible for this risk to the project?
- H) DOT&PF officials have given various answers for how long the road would be closed.

Group Comment Response:

A) Heavy snowfall and avalanches were accounted for in the estimated road closure time, and DOT&PF and FHWA are comfortable with the number of predicted closures. The road would be primarily closed when avalanche conditions are present and mitigation cannot be accomplished due to weather conditions. This is why there are as many closure days, as noted in the *2013 Update to Appendix J – Snow Avalanche Report*, Section 2.5, Figure 1: Comparison of Selected Options. Weather patterns are dynamic and it is speculative to state that events causing road closures will increase, decrease, or stay the same over time.

B) Worst cases were accounted for by using actual weather records, rather than theoretical estimates. The closure program is explained in Section 6.4.5, Highway Closure Program, and the calculations for closures are detailed in Appendix 4: Highway Closures as follows:

Closure periods were calculated using the weather logs and avalanche observations from the same six years of field studies as were used in the AHI calculations, with the same correction factors applied.

Each avalanche cycle was evaluated to determine how long the highway would have been closed, and what level of explosive work would have been conducted. Weather events that would have been forecast as avalanche cycles but turned out to be false alarms were also tallied, but given lower figures for closure time and explosive operations, as would have occurred once forecasters realized the expected activity was not materializing.

Highways with mitigated AHIs comparable to the East and West Lynn Canal route are left open at night at “low” through “considerable” hazard levels, unless natural avalanches are forecast to reach low elevations. If avalanches are likely to reach low elevations, and explosive work is not completed, the highway would be closed at night. Night closures were tallied for the major avalanche cycles.

Because howitzer use allows closure section by section as explosive work proceeds, the West Lynn Canal alternative uses spot closures in daytime for explosive work when the danger level is increasing but instability is limited. The highway would have been closed when the instability is increasing more rapidly than explosive work can proceed. Prolonged closures were tallied under these conditions.

Limitations of darkness and storm conditions were factored into the initial tallies for all options. Corrections were added as follows:

- a. An additional 20 percent was taken from the explosive delivery mission tally for helicopter-based programs, because many days that appear suitable based only on the weather records would in fact be too windy, foggy, or stormy. The mission tally was simply reduced, as the window of opportunity would pass and the snowpack would either slide or stabilize on its own.
- b. All blaster box figures were reduced 30 percent because the raw mission tally reflects only their capability for being fired in storm conditions. Operations using blaster boxes report that the high cost of ammunition and its delivery by helicopter necessitate using them conservatively.
- c. Howitzer use figures for the West Lynn Canal WLC1 option were only reduced ten percent, as weather would not have much effect on transporting a trailered howitzer on the highway.

The tallies for missions and highway closure times under all options were further adjusted by 20 percent for crew limitations. It is often impossible to conduct explosive operations because the entire maintenance crew is tied up with other urgent work, is working far enough away that they cannot get back in time, because conditions develop too rapidly to respond, or because of budget and workforce limitations. Some other highway operations reported even greater limitations due to crew factors, but it was assumed that safety and reliability of this highway would be a high enough priority to merit adequate funding. Short funding would increase closure time.

The potential for change is noted in the *2017 Update to Appendix J – Snow Avalanche Report*. Some additional paths were created by mass wasting processes, primarily landslides. Others were added due to alignment changes.

Avalanche paths on highways worldwide are dynamic, and their risk is mitigated to acceptable levels. There is nothing about Lynn Canal that would give reason to expect changes that could not be mitigated acceptably. It would be reasonably foreseeable to have changes that could be mitigated, rather than ones that could not.

C) DOT&PF does not account for “very difficult” or “difficult” driving conditions on any roadways. However, DOT&PF does report driving conditions for all Alaska major highways in the 511 system, which would include any of the alternatives that extend the road. DOT&PF would have maintained and plow/sand the roadway to provide safe driving conditions.

D) DOT&PF completed a thorough study of the avalanche potential and identified resources needed to handle the hazard mitigation and debris removal. The plan includes a list of all resources required and the costs associated with all aspects of avalanche hazards. Note that the *2017 Update to Appendix D – Technical Alignment Report*, Appendix C, includes these Maintenance and Operations cost estimates and the *2017 Update to Appendix J – Snow Avalanche Report*, Appendices 9 through 13, have detailed

Maintenance and Operations cost estimates for avalanche mitigation specifically.

E) Trained, experienced avalanche technicians would monitor the JAI Project route on a daily basis. The technicians would use observations, weather station data, weather forecasts, and snow telemetry data to determine the hazard. The technicians would identify times when avalanche hazard was high, and would recommend avalanche control operations or preventative road closures when the hazard was high. Clarifying language was added to the Final SEIS in Sections 4.3.8.2 and 4.4.8.1.

F) DOT&PF would use several means to announce road closures and re-openings. Planned and unplanned closures would be posted on the 511 website, phone, and various social media platforms to ensure that road users receive regular updates of highway conditions. Clarifying language was added to the Final SEIS in Sections 4.3.8.2 and 4.4.8.1.

G) Damage from rockslides and avalanches would not put the road at risk. The likelihood of a slide event was assessed and would be mitigated to the extent possible during highway design if a build alternative was selected. DOT&PF is responsible for these risks and is staffed and equipped to repair damage from slides and to maintain the highway in operable condition. DOT&PF would have dedicated maintenance personnel and resources for routine maintenance, and would use State and/or federal highway funds to perform major repairs as needed. Clarifying language was added to the Final SEIS in Sections 4.3.8.2 and 4.4.8.1.

H) In the 2006 Final EIS, Table 4-16, road closures for Alternative 2B were estimated to be approximately 33.9 days per year. The Draft SEIS, Table 4-27, estimated road closures to be approximately 12.1 days per year. This reduction in road closures is due to added avalanche mitigation measures such as snowsheds, remote exploders, bridges, and elevated fills.

7.4 Bald Eagles

Group 27

Topic/Subtopic: Bald Eagles/Mitigation

Group Comment Text:

Even if DOT&PF is able to get an eagle Disturbance Permit, the U.S. Fish and Wildlife Service (USFWS) may impose significant restrictions on construction activities, beyond what DOT&PF may be expecting, and could require compensatory mitigation, which will likely add to the cost of building the road. Cost of bald eagle compensatory mitigation should be estimated and included in the cost estimate for each alternative.

Group Comment Response:

Mitigation of project impacts from alternatives on bald eagles will be site-specific and based on where active bald eagle nests are observed in a pre-construction survey. Mitigation, if necessary, would be included as part of the Bald and Golden Eagle Protection Act permitting process. Given the anticipated impacts for each alternative and DOT&PF past experience, bald eagle mitigation would not add notably to the cost of a specific alternative.

Group 25

Topic/Subtopic: Bald Eagles/Operation/Maintenance Impacts

Group Comment Text:

A) The Draft SEIS did not account for avoidance of communal roosting locations during blasting activities, and DOT&PF has not completed a survey to identify these locations.

B) The Draft SEIS asserted that “it is not practicable to limit construction” to the period outside of bald eagle breeding season, as recommended by the USFWS’s National Bald Eagle Management Guidelines. This assessment is inadequate.

C) The Draft SEIS did not account for helicopter use for avalanche control activities near nests during the breeding season.

D) The Draft SEIS did not provide any basis for analyzing whether the disturbance of bald eagles in most of their range along the east side of Lynn Canal is compatible with their preservation, and made no mention of other permitted takes or other factors affecting the local and regional eagle populations.

Group Comment Response:

A) Per the comment, Sections 4.3.16, 4.4.16, 4.6.16, and 4.8.12 of the Final SEIS incorporated the evaluation of effects to bald eagles during operation and construction from the *2004 Appendix R – Bald Eagle Technical Report* and *2014 Update to Appendix R – Bald Eagle Technical Report*. Also, Section 5.7 of the Final SEIS was updated to clarify that a pre-construction survey would be conducted for bald eagles. As described in the *2014 Update to Appendix R – Bald Eagle Technical Report*, surveys conducted since 1997 have not indicated the presence of communal roosting sites along the project.

B) The USFWS National Bald Eagle Management Guidelines recommend that activities avoid the nesting season and provides a set of distances for construction activities near active eagle nests. When avoidance is not viable, the Guidelines allow for take and disturbance of nest trees. As stated in Sections 4.3.16 and 4.8.12.6 of the Draft SEIS, Alternative 2B was modified to avoid take and to minimize disturbance of nest trees. In addition, construction of Alternative 2B would have been staged and would not have occurred along the entire alignment in any one season.

C) As explained in Section 5.2 of the *2014 Update to Appendix R - Bald Eagle Technical Report*, bald eagle nests located in or near the avalanche prone areas may have been impacted by intermittent helicopter operations and blasting noise. Response to such disturbances may have included flushing from, or abandoning, the nest.

D) Section 4.9 of the Draft SEIS included an evaluation of cumulative effects on bald eagles. Past, present, and reasonably foreseeable projects in combination with the JAI Project would have resulted in the loss of a small amount of habitat, no loss of known nest trees for bald eagles, and no measurable loss of food sources. Considering the ability for bald eagles to habituate to human presence, the cumulative impact of increased human presence in the region would not likely have a population-level effect on bald eagles.

Group 26

Topic/Subtopic: Bald Eagles/Operation/Maintenance Impacts

Group Comment Text:

This eagle population may be more sensitive and not adapt to disturbance, and may abandon nests during construction due to increased human presence in the area.

Group Comment Response:

Per the comment, Section 4.8 of the Final SEIS incorporated the evaluation of effects to bald eagles during operation and construction from the *2004 Appendix R – Bald Eagle Technical Report* and *2014 Update to Appendix R – Bald Eagle Technical Report*. The evaluation included an assessment of the potential for bald eagle nest abandonment during construction, as well as other potential effects on bald eagle populations from disturbance activities.

Group 24

Topic/Subtopic: Bald Eagles/Regulations

Group Comment Text:

A) The Draft SEIS was incorrect in assuming that permits under the Bald and Golden Eagle Protection Act and variances from the City and Borough of Juneau's (CBJ's) Land Use Code will be granted to the JAI Project and would include stipulations sufficient to allow successful use of a nest by eagles. Why did the Draft SEIS assume that the permits/variances would be approved as requested?

B) The Draft SEIS stated that no nest trees would be removed, but it did not account for the removal of future nest trees. For the discussion of impacts on eagles to be complete, it needs to include impacts caused by removal of trees that could have nests in the future if they are not removed for the road.

C) Due to all of the clearcutting needed for the road, DOT&PF should consult with USFWS about applying timber harvesting operations guidelines with respect to bald eagles, instead of requesting a permit to disturb an unprecedented number of nests and communal roosts.

Group Comment Response:

A) Other projects completed by DOT&PF have been granted permits under the Bald Eagle and Protection Act from USFWS and have received set back variances from CBJ. As stated in Section 4.8.12.6 of the Draft SEIS, USFWS may require additional monitoring or mitigation as a stipulation of a permit approval. CBJ previously issued a bald eagle set back variance for roadway construction Echo Cove to Sweeny Creek as part of a project in the vicinity.

B) Section 4.8.12 of the Final SEIS was updated to denote that the long-term loss of potential nesting trees removed for the road alternatives would be less than 1 percent of available nesting habitat for bald eagles and would not affect the overall population of bald eagles in Lynn Canal for Alternatives 2B, 3, 4B, and 4D.

C) The National Bald Eagle Management Guidelines specify that construction of roads is a Category A activity, and the Guidelines relative to that category apply to the JAI Project. As explained in the *2014 Update to Appendix R – Bald Eagle Technical Report* of the Draft SEIS, only 25 to 55 percent of nests are occupied in any given year. DOT&PF does not anticipate the need for any Take Permits for the JAI Project at this time as no build alternative has been selected. DOT&PF would have conducted pre-construction on-the-ground nest surveys to confirm the location of trees with eagle nests if a build alternative had been selected. As described in the *2014 Update to Appendix R – Bald Eagle Technical Report*, surveys conducted since 1997 have not indicated the presence of communal roosting sites along the JAI Project alternatives. For 5 years following construction, DOT&PF would have funded USFWS aerial surveys to assess the potential impacts from the project on the Lynn Canal bald eagle population.

7.5 Climate Change

Group 182

Topic/Subtopic: Climate Change/Adapting the Project for Climate Change

Group Comment Text:

A) The Draft SEIS did not consider climate change in regards to how rising global sea levels, storms, and ground movement would affect the project (e.g., through increasing road closures as sea levels rise).

B) Effects of climate change will increase costs and reduce benefits of the road.

Group Comment Response:

A) Section 4.7.9 of the Draft SEIS addressed potential impacts of climate change on the JAI Project, including rising sea levels, uplift of the land as the weight of glaciers melts off of it, increased storm intensity, and other factors. As noted in Section 4.7.9, current design practices address the potential impacts to project infrastructure resulting from the changing climate and resulting sea level rise, along with increased frequency of severe weather events. Section 4.7.9 stated that changes in sea level and increased storm intensity are the primary climate change threats likely to impact the project. However, this section noted that sea level change was not a major concern in the coastal areas of southern Alaska. In fact, it is predicted that sea level in the Juneau area will actually decrease between 1 and 3.6 feet as a result of loss of glacial ice and the resulting uplift. Therefore, sea level change would not be anticipated to affect project facilities constructed near the shoreline.

B) Implementation of the appropriate design practices were included in the construction cost estimate and, in the case of Alternatives 2B and 3, would support the long-term benefit of the road.

Group 183

Topic/Subtopic: Climate Change/Adapting the Project for Climate Change

Group Comment Text:

The Draft SEIS failed to include the required “hard look” at the implications of climate change on the project. The SEIS should consider/include:

A) The impact of climate change on road safety in regards to avalanches, debris slides, storm intensity, geoid movement, and changing precipitation amounts and patterns.

B) How climate changes will affect future costs associated with re-engineering and maintenance.

Group Comment Response:

Climate change impacts could threaten transportation infrastructure. As such, the U.S. Department of Transportation (USDOT) and FHWA have developed policy and guidance regarding climate resiliency. It is FHWA policy to integrate consideration of climate change into its planning, operations, policies, and programs (FHWA Order 5520). The Draft SEIS addresses the implications of climate change on the project in Section 4.7.9. Taking a “hard look” at the effects of climate change on any alternative can only be as reliable as predictions for future conditions.

A) As noted in Section 4.7.9 of the Draft SEIS, current design practices address the potential impacts to infrastructure resulting from climate change and increased storm intensity (i.e., the impact of climate change and increased storm intensity would have been considered during design of project facilities if a build alternative were selected). Impacts to the road from avalanches, rock slides, and debris flows that might have been associated with climate change were discussed in Sections 4.3.8 and 4.4.8 of the Draft SEIS.

B) Climate change will not affect future costs. If a build alternative had been selected in the ROD, during final design, DOT&PF would have considered climate change effects and made adjustments to the design as needed. This would have reduced the potential for re-engineering project features in the future. DOT&PF evaluates maintenance costs on an annual basis for all State highways and would increase maintenance budgets as warranted by changing conditions.

Group 184

Topic/Subtopic: Climate Change/Adapting the Project for Climate Change

Group Comment Text:

The project should promote mass transit options (e.g., ferries) and make efforts to mitigate climate change by not promoting infrastructure for single vehicle transport.

Group Comment Response:

FHWA and DOT&PF have promoted mass transit and multi-modal solutions with the JAI Project. All project alternatives use the ferry, and five of the build alternatives are primarily ferry transportation. FHWA and DOT&PF are charged with serving the needs of the travelling public under terms of current laws and regulations. Most people, including those

in the project area, travel by personal automobile, and substantial national and statewide funding emphases are frequently focused on accommodating automobiles. Mass transit is part of the national and statewide transportation package, but a pure mass transit project (focused solely on moving people) would not satisfy the purpose and need of the JAI Project. Regarding ferries as mass transit that might help reduce the problem of climate change: As indicated in Table 4-80 (SEIS Section 4.7.9, Climate Change), ferry alternatives would emit large amounts of greenhouse gasses (GHGs). While GHG emissions vary among the alternatives, the variance is not based on the proportion of road driving versus ferry travel. The data indicated that selecting a ferry alternative versus a road-and-ferry alternative would not have necessarily mitigated effects of climate change.

Group 425

Topic/Subtopic: Climate Change/Method of Analysis

Group Comment Text:

The Draft SEIS did not consider some important contributions to climate change resulting from this project and underestimated the GHG emissions. For example, the analysis should consider ferry emissions during loading and unloading, vehicles idling at ferry terminals, ferry use of diesel fuel, loss of carbon sequestration from trees that have been cut, and the social cost of carbon.

Group Comment Response:

The Draft SEIS text was based on FHWA internal guidance for addressing climate change in environmental documents. FHWA is satisfied that the information provided in the SEIS is consistent with that guidance and adequate for the proposed action.

For projects located in nonattainment areas, analysis of idling vehicle emissions, and possibly those associated with loading/unloading of ferries, are conducted via hot-spot CO and particulate matter (PM) analyses; however, because the project is located in an attainment area, hot-spot analyses are not required. Furthermore, the speculative nature of idling emissions (i.e., how long the idling occurs, how many cars) would be difficult to characterize with any level of accuracy. Therefore, FHWA’s opinion is that the current analysis of roadway vehicular emissions is sufficiently conservative for identifying impact conditions.

Based on the comment, updated emissions estimates from ferry vessels were included in the Final SEIS, including CO₂ estimates from diesel fuel consumption.

FHWA’s opinion is that the qualitative discussion of GHG emissions from construction activities is sufficiently conservative for assessing impact conditions.

Loss of carbon sequestration from permanent removal of trees was added as an impact with respect to climate change and cumulative effects on carbon sequestration. This loss relative to the abundance of trees in the airshed would result in a negligible impact.

The social cost of carbon is an estimate of the costs, expressed in monetary value, by damage caused by each additional metric ton of carbon dioxide put into the atmosphere. The damage includes health impacts, economic dislocation, agricultural changes, and other

effects that climate change can impose on humanity. This value is generally incorporated into a cost-benefit analysis. The social cost of carbon is difficult to calculate, however, and estimates by economists vary widely. The Interagency Working Group on the Social Cost of Greenhouse Gases (IWG, formerly the Interagency Working Group on the Social Cost of Carbon) continues to develop methods for estimating the social cost of carbon. In its most recent Technical Support Document on this subject, IWG provided estimates ranging from \$11 to \$56 per metric ton of CO₂ in 2015, based on averages from three different models and depending on discount rates (IWG, 2016). The social cost of carbon increases over time because future emissions are expected to produce larger incremental damages as physical and economic systems become more stressed in response to greater climatic change, and because Gross Domestic Product is growing over time and many damage categories are modeled as proportional to Gross Domestic Product. By 2050, the estimates of the social cost of carbon range from \$26 to \$95 per metric ton of CO₂ (IWG, 2016).

According to Council on Environmental Quality (CEQ) guidance, NEPA does not require monetizing costs and benefits and, when there are important qualitative considerations, the weighing of the merits and drawbacks of alternatives should not use a monetary cost-benefit analysis (40 CFR 1502.23). With respect to GHG emissions, use of a monetary cost-benefit analysis should be appropriate and relevant to the choice among alternatives being considered, (CEQ, 2016).

FHWA determined that using the social cost of carbon methodology to assess the impacts of the JAI Project alternatives would not be appropriate and relevant to the choice among alternatives; therefore, the methodology is not part of this NEPA analysis. This determination was made for the following primary reasons: (1) the wide range and uncertainty in placing estimates of the value of carbon renders the social cost of carbon methodology speculative and (2) the quantitative analysis of GHG emissions for the JAI Project alternatives indicated that their contribution would have been a relatively minor contribution to global emissions.

Group 176

Topic/Subtopic: Climate Change/Project Impacts on Climate Change

Group Comment Text:

The Draft SEIS Climate Change section did not discuss the cumulative effect of the project on ocean acidification.

Group Comment Response:

Section 4.7.9, Climate Change, identifies ocean acidification as an effect of climate change. The discussion was expanded in the Final SEIS to address the relationship of the proposed project to ocean acidification. The added discussion also acknowledged the contribution of the project to the general effects of climate change. In addition, the Cumulative Impact section regarding Air Quality (SEIS Section 4.9.2.7), was revised to acknowledge ocean acidification as a cumulative effect of increased GHG emissions.

Group 177

Topic/Subtopic: Climate Change/Project Impacts on Climate Change

Group Comment Text:

A) The use of ferries can make a huge dent in GHG, while the use of vehicles over the same route can significantly increase the amount of GHG emissions. Why should the State fund a project that would encourage more vehicles on roads and more burning of fossil fuels, furthering the climate crisis?

B) Due to the potential for the project contributing to further climate change from increased CO₂ and other GHG emissions, all alternatives except Alternative 1 – No Action and Alternative 4C should be excluded from further consideration.

Group Comment Response:

A) The Draft SEIS addressed fuel use and calculated gallons of fuel that would be used by ferries and automobiles for each alternative in Section 4.7.6, Energy. This information was used to calculate GHG emissions for ferries and automobiles for each alternative in Section 4.7.9, Climate Change. The amount of vehicle traffic, length of road-miles, types and sizes of ferry vessels, and length of marine-miles traveled for each alternative affect the total GHG emissions. Recognizing the preferred alternative may not be the alternative that would contribute the least amount of GHG to the atmosphere, FHWA and DOT&PF must weigh those impacts, and all social, economic, natural, and cultural impacts, against the purpose and need for the project and their duties as public agencies to provide transportation infrastructure and mobility.

The commenters' assertions regarding ferries generating less GHG emissions than vehicles is incorrect. As discussed in Section 4.7.9 of the Draft SEIS, 35 percent of all GHG emissions in the State are from the transportation sector, and CO₂ emissions from motor vehicles in the State of Alaska contributed less than one hundredth of 1 percent (0.0095 percent) of global emissions in 2010 and are projected to contribute even less by 2040. GHG emissions were calculated for future conditions (2050 in the Draft SEIS) associated with the project based on factors such as projected traffic and estimates of fuel consumption associated with vehicles and ferries (see Table 4-71 of the Draft SEIS). As shown in that table, GHG emissions from ferries are higher than those from vehicles under all alternatives. Under Alternative 2B, ferries comprise 55 percent of the total project GHG emissions; under Alternative 3, ferries comprise 66 percent of the total project GHG emissions.

B) The assertion that only Alternative 1 – No Action and Alternative 4C should be considered due to the potential for other alternatives to contribute to further climate change is problematic as it does not consider the purpose and need for this project or the many factors that decision makers are required to evaluate in reaching a decision. Total GHG emissions, along with other project impacts and benefits, are considered in the SEIS to allow FHWA to make an informed decision in the selection of an alternative.

Group 178

Topic/Subtopic: Climate Change/Project Impacts on Climate Change

Group Comment Text:

The Draft SEIS did not address the loss of carbon capture caused by the removal of trees in its analysis of alternatives with roads.

Group Comment Response:

Section 4.7.9 of the SEIS addresses climate change. The text was augmented in the Final SEIS to include the incremental effect of removing trees in the road corridors, causing loss of carbon capture (see also Section 4.9.2.7 of the Final SEIS).

Group 423

Topic/Subtopic: Climate Change/Project Impacts on Climate Change

Group Comment Text:

It is unclear whether ferries or vehicles use more fuel. The SEIS should include an explanation of estimated fuel usage for ferries and vehicles under each alternative and use this information in the assessment of climate change impacts.

Group Comment Response:

The Draft SEIS addressed fuel use and calculated gallons of fuel that would be used by ferries and automobiles for each alternative in Section 4.7.6, Energy. These values were used to determine greenhouse gas emissions, which are presented for ferries and automobiles for each alternative in Section 4.7.9, Climate Change.

7.6 Construction

Group 132

Topic/Subtopic: Construction/General

Group Comment Text:

The Draft SEIS included a construction cost estimate from 2009. The SEIS should provide an updated estimate.

Group Comment Response:

The Draft SEIS included a cost estimate for all alternatives that was updated to reflect 2012 construction costs. This is discussed in Section 4 of the *2014 Update to Appendix D – Technical Alignment Report*. Further, the estimates were included in Attachments D and E to this report for the ferry terminal and road capital costs respectively. The Final SEIS was updated to reflect 2016 construction costs. The method for determining these costs is discussed in Section 4 of the *2017 Update to Appendix D – Technical Alignment Report*. The updated estimates are included in Attachments D and E to this report for the ferry terminal and road capital costs, respectively.

Group 133

Topic/Subtopic: Construction/General

Group Comment Text:

Who is responsible for highway construction, schedule, work quality, and maintenance?

Group Comment Response:

DOT&PF is responsible for the highway construction and maintenance. The road would have been constructed by a contractor selected during the competitive bid process. Management and oversight of the contract and contractor's work would be accomplished by DOT&PF. Standard contract provisions require the work to be completed in accordance with DOT&PF specifications. If the work does not meet the contract specifications, the contractor would be required to correct the work to ensure compliance with the contract. When a project is bid under the competitive bid process, a completion date is specified and contractors bid the work accordingly. If the completion date is not met, liquidated damages are implemented and applied to the contract. Scheduling the work to meet the contract completion date is the contractor's responsibility. After project completion, the road would be owned and maintained by DOT&PF.

Group 135

Topic/Subtopic: Construction/General

Group Comment Text:

Will the highway alternatives be paved and include culverts and bridges?

Group Comment Response:

All proposed highways will be paved and include culverts and bridges.

Group 136

Topic/Subtopic: Construction/General

Group Comment Text:

Will the construction footprint account for lights, cell towers, and turnouts?

Group Comment Response:

Roadway lighting and cell towers were not included as components of the alternatives evaluated in the SEIS. Roadway lighting was considered; however, lighting of low volume rural roadways is not cost effective or consistent with DOT&PF practice. It was not anticipated that lighting would be installed along any road alternative in the foreseeable future. Securing the necessary authorizations and the design and construction of cell towers would be the responsibility of private cell phone providers. Locations for pullouts and scenic overlooks have been identified in consultation with USFS and are included in Alternatives 2B and 3 and are described in Sections 4.3 and 4.4 of the SEIS.

Group 189

Topic/Subtopic: Construction/General

Group Comment Text:

- A) Where and how would the large amount of rock and materials generated from blasting and cuts during road construction be disposed of?
- B) How would explosions during construction impact tourism?

Group Comment Response:

A) Generally, the material generated from cuts are used for fills. Engineers typically try to balance cuts and fills. DOT&PF would have characterize the geochemical properties of blasted rock to confirm that the rock was not hazardous and could be used as clean fill for the roadway and ferry terminal embankments (Sections 4.3.8.4 and 4.2.8.3 of the Draft SEIS). DOT&PF anticipated incorporating all mineral materials generated from blasting into the road embankments (Sections 4.3.8.4 and 4.2.8.3 of the Draft SEIS). Overburden would have been used to cover shot rock slopes, as practicable, to reduce their visibility (Sections 4.3.3.4 and 4.4.3.4 of the Draft SEIS). No material from road construction would have been disposed of as waste in a wetland or water body. In addition, the Wetlands Permit Application contained additional information specifying that “no blasting is anticipated within waters of the U.S. All blasting near waters of the U.S. would be controlled to avoid incidental discharge of blasted materials into those waters (including wetlands) adjacent to the project. Construction camps, borrow pits, and waste areas would be sited in upland areas and stabilized during and after use to avoid and minimize impacts to water quality” (Appendix Z 2014 Update to X – Permit Application & 404b1 & Wetlands).

B) Lynn Canal is typically 2 to 6 miles wide. Blasting noise is expected to travel 3 to 4 miles so likely would be audible in mid-channel but not loud. It may not be audible at all over the typical noises of a cruise ship, ferry, or other vessel. Blasting would be in isolated areas, and different areas would be blasted at different times, so the impact would not be continuous or widespread and would be unlikely to be heard in any community. For any given tourist's visit, it likely would be a minor annoyance or curiosity for a short time. Tourism as an industry is not expected to be negatively affected. Sections 4.3.5 and 4.4.5 of the Draft SEIS discussed tourism by community for the two road alternatives for which blasting would occur, and Section 4.8.8 discussed noise of construction. The distance blasting noise may carry was discussed for wildlife in the Draft SEIS (Section 4.8.12, particularly for Steller Sea Lions under Section 4.8.12.7), and this distance discussion was added to Section 4.8.8 of the Final SEIS in relation to humans on the water or using the shoreline areas during construction.

Group 438

Topic/Subtopic: Construction/General

Group Comment Text:

The Draft SEIS did not provide a clear explanation or engineering plan for how road construction would be executed.

Group Comment Response:

An EIS is not a design or engineering document. The Draft and Final SEIS provided descriptions of proposed construction activities to a suitable level of detail for DOT&PF and FHWA to assess potential impacts, and for decision makers to select an alternative in a ROD.

The project's 2006 Initial Financial Plan and the 2007 financial plan update (available on the project website) described how construction would be divided into zones and would occur through at least five sequenced contracts. Prior to funding construction, FHWA would need to approve an updated financial plan, which would explain the proposed sequencing and limits of the construction projects for the selected alternative.

Group 482

Topic/Subtopic: Construction/General

Group Comment Text:

A) How will cut and fill areas be impacted by weather? Will these cuts and fills increase the amount of snow sliding into the roadway?

B) Are the engineering estimates for constructing bridges (Lacy and Antler Rivers) accurate?

C) What is the depth to bedrock?

D) Have meltwater flows from the glacier and weather been accounted for in the highway alternatives?

Group Comment Response:

A) Cut and fills would be consistent with typical roadway construction in the Southcoast region. The impact on cuts and fills due to weather is not a concern. In particular, most embankments would be constructed from shot rock, which is less susceptible to erosion than soil material. Soil embankments would be seeded. In cut areas, there would be sufficient ditch width to prevent snow from sliding onto the roadway. All avalanche chutes have been appropriately mitigated. An increase of the amount of snow sliding onto the roadway due to cuts and fills is not expected.

B) The engineering estimates for the Lacy and Antler River bridges were updated to reflect 2016 construction prices. These costs were reflected in Attachment E of the *2017 Update to Appendix D – Technical Alignment Report*. All bridge cost estimates were based upon historic bid tab data collected throughout Alaska. Where necessary, unit prices were adjusted to account for the geographic location, project scale, and other relevant factors.

C) The depth to bedrock for the numerous bridges for the road alternatives varied widely. For the Lace, Antler, and Katzehin River bridges, the depth to bedrock varied along the length of the bridges. Not all bridge piles were designed/required to extend to bedrock. All bridges were founded on deep pipe piles.

D) Meltwater flows have been accounted for in the design of the bridges and roadway in highway alternatives.

Group 147

Topic/Subtopic: Construction/Mitigation

Group Comment Text:

A USFS public use cabin located to minimize “other user interruptions” to the wilderness experience will be impacted by construction of Alternative 2B as it will put this cabin on the road system. What mitigation would be provided for this impact?

Group Comment Response:

Sections 5.11, 5.12.1, and 6.2.2.2 of the Draft SEIS identified mitigation for changes to the Berners Bay Cabin. A trail would be provided to the cabin, which would become a road-accessible walk-up cabin, and a new water-accessible USFS cabin in a remote area would be provided in coordination with USFS. Section 6.2.2.2 documented that the toe of the highway embankment would be more than 800 feet from the cabin use area, with the centerline approximately 1,000 feet away and 500 feet higher in elevation.

Section 2.3.3.1 of the Draft SEIS, which described Alternative 2B and indicated 500 feet of separation between the cabin and the new highway, was revised in the Final SEIS to reflect the greater separation distances. While Section 5.11 of the Draft SEIS discussed mitigation for the Berners Bay Cabin, this measure only applied under Alternative 2B and is no longer included in Chapter 5 of the Final SEIS.

Group 137

Topic/Subtopic: Construction/Visual

Group Comment Text:

A) Will the road/terminal be lit?

B) Will the lights at the Katzehin Ferry Terminal be shielded to decrease glare seen from Haines?

C) How will lighting on the highway affect wildlife?

Group Comment Response:

A) Appropriate lighting would have been provided at the ferry terminal facilities.

B) The overhead lighting fixtures would have been designed to minimize glare to ensure vessel and pedestrian safety and reduce light pollution effects. However, the lighting would have likely been visible from Haines.

C) Roadway lighting is not anticipated for build alternatives. The terminal sites would have lighting, but its effect on wildlife would be very localized and is anticipated to be minimal.

Group 144

Topic/Subtopic: Construction/Mitigation

Group Comment Text:

A) How many camps and generators are proposed?

B) Bears are incorrectly grouped with carnivores and scavengers. The SEIS should state that bear-proof containers and practices would be used. Wildlife measures are to protect wildlife as well as humans.

Group Comment Response:

A) An independent estimate that was completed for Alternative 2B by Western Federal Lands in the 2009 Cost Report determined that two construction camps would be needed to construct the project. These camps would typically be powered by dual diesel power generators. It is also likely that numerous portable generators would be needed to periodically support tools or equipment surrounding the camp. For Alternative 3, it was assumed that one camp with similar characteristics and accommodations would be utilized. The costs for these camps were reflected in the cost estimates for Alternatives 2B and 3.

B) Sections 5.9 and 5.12.1 of the Draft SEIS stated, “During construction, all garbage would be properly disposed of in closed bear-proof containers to avoid attracting bears and other carnivores and scavengers.” This statement indicates that bear-proof containers would be in use. Although “carnivore” and “omnivore” and “carnivore” and “scavenger” are not mutually exclusive terms, the language was changed in the Final SEIS to read “...bears and other wildlife” to avoid confusion. Discussion in Section 5.9 of the Final SEIS of a wildlife interaction plan was modified to indicate that the plan would be for the protection of wildlife as well as humans.

7.7 Cultural, Historical, and Archaeological Resources

Group 274

Topic/Subtopic: Cultural, Historical, and Archaeological Resources/Consultation with Tribes

Group Comment Text:

A) Sealaska Corporation and Douglas Indian Association (DIA) request that a cultural resource specialist be hired to monitor construction activity in areas where there is potential to impact historic and cultural resources of significance to the Tribe. Monitoring should include Tribal Government officials or designees.

B) The Tribes request immediate contact if anything of possible historic or cultural significance to the Tribe is disturbed or found through construction or monitoring activities.

Group Comment Response:

A) As a result of FHWA and DOT&PF's meetings on February 25, 2016, with Sealaska Corporation, Sealaska Heritage, DIA, Goldbelt Corporation, and the State Historic Preservation Office (SHPO), it was noted that monitoring in specific areas may be warranted. Continued consultation with these Tribal entities and SHPO, if a build alternative had been selected, would typically occur during detailed design to determine specific locations where construction monitoring may be appropriate.

B) As stated in Section 4.8.3 of the Draft SEIS, if a previously unknown cultural resource or burial site/human remains or associated funerary objects were discovered during construction, work in the vicinity of the discovery would halt until the discovery was evaluated and appropriate consultation, including with Tribes, is conducted consistent with Section 106 of the National Historic Preservation Act.

Group 277

Topic/Subtopic: Cultural, Historical, and Archaeological Resources/Existing Conditions

Group Comment Text:

A) The SHPO concurred with FHWA's determination that Alternative 2B would have no adverse effect on any historic property, but this is an incorrect assessment. Berners Bay is an area that is culturally significant as the ancestral land of the Auk Kwan Tlingit. Cultural resources and human remains/burials have been identified in Berners Bay, as well as near the proposed alternative.

B) The project could have an indirect impact on adjacent sites by increasing access to the area. This site should be given a larger buffer for avoidance.

C) Spirit Mountain (or Lions Head Mountain) located in Berners Bay is sacred to the Auk Kwan.

D) All valuable cultural resources are not included in the National Register of Historic Places.

Group Comment Response:

A) FHWA has complied with Section 106 of the National Historic Preservation Act for this project. The presence of historic properties and places of traditional religious and cultural importance to Tribes and other historic properties within the area of potential effect (APE) for each alternative were established through background research, extensive consultation, and field investigations. Field and aerial surveys did not identify historic properties of cultural importance to the Tribes within the project APE. Based on research, consultation, and field investigations, it was determined that no historic properties of cultural importance to the Tribes would be directly impacted by any reasonable alternative. However, it was determined that because some alternatives are within the boundaries of the Berners Bay Historic Mining District, there would be an effect to the Mining District, but the effect would not be adverse (see Section 3.1.3 of the Draft SEIS for further detail).

To protect sensitive site information, the data and analyses contained in these documents were only summarized in the SEIS, although all of the information therein was used in

making determinations of eligibility and findings of effect. For example, the locations of sensitive archaeological and burial sites were not disclosed in the Draft SEIS. It is understandable that a review of the Draft SEIS could lead to confusion in regards to the summary of this site information appearing not to include all site locations.

FHWA and DOT&PF, along with the SHPO, had meetings on February 25, 2016, with Sealaska Corporation, Sealaska Heritage Institute, DIA, and Goldbelt Corporation to address the concerns expressed in comments on the Draft SEIS. Upon conclusion of these meetings, FHWA maintained that their determination of no adverse effect on any cultural resources and historic properties is valid.

As was discussed during those meetings, the Alaska Heritage Resources Survey (AHRS) database was reviewed for the SEIS. Reported locations of known cultural resources were considered during the development of the project, including the historic Tlingit winter village with burial sites and petroglyphs in Berners Bay. The presence of any historic properties within the APE for each alternative was established through record searches; surveys within the APE; and consultation with Tribes and organizations, USFS, and SHPO. No previously unidentified sites of cultural or historic importance were identified during the February 25, 2016, meeting discussions.

FHWA and DOT&PF intend to continue consulting with Sealaska Corporation, Sealaska Heritage, DIA, Goldbelt Corporation, other Tribal entities, SHPO, and USFS as the project moves forward.

Section 3.1.3 of the Draft and Final SEIS included information regarding cultural resources within the project's APE, and Sections 4.1.3, 4.3.4, 4.4.4, 4.5.4, 4.6.4, 4.8.3, and 4.9.2.3 of the Draft and Final SEIS included a discussion of project effects to known historic properties.

The existence of burial sites and sites of cultural importance in the Berners Bay area was first noted during the initial archaeological literature review for this project, conducted in 1994. Their reported locations were considered during the development of the inventory design and were factored into the field survey methodology. This design was developed in consultation with archaeologists from USFS and the Alaska Office of History and Archaeology.

As stated in Sections 4.8.3, 5.10, and 5.12.1 of the Draft SEIS, if a previously unknown cultural resource or burial site/human remains were discovered during construction, work in the vicinity of the discovery would halt until the discovery was evaluated and appropriate consultation, including with Tribes as appropriate, is conducted per Section 106 of the National Historic Preservation Act. If the discovery included human remains or associated funerary objects, it could also be subject to the provisions of the Native American Graves Protection and Repatriation Act (NAGPRA), and Tribal consultation would be conducted per NAGPRA.

B) DOT&PF and FHWA have acknowledged that indirect impacts could occur as a result of the project. Indirect impacts to cultural resources from the project were discussed in Sections 4.3.4, 4.4.4, and 4.6.4 of the Draft SEIS. During the February 25, 2016,

consultation meetings with Sealaska Corporation, Sealaska Heritage, DIA, Goldbelt Corporation, and SHPO, DOT&PF agreed to revisit the Alternative 2B alignment and evaluate the possibility of shifting the road further from these sites, knowing that topography and other geological situations may prohibit it. Additional text was added to Section 3.1.3 of the Final SEIS regarding the cultural importance of the project area.

C) Spirit Mountain (or Lions Head Mountain) would not be impacted by the highway for Alternative 2B. As discussed in Section 4.3.4, FHWA determined that Alternative 2B would have no adverse effect on any historic property, and SHPO concurred that a finding of no adverse effect remains appropriate for this alternative. No other reasonable alternative would approach Spirit Mountain.

D) Evaluation and identification of prehistoric and historic properties of traditional religious and cultural importance to Tribes, either included or eligible for inclusion on the National Register of Historic Places in the SEIS, is based on record searches, surveys within the study area, and consultation with Tribes and organizations, USFS, and SHPO. As reported in Section 3.1.3 of the Final SEIS, DOT&PF and FHWA understand that the project is located in an area that has been identified as culturally significant by Tribes. No previously unidentified sites of cultural or historic importance were identified as a result of comments received on the Draft SEIS, or during FHWA and DOT&PF consultation meetings on February 25, 2016, with Sealaska Corporation, Sealaska Heritage, DIA, Goldbelt Corporation, and SHPO. FHWA and DOT&PF intend to continue consulting with Sealaska Corporation, Sealaska Heritage, DIA, Goldbelt Corporation, other Tribal entities, SHPO, and USFS as the project moves forward.

Group 270

Topic/Subtopic: Cultural, Historical, and Archaeological Resources/General

Group Comment Text:

The State fails to consider the Native use of land and the rights of Natives on these lands under the law.

Group Comment Response:

The State has considered the Native use of lands and the rights of Natives on lands within the project area. It is DOT&PF and FHWA's intent to continue to fully consult with Alaska Native groups regarding this project; disclose project impacts to their interests; and avoid, minimize, or mitigate project effects on historic and cultural properties and impacts on subsistence hunting, fishing, and gathering activities.

DOT&PF and FHWA have followed the process laid out in the regulations (e.g., Section 106 of the National Historic Preservation Act) for consulting with Tribes and identifying and protecting culturally important sites. The Draft SEIS discussed this process in Sections 3.1.3 and 4.1.3.

Section 810 of the Alaska National Interest Lands Conservation Act (ANILCA) requires an evaluation of subsistence uses and needs. Existing levels of subsistence hunting, fishing, and gathering were addressed in Section 3.1.6 of the Draft SEIS and Section 3.2.4 in Appendix DD, *Land Use Technical Report*, of the Draft SEIS. Project impacts to

subsistence resources were discussed in Sections 4.2B.6, 4.3.6, 4.4.6, 4.5.6, and 4.6.6 of the Draft SEIS and Sections 4.1.4.2, 4.1.5.2, and 4.1.6.2 of Appendix DD.

Most of the land crossed by the highway segments for Alternatives 2B and 3 are in the Tongass National Forest or the Haines State Forest. A discussion of land use and impacts from the project on land use was included in Section 3.1.1 and 4.1.1, 4.2B.1, 4.3.1, 4.4.1, 4.5.1, and 4.6.1 of the Draft SEIS and Appendix DD, *Land Use Technical Report*. FHWA and DOT&PF consulted with USFS regarding land use issues in the Tongass National Forest.

Group 282

Topic/Subtopic: Cultural, Historical, and Archaeological Resources/Method of Analysis

Group Comment Text:

Comments received on the Draft SEIS expressed concern that the project will have direct and indirect adverse effects on culturally significant Auk Kwan ancestral lands, cultural resources, and human remains/burial sites. These comments suggest:

A) DOT&PF failed to consult fully with interested parties for potential impacts to historic and cultural resources, and did not conduct additional field studies for the Draft SEIS. Therefore, FHWA has failed to consider all the relevant information, resulting in an incomplete consideration of impacts to cultural resources.

B) The Auk Kwan Tribe was not consulted as required under Section 106 of the National Historic Preservation Act.

C) New research indicates that the protocols developed for guiding archaeological survey (i.e., areas having high potential for cultural resources) did not consider the effect of isostatic rebound on these areas.

Group Comment Response:

A) As discussed in Sections 3.1.3 and 7.1 of the Draft SEIS, DOT&PF sent letters in September 2003 to 11 tribal organizations, of which, 6 are Federally Recognized Tribes (Chilkoot Indian Association of Haines, Klukwan Inc., Golbelt Inc., Chilkat Village of Klukwan, Sealaska Corporation, DIA, Tlingit and Haida Central Council, Skagway Traditional Council, Auk Kwan Traditional Council, Sealaska Heritage Institute, Hoonah Indian Association), SHPO, USFS, and National Park Service (NPS), inviting them to participate in the process of identifying cultural properties (prehistoric and historic) and determining the effects of the alternatives on such properties for the 2005 Draft SEIS. DOT&PF conducted follow-up phone calls and face-to-face meetings when requested by the Tribes and Native organizations. In August 2004, FHWA sent letters to these same entities, inviting them to comment on FHWA's determination of eligibility on historic properties for the National Register of Historic Places and determination of potential effects on any historic properties in the APE.

In 2012, SHPO was consulted and concurred with the APE for the project and field methodology. In addition, SHPO concurred with FHWA's determinations of eligibility for all historic properties within the APE of Alternative 2B (with minor changes to the site

boundaries) as discussed in Section 4.3.4. The Tribes and Tribal organizations were additionally notified regarding opportunities for input through scoping outreach, the notice of availability, and the public hearing process as part of the Draft SEIS. FHWA and DOT&PF did not receive scoping comments from Tribes or Tribal organizations but did receive comments from DIA, Sealaska, and Auk Kwan on the Draft SEIS. FHWA and DOT&PF responded to Draft SEIS comments in the Final SEIS (see this appendix). The APEs did not change between SHPO's concurrence and the Draft SEIS. Following the additional consultation described below, FHWA and DOT&PF reviewed the existing analysis and determined that additional field investigations are not necessary (see paragraph below).

The investigations (research and field studies) of cultural resources presented in the Draft SEIS was a synthesis of several technical reports and memoranda regarding historic and archaeological sites prepared for this project between 1994 and 2005. A follow-up literature review was conducted in 2012 to determine if any new information regarding cultural resources in the APE had become available since 2005. No new cultural resources were identified within the APE. Together, these documents comprise the cultural resources record for the project. In part, they include:

- *Archaeological Inventory of the East Lynn Canal Alternative, Juneau Access Road Improvement Project.* Gary Wessen, Elena Nilsson, Michael S. Kelly, and Sandra Flint. Dames and Moore, Inc., Chico, California. 1994.
- *Archaeological Survey on the West Coast of Lynn Canal: William Henry Bay to Pyramid Island.* Amy F. Steffian, Owen K. Mason, and Stacie J. McIntosh. Northern Land Use Research, Fairbanks. 1994.
- *Inventory and Evaluation of Historic Properties For Lands Within the Area of Potential Effect from Addendum No. 1 to the Plan of Operation for the Kensington Gold Project.* Submitted by Coeur Alaska in April 2002. Brenden Raymond-Yakoubian. Integrated Concepts and Research Corporation, Anchorage. 2004.
- *Juneau Access Road 2003 Cultural Resource Studies: West Lynn Canal Alternative Update and Skagway Approach Survey Results.* Catherine M. Williams, Peter M. Bowers, and Lisa J. Slayton. Northern Land Use Research, Inc., Fairbanks. 2004.
- *Determination of Eligibility for the Dalton Trail (SKG-052).* Northern Land Use Research, Inc., Fairbanks. 2004.
- *Determination of Eligibility for the Skagway Hydroelectric Complex District (SKG-189).* Northern Land Use Research, Inc., Fairbanks. 2004.
- *Determination of Eligibility for the Lower Dewey Lake Trail (SKG-203).* Northern Land Use Research, Inc., Fairbanks. 2004.
- *Juneau Access Road 2004 Cultural Resource Studies, East Lynn Canal Alternative Update.* Michael R. Yarborough and Catherine M. Pendleton. Cultural Resource Consultants LLC, Anchorage. 2004.
- *Juneau Access Road 2005 Cultural Resource Study, East Lynn Canal Alternative Update.* Michael R. Yarborough and Catherine M. Pendleton. Cultural Resource Consultants LLC, Anchorage. 2005.
- Alaska Heritage Resources Survey database, State of Alaska Office of History and Archaeology, 2012.

To protect sensitive site information, the data and analyses contained in these documents were only summarized in the Draft and Final SEIS, although all the information therein was used in making determinations of eligibility and findings of effect. For example, the locations of sensitive archaeological and burial sites were not disclosed in the Draft and Final SEIS. It is understandable that a review of the Draft and Final SEIS could lead to confusion regarding the summary of this site information, since it did not include all site locations.

On February 25, 2016, meetings with Sealaska Corporation, Sealaska Heritage, DIA, Goldbelt Corporation, and SHPO verified that no previously unidentified sites of cultural or historic importance were missed.

B) Consistent with Section 106 procedures, the Auk Kwan was not specifically consulted under Section 106 as a Tribe because the Auk Kwan is not a Federally Recognized Tribe. However, as a part of the NEPA process, the Auk Kwan have been given multiple opportunities to provide input on the project. Comments from Auk Kwan members on the Draft SEIS were considered and are addressed in this appendix JJ. FHWA and DOT&PF followed State and federal regulations as well as FHWA guidelines regarding consultation with Federally Recognized Tribes.

C) The effects of isostatic rebound (referred to as uplift in the SEIS) were considered as a part of the archaeological analysis. Section 3.2.1.1 of the Draft SEIS reported that after deglaciation, the gradual rebound of land that had sunk below its original level due to weight of glacial ice resulted in the emergence of marine deposits and uplifted rock faces. Clarifications and additional information was added to Section 3.1.3 of the Final SEIS regarding survey methodology and considerations in the APE.

Group 294

Topic/Subtopic: Cultural, Historical, and Archaeological Resources/Mitigation

Group Comment Text:

What mitigation is proposed to address the numerous burial sites that could be disturbed in Berners Bay?

Group Comment Response:

The presence of burial sites and/or historic properties within the vicinity of the APE for each alternative was established through background research, consultation, and field investigations. No known burial sites would be affected by any alternative.

Because project alternatives are not anticipated to disturb burials/burial sites in Berners Bay, no site-specific mitigation was proposed. However, as stated in Section 4.8.3 of the Draft SEIS, if a previously unknown cultural resource or burial site/human remains were discovered during construction, work in the vicinity of the discovery would halt until the discovery was evaluated and appropriate consultation, including with Tribes, was conducted consistent with Section 106 of the National Historic Preservation Act.

7.8 Cumulative

Group 201

Topic/Subtopic: Cumulative/Economic

Group Comment Text:

Are businesses and organizations likely to develop along the road? For example, do the cruise ship companies plan to construct additional gift stores and docks where they can sell excursions and avoid paying high rents and docking fees in Juneau and Skagway?

Group Comment Response:

Private land along Alternatives 2B and 3 is very limited. Most of the land along the highway routes for Alternatives 2B and 3 is USFS land or Haines State Forest land and would be unlikely to be developed by any cruise company or other business or organization for commercial use. Such proposals would be subject to a USFS environmental document and decision or a separate State Forest decision, and docks would be subject to State permits for use of submerged lands and USACE environmental document and permits for fill in waters of the U.S.

Group 204

Topic/Subtopic: Cumulative/Economic

Group Comment Text:

If actual traffic numbers fall below projections, AMHS revenues will not meet projections, putting the AMHS at further risk.

Group Comment Response:

If actual traffic volumes fall below projections, AMHS has the operational flexibility to respond through such actions as reducing operating hours or assigning a vessel elsewhere in the system. The transportation system in Lynn Canal is projected to be subsidized by the State under any project alternative. Revenues, expenditures, and State support are discussed in Appendix BB, *Revenues and Expenditures Report for Lynn Canal, Fiscal Years 2005–2015*, as well as Section 1.4.4 and the appropriate sections (Other Transportation Impacts - AMHS) in Chapter 4 of the Draft SEIS. FHWA and DOT&PF cannot speculate how AMHS might alter service in response to changes in revenues, expenditures, and State support.

Group 186

Topic/Subtopic: Cumulative/General

Group Comment Text:

The Draft SEIS does not address the indirect effects of the road on wildlife and habitat. Human disturbance (e.g., trash, dumping, bonfires, firearms, tour group activities, etc.) would cause degradation to terrestrial and aquatic wildlife species and habitat, and would alter the natural, recreational, and wilderness characteristics of the area. What would be the strategy for funding patrols for the area and reducing illegal dumping and shooting along the highway?

Group Comment Response:

The Terrestrial Habitat sections and Terrestrial Mammals subsections (under Wildlife) for each alternative in Chapter 4 of the Draft and Final SEIS addressed indirect effects of the road on wildlife and habitat, including trash and dumping. The Alaska State Troopers would have had primary authority regarding law enforcement along the highway. The Alaska Department of Safety, through the Division of Alaska Wildlife Troopers, have primary hunting and fishing regulation enforcement responsibilities. USFS also has enforcement duties on its lands. These agencies are funded generally from State or federal funds and are not funded project by project. While the Draft SEIS acknowledged litter and dumping might have occurred along a road, even with enforcement efforts, litter and dumped items typically do not result in important impacts to wildlife species. It is possible individual animals could have been affected.

Group 197

Topic/Subtopic: Cumulative/Land Use

Group Comment Text:

The road through USFS land may have additive impacts to natural resources by providing access to Land Use Designation (LUD) lands. The Draft SEIS did not account for funding to mitigate and regulate access.

Group Comment Response:

The purpose of the project is to provide a roadway for transportation; not to provide access to adjacent lands. USFS has the authority to regulate access to its lands. While USFS lands are public lands and typically open for public use, USFS could institute restrictions on how the land is used (e.g., to protect sensitive resources), but neither DOT&PF nor FHWA have that control. Limiting places to park, however, is a long-term measure that is within DOT&PF control. No roadside parking is being provided other than turnouts whose locations have been determined through years of coordination with USFS. USFS would be responsible for any future access and resulting need for management or control.

Group 211

Topic/Subtopic: Cumulative/Marine and Freshwater Habitat/Species

Group Comment Text:

A) Improved access from the highway could increase sport fishing pressure in areas that have experienced little pressure before.

B) Degradation from the road could lead to reduced returns and productivity, which would affect commercial fisherman.

Group Comment Response:

A) As discussed in the Draft SEIS, Alternative 2B could result in increased competition and pressure for sport fishers. However, the Alaska Department of Fish and Game (ADF&G) and the Board of Fish regulate salmon sport fishing seasons and limits, and are charged by the Alaska Constitution with managing for sustained yield. They frequently must address allocation between sport and commercial fishing interests. Draft SEIS Section 4.3.1.3 addresses sport fishing as potential competition for commercial fishing for

Alternative 2B and discloses likely increased use of fish streams along the route. Similar subsections address the topic for other alternatives.

B) The road itself and the bridges are not expected to create substantial impact to fish. Most streams will be crossed without piers. Wide river deltas, such as the Lace River entering Berners Bay, will include piers placed 130 feet apart and would provide little or no impediment to fish passage.

Group 191

Topic/Subtopic: Cumulative/Past, Present, Reasonably Foreseeable Actions

Group Comment Text:

How does this project relate to the idea of relocating the State capital? People in support of moving the capital may point to the high construction and annual maintenance costs of the Juneau access road as wasteful capital expenditures and reasons for moving the capital from Juneau.

Group Comment Response:

The purpose and need for the project is to improve access to and from Juneau for Lynn Canal communities, not to resolve a debate on relocating the State's capital. As stated in Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS, Alternatives 2B and 3 would not provide a direct highway link to Juneau. Because Alternative 2B would improve access to Juneau in terms of cost, frequency, and capacity, this may reduced the perception that it is difficult and expensive for Alaska residents to visit the capital. However, it is unlikely implementation of any of the alternatives would substantially alter the debate. Improving transportation within Lynn Canal is warranted, in part, because Juneau is the capital, but the purpose of providing improved transportation is for business, recreation, school activities, medical, shopping, and any other reason people move between communities. The Draft SEIS disclosed avalanche issues and construction, operating, and maintenance costs. The State cannot regulate how people use this information to support their arguments in favor of or against the project.

Group 192

Topic/Subtopic: Cumulative/Past, Present, Reasonably Foreseeable Actions

Group Comment Text:

A) The Draft SEIS failed to rigorously explore the potential cumulative and indirect effects of the JAI Project that would result from development in the area.

B) The Draft SEIS did not include an evaluation of the existing mining claims in the area and how the road might improve their economic viability. More mining in the area would increase environmental impacts.

C) The Draft SEIS did not consider the potential for commuter traffic in Lynn Canal (i.e., people in Haines and/or Skagway commuting to Juneau for work).

D) The SEIS should consider future possibilities associated with Alternative 3, including additional ferry access, recreation, mining, access to nearby communities, and utilities.

Several public landings and camping areas could be constructed between Glacier Point and Icy Straits for ease of access and safety.

Group Comment Response:

A) The Draft SEIS included analyses of the indirect effects of the project alternatives in Sections 4.2 through 4.7 and cumulative impacts in Section 4.9. Indirect effects are the effects of a project that occur later in time or outside of the direct impact area. Potential indirect impacts of the project described in the Draft SEIS included increased hunting pressures and recreation use of USFS lands as a result of increased access with Alternative 2B, and an increase in the need for housing in Haines or Skagway as a result of more flexible and frequent travel opportunities to those communities.

Cumulative impacts refer to the additive effects of the direct and indirect impacts of the proposed project and other past, ongoing, and reasonably foreseeable actions affecting the same resources. The cumulative effects analysis is based on potential cumulative impacts identified in Scoping and on reasonably foreseeable actions that may contribute to cumulative impacts. FHWA and DOT&PF rigorously explored these types of impacts by contacting local and State officials to identify ongoing and planned activities that may affect the same resources as the proposed action, how resources are currently being managed, and what growth scenarios are anticipated in the affected communities with and without the project.

B) The Draft SEIS (page 4-37) acknowledged that a highway would provide easier and less expensive access to mineral resources, but access alone does not determine whether a mineral deposit would be developed. FHWA and DOT&PF are not aware of specific mining prospects that would go into development if a road were built, hence the statement “It is unlikely that any mineral deposits within the region would be developed solely because of this improved access.” The Final SEIS was updated with new information pertaining to reasonably foreseeable future exploration associated with the Kensington Gold Project (Section 4.9.1.1) and potential cumulative impacts to habitat for mountain goats, wolves, and eagles; marine species using the adjacent and downstream Berners Bay; wetlands and water quality; and disturbance to wildlife from activities such as blasting (see Section 4.9.2).

C) The traffic models used to develop traffic projections included a number of assumptions regarding trip destinations and reasons for travel, including travel for work, recreation, and shopping.

D) The cumulative impacts assessment provided in Section 4.9 of the Draft SEIS considered reasonably foreseeable future actions. FHWA and DOT&PF cannot speculate on the types of development that might occur in the future. As noted in Section 4.9.1, “reasonably foreseeable” actions are those that are funded or permitted and would occur with or without the JAI Project.

Group 687

Topic/Subtopic: Cumulative/Social

Group Comment Text:

The project should not move forward without analyzing an Auke Bay bypass, due to cumulative impacts the project would have on the Auke Bay community.

Group Comment Response:

The alternatives as proposed and evaluated in the SEIS meet the purpose and need for the JAI Project without requiring any additional road improvements in Auke Bay; associated traffic forecasts do not indicate a need for any improvements for the highway in Auke Bay to function in a safe manner.

Group 210

Topic/Subtopic: Cumulative/Terrestrial Habitat

Group Comment Text:

A highway alternative could lead to deforestation.

Group Comment Response:

Deforestation is not considered likely to occur because most of the land along Alternative 2B is part of Tongass National Forest and is highly managed, mostly for preservation of resources. Similarly, most of the land along the Alternative 3 corridor is in Tongass National Forest and Haines State Forest. The addition of a road would not likely change management of the land in these areas.

Group 208

Topic/Subtopic: Cumulative/Water Resources

Group Comment Text:

The Draft SEIS did not evaluate the potential indirect effects of spills, runoff, sedimentation, and altered hydrology associated with long-term highway use on aquatic resources. For example, sanitary wastewater discharge at the Katzechin Ferry Terminal could affect Katzechin River eulachon and spill events in Berners Bay could affect spawning of herring, eulachon, and capelin. Over time, the additive impact could be large.

Group Comment Response:

Section 4.3.9.3 of the Draft SEIS evaluated the potential effects of fuel spills/leaks, debris generation, winter sanding, and vehicular traffic. Highway construction, maintenance, and operation of the Alternative 2B road could affect water quality by introducing metals, fuel, oil, and other potential contaminants to water courses. The analysis of these discharges indicated that they would not substantially alter water quality. The comment example of wastewater discharge from ferry terminals was also evaluated and addressed and the SEIS notes that discharges would be treated to meet federal and State standards prior to discharge into Lynn Canal.

Impacts from water quality on aquatic species (e.g., eulachon, herring, and capelin) in Lynn Canal, including the Katzechin River and Berners Bay, were assessed in the 2014

Update to Appendix N – Essential Fish Habitat Assessment and errata. As described in detail in the 2004 *Appendix N – Essential Fish Habitat Assessment*, surface runoff from the proposed highway and bridges would not exceed water quality standards or adversely impact the water quality of receiving waters for the long term. Wastewater would be treated prior to discharge to meet water quality standards. As such, maintenance and operation of the highway alternatives would not likely lead to degradation of anadromous and marine Essential Fish Habitat (EFH) or effects on the commercially important EFH species (e.g., eulachon, herring, and capelin).

Stormwater research indicates that runoff from low volume rural roadways has minimal to no impact on the water quality of receiving waterways. Runoff from the proposed road/bridges would not exceed ADEC Water Quality Standards (AWQS) or adversely impact the water quality of receiving waters for the long term. There is the potential for an oil/hazardous substance spill resulting from vehicle accidents. To minimize construction and long-term water quality impacts, best management practices (BMPs) would be implemented (see Sections 4.8.6 and 4.3.9.3).

Ferry operations would have minimal impact under Alternative 2B. Mainliner wastewater discharges would be eliminated because the ferries used under Alternative 2B would have sanitary waste holding tanks. In addition, the Katzehin Ferry Terminal would have a sewage treatment facility with permitted outfall, and its discharges would be within permit guidelines. Similar to the system used at the Auke Bay Ferry Terminal, the aeration and ultraviolet light disinfection would be used at the Katzehin Ferry Terminal, so no adverse impacts to water quality would occur. Ferry operations could result in accidental discharges, spills, and leaks. Historically, however, these have been minor with only minimal and temporary impacts to water quality.

Aquatic species, as assessed in the 2014 *Update to Appendix N – Essential Fish Habitat Assessment*, would not be affected because the water quality impacts would be mitigated. In addition, a State Section 401 water quality certification was issued for Alternative 2B, confirming that this alternative would adequately and appropriately meet water quality standards for receiving waters.

7.9 Editorial and Document Management

Group 301

Topic/Subtopic: Editorial and Document Management/General

Group Comment Text:

A) Please confirm/correct the number of avalanche chutes, zones, and locations in the document.

B) Please confirm/correct the varying distances from the Berners Bay Cabin.

Group Comment Response:

A) As stated in Section 4.3.8.2 (Avalanches) of the Draft SEIS, “The 2013 *Update to Appendix J – Snow Avalanche Report* (see Appendix Z) identifies 43 avalanche paths along the East Lynn Canal Highway corridor. The proposed highway alignment for Alternative 2B crosses 41 avalanche paths (the other two identified paths do not reach the alignment).”

Since these two paths would not have reached the alignment, no mitigation is necessary and thus was not brought into discussion in the Executive Summary.

B) The centerline of the Alternative 2B alignment is approximately 1,000 feet east of the Berners Bay Cabin at an elevation approximately 500 feet above the cabin. This information was updated/corrected throughout the document.

Group 416

Topic/Subtopic: Editorial and Document Management/General

Group Comment Text:

A) The Draft SEIS's analysis, predictions, methodologies, and conclusions were flawed and subject to opinions, not supported by evidence.

B) Data and metrics should be ground-truthed.

C) The Draft SEIS did not include new information, including information about geological hazards and prior substantive comments.

D) The Draft SEIS used faulty or best case scenario assumptions to arrive at conclusions that were disputed by its own attached data.

E) The Draft SEIS omitted references such as the Haines Household Opinion Survey, which could not be readily found via an internet search.

Group Comment Response:

A) The reports and analyses used and developed for the Draft and Final EIS used a variety of data, forecasting tools, and methodologies. As appropriate, professional judgment by subject matter specialists was often employed in these analyses. Such analyses can be subject to criticism, especially as time passes and scientific understanding changes; however, they reflect the best effort at the time to characterize and understand the alternatives and their impacts in the future. In the original communication, this comment was the general lead-in to several issues that were coded as separate comments and addressed elsewhere.

B) There were disparate methodology and data needs for each of the studies and reports generated or referenced for the SEIS. Each was reviewed by subject matter specialists and reflect the best effort at the time to characterize and understand the alternatives and their impacts based on a preliminary level of design. An EIS documents a process to provide comparative data to inform decision makers. Exhaustive scientific studies are not always available or needed to accomplish this goal. FHWA and DOT&PF anticipate that some ground truthing would have taken place during final design and before construction if a build alternative had been selected, such as bald eagle nest locations, wetlands delineation, and amphibian pond location surveys.

C) The Draft SEIS included new and updated information from the 2006 EIS. As detailed in Section 3.2.1, Geology, DOT&PF conducted a geotechnical investigation in 2006 and shifted the alignment of Alternative 2B to avoid many of the geologic hazards identified in

the previous survey. DOT&PF also updated the geologic hazards evaluation in 2012 and *Update to Appendix J – Snow Avalanche Report* (Appendix Z) in 2013, and incorporated the information into the Draft SEIS. A summary of the Alternative 2B geological hazards and related mitigation strategies are discussed in the *2017 Update to Appendix D – Technical Alignment Report*.

D) A response to the suggestion that the Draft SEIS uses faulty assumptions or best case scenario assumptions to arrive at conclusions disputed by DOT&PF's own data is difficult to craft without specific examples. The collection of data, development of assumptions, and methodologies were all reviewed by subject matter specialists, and reflect the best effort at the time to characterize and understand the alternatives and their impacts. DOT&PF and FHWA has welcomed scrutiny into the process and has adjusted or updated analyses over time based on input from the public and agencies.

E) The Section 10, References, pointed users to a website that had hosted Haines community news, including the 2011 Haines Household Opinion Survey final report, but it now appears to be redirecting users to advertisements. Appendix EE, *Socioeconomic Effects Technical Report* (References), of the Final SEIS was updated to identify the new location, which could be found online (at the time of this appendix's publication) at: http://www.hainesalaska.gov/sites/default/files/fileattachments/administration/page/1585/haines_survey_report.pdf

Group 417

Topic/Subtopic: Editorial and Document Management/General

Group Comment Text:

Please update the index to include references to herring in Chapters 3, 4, and 5.

Group Comment Response:

Per your comment, the Final SEIS index has been updated and includes references to herring.

Group 427

Topic/Subtopic: Editorial and Document Management/General

Group Comment Text:

Table 1-2 in the Draft SEIS is at variance with Appendix B to Appendix AA, *Traffic Forecast Report*, and should be updated with current Department of Labor population statistics that forecast flat population growth in Southeast Alaska through 2042.

Group Comment Response:

Table 1-2 has been spot checked against population history and forecast in Appendix B to Appendix AA, and it appears no change to the table is necessary. Table 1-2 does not use forecasts but focuses only on historical data.

Group 428

Topic/Subtopic: Editorial and Document Management/General

Group Comment Text:

A) The Regional Snowfall discussion (Section 5 of the *2013 Update to Appendix J – Snow Avalanche Report*) does not have correct data for “Haines Downtown” and has questionable data from the “Haines Airport” location. For example, the Haines Downtown snowfall average for the past 15 years of official complete records is 160.1 inches, more than double the figure listed in the Draft SEIS. October through April conditions, maintenance requirements, road closures, and avalanche mitigation need to reflect the true average Haines snowfall.

B) The Katzehin to Taiya Inlet snowfall data should not be included in the average as this is not part of the road alignment. Including it causes the overall alignment average to be significantly understated.

C) The reported calculated route average is based on a simple average of the three segments and does not give weight to the respective distances delineated by the described segments. The “true” estimated two-segment route average should be used instead.

Group Comment Response:

The *2017 Update to Appendix J – Snow Avalanche Report*, Section 5 Regional Snowfall, states that these were estimates based on limited data. As with all projects in Alaska, the available weather data is regional rather than project-specific, and period of record is variable and usually not very long, as climate records go. Different data sets over different periods inevitably yield a range of values, and quality of the data is variable. This is why avalanche hazard evaluation and program design is based on actual observed and recorded avalanche activity; not on snowfall estimates or weather records. No greater level of accuracy is either available or necessary for avalanche evaluation at the EIS level, nor are additional weather measurements needed before the design, construction, and operations stages.

A) The weather data included in the *2013 Update to Appendix J, Snow Avalanche Report* were not updated from the original 2005 studies. These figures were updated in the *2017 Update to Appendix J – Snow Avalanche Report* presented in the Final SEIS with what is currently available online, including their periods of record, from the Juneau office of the National Weather Service:

Juneau International Airport (1981 to 2010): 87 inches (2.2 meters)

Lena Point (1983 to 2015): 80 inches (2.0 meters)

Tee Harbor area (station no longer exists): 145 inches (3.7 meters)

Haines downtown (2000-2015): 165 inches (4.2 meters)

Haines Airport (1972-2013; no longer records snowfall): 133 inches (3.4 meters)

Haines Highway, Pleasant Camp (2001-2015): 236 inches (6.0 meters)

Skagway Airport (1965 to 2010; no longer records snowfall): 49 inches (1.2 meters)

Skagway (harbor; no longer records snowfall): 37 inches (0.9 meters)

Skagway Power (downtown; 2001-2015): 52 inches (1.3 meters)

B) The estimates presented in the original 2005 study were unchanged by the new data, and the estimated snowfall at starting zone elevations along the East Lynn Canal route from Berners Bay to the Katzehin River could be best described as ranging from approximately 150 inches (3.8 meters) to 210 inches (5.3 meters). This is less than 200 inches (5.1 meters) overall. The figure for all of Lynn Canal, from Berners Bay to Skagway, is useful as regional climate information along the entire route, including those portions served by ferries.

C) A paragraph has been added in the *2017 Update to Appendix J – Snow Avalanche Report* to clarify the rough nature of the snowfall estimates, and their lack of importance to the avalanche assessment and mitigation program: “Snowfall is not calculated into avalanche hazard evaluation or used to develop mitigation measures. Avalanche studies are based on hard data from actual avalanche occurrences, rather than indirect calculation from snowfall figures. Snowfall for Alaska projects must always be estimated from the records that are available in the region. These observations are usually incomplete, and taken over a relatively short period of record, so the snowfall estimates are necessarily rough estimates only.”

Group 429

Topic/Subtopic: Editorial and Document Management/General

Group Comment Text:

More emphasis should be placed on Figure ES-1 (2020 Forecast Summer Demand and Capacity for All Alternates) in the Executive Summary.

Group Comment Response:

The commenter, in this and associated comments, suggested that traffic demand for Alternatives 2B and 3 would be lower than indicated and attached a revised Figure ES-1 to illustrate. The commenter is generally critical of the terminology and methods used to generate forecasts of demand and associate them with capacity. Traffic modelers for the project considered the input relative to the methods they used and concluded the methods used were sound. The alternatives were compared using a consistent forecasting model across all the alternatives. The discussion of these forecasts appears in Sections 4.1.5, 4.3.7, 4.4.7, 4.5.7, and 4.6.7 of the SEIS, and the numbers in these sections were updated in the Final SEIS. Detailed traffic forecasts and methods were provided in Appendix AA, *Traffic Forecast Report*. Although some people may read only the Executive Summary, it is meant only as an overall summary of these issues and should not be taken as the full discussion.

Group 430

Topic/Subtopic: Editorial and Document Management/General

Group Comment Text:

The SEIS should be clear and concise as required by the CEQ. As such, information within the document should be consolidated and reorganized. For example, the Draft SEIS appendices are not easily located within the Appendices Volumes (1-6), and errata sheet information should be incorporated within the updated appendices.

Group Comment Response:

DOT&PF recognizes the difficulties in reviewing and navigating the long and complex SEIS documents. The long history of the EIS and SEIS processes makes it difficult to have concise documents. Consolidating and reorganizing documents may serve some users; however, DOT&PF and FHWA sought to maintain the original EIS's order and highlight where changes and additions were made to avoid concerns from stakeholders that materials were being hidden or removed from the record. This has resulted in study appendices being located in different files. The Final SEIS conforms to standard practices for the organization of NEPA documents, and reorganization of the documents could cause frustration and confusion for many public and agency stakeholders who have been following the project and its documents throughout its long time frame.

7.10 Energy

Group 46

Topic/Subtopic: Energy/Method of Analysis

Group Comment Text:

A) The analysis should factor in increased use of electric vehicles and the associated reduced fuel cost.

B) The analysis should consider the increasing use of electrical vehicles by incorporating vehicle charging stations into the highway alternatives. Electrical power will also be needed at the Katzehin Ferry Terminal.

C) The analysis should account for the reduction in GHG emissions from electrical vehicle use. For example, the emissions reported in Table 4-71: Estimated GHG Emissions by Alternative (2050) should be reduced for Alternative 2B due to anticipated increased electric vehicle usage.

D) The analysis should consider the lower cost per vehicle for Alternative 2B to reflect the present and pending electric transportation transformation.

Group Comment Response:

Regarding A), B), C), and D): Section 4.7.9 of the Draft SEIS addresses vehicles that might use alternative energy sources in a discussion of the unpredictable nature of projecting GHG emissions. Because such vehicles are not the standard and because future use is not known, the Draft SEIS addressed common gasoline-fueled vehicles. In this way, the analysis was conservative in terms of projecting user costs, emissions, and related environmental impacts. There are no current State or federal policies or laws requiring that charging stations for electric vehicles be included in transportation projects in Alaska. Fueling for vehicles, regardless the type of fuel, is typically left to the private sector; therefore, no charging system or electrical utility along the road corridor is proposed as part of the project.

Group 50

Topic/Subtopic: Energy/Method of Analysis

Group Comment Text:

A) Are there opportunities to reduce fuel consumption with the existing AMHS fleet?

B) Is natural gas an alternative fuel that could provide a cost savings?

C) What would the costs of upgrades and potential savings with another fuel source look like in comparison to current fuel usage patterns?

Group Comment Response:

A) Addressing fuel consumption across the entire fleet would not address the purpose and need of this project. The focus of the JAI Project is on reducing State costs within the Lynn Canal Corridor, and the concern is overall costs, not just fuel costs. While fuel costs are an important component of overall costs, staffing is the largest cost, especially for ferries that operate long hours and require two worker shifts. Day boat shuttle ferries help to address the staffing issue. Building new vessels is an opportunity to build the latest technology for fuel efficiency into the ship, but costs savings on fuel would likely be incremental and unlikely to result in large savings overall, because considerable energy must be generated to push vessels through the water. See also Response B, below.

B) Currently, natural gas is not a viable option in Southeast Alaska, as no source is available. The new Day Boat ACFs, which would be used in some of the alternatives, will use Tier III engines, which operate at the highest efficiency. These engines can be converted to use natural gas in the future, should a natural gas supply be available. However, natural gas storage tanks would be required to be above deck, thus reducing passenger capacity.

C) The alternatives presented in the SEIS use the technology and fuel sources available in Southeast Alaska. Given the issues indicated in Responses A and B, analyzing the costs of upgrades to existing ferries to use more efficient engines or to convert ferries to other fuel sources is outside the scope of this project and its purpose and need.

7.11 Environmental Justice

Group 308

Topic/Subtopic: Environmental Justice/Method of Analysis

Group Comment Text:

A) Per Executive Order (EO) 12989, the economic and health impacts to low-income and minority citizens should be considered for this project. The Draft SEIS failed to include meaningful analysis regarding EO 12898 mandates related to cost and time burdens across all alternatives.

B) Cost impacts to walk-on passengers—including the elderly, disabled, students, and low-income families—is not adequately considered. Alternative 2B would put an unfair burden—in terms of cost, time, and ability to travel—on low-income populations.

[Note, general impacts to walk-on passengers are addressed under Comment Group #116.]

C) This project allows the State to neglect its duty to provide public transportation to all Alaskans, with Alternative 2B disproportionately affecting the disabled, elderly, students, and those without well-maintained and/or four-wheel-drive vehicles.

Group Comment Response:

A) FHWA complied with EO 12989, as well as USDOT and FHWA guidance on Environmental Justice in the Draft SEIS. As discussed in Section 3.1.5 of the Draft SEIS, the EO requires federal agencies to identify and address, “as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority and low-income populations.” In this NEPA analysis, FHWA did not identify a disproportionately high and adverse effect on low-income and/or minority communities as a result of project alternatives.

Cost and time burdens for all travelers, including low income and minority populations, were discussed in Chapter 4 of the Draft SEIS. Reducing user costs was an element of the purpose and need statement. The alternatives evaluated in the Draft SEIS met the need for reduced user costs to varying degrees. Additional discussion regarding cost information and impacts to low-income and/or minority walk-on passengers were added to Sections 4.3.7.5, 4.4.7.5, 4.7.2 of the Final SEIS and Sections 3.1.4 and 3.1.5 of the *Socioeconomic Effects Technical Report* (Appendix EE).

B) While commenters have included the elderly, disabled, and students in comments regarding EO 12989, these populations are not Environmental Justice populations. This does not mean, however, that FHWA has not considered impacts from the proposed project on these populations.

Similar to any other passenger, elders, disabled, and students traveling by ferry would need to continue making their own accommodations for traveling on the highway portion of their trip between Lynn Canal communities, whether from Auke Bay to Juneau or Katzechin to Juneau. AMHS accommodates disabled passengers per the ADA. Providing transportation for walk-on passengers is not a primary responsibility of DOT&PF (see Section 1.4.1.1). Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS described how pedestrians and cyclists will be accommodated with Alternatives 2B and 3, respectively, and includes an analysis of the potential for a bus or van service to develop in the Lynn Canal corridor.

The current surface transportation system in Lynn Canal operates like an expensive toll road, which has an impact on low-income travelers, in some cases precluding their ability to travel outside their hometown. As indicated in the Draft SEIS, vehicle travel on the AMHS costs roughly four to six times as much as travel over the same distance on a highway (see Section 1.4.5). One of the stated purpose and need elements of the project is to reduce user costs for transportation in the corridor. As previously stated, FHWA has determined, based on traditional measures of Environmental Justice, that none of the build alternatives would have a disproportionately high and adverse effect on low-income or minority communities.

However, based on this comment, additional information regarding impacts to elderly, disabled, and student passengers was added to Sections 4.3.7.5 and 4.4.7.5 of the Final SEIS and Sections 3.1.4 and 3.1.5 of the *Socioeconomic Effects Technical Report* (Appendix EE).

C) The State does not have a duty to provide town to town public transportation. The marine highway system was developed to provide a means to transport vehicles. Passenger transportation (walk-ons) was a consequence of this action. FHWA does not deny that some of the project alternatives will affect travelers in Lynn Canal to varying degrees. However, FHWA has determined that none of the build alternatives would have a disproportionately high and adverse effect on low-income or minority communities, which could include elderly, disabled, and student passengers. Additional information regarding impacts to elderly, disabled, and student passengers was added to Sections 4.3.7.5 and 4.4.7.5 of the Final SEIS and Sections 3.1.4 and 3.1.5 of the *Socioeconomic Effects Technical Report* (Appendix EE).

The AMHS is the only public transportation that carries both passengers and vehicles in Lynn Canal. The purpose of this project is to improve surface transportation within Lynn Canal. As explained in Section 1.4.1.1 of the Draft EIS, the State's primary responsibility is to provide a transportation facility for vehicles. Because of the nature of the AMHS, the facilities to move vehicles also accommodate walk-on passengers. However, this is a secondary function. The project's purpose is not to provide public transportation. Alternative 2B was selected as the preferred alternative for the Draft SEIS because DOT&PF and FHWA believe it best met the purpose and need for the project.

7.12 Essential Fish Habitat (EFH) – Marine and Freshwater

Group 29

Topic/Subtopic: Essential Fish Habitat – Marine and Freshwater Justice/Existing Conditions

Group Comment Text:

No data collection or analysis on eulachon, herring spawning, or biomass have been completed at the Katzechin River delta. The data could have been easily collected by expanding the area surveys that ADF&G uses monthly to get data for fishing regulations in Lynn Canal. This information gap does not allow for a rigorous analysis of Alternative 2B impacts on EFH at the Katzechin River delta.

Group Comment Response:

FHWA has coordinated with National Marine Fisheries Service (NMFS) on the project since 1994, and has continued to coordinate with the NMFS on the EFH assessment, Endangered Species Act (ESA) Section 7 consultation, and Marine Mammal Protection Act authorization (eulachon and herring are prey species for ESA listed species and marine mammals). NMFS provided comments on the Draft SEIS EFH Assessment, requesting minor clarifications. The EFH assessment was updated through errata, which is included in Appendix Z of the Final SEIS. Section 4.3.13 of the Draft SEIS noted that EFH is present within the Katzechin River delta area. Surveys have been conducted at the site and confirmed the presence of Pacific herring and eulachon in the Katzechin River delta. The

analysis in the Draft SEIS considered the presence of these species and the potential impacts from project activities on these species.

Group 30

Topic/Subtopic: Essential Fish Habitat – Marine and Freshwater Justice/Existing Conditions

Group Comment Text:

The Final SEIS should consider incorporating elements into the design of the Auke Bay Ferry Terminal for Alternative 1B to dissipate the additional wave energy from vessels and minimize continued degradation of the adjacent Auk Nu Cove eelgrass bed.

Group Comment Response:

Alternatives 1B, 4A, and 4C did not propose additional modifications to the existing Auke Bay Ferry Terminal to dissipate additional wave energy. Based on the comment, Sections 4.2B.13 and 4.5.13 of the Final SEIS acknowledged the increased wave energy effects on eelgrass from utilizing Auke Bay for Alternatives 1B, 4A and 4C. Eelgrass in these terminal areas is already disturbed, and nearshore habitat around Lynn Canal is extensive; therefore, localized, periodic disturbances and additional wave energy at the Auke Bay Ferry Terminal from ferry operations is not anticipated to substantially degrade the eelgrass bed adjacent to Auk Nu Cove beyond its existing condition.

Group 36

Topic/Subtopic: Essential Fish Habitat – Marine and Freshwater Justice/Habitat Fragmentation/Loss

Group Comment Text:

A) What impact would off-road vehicles (ORVs) have on wildlife and anadromous streams?

B) Increased access for ORVs in the Berners Bay area would affect salmon and eulachon spawning habitat.

C) Negative impacts from the road include more vandalism and degraded areas from ORVs.

Group Comment Response:

A) Impacts to wildlife and stream habitat from ORVs were discussed in Section 4.3.12 of the Draft SEIS. ORVs could damage upland and wetland vegetation, resulting in direct loss of habitat and habitat damage through destruction of vegetation, erosion, and increased stream siltation. Noise and the presence of ORVs could displace some wildlife species, resulting in mortality from collisions or human interaction. See also Response B, below.

B) The proposed project does not include access facilities for ORVs; however, a highway would afford ORVs access to adjacent lands. As stated in Section 4.3.12, USFS is aware of the potential for ORV impacts and plans to develop an ORV enforcement policy if the East Lynn Canal Highway is constructed.

C) Impacts to terrestrial habitat through camping and hiking, illegal dumping, and unauthorized collection of firewood were discussed in Section 4.3.14 of the Draft SEIS. Impacts to aquatic habitat, fish habitat, and wildlife were described in Sections 4.3.12, 4.3.13, and 4.3.15 of the Draft SEIS.

Group 37

Topic/Subtopic: Essential Fish Habitat – Marine and Freshwater Justice/Habitat Fragmentation/Loss

Group Comment Text:

A) The Draft SEIS does not consider the importance of the Lynn Canal nearshore habitat (intertidal or subtidal) to juvenile salmonids, eulachon, or other species for critical feeding or refuge areas.

B) The Draft SEIS did not adequately address the effects of increased fill incorporated into the design after the 2006 ROD at the Katzeihin River and Katzeihin Ferry Terminal on EFH, salmonids, eulachon, and prey species of Steller sea lions. Because the Katzeihin River includes important habitat for fish, fish for the nearby Steller sea lion critical habitat at Gran Point, and is an important contributor to the commercial chum fishery, the SEIS should address the effects of fill at the Katzeihin River.

C) The Draft SEIS did not include information regarding how long construction related infrastructure (e.g., temporary barge ramps along the shores of Lynn Canal to allow access of upland field camps) would remain in place or what the EFH impact of these facilities would be. The Draft SEIS did not include a detailed plan and timeline for the post-construction recovery of these sites.

D) The Draft SEIS contains references to “unidentified fish” in shoreline surveys. The species composition and areas most essential to these fish were never determined.

E) The Draft SEIS failed to consider the indirect impacts to fish that can result from structural shoreline modifications that permanently alter physical processes.

F) Although the slopes of fill areas would likely be colonized by similar intertidal and subtidal species to those on the fill site over a few seasons, the amount and character of the area available for recolonization would be different from the undisturbed intertidal and subtidal zone. Recolonization would not restore the community to its original state, reducing its value as foraging habitat for commercial fish species.

Group Comment Response:

A) The importance of near shore habitat was addressed in the Draft SEIS. Areas of near shore habitat that were considered high value EFH areas would be avoided as determined in coordination and consultation with ADF&G, USFWS, and NMFS. The Draft SEIS described the presence of marine habitat and anadromous species in Sections 3.3.2 and 3.3.4 and the potential impacts to these resources for each alternative in Chapter 4. However, as a result of the comment, recent available data on EFH and species use of the Katzeihin River and delta area was incorporated into Sections 3.3.2 and 3.3.4, and revisions to descriptions of potential impacts from the alternatives were provided in Chapter 4 of the

Final SEIS. Chapter 4 of the Final SEIS was also expanded to include an evaluation of the effects on the larval stage of eulachon from Alternative 2B, 3, and 4B/4D.

B) The addition of fill proposed since issuance of the 2006 ROD in intertidal and subtidal areas was proposed to address concerns related to scour at the Katzehin River bridge abutment for Alternative 2B. This would result in placement of additional materials and an overall increase of 0.64 acre of fill within the Katzehin River intertidal area, 0.55 acre of which would affect EFH. Construction and long-term effects to EFH from the ferry terminal north of the Katzehin River were evaluated in Sections 5.4.1.2, 5.4.2.3, and 5.4.2.4 of the 2004 *Essential Fish Habitat Assessment* and Sections 2.1.1 and 2.1.2 of the 2005 *Addendum to Appendix N – Essential Fish Habitat Assessment*. Due to comments, the site-specific effects of the increased fill on EFH in this area were described in Section 4.3.13 of the Final SEIS. The realignments of Alternative 2B since 2004 have reduced EFH impacts associated with highway fill and crossing structures for the Antler, Berners/Lace, and Katzehin Rivers. As stated in Section 4.2.2 of the 2014 *Update to Appendix N – Essential Fish Habitat Assessment*, 25.5 acres of intertidal and subtidal fill is a small portion of the available habitat in Lynn Canal and would have minimal effects on the EFH available in Lynn Canal.

C) The impacts to EFH from construction and operation of Alternative 2B were presented in Section 4.2.2 of the 2014 *Update to Appendix N – Essential Fish Habitat Assessment* and Section 2.1.2 of Attachment A 2005 *Addendum to Appendix N – Essential Fish Habitat Assessment*. Information from these reports was incorporated into Sections 4.3.13 and 4.8.11 of the Draft SEIS. In addition, Section 4.8.11 of the Final SEIS included an evaluation of the effects of the temporary barge ramps on eulachon and the anticipated post construction recovery timeline per the comment.

D) Although not all species were identified during the surveys, the assessment presented in Section 4.2.2 of the 2014 *Update to Appendix N – Essential Fish Habitat Assessment*, Section 2.1.2 of Attachment A 2005 *Addendum to Appendix N – Essential Fish Habitat Assessment*, and Section 4.3.13 and 4.4.13 of the Draft SEIS provided an evaluation of effects representative of fish species known to occur in Lynn Canal and its tributaries. FHWA regards the analysis contained in these documents to be sufficient for characterizing impacts to these resources and making an informed decision for the project. Consultation with NMFS as part of the EFH assessment and ESA Section 7 consultation, led to agreement with the use of representative species to assess potential impacts to aquatic species.

E) Section 4.3.13 of the Final SEIS was updated to include potential indirect effects to fish from shoreline modifications due to placement of fill associated with the highway alternatives. The loss of near shore habitat associated and potential effects to juvenile salmon are presented in Section 4.2.2 of the 2014 *Update to Appendix N – Essential Fish Habitat Assessment*, Section 2.1.2 of Attachment A – 2005 *Addendum to Appendix N – Essential Fish Habitat Assessment*, and 5.6.2 of the 2005 *Appendix N - Essential Fish Habitat Assessment*.

F) Section 4.3.13 and 4.4.13 of the Draft SEIS includes analysis of the potential for recolonization in the intertidal and subtidal areas following construction of the road

alternatives. Species that recolonize these areas will continue to provide foraging habitat for commercial fish species at a similar level and value as the original species. In addition, the loss of intertidal and subtidal habitat represents less than 1 percent of the overall habitat in Lynn Canal and would not affect regional populations of species that depend on these areas.

Group 38

Topic/Subtopic: Essential Fish Habitat – Marine and Freshwater Justice/Mitigation

Group Comment Text:

The Final SEIS should re-evaluate the impacts of the preferred alternative (Alternative 2B in the Draft SEIS) to determine if the level of mitigation already completed (e.g., Yankee Cove artificial reef site) is commensurate with, and compensates for, effects the final alternative may have on living marine resources, including EFH. Current mitigation measures for the Katzehin River only address construction. Additional mitigation for this and other areas may be needed to address final project impacts.

Group Comment Response:

In the 2006 FEIS, DOT&PF committed to \$780,000 in-lieu fee compensation to offset unavoidable adverse impacts to intertidal and subtidal marine waters (EFH). In 2008, DOT&PF provided \$324,000 to construct the Yankee Cove project that established two artificial reefs to enhance habitat important to spawning and rearing fish, including Pacific herring and marine invertebrates. FHWA determined the balance remaining (\$456,000), in addition to the in-water work timing window to avoid sensitive life stages of fish (March 15 through June 15) and other measures described in Chapter 5 of the Draft SEIS, would provide adequate mitigation for Alternative 2B impacts to marine resources. Alternative 1 – No Action (preferred alternative) would not result in impacts; therefore, no mitigation is required or proposed under Alternative 1 – No Action.

7.13 Fish – Marine Fish, Anadromous Fish, and Shellfish

Group 39

Topic/Subtopic: Fish – Marine Fish, Anadromous Fish, and Shellfish/Existing Conditions

Group Comment Text:

The Draft SEIS did not evaluate the effects of the proposed road and ferry terminals on the larval stage of Lynn Canal eulachon. There was too little information on the marine distribution of larval and juvenile eulachon to determine the extent of the impact to these fish.

Group Comment Response:

Per the comment, Section 4.3.13, 4.4.13, and 4.6.13 of the Final SEIS was expanded to include an evaluation of the effects of Alternatives 2B, 3, 4B, and 4D on the larval stage of eulachon in Lynn Canal.

Group 40

Topic/Subtopic: Fish – Marine Fish, Anadromous Fish, and Shellfish/Existing Conditions

Group Comment Text:

Anadromous streams listed in the Draft SEIS are not accurate in terms of species compositions and the location of fish passage barriers. ADF&G, Habitat Division staff will be correcting the anadromous waters catalog next spring and will provide the corrected information to DOT&PF as it becomes available.

Group Comment Response:

The description of anadromous waters in both the Draft and Final SEIS was based on best available information from ADF&G. The most recent version of the anadromous waters catalog was provided to DOT&PF and incorporated into the Final SEIS.

Group 149

Topic/Subtopic: Fish – Marine Fish, Anadromous Fish, and Shellfish/General

Group Comment Text:

A) A map showing the location of Berners Bay herring spawning locations should be included in the Final SEIS and should include ADF&G, Commercial Fisheries Division's Geographic Information System (GIS) shapefiles.

B) The status of the federal ESA listing of the Southeast Alaska Distinct Population Segment of Pacific herring should be included in Chapter 3 of the Final SEIS.

C) Chapter 3 of the Final SEIS should state that the herring fishery could resume if the Lynn Canal population recovered.

Group Comment Response:

A) Pacific herring spawning maps provided by ADF&G were incorporated into Section 3.3.4.1 and Figure 3-19 of the Final SEIS.

B) Per the comment, Section 3.3.7 of the Final SEIS addresses the Pacific herring petition to list under the ESA and NMFS conclusion that the listing was not currently warranted.

C) An assessment of population recovery in Lynn Canal for Pacific herring was included in Section 3.3.4.1 of the Final SEIS.

Group 483

Topic/Subtopic: Fish – Marine Fish, Anadromous Fish, and Shellfish/Existing Conditions

Group Comment Text:

A) The SEIS should include a commitment to replace the herring spawning habitat that would be lost with development of a ferry terminal at Sawmill Cove.

B) The in-water work window in the Antler and Lace Rivers should be extended by a week to protect outmigrating eulachon larvae from shock from setting pilings and vibration from heavy equipment.

C) What species are included and what activities are covered with the March 15 through June 15 in-water work window?

Group Comment Response:

A) Sections 4.4.13 and 4.6.13 of the Draft SEIS described the potential impacts to fish species from development of the Sawmill Cove Ferry Terminal. Mitigation for overall project impacts to fish was included in the Final SEIS based on consultation with NMFS for EFH.

B) The timing of eulachon outmigration was taken into consideration for determining in-water work windows. Section 4.2 of the *2014 Update to Appendix P – Anadromous and Resident Fish Technical Report*, which described Alternative 2B and its river crossings, stated that construction would not begin until June 15 to avoid impacts to eulachon at their larval stage. The in-water work windows were recommended by NMFS and ADF&G. Further, piers were only proposed in major water crossings where full spanning of the channel was not feasible, so any outmigration occurring after June 15 would not have been impeded.

C) In-water work windows are recommended by NMFS and ADF&G with primary considerations given to important fish species, including anadromous and other game fish and threatened, endangered, or sensitive species. Periods are established to avoid the vulnerable life stages of these fish including migration, spawning, and rearing.

Group 42

Topic/Subtopic: Fish – Marine Fish, Anadromous Fish, and Shellfish/Operation/
Maintenance Impacts

Group Comment Text:

The Draft SEIS did not evaluate the effects of increased marine and highway traffic, runoff from roads and parking lots, ORVs, wastewater discharge, barriers to fish movement, and increased silt and sedimentation on fish species. Specifically:

A) The road and bridges would create a barrier and interfere with returning salmon.

B) Road runoff, silt, and pollutants would enter streams and result in damage to spawning streams.

C) Wastewater from the ferry terminal, ferry traffic, and development on the shoreline would affect fish movement and habitat availability at Katzehin and in Berners Bay.

Group Comment Response:

A) Section 4.3.13 of the Draft SEIS explains that bridge crossings for Alternative 2B would not encroach on stream channels, except in the case of the Antler, Lace, and Katzehin Rivers, and that the piers in those rivers would be approximately 130 feet apart and would not impede fish movement.

B) Section 4.3.13 of the Draft SEIS addresses the potential presence of pollutants and

sediment in highway runoff. These substances would not likely be concentrated enough to cause direct mortality or disturbance to anadromous and resident fish due to the low volume of traffic expected. Impacts from runoff were also discussed in the 2004 *Essential Fish Habitat Assessment* (See 2005 Supplemental Draft EIS Appendices: www.juneauaccess.alaska.gov).

C) Sections 4.3.13, 4.4.13, and 4.6.13 of the Draft SEIS considered discharges of sanitary wastewater from new ferry terminals as well as marine vessels, leakage of fuels and lubricants from marine vessels, and the potential effects on fish. They also describe impacts to habitat from the shoreline development of the ferry terminals. Water quality effects and shoreline development are not expected to affect overall populations of aquatic species.

7.14 Geology

Group 161

Topic/Subtopic: Geology/Geologic Hazards as Impacts on Alternatives

Group Comment Text:

The project facilities (road, bridges, ferry terminals) are at risk from geologic events:

A) What measures are in place to protect the highway, bridges, and ferry terminals during a tsunami or earthquake?

B) Glaciomarine and glacier outwash deposits are known to be potentially unstable during major earthquakes. These muds and clays could cause significant engineering problems along the right-of-way, but particularly for pilings for the major rivers.

C) What effects would glacier outburst floods, seasonal debris flows, glacier isostatic adjustment, and glacial river sediment load have on project facilities?

Group Comment Response:

A) Bridges, ferry terminals and other structures are designed to satisfy the requirements of the American Association of State Highway Transportation Officials (AASHTO) *Guide Specifications for LRFD Seismic Bridge Design*. These guidelines identify measures such as structural components for bridges and ferry terminal structures that help them to resist seismic effects related to earthquakes. The seismic guide specifications (similar to a building code) include requirements that allow engineers to design bridges that can safely accommodate earthquake-induced ground movements without undue risk of collapse. This design goal is achieved by providing bridges that can safely undergo the large distortions that result from earthquakes. There is no national standard for the design of structures to resist the effects of tsunami; however, the bridges and ferry terminal components incorporate design recommendations associated with the hurricane type storm surges that are similar to tsunami effects such as high water levels and loads imposed from storm waves. For road components other than structures, there are no guidelines for seismic resistance. Road embankments that have the potential to be impacted by wave action or tsunamis, are designed to include measures provided by guidance from the FHWA HEC-25 (Highways in the Coastal Environment), USACE EM 1110-2-1100 (Coastal Engineering Manual), and the Alaska DOT&PF Coastal and Harbor Design Procedures Manual.

B) While there is no national standard for the design of structures to resist the effects of liquefaction, soil softening, lateral spread and slope instability, these issues are considered in the design. The bridges are founded on deep, large diameter pipe piles that can accommodate large deformations associated with seismic hazards. A geotechnical exploration plan was executed to determine the engineering properties of the underlying soil which, in turn, are used to develop foundation recommendations that reflect the site conditions.

C) The most potential for impact from these the natural occurrences would be on bridges due to raising or lowering of the riverbed. These types of occurrences would have no impact on bridges due to design of the piles that support the bridges accommodating long-term scour and other factors that alter the riverbed elevation.

Group 163

Topic/Subtopic: Geology/Geologic Hazards as Impacts on Alternatives

Group Comment Text:

The Draft SEIS did not fully consider the geological hazards that would affect design and long-term use of the highway:

A) Information related to landslides and geological hazards was not updated with information from the 2006 and 2012 geotechnical reports.

B) Potential risks associated with geologic hazards were to be further evaluated in geotechnical and hydrologic studies conducted in support of final design and construction; however, it is critical to disclose these risks now so that decision makers may make a reasoned choice between alternatives.

C) The explanation of the rockfall hazard is unclear. The reported number of locations of rock slide areas and their relationship to avalanche paths was inconsistent in the Draft SEIS.

D) How will geologic hazards be mitigated?

Group Comment Response:

A) The *2017 Update to Appendix D – Technical Alignment Report* was updated to include a discussion of the geologic hazards within Alternative 2B.

B) The purpose of the Surficial Mapping and Hazard Mapping conducted as a part of the *Lynn Canal Highway Phase I Zone 4 Geotechnical Investigation* (Golder Assoc., 2006) was to identify risk as it pertained to the public and construction. All known and identified risks were disclosed and considered during the preliminary design of Alternative 2B. The risks associated with these hazards are summarized in the *2017 Update to Appendix D – Technical Alignment Report*.

C) All hazard types were defined in the *Lynn Canal Highway Phase I Zone 4 Geotechnical Investigation* (Golder Assoc., 2006) in Section 3.3.1, Definition of Hazards. While rockfall is used to define individual blocks of rock that detach from bedrock outcrops and fall, rockslides are comprised of multiple blocks. Both are natural processes that are present along most highways in Alaska. DOT&PF manages rockfall and other types of hazards along existing highway corridors with the Unstable Slope Management Program (USMP). It is expected that should Alternative 2B be constructed, all the rock cuts and rock slopes that exist along the highway corridor would have been inventoried, assessed, and ranked in accordance with DOT&PF's USMP policies. There are two rockslide locations. Avalanche studies conducted as part of the *2013 Update to Appendix J – Avalanche Technical Report*, indicated that large rockslide paths might develop as avalanche paths in the future, although this is undemonstrated at either of the identified rockslide locations. The Draft SEIS contained alignment sheets (Attachment A of the *Technical Alignment Report*) that depicted the locations of the identified geological hazards and the avalanche paths. Both were treated individually for design purposes and mitigated differently. Where avalanche paths and geological hazards are coincident, the *Technical Alignment Report* geological update reported the respective proposed mitigation measures.

D) Geologic hazards would have been mitigated with standard of practice strategies. These strategies—avoidance, removal, conveyance, stabilization, protection, and monitoring—are used for all highway projects as a normal course of business. None of the hazard types identified along the East Lynn Canal Highway corridor are unique or unusual. A summary of the geologic hazards and related mitigation strategies were discussed in the *2017 Update to Appendix D – Technical Alignment Report*.

Group 158

Topic/Subtopic: Geology/Operation/Maintenance Impacts

Group Comment Text:

A) The Draft SEIS did not adequately address the issues related to acid generating rock. Publications by the USFS, Bureau of Mines, Alaska Department of Natural Resources (DNR), and ADEC specific to this concern in the project area should have been reviewed.

B) The SEIS should disclose what it will cost to dispose of acid generating rock.

Group Comment Response:

A) The level of investigation and analysis provided (with preliminary design) is adequate for the purposes of the Final SEIS. The *2017 Update to Appendix D – Technical Alignment Report* included discussion of acid generating rock. The potential for acid generating rock was not raised as a concern during the entire development of the 2006 FEIS or during the scoping phase for the Draft SEIS. Detailed on-site investigation for the potential of acid generating rock would typically be identified in final design-level geotechnical investigations if a build alternative had been selected. The presence of acid generating rock is only a hazard in areas where rock cuts must be made. Once the presence of this rock type was identified, it would either have been avoided or a mitigation plan would have been established for the appropriate use, encapsulation, or disposal of the material.

The geological maps referenced in the comment were reviewed. The maps indicated the potential of acid generating rock within Alternative 2B between Station 757+00 and Station 1459+00. Mineralization associated with potential for causing acid rock drainage was described in bedrock units along the Alternative 3 corridor.

B) If acid generating rock is identified, the detailed estimates for disposing of any acid generating rock would have been determined by the location and volume encountered. This would typically be undertaken in the final design phase of the project if a build alternative had been selected. However, the Final SEIS cost estimates were updated to include a contingency cost item for acid generating rock disposal for Alternatives 2B and 3.

Group 159

Topic/Subtopic: Geology/Operation/Maintenance Impacts

Group Comment Text:

A) What equipment and personnel resources are needed to remove debris from rockslides, and where would equipment be stored?

B) How often would the road be closed?

C) How long would it take to remove rockslide debris, and where would the rockslide debris be disposed?

D) What are the costs associated with rockslide debris removal?

E) The Draft SEIS does not consider maintenance issues associated with debris flows.

Group Comment Response:

A) A new Maintenance and Operation (M&O) Station would have been constructed near the original Comet Mine camp (MP 66) for Alternative 2B. Equipment for snow removal and debris cleanup would have been stored at this location. Equipment routinely used to clear debris from highways in Alaska includes pickups equipped with snow plows, loaders, excavators, and dump trucks. Debris cleanup is a routine activity for DOT&PF M&O.

B) It is impossible to precisely predict road closures. However, DOT&PF makes every attempt to mitigate hazards impacting State highways. To protect against potential closures along the Lynn Canal Highway, DOT&PF conducted a hazard mapping program designed to identify the hazards and provide a preliminary assessment of their relative severity. As discussed in *Lynn Canal Highway Phase I Zone 4 Geotechnical Investigation*, hazard frequency values "... should be considered preliminary estimates." These preliminary estimates were assigned to aid in identification of active hazards versus inactive hazards. The frequency categories presented in Section 3.3.2 of that report could just as effectively be labeled: unknown, frequent, less frequent, infrequent, and rare. The ultimate purpose for providing the estimates of hazard frequency, quantity, predictability, and all other parameters was to highlight areas of importance where additional design effort would be required. The preliminary hazard mapping conducted for this project was highly successful in doing that.

The *2014 Update to Appendix D - Technical Alignment Report* included a brief discussion of geologic hazards. Each identified hazard was tabulated to show the associated mitigation condition based on the current design. Based on the current design, inadvertent road closures may occur over the lifetime of the project. It is expected that these closures would have required less than half a day to clean up. It is also expected that in the event of a full width road closure, single lane traffic would be restored within two hours and two-lane traffic would be restored within half a day. This is consistent with closures experienced on other Alaska highways with similar terrain.

If a build alternative had been selected, during the final design phase of this project, areas impacted by hazards that were not already been mitigated by the current alignment and could potentially close the road would have been looked at in additional detail. With the goal of eliminating or minimizing road closures to the extent possible, detailed mitigation measures would have been designed after more data and a refined understanding of each hazard could be obtained. There is, however, always the possibility of a large anomalous event. These rare events occur on highways through mountainous terrain common in states like Alaska, Washington, Oregon, Colorado, Montana, and Wyoming.

C) The time required to remove debris from the highway varies depending on type, size, and volume of material. M&O policy is to quickly open one lane of travel to allow traffic flow during remaining cleanup. Debris is typically disposed of along the downhill shoulder of the highway within the right-of-way. The following are three typical scenarios to help provide a more definitive estimate of the time required to clear debris from the road:

(1) In Ketchikan, rockslides of 10 to 30 cubic yards are not uncommon. These events typically fill the rockfall catchment ditch and spill over onto the paved shoulder and part of one lane. In this case, traffic is routed around the debris using standard traffic control devices to redirect the traffic onto the unaffected lane and shoulder. Once M&O is notified of the road closure, traffic flow would be re-established in this manner in approximately 30 to 60 minutes by personnel responding from the Lynn Canal M&O Station.

(2) In Ketchikan and parts of the Haines Highway, there are infrequently rockslide events of 50- to 100 cubic yards that fill the rockfall catchment ditch, shoulder, and one lane, then spill over into the second lane and shoulder. In this case, M&O would respond with crew and equipment sufficient to provide traffic control and cleanup simultaneously. Once M&O is notified of the road closure, single lane traffic flow would be re-established in this manner in approximately 1 to 2 hours by personnel responding from the Lynn Canal M&O Station.

(3) Debris flows on the Haines Highway have covered the full width of the highway, requiring a full day to open up a single lane of traffic.

D) Highway cleanup costs are tied to the M&O labor and equipment rates and any additional rentals or contracted assistance. These costs are typical highway maintenance costs that have been accounted for in alternative cost estimates and were reflected in Attachment C to the *2014 Update to Appendix D - Technical Alignment Report*.

E) The Draft SEIS construction cost estimate included a placeholder for addressing debris flows. Maintenance associated with debris flows is very well understood by the Southcoast Region design section through involvement with large scale debris flows along the Haines Highway. Design strategy for the debris flows is primarily focused on eliminating maintenance requirements by conveying the debris flow event under the road by using bridges or through the road via large purposefully designed debris flow pipes. The high angle, well channelized debris flows along the East Lynn Canal Highway corridor are ideally suited for this strategy.

7.15 Hazardous Materials

Group 205

Topic/Subtopic: Hazardous Materials/Operation/Maintenance Impacts

Group Comment Text:

A) What spill response measures and BMPs are in place in the event of a spill on the highway?

B) What toxins would occur in stormwater run-off, and how would it affect the surrounding area during road M&O activities?

Group Comment Response:

A) DOT&PF is prepared to respond to spills on the highway in accordance with ADEC guidelines. M&O crews are trained in spill response and have spill response equipment on hand to contain and clean up spills. BMPs include deploying containment and absorbent material to isolate the spill, immediately notifying other responding agencies, properly disposing of cleaned-up hazardous material, and follow-up monitoring of the spill site

B) The main pollutants that could potentially run off the highway via stormwater are oil and poly-carbon based products. These types of pollutants come from the fuels, lubricants, and additives used to keep vehicles and equipment in operational order. If these pollutants were to spill onto the highway, they would settle within the adjacent road shoulder and ditch lines. Ditches are cleaned when necessary and debris is stockpiled at an approved site away from aquatic sources, thus minimizing effects on the environment. The effects on the environment would be no more or less than any other highway in Alaska of similar traffic volume, which have been documented to be low.

7.16 Land Use

Group 490

Topic/Subtopic: Land Use/Existing conditions

Group Comment Text:

Registry Rock and Dewey Lakes Recreation Area should be added to the list of municipal parks in Section 6.2.1 of the SEIS.

Group Comment Response:

Neither of these areas is subject to use by any of the alternatives addressed in detail in the Draft and Final SEIS. Sections 3.1.1.6 (Land and Resource Uses) and 3.1.1.7 (Parks and Recreation Facilities) of the Draft and Final SEIS addressed parks and recreation in the

project area. Section 6.2.1 referenced in the comment is for park and recreation lands protected by Section 4(f). Dewey Lakes Recreation Area was already mentioned in Section 3.1.1.7. FHWA examined the Dewey Lakes Recreation Area in its analysis for the 2005 Draft EIS and determined it was not a Section 4(f) property. It has not been formally considered since then because no alternative would have affected it. Therefore, it is appropriate that it was not addressed in Section 6.2.1 of the Draft SEIS.

Registry Rock was added to Section 3.1.1.7 of the Final SEIS as an attraction, although it appears no entity has designated it for park, recreation, or historic purposes. The 2009 Comprehensive Plan showed current ownership in the area of Registry Rock as Municipality of Skagway, current land use as Commercial, zoning as Industrial, and “Future Growth Designation” as “Waterfront Commercial Industrial.” By Municipality of Skagway definition in its Municipal Code, municipal lands outside the Industrial zoned area are part of Dewey Lakes Recreation Area, so Registry Rock (inside the Industrial zone) is not part of the recreation area. These zoning designations and apparent lack of any separate designation as a park, recreation area, or historic site indicate that Registry Rock is not protected under Section 4(f). Therefore, it is appropriate that Section 6.2.1 of the Draft SEIS did not discuss Registry Rock.

Group 505

Topic/Subtopic: Land Use/General

Group Comment Text:

Road alternatives will degrade unique wilderness values along Lynn Canal due to habitat loss and fragmentation, wildfires, overhunting, sprawl, and other environmental degradation. The wild area along Lynn Canal should remain free of roads.

Group Comment Response:

It is important to note that Congress established transportation corridors on both sides of Lynn Canal in Section 4407 of SAFETEA-LU. In addition, USFS has included transportation corridors on both sides of Lynn Canal as a part of their adopted Forest Plans for many years. The SEIS addresses impacts of a road providing access to Berners Bay and other areas along Lynn Canal, areas currently enjoyed as wild areas for remote recreation. Effects discussed include impacts to hunting and fishing. For example, see Section 4.3.1.3 regarding land use impacts from Alternative 2B. The SEIS disclosed impacts of habitat loss and fragmentation, particularly under the discussion of terrestrial mammals (the 15th subsection under each alternative). Juneau sprawl would be unlikely to occur along proposed road corridors, because the land along both sides of Lynn Canal is mostly Tongass National Forest or Haines State Forest and is not available for commercial and residential development. Areas of private land could become developed, but very little private land occurs on either side of Lynn Canal in the area where road corridors are proposed. A small area south of Haines on the west side is the principal exception.

Group 508

Topic/Subtopic: Land Use/General

Group Comment Text:

The Draft SEIS incorrectly stated that State projects are not required to conform to local land use plans. State projects must comply with local planning and zoning ordinances and other regulations, unless the governor grants a waiver. Alaska Statutes (AS) 35.30.020 and 35.30.030 should be reviewed.

Group Comment Response:

The Draft SEIS is correct in stating “State agencies’ are not required to conform to local land use plans.” The comment is correct that AS 35.30.020, requires that DOT&PF construction plans “shall comply with local planning and zoning ordinances and other regulations in the same manner and to the same extent as other land owners.” Municipalities develop specific planning and zoning ordinances and regulations to implement goals and objectives of broader and more general land use plans. See AS 29.40.030-040. DOT&PF is required to comply with municipal ordinances and regulations, not with general policy statements and goals that are embodied in municipal land use plans.

Group 499

Topic/Subtopic: Land Use/Recreation Access/Impacts

Group Comment Text:

A) Will recreational access points (parking lots, picnic areas) or campgrounds be developed along the proposed roadway? If so, how would they be funded?

B) Has the benefit of expanded recreation use been considered?

C) Is it the role of DOT&PF to provide low-cost recreation by improving access to this area? If so, should the recreation costs be considered against each other?

Group Comment Response:

The Draft SEIS addresses impacts of a road providing access to Berners Bay and other areas currently enjoyed for remote recreation, disclosing the perceived negative impacts as well as the perceived positive impacts. See for example Section 4.3.1.3 for Alternative 2B.

A) The Draft SEIS stated the locations of 11 pullouts for Alternative 2B and 8 pullouts for Alternative 3. See the beginnings of Sections 4.3 and 4.4 as well as Figures 4-1 and 4-13 of the Draft SEIS. These pullouts typically are associated with rivers, coves, and scenic overlooks. From a transportation point of view, they were intended for rest breaks, but they are acknowledged to provide access to surrounding land for recreationalists, and the Draft SEIS indicated that future USFS trails were reasonably foreseeable from some of these pullouts. The Draft SEIS indicated these would have been funded by others (see also Section 4.9.1.3). The construction of the pullouts would be funded primarily with federal funds. The State of Alaska would have been responsible for funding the maintenance.

B) The benefits of expanded recreation were presented in the Draft SEIS in sections on land use, see for example Section 4.3.1.3 for Alternative 2B.

C) DOT&PF does not have the mission nor the authority to provide recreational access points and recreational developments on National Forests lands. The purpose of the project is as stated in Chapter 1, Purpose and Need, of the Draft SEIS. Recreation access may be a side benefit for many but is not a purpose of the project.

Group 501

Topic/Subtopic: Land Use/Recreation Access/Impacts

Group Comment Text:

A) The road will provide access to currently inaccessible areas, which will degrade hunting and fishing opportunities from access and increased use; result in over-harvesting, competition, and illegal hunting and fishing; and degrade wilderness and recreational experiences along the route and at Berners Bay.

B) The cabin at Berners Bay will no longer be remote. The SEIS should be specific about the distance the road will be from the cabin.

Group Comment Response:

A) The SEIS addresses impacts of a road alternative providing additional access to Berners Bay and other areas currently enjoyed for remote recreation, and discloses those impacts (including impacts to hunting and fishing). Hunting and fishing effects are also addressed under the Subsistence and Terrestrial Mammals sections for each alternative (4.3.6 and 4.3.15.3 for Alternative 2B).

B) The SEIS was explicit in several locations about the separation of the proposed highway from the existing Berners Bay Cabin. The centerline would be approximately 1,000 feet from the cabin. A pullout and trail would have been established as part of the project, making this a road- or boat-accessible cabin. In addition, the project would have constructed a new, remote, water accessible cabin in cooperation with USFS. The Final SEIS text was revised to consistently report the correct separation distance between the cabin and highway under Alternative 2B (see Sections 2.3.3.1, 3.2.6, 4.7.7.1, and 6.2.2.2).

Group 491

Topic/Subtopic: Land Use/TNF Land Use Designations

Group Comment Text:

A) The JAI Project is not exempt from the USFS Forest Management Plan and must comply with regulations pertaining to Old Growth Habitat Requirements and the Roadless Rule. Road construction is prohibited unless the Secretary of Agriculture finds that the project is in the public interest and no other reasonable and prudent alternative exists.

B) The Draft SEIS did not address the project's impact on Old-Growth Habitat.

Group Comment Response:

A) The State of Alaska currently holds an easement interest in each transportation and utility corridor established by Congress in SAFETEA-LU Section 4407, as amended by the FAST Act. Once the State of Alaska determines the precise location of the highway facility

within the Section 4407 corridor, USFS must issue recordable documentation of the Congressionally established easement. Congress stated its intent that “the Secretary of Agriculture will not withhold or deny the issuance of an easement for a proposed transportation or utility project that otherwise has all necessary construction permits and authorizations from other State and Federal agencies.” (Senate Report 114-80, at pages 23-24 (July 15, 2015)). Thus, USFS’s issuance of recordable documentation of the easement is a non-discretionary and ministerial act. The Secretary of Agriculture and USFS may be required to make a finding under the Roadless Rule and may need to complete a NEPA decision for a plan amendment related to adjusting Old Growth Habitat LUD boundaries to recognize the highway easement; however, these processes and decisions would be internal to USFS and could occur after the completion of the Final SEIS.

The Roadless Rule excepts classes of road projects from its general prohibition, including an exception when the Secretary of Agriculture determines that a road is provided for by statute or treaty (36 CFR 294.12(b)(3)). Transportation and utility rights-of-way and easements along the east and west sides of Lynn Canal were granted to the State of Alaska by Congress in SAFETEA-LU’s Section 4407. Thus, the Secretary of Agriculture need only to make an affirmative finding that Congress provided a highway easement by statute in order to fulfill the requirements of the Roadless Rule.

The Final SEIS contained information that USFS may need in order to make its required findings and decisions. Appendix DD, *Land Use Technical Report*, provided an evaluation of Roadless Area characteristics, as requested by USFS, to allow for evaluation under the Roadless Rule. Some material, particularly in the discussion of Old Growth Forest Reserves, was reviewed and updated to reflect the current understanding among the State and federal agencies. While the Final SEIS presented this material for USFS consideration, according to Congress’s recent statement of intent, the Secretary of Agriculture and the USFS do not have authority to withhold or deny the issuance of the Congressionally granted transportation and utility easement once the proposed highway facility has all necessary permits for construction from State and federal agencies other than the USFS.

B) It is not accurate to state that the Draft SEIS failed to address the consequences of losing old growth habitat. Also, it is not accurate to state that the only assessment of these impacts is an attempt to quantify the number of acres of old growth forest that would have been lost. The effects of the loss of habitat as a result of the project was principally recorded in sections addressing terrestrial habitat and wildlife, with related information in wetlands and water habitat sections (generally subsections 12 through 17 under each alternative in Chapter 4), and in associated technical reports. The link between the land management and the terrestrial habitat and wildlife discussions was strengthened in the Final SEIS, with better cross-references and language more clearly linking the sections.

The USFS process for examining whether the Old Growth Habitat LUD boundaries need to be changed was undertaken for Alternative 2B by USFS, ADF&G, and USFWS since publication of the Draft SEIS, and results were incorporated into the Final SEIS. Modifications to small Old Growth Reserve boundaries have been recommended as an outcome of that process.

Group 496

Topic/Subtopic: Land Use/TNF Land Use Designations

Group Comment Text:

Neither Section 4407 of SAFETEA-LU, nor the related Memorandum of Understanding between USFS and the State of Alaska pertaining to SAFETEA-LU, grant specific rights-of-way or easements that exempt them from applicable federal laws and regulations for federally funded highway projects.

Group Comment Response:

Since this comment topic was submitted in 2014, Congress amended Section 4407 of SAFETEA-LU in Section 1446 of the 2015 transportation authorization legislation known as the FAST Act (Pub. L. 114-94). As amended, Section 4407 states that Congress has granted the easements that connect the communities of Southeast Alaska, including easements cross Inventoried Roadless Areas.

In the FAST Act, Congress provided technical corrections to Section 4407 of SAFETEA-LU to clarify the transportation and utility rights-of-way and easements that are granted. Section 4407 now reads: “Notwithstanding any other provision of law, the reciprocal rights-of-way and easements identified on the map numbered 92337 and dated June 15, 2005, are granted.”

With passage of the FAST Act, Congress unambiguously granted these easements to the State of Alaska. Map 92337 depicts transportation and utility corridors connecting communities in Southeast Alaska. The precise location of the highway and utility easements within these corridors is to be determined through environmental review and permitting for construction of the highway; once a project receives construction authorization from State and federal regulatory agencies (other than USFS), USFS must issue the Section 4407 easement for construction and operation of the highway. This process was summarized in the Congressional intent language accompanying the Section 4407 amendment:

“As soon as possible, the Committee intends the Secretary of the Agriculture (Secretary) to prepare and deliver to the State of Alaska an easement for the construction and operation of each highway located in a transportation and utility corridor identified on Map 92337 where the State of Alaska has already secured all necessary Federal and State permits for the construction of each highway facility.... The Committee intends that the Secretary of Agriculture will not withhold or deny the issuance of an easement for a proposed transportation or utility project that otherwise has all necessary construction permits and authorizations from the other State and Federal agencies.” (Senate Report 114-80, at pages 23-24 (July 15, 2015))

Passage of the FAST Act in December 2015 resolved certain questions pertaining to the original language of Section 4407; as stated by Congress: “The technical correction to this section [Section 4407 of SAFETEA-LU] cures a perceived defect and now will allow the exchange of all remaining reciprocal easements to continue” (Senate Report 114-80, at page 23 (July 15, 2015)). The Final SEIS Land Use sections in Chapters 3 and 4 were reviewed and updated as needed to reflect the amended language. Section 3.1.1.3 regarding State lands was updated to reflect the State’s land interest in these easements. This

clarification of the law and these changes to the SEIS should allow USFS and FHWA to reach their respective decisions without substantial further questions of legislative intent.

Section 4407 does not explicitly afford the USFS any discretion in approving the conveyances. The Draft SEIS did not “suggest that Section 4407 of SAFETEA-LU grants the State specific rights-of-way or easements.” Rather, SAFETEA-LU and the FAST Act granted transportation and utility easements along corridors connecting the communities of Southeast Alaska. Because Congress granted transportation and utility easements in general corridors, the State of Alaska and USFS developed a Memorandum of Understanding to provide a process and procedure for the exchange of the Congressionally granted easements after the precise locations of the facilities are identified. Language in the Final SEIS was reviewed and revised as necessary for clarity on these points.

Group 633

Topic/Subtopic: Land Use/TNF Land Use Designations

Group Comment Text:

Section 4.3.1.3 of the Draft SEIS stated that “Alternative 2B would reduce the amount of land remaining roadless. This remaining area would appear natural, and would still provide opportunities for solitude, self-reliance, adventure, and primitive recreation. The roadless boundary would not change....” This statement is inaccurate because the portion of what is presently roadless no longer would be. Users seeking such an experience would have to head inland from the road and would no longer be able to experience an undeveloped interface between shoreline and adjacent upland terrain.

Group Comment Response:

The statement is accurate, although it is understandable that it could be confusing. USFS’s Inventoried Roadless Areas are areas that were mapped in the past. As changes occur on the land, such as the proposed road components of Alternatives 2B and 3, the mapped areas (“roadless area boundary”) would not change, but the area literally free of road influence would be reduced, as indicated in the paragraphs at and above the text quoted in this comment. This effect refers to the formal, designated inventoried roadless area. It is true that the character of other areas that do not currently have roads would also change. Such changes were already discussed in the SEIS. For example, see Section 4.3.1.3 regarding Alternative 2B.

7.17 National Environmental Policy Act

Group 317

Topic/Subtopic: National Environmental Policy Act/FHWA Requirements

Group Comment Text:

A) Alternative 2B will not meet federal and State requirements for providing a safe transportation system for the traveling public. Under 23 United States Code (USC) 109, the Secretary of Transportation’s approval of a highway is conditioned upon a determination that the facility will adequately serve the existing and planned future traffic of the highway in a manner that is “conducive to safety, durability, and economy of maintenance.” The safety determination should be in the context of comparing Alternative 2B to the existing facilities.

B) The cost of making the road safe must be included in the Draft SEIS.

Group Comment Response:

A) Any transportation project developed by DOT&PF and approved by FHWA must meet established engineering standards and practices for safety and reliability. FHWA may grant an exception to a specific design criteria on a case by case basis with justification. FHWA would have ensured that any alternative selected for construction fulfills the standard identified in 23 USC 109. DOT&PF and FHWA disclosed the anticipated implications to safety of travel in Lynn Canal under each of the alternatives in the SEIS, including Alternative 1 – No Action. The safety record of AMHS and anticipated safety of the primarily roadway alternatives were disclosed in the SEIS. While it is true that highway travel tends to have more accidents, there is no reason to believe that accident frequency on Alternative 2B or 3 would have been statistically different than on similar highways in Alaska.

B) The costs associated with construction (including safety features), maintenance, and operation of these roads were disclosed in the Draft and Final SEIS. All roads constructed under State and federal authority must follow State and federal design procedures and standards that have been established to support safe travel.

Group 318

Topic/Subtopic: National Environmental Policy Act/FHWA Requirements

Group Comment Text:

Financial planning in the Draft SEIS is inadequate and counter to the State’s requirement for fiscal constraint and financial planning required by 23 USC 135. Approval of a preferred alternative that cannot be funded would be arbitrary, capricious, and an abuse of discretion. Partial funding would lead to segmentation of the project; partial construction of a road would not meet the project’s purpose and need, nor would it have independent utility under NHS criteria.

Group Comment Response:

Approval of any of the alternatives is not arbitrary, capricious, or an abuse of discretion. Had a build alternative been selected, it would have been fully funded and completely built. There is no alternative that only goes to Kensington Mine. This project has been advanced by FHWA, as evidenced by a 2006 ROD, continued efforts in the SEIS, and their previous approvals of the STIP (consistent with 23 USC 135(g)). Alternative 1 – No Action has been selected; therefore, there is no funding in the STIP for this project.

Group 405

Topic/Subtopic: National Environmental Policy Act/General

Group Comment Text:

A) The State has failed to fully adhere to CEQ regulations for complying with NEPA because the Draft SEIS lacks discussion of the relationship between project costs and benefits by including analysis of unquantified environmental impacts, values, and amenities (40 CFR 1502.23).

B) The cost-benefit analysis in the Draft SEIS only considered conventional costs and did not consider environmental impacts, values, and amenities or the long-term cumulative effects on climate, which can have monetary costs.

Group Comment Response:

A) 40 CFR 1502.23 refers to traditional cost benefit analysis, where all costs and benefits are described quantitatively, if possible, and qualitatively otherwise. That type of cost benefit analysis is not required by NEPA and has not been conducted as part of this SEIS. Analysis of the economic efficiency and cost-effectiveness of project alternatives was limited to User Benefit Analysis, Life Cycle Cost Analysis, and Total Project Life Cost Analyses. Conducted in accordance with standards set by AASHTO, these analyses did not, and were not intended to, consider the full spectrum of costs and benefits. JAI Project economic efficiency and cost-effectiveness analyses did not include economic benefits associated with each alternative (e.g., from commercial or industrial development) nor did it include effects on environmental values or amenities.

B) The analysis did not monetize costs to the natural environment. As stated in Section 4.1 of the Draft and Final SEIS, the analysis focused primarily on standard economic indicators and did not attempt to incorporate economic impacts to the natural environment, economic cumulative effects on climate, or economic benefits such as new access to recreation areas. No attempt was made to monetize impacts to the natural environment. Impacts were quantified in other ways (e.g., acres of land affected) and were discussed qualitatively throughout other sections of the SEIS.

Benefit cost ratios described in the Draft SEIS were not intended to represent a full measure of all benefits and costs associated with project alternatives. In fact, benefit cost ratios described in Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*, of the Draft SEIS were narrowly based on user (traveler) benefits alone and did not consider a wide range of other potential household, commercial, industrial, and community benefits associated with improved Lynn Canal access.

The purpose of the economic efficiency and cost-effectiveness analysis conducted as part of the Draft SEIS was to determine which alternatives serve the largest number of travelers and the lowest possible cost. A number of measurements are important in the selection of a preferred alternative. For example, the total number of travelers served is important. Alternative 2B serves substantially more travelers than any other alternative (9.6 million vehicles versus 1.4 to 3.4 million vehicles for the marine alternatives). The cost to serve each traveler is another important measurement (Alternative 2B is lowest in terms of per user cost).

Group 407

Topic/Subtopic: National Environmental Policy Act/General

Group Comment Text:

There should be an independent review of the assumptions and conclusions in the SEIS.

Group Comment Response:

The Draft SEIS was released for public and agency review and comment, as required by law. This, in essence, serves as part of an independent review, especially regarding environmental regulatory elements. In addition, the travel demand methodology was independently reviewed by a doctorate professor that specializes in traffic forecasting, and the avalanche information was independently reviewed multiple times. The initial 2004 draft study was reviewed by three nationally prominent avalanche specialists. Specific information included in the 2013 Draft SEIS update was reviewed by a nationally prominent specialist. In addition, FHWA provided an independent review of the assumptions and conclusions in the SEIS.

Group 410

Topic/Subtopic: National Environmental Policy Act/General

Group Comment Text:

A direct, side-by-side comparison of the economic modeling results between road and marine travel cannot be made because the AASHTO methodology employed was not designed to evaluate ferry systems. This issue was raised during the 1997 Draft EIS, but the same methodology was used again. NEPA requires an agency “to respond in a substantive and meaningful way” when given specific criticism for using an inappropriate methodology.

Group Comment Response:

Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*, acknowledged the challenges of employing a traditional AASHTO methodology in evaluating projects involving modes of transportation other than roads. However, the AASHTO methodology, customized for the JAI Project with the specific modifications noted in Appendix FF, remains appropriate and the best available approach for measuring user benefits associated with each alternative. Further, sensitivity analysis allowed for testing of model inputs and results most closely related to problematic aspects of the AASHTO methodology, such as frequency delay costs.

Group 415

Topic/Subtopic: National Environmental Policy Act/General

Group Comment Text:

FHWA needs more justification as to why it would approve a ROD for a project with such a low cost-benefit ratio. The project's net negative benefits do not supply a compelling reason for approval, or show the long-term benefits to the State if it were to be approved.

Group Comment Response:

Benefit cost ratios described in the Draft SEIS were not intended to represent a full measure of all benefits and costs associated with project alternatives. In fact, benefit cost ratios described in Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*, of the Draft SEIS were narrowly based on user (traveler) benefits alone and did not consider a wide range of other potential household, commercial, industrial, and community benefits associated with improved Lynn Canal access.

The purpose of the economic efficiency and cost-effectiveness analysis conducted as part of the Draft SEIS was to determine which alternatives serve the largest number of travelers at the lowest possible cost. That all benefit cost ratios calculated in Appendix FF are less than 1 does not mean investment in better infrastructure is imprudent; it mainly reflects that transportation infrastructure costs are very high in Alaska, where populations are generally small, distances long, terrain often challenging, and sea conditions often difficult. Analysis of economic efficiency in the Draft SEIS indicated that Alternative 2B would be superior to other action alternatives, except Alternative 4D, which supports one-third the traffic associated with Alternative 2B. In arriving at a decision, DOT&PF and FHWA must balance the cost-benefit ratio result with consideration of all impacts and benefits described throughout the EIS and appendices.

Group 322

Topic/Subtopic: National Environmental Policy Act/NEPA Requirements

Group Comment Text:

The public and decision makers have not been provided current or sufficient information to consider the impacts of the project in accordance with NEPA. A new environmental document should be prepared with updated and revised information, as well as unbiased methodologies and assumptions. The Draft SEIS failed to provide adequate data to support DOT&PF and FHWA conclusions.

Group Comment Response:

FHWA and DOT&PF strongly disagree with the assertion that the Draft SEIS did not provide adequate data to support conclusions. The document is comprehensive and complete. Impacts of the project alternatives were disclosed to a reasonable level for public review and for decision makers to identify an alternative that best met the purpose and need for action. FHWA and DOT&PF have updated information in the Final SEIS to refresh data, correct errors and omissions, or in other ways respond to comments on the Draft SEIS, as appropriate. There is no need to prepare a new document for public review.

Group 325

Topic/Subtopic: National Environmental Policy Act/NEPA Requirements

Group Comment Text:

FHWA should not issue a simultaneous Final SEIS/ROD. A new document should be prepared for public review.

Group Comment Response:

FHWA and DOT&PF have updated information in the Final SEIS to include newly available data, correct errors and omissions, or in other ways respond to comments on the Draft SEIS, as appropriate. The document is comprehensive and complete. No new studies or additional interpretations of project data are needed. There is no need to prepare a separate new document for public review. Per 23 USC 139(n)(2), FHWA developed and approved a combined Final SEIS and ROD.

Group 329

Topic/Subtopic: National Environmental Policy Act/NEPA Requirements

Group Comment Text:

If DOT&PF intends to build the road to Skagway, the project has been improperly segmented to avoid NEPA compliance. Evidence that a link to Skagway has been considered can be found in testimony to an Alaska State Legislature House Transportation Standing Committee Hearing (February 12, 2008) and in an easement between USFS and DOT&PF (November 22, 2006).

Group Comment Response:

At this time, DOT&PF has no intention to pursue an extension of a road from Katzehin to Skagway.

It is true that USFS has incorporated three transportation/utility corridors along Lynn Canal into the Tongass National Forest Plan: (1) from Echo Cove along the shore to Skagway, with a ferry terminal near the mouth of the Katzehin River; (2) from Skagway southward along Taiya Inlet, then northwesterly along Lutak Inlet to Haines; and (3) from Haines across the Chilkat River/Inlet near Pyramid Island, then south to William Henry Bay. Easements for these corridors and many others in Southeast Alaska were granted by Congress in SAFETEA-LU as amended by the FAST Act.

Group 330

Topic/Subtopic: National Environmental Policy Act/NEPA Requirements

Group Comment Text:

A) The Draft SEIS violates NEPA because it does not contain a true No Action alternative: Alternative 1 – No Action should represent existing conditions.

B) Because the Draft SEIS fails to support its assumption that reduced AMHS service elsewhere would result in unmet demand, its conclusion that ferries may not be reassigned is arbitrary and “does not represent the ‘substantial treatment’ required by NEPA’s implementing regulations to any non-construction alternatives.”

Group Comment Response:

A) Alternative 1 – No Action consists of the highway and ferry transit system existing as of 2014, plus improvements programmed by DOT&PF in the Statewide Transportation Improvement Fund, the two state funded ACFs currently under construction at the time of this Final SEIS, and the stated AMHS plans for their use in Lynn Canal. Programmed improvements are described in Section 2.3.1 of the Draft SEIS. Including programmed improvements as part of a No Action alternative is common practice in preparing EISs where the improvements are already committed; this does not violate NEPA and is consistent with FHWA policy and guidance. There is no guarantee that any AMHS asset would be deployed in Lynn Canal as service is constantly changing. However, DOT&PF and FHWA have determined that Alternative 1 – No Action as described in the Draft SEIS is an appropriate representation of the State transportation system in Lynn Canal if no action were taken under the JAI Project.

B) The Draft SEIS does not claim that reduced service elsewhere would “result in unmet demand.” Appendix CC, *Development of Alternative 1B – Enhanced Service with Existing Alaska Marine Highway (AMHS) Assets*, indicated that moving certain vessels would jeopardize AMHS’s mission and explained the impacts to the mission from moving those vessels. In many instances, the AMHS would not be able to easily relocate vessels from one area to another without serious service consequences. In each of these cases, there are people and businesses that rely on the AMHS service they get, even if some consider the demand “pathetic” or the service level provided “excessive.” The conclusion that ferries may not be reassigned is not arbitrary and is explained explicitly in Appendix CC.

Group 311

Topic/Subtopic: National Environmental Policy Act/ Other Federal Agencies

Group Comment Text:

The Draft SEIS needed to include information on USDOT funding guidelines.

Group Comment Response:

Environmental documents typically do not include information on USDOT funding guidelines. However, “A Guide to Federal-aid Programs and Projects,” which discusses Federal-aid funding types and associated requirements may be found on the FHWA website at: <http://www.fhwa.dot.gov/federalaid/projects.cfm>.

7.18 Public Process

Group 287

Topic/Subtopic: Public Process/Accessibility

Group Comment Text:

A) The manner in which comments and testimony are collected may bias the type of comments received. People who do not support the road are more likely to submit comments online and attend meetings, while people who support the road may feel discouraged from doing so.

B) The Alaska Legislature does not have a task force for public input. Time-limited testimony by invitation only has been the norm on the JAI Project. People are not part of the decision-making process, nor can they make suggestions.

Group Comment Response:

A) The public involvement process is meant to provide opportunities for information to be shared among project proponents and opponents. Opportunities to comment are made public and are not targeted to any stakeholder groups. Comments, whether from testimony at public meetings or through website submittal, email, faxes, letters, or other forms, are not taken as a representative poll of public interest on the project for use in decision making (i.e., the decision is not based upon a vote). Commenters who support the road have had several means to comment other than attending public meetings, including web submittals, faxes, letters, and emails. All comments received have been given equal consideration regardless of the source of the comments.

B) DOT&PF and FHWA welcome public input in this process. The Draft and Final SEIS were developed with input from stakeholders, including community members, local residents, regulatory agencies, port and harbor commissions, and conservation organizations. Testimony in public meetings must include time limitations to provide equal opportunity for all individuals to give their input in that forum. By giving each speaker the same amount of time, everyone is given an opportunity to be heard. Written comments are not limited and all comments are equally considered regardless of venue.

Regarding Legislative testimony, that process is separate from the JAI Project. DOT&PF and FHWA have no control over testimony before the Legislature (e.g., who, when, for how long, etc.).

Group 288

Topic/Subtopic: Public Process/Accessibility

Group Comment Text:

A) The online comment tool was not user friendly. There needs to be an acknowledgment that a comment was received.

B) Submitted emails were not accepted by the project's email system.

C) Materials related to the project should be readily available to the public on the website.

Group Comment Response:

A) If a comment was successfully submitted using the website, a popup message did appear to indicate that the comment was successfully transmitted. While more than 675 commenters successfully submitted comments on the website, some commenters may have had difficulty, particularly if they had very lengthy comments or tried to attach additional documents or figures. The website was only one of many ways that comments could be submitted. Comments could also be emailed, faxed, mailed, dropped off in person, or recorded at the public hearings. If attachments in an electronic communication appeared to be missing, and contact information was available, DOT&PF contacted the individual to obtain the missing attachment.

B) There are many technological reasons why an email may have been rejected by the system. The website includes contact information for DOT&PF personnel to address such issues. In addition, DOT&PF provided several mechanisms for commenting (email, fax, mail, etc.) with the intent of accommodating a wide range of technological experience and access abilities. In one instance, a flood of emails entered the system at once over a weekend and put the system on alert, temporarily halting communications from one organization. All of these individual emails were identified with one organization, so DOT&PF worked with the organization to have a CD mailed to DOT&PF with all the individual comments.

C) The full Draft SEIS—in its entirety and as individual chapters, figures, and Appendices—was posted on the website at the time the Notice of Availability was published. The website also contains updated geotechnical reports and alternative descriptions, 2012 SEIS Scoping summary materials, the 2009 cost report and materials related to the 2005 Supplemental Draft EIS and 2006 FEIS. The October 2014 Draft SEIS public hearing session times and locations were also posted on the website. Chapter 10, References, pointed users to a website that had hosted Haines community news, including the 2011 Haines Household Opinion Survey final report, which now appears to be redirecting users to advertisements. As of the publication of this Final SEIS, the report can be found online at:

http://www.hainesalaska.gov/sites/default/files/fileattachments/administration/page/1585/haines_survey_report.pdf. The Final SEIS has been updated to identify the new location.

Group 284

Topic/Subtopic: Public Process/Ballots and Resolutions

Group Comment Text:

A) Previous public polls, resolutions, and ballot initiatives have voted against the road in favor of improved ferry service.

B) The public testimony and comments of those who do not favor the road is not considered in the decision-making process.

Group Comment Response:

A) The purpose of the NEPA review process is to provide the public and agencies the opportunity to comment on the reasonable alternatives and the adequacy of the environmental analysis of those alternatives presented in the Draft SEIS. NEPA's public

process is not a “vote” on the project or specific alternatives; however, substantive information provided by the public and other stakeholders is carefully considered by FHWA and DOT&PF decision makers during the review and decision-making process. Information regarding advisory votes and resolutions was be taken into consideration by decision makers, but is not binding on them.

B) All comments received during the Scoping and Draft SEIS public comment periods—those in favor of mainly road alternatives and those opposed to mainly road alternatives—have been considered and were used to prepare the Final SEIS, contributing to the information weighed by the decision maker, FHWA, in identifying the selected alternative documented in the ROD.

Group 285

Topic/Subtopic: Public Process/Ballots and Resolutions

Group Comment Text:

The decision to build the road should be put to a public vote or poll.

Group Comment Response:

The purpose of the NEPA review process is to provide the public and agencies the opportunity to comment on the reasonable alternatives and the adequacy of the environmental analysis of those alternatives presented in the Draft SEIS. NEPA’s public process is not a “vote” on the project or specific alternatives; however, substantive information provided by the public and other stakeholders is carefully considered by FHWA and DOT&PF decision makers during the review process. Information regarding advisory votes and resolutions was be taken into consideration by decision makers, but is not binding on them.

Group 681

Topic/Subtopic: Public Process/General

Group Comment Text:

A) Not enough information has been provided to the public regarding the project, its impacts, and how it will affect the existing ferry system.

B) FHWA and DOT&PF have not complied with AS 44.62.213(b), which requires the agency to respond to requests for information within 10 days and ensure the questions and answers are made available to the public.

C) The group First Things First sent out materials that appear to be from DOT&PF advocating for a certain alternative. Why is DOT&PF allowing this?

Group Comment Response:

A) FHWA and DOT&PF disagree with the assertion that information provided to the public regarding the project, impacts, and specifically impacts to ferries, has been inadequate or incomplete. The Draft SEIS is comprehensive and complete. At the time the Draft SEIS and appendices were released to the public, those documents were posted on the JAI Project website. Hard copies of the Draft SEIS were provided upon request.

Electronic copies of the Draft SEIS and appendices were also provided free upon request. Hard copies of the Draft SEIS and appendices were available at libraries in Juneau, Skagway, and Haines and CD copies of the Draft SEIS and appendices were made available at the public hearings. This distribution provided ample opportunity for any interested member of the public to review the Draft SEIS and its supporting technical appendices, including impacts to the ferry system. FHWA and DOT&PF have updated information in the Final SEIS to refresh data, correct errors and omissions, or in other ways respond to comments on the Draft SEIS, as appropriate.

B) Article 4 of the Alaska Administrative Procedures Act (AS 44.62.180-290) provides the procedures for the adoption of regulations by a State agency. The statutory provisions referenced in the comment, AS 44.62.213(b), is only applicable when a State agency is adopting, amending, or repealing a regulation; the statutory provision and its requirements are not part of the Alaska Public Records Act and are not applicable to request for public records referenced in the comment. DOT&PF's response to the records request referenced in the comment was accomplished in accordance with the Alaska Public Records Act.

C) DOT&PF cannot monitor or control the distribution of publicly available information.

Group 280

Topic/Subtopic: Public Process/Other Agency Consultations

Group Comment Text:

A) The Municipality of Skagway requests the opportunity to review the Final SEIS prior to ROD.

B) The comment period was inadequate to fully review and provide thorough comments on the Draft SEIS.

C) Many of the supporting documents that are referenced are not included or are buried in the Draft SEIS and cannot be discovered and retrieved within the timeframe of the comment period.

Group Comment Response:

A) Per 23 USC 139(n)(2), FHWA developed and approved a combined Final SEIS and ROD. FHWA and DOT&PF updated information in the Final SEIS to include newly available data, correct errors and omissions, or in other ways respond to comments on the Draft SEIS, as appropriate. The document is comprehensive and complete. No new studies or additional interpretations of project data were necessary.

B) Public review period for the Draft SEIS was extended from the CEQ-required 45 days to 60 days, giving more time for review based on the document's complexity.

C) It is true that not all the supporting documents that are referenced in the Draft SEIS are included in the Draft SEIS or available on the Project website. However, all documents referenced in the Draft SEIS are available as part of the Project's administrative record. The project website provides access to all technical reports appended to the Draft SEIS, as well as the geotechnical studies and project documents preceding SEIS development.

These were all available at the time the Draft SEIS was released.

Group 281

Topic/Subtopic: Public Process/Other Agency Consultations

Group Comment Text:

The Juneau Audubon Society requests to be involved as a stakeholder during design and permitting in regards to wildlife mitigation.

Group Comment Response:

Direct stakeholder involvement for permitting would best be accomplished by working directly through the actual regulatory agency issuing the permit, such as through the Section 10/404 Public Notice issued by USACE. Alternative 1 – No Action has been selected as the preferred alternative in the Final SEIS; therefore, no additional permitting and design is anticipated. If a build alternative had been selected for development, DOT&PF would have coordinated with USACE and other agencies to develop appropriate design and mitigation.

Group 290

Topic/Subtopic: Public Process/Public Hearing

Group Comment Text:

Hearings should have been held outside of Southeast Alaska, such as in Anchorage where the majority of Alaskan residents live, to allow for participation by other potentially affected interests.

Group Comment Response:

FHWA and DOT&PF typically limit public hearings to communities that would be directly affected by a proposed action. Acknowledging that other parties from outside of these communities may have an interest in the project, it is not practical to host in-person meetings with them. FHWA and DOT&PF located the public hearings in areas where people who might experience changes in their quality of life, community, or surrounding environment as a result of the project would be reasonably able to attend. All potentially affected interests had equal opportunity to submit comments and participate in the decision making process for the JAI Project through website and electronic availability of the Draft SEIS, all Technical Report Appendices, and other pertinent project information. All comments received were given equal weight during considerations.

Group 291

Topic/Subtopic: Public Process/Public Hearing

Group Comment Text:

The public hearings held in Haines and Skagway were a waste of money.

Group Comment Response:

FHWA and DOT&PF do not believe the public hearings held in Haines and Skagway were a waste of money. Participation in the public comment process—either through hearings or

submitting written comment—is an important way to participate in the decision-making process. FHWA and DOT&PF held public hearings in the three communities that are the focus of the JAI Project. Hearings provided an opportunity for residents to submit oral comments directly to FHWA and DOT&PF staff. More than 47 people in Haines participated in the pre-hearing public open house, and 65 signed up to testify at the hearing. In Skagway, 56 people signed in at the open house and 37 people testified at the hearing.

Group 295

Topic/Subtopic: Public Process/Public Hearing

Group Comment Text:

There is no evidence that scoping was conducted as part of the Draft SEIS to identify critical issues.

Group Comment Response:

Chapter 7 of the Draft SEIS provided evidence of the Scoping process undertaken for the JAI Project SEIS. FHWA and DOT&PF conducted Scoping during January and February 2012 to obtain input from agencies and the public on the new Alternative 1B, updated reasonable alternatives, and new information about the project area. Chapter 2 of the Scoping Summary Report (available on the project website) described the activities, methods, and materials utilized to conduct Scoping for agencies and the public. These included the Notice of Intent published in the Federal Register, newspaper advertisements and an informational insert, development of a project mailing list, a newsletter and postcard, agency meetings, and web site postings.

7.19 Purpose and Need

Group 533

Topic/Subtopic: Purpose and Need/Bias

Group Comment Text:

A) In general, the analysis of alternatives in the Draft SEIS is biased to favor road alternatives over ferry alternatives.

B) All alternatives should be developed to a comparable level of detail for a true, unbiased evaluation. The Draft SEIS did not compare logistical, financial, environmental, or maintenance costs equally across alternatives.

C) Studies that do not support Alternative 2B were downplayed and ignored in the Draft SEIS.

Group Comment Response:

A) The purpose and need information is not biased, but rather documents legitimate transportation problems with the current system. All the reasonable alternatives, both road and marine, meet the purpose and need for the project to varying degrees.

B) All alternatives were developed to a sufficient level of detail to support a reasoned choice under NEPA. DOT&PF and FHWA went to considerable lengths to evaluate each of the alternatives equally and objectively. Consistent metrics were provided, comparable

studies were conducted, and all results were disclosed and published. In 2006, FHWA completed a ROD. Following the ROD, FHWA issued Authority to Proceed (ATP) for Final Design, Right-of-Way, and Advance Construction. When the ROD was vacated in 2009, the ATPs for Final Design, Right-of-Way, and Advance Construction was rescinded and no further design work was done except as needed to address Draft SEIS issues. Consequently, more detail is available for Alternative 2B as final design studies and permitting activities provided additional information. Nevertheless, all alternatives have been developed with sufficient detail to compare impacts, costs, and benefits. The additional information available on the 2006 selected alternative, is not the result of bias, but rather a consequence of the lawsuit and the restart of the NEPA process. It is not necessary to advance all alternatives to this advanced level to fairly compare alternatives.

C) The analysis for the SEIS was conducted by professionals with expertise doing this type of analysis, based on sound methodologies, and use of updated baseline data. All studies and analyses were disclosed and published. The work was reviewed through multiple public review periods over many years. DOT&PF and FHWA reviewed all material, analysis, and comments to identify a preferred alternative; they did not downplay or ignore information or analysis.

Group 534

Topic/Subtopic: Purpose and Need/Bias

Group Comment Text:

A) Travelers will not benefit from this project, so who will benefit (e.g., mining, logging, oil, or gas companies; land developers; or other special interest groups)?

B) What is the project's real purpose?

Group Comment Response:

A) The SEIS indicates that travelers would benefit from the project, principally by substantially reducing the average travel time and cost of travel between communities, increased flexibility on when they can travel, and increased capacity in the Lynn Canal corridor. These benefits would accrue to all travelers, including business and industry. It is not the purpose of the project to single out a specific business or industry group for benefits; the project serves all users. The SEIS addressed effects to logging, the Kensington Gold Project, fishing, and other business interests in the Socioeconomic Resources sections of Chapter 4 for each alternative (see subheadings for Industry/Commercial Sectors).

B) The purpose and need for the project is spelled out in Chapter 1 of the SEIS. As stated in Chapter 1, the purpose and need is multi-faceted. The State of Alaska provides transportation for all legitimate transportation—for shopping, commuting, social connections, recreation and tourism, other business and industry, freight, military and security needs, and for school teams to compete with other schools, among the many travel purposes. It is the goal of the State to provide better flexibility, additional capacity, improved travel time, and reduced costs for all users. The specifics of these project purposes appear in Chapter 1.

Group 536

Topic/Subtopic: Purpose and Need/Bias

Group Comment Text:

A) How much money has been spent on final design of the East Lynn Canal Road?

B) What documentation authorized development of the preferred alternate in the Draft SEIS to such a high level?

Group Comment Response:

A) Approximately \$8 million was spent on final design for Alternative 2B between the 2006 ROD and the injunction that was put in place in 2009.

B) In 2006, FHWA completed a ROD. Following the ROD, FHWA issued ATP for Final Design, Right-of-Way, and Advance Construction. When the ROD was vacated in 2009, the ATPs for Final Design, Right-of-Way, and Advance Construction was rescinded and no further design work was done except as needed to address Draft SEIS issues.

Group 538

Topic/Subtopic: Purpose and Need/Bias

Group Comment Text:

Has the ferry service been intentionally manipulated or degraded to reduce ridership in an effort to justify the project?

Group Comment Response:

AMHS ferry service has not been manipulated or degraded to try to justify the project. AMHS is continually working to reduce costs and limit cost increases while providing the best service it can given vessel availability and budgetary limits placed upon it. AMHS is expensive to operate and maintain, and has been targeted over the years for cost savings. The goal of this project, as described in Chapter 1, Purpose and Need, is trying to deal with these very challenges—finding a way to provide better service at a lower cost to users and the State.

Group 539

Topic/Subtopic: Purpose and Need/Bias

Group Comment Text:

The Draft SEIS analysis misinterprets or biases the elements of the purpose and need statement to favor Alternative 2B or provides specious analysis to support Alternative 2B. The following examples are cited:

A) It will not be more convenient or cheaper for foot (walk-on) traffic. The focus on moving vehicles is biased.

B) Because of poor weather and avalanches, flexibility for travel and capacity of road alternatives is misleading. There is no accounting for many days of non-optimum driving conditions. Travel times are too optimistic.

C) Alternative 2B restricts flexibility and opportunity to travel because travelers cannot make reservations for vehicles in advance. Travelers must plan trips to coincide with ferry schedule departures and arrivals driving the road. Not being guaranteed a spot limits flexibility.

D) The purpose of the project it is to “provide capacity to meet transportation demand in the corridor,” not to “generate and accommodate the greatest projected traffic demand.” The Draft SEIS analyzes the alternatives by determining how much each would increase demand to favor the road alternatives.

Group Comment Response:

The purpose and need information is not biased or based on flawed analysis, but rather documents legitimate transportation problems with the current system. To some extent, the commenters confuse the purpose and need, which documents existing problems, with impacts that they do not like.

A) Walk-on passengers would be accommodated on shuttle ferries. The road alternatives (2B and 3), however, represent a shift in the way transportation would be provided in the corridor—away from a primarily public transportation mode that operates more like a public transit service, to a highway system where private vehicles provide most of the transportation (shorter, shuttle ferries would provide links connecting the roadways). The SEIS acknowledged the impact to travelers wishing to not take a vehicle but also makes clear the State does not recognize a responsibility to provide public transportation. The cost of taking a vehicle would be considerably cheaper under Alternative 2B than it would be under Alternative 1 – No Action; therefore, there would be less economic incentive to travel as a walk-on passenger. DOT&PF and FHWA recognize that this shift would have an effect on passengers who do not own vehicles (approximately 9 percent of the combined Juneau, Haines, and Skagway households). Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS described impacts to “Pedestrians and Bicyclists” for Alternatives 2B and 3, including walk-on passengers.

B) The Draft SEIS acknowledged that adverse driving conditions would occur on the East Lynn Canal Highway in the winter, but anticipated that State maintenance crews would keep the highway open under all but the most severe conditions. Such severe weather conditions might have called for road closures. DOT&PF and FHWA disclosed the impacts of potential road closures and mitigated those effects to the extent that travel delays and closures would be minimized. Service to and from Juneau during a road closure would have been provided by running a ferry in Lynn Canal. Therefore, even during road closures, the flexibility for travel under the proposed road alternatives would be at least as good as the existing service. All alternatives were forecast based on an annual average basis, and all alternatives were treated equally. Service and cancellations on the marine alternatives could also have occurred, and like the road alternatives, travel times were based on the average.

C) Alternative 2B would have increased flexibility of travel as compared to Alternative 1 – No Action. Having frequent service, multiple times per day would increase the flexibility of when travel could occur and would decrease the need for a reservation. Under the

current ferry system in Lynn Canal travelers have limited choices for what time of day or day of the week to make their trip. Contrary to the comment, there would actually be less need to plan trips to coincide with scheduled ferry arrivals and departures. Because of the frequent drive through loading and unloading nature of the ferry trip under Alternatives 2B and 3, capacity and travel time would be improved and travelers would not need reservations. If a traveler missed their planned ferry connection (or the ferry they had planned to take was full), they would only have to wait a few hours for another sailing (as opposed to the next day, which they would need to do under Alternative 1 – No Action). Increasing the frequency of travel under Alternative 2B greatly increases the system capacity, improves the flexibility of when people can travel, and eliminates the need to have a reservation.

D) The purpose and need statement is to provide capacity to meet transportation demand in the corridor. Each of the reasonable alternatives satisfies the purpose and need to varying degrees in that they provide greater capacity than Alternative 1 – No Action and they each have been designed to accommodate the demand that would occur given differences in attributes such as cost, travel time, and convenience. In other words, there is an underlying latent demand for travel in the corridor (unconstrained demand) and more or less of that demand will be realized with each alternative depending on the attributes of that alternative.

The Draft SEIS used the term “generate,” which did not clearly communicate the situation. The phrasing “realize and accommodate” was substituted for the phrasing “generate and accommodate” to try to clear up confusion. There is nothing biased in transportation providers wanting to identify, select, and build alternatives that maximize the usefulness of the investment in the transportation facility as measured by the number of people who will use it. It was this notion being connoted in the phrasing “realize and accommodate” the greatest projected demand.

Group 540

Topic/Subtopic: Purpose and Need/Bias

Group Comment Text:

Since capacity is the key logistical metric, the ferry constraints decide the preferred alternative regardless of environmental impacts. Environmental impacts do not seem to have been considered in the selection of the preferred alternative in the Draft SEIS.

Group Comment Response:

The purpose and need for the JAI Project were oriented towards transportation benefits, and the identification of the preferred alternative was based on balancing how well alternatives met the transportation need with their social, economic, and natural environmental impacts. Impacts to the natural and socioeconomic environment, as well as the ability to mitigate impacts, are important considerations that weigh into USACE’s decision in issuing its Section 404 permit. This comment is based on the text of the Section 404(b)(1) analysis, which is related to the USACE permit application attached to the SEIS. The USACE has specific criteria that define practicable alternatives, including costs, logistics, and technology in consideration of the overall project purpose. In addition, the overall project purpose must be met by any alternative to be considered practicable.

Therefore, an alternative may be dismissed by the USACE based on their regulatory criteria, including logistics.

Group 562

Topic/Subtopic: Purpose and Need/Bias

Group Comment Text:

The Draft SEIS is biased because it was too focused on access to/from Juneau and did not sufficiently cover the link between Haines and Skagway, or connections from Juneau to points south.

Group Comment Response:

The purpose and need statement for the project is to improve surface transportation to and from Juneau. DOT&PF and FHWA have updated the data in Chapter 1 of the Draft SEIS since 2006 and have reconfirmed the project purpose and need. Because Juneau is a regional hub, with a substantial population and employment base, the demand for travel in and out of Juneau has been identified as driving the primary needs of the project.

Group 527

Topic/Subtopic: Purpose and Need/Completeness

Group Comment Text:

Travel safety and reliability should be included in the purpose and need statement.

Group Comment Response:

Safety and reliability are included in the purpose and need statement for a project only if there is a demonstrable safety or reliability problem on the transportation link being considered. An example would be where there are a higher number of accidents than the State average for similar transportation links. Safety and reliability are not a problem with the current system; therefore, neither safety nor reliability are a stated purpose and need factor for the proposed project. Any transportation project proposed by DOT&PF and FHWA must meet established engineering standards and practices for safety and reliability. Therefore, all of the evaluated project alternatives were developed to be safe and reliable in accordance with standards.

Group 528

Topic/Subtopic: Purpose and Need/Completeness

Group Comment Text:

The SEIS purpose and need should include a comprehensive measure of overall cost-effectiveness criteria (e.g., net present value, benefit-cost ratio, etc.) to measure State and user costs, which are components of the purpose and need statement.

Group Comment Response:

Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*, is an economic analysis of user benefits and of costs to users and the State. These measures are evaluation tools and come into the SEIS principally in Chapter 4 in discussions of effects

of the alternatives. These measures figure into the purpose and need for the project because the benefits of time saved, lower user costs, and lower costs to the State are part of the project's purpose and need statement. Purpose and need statements are unique to each project and do not typically include “cost-effective” language. Appendix FF addresses cost effectiveness and benefit-cost ratio, along with other measures.

Group 529

Topic/Subtopic: Purpose and Need/Completeness

Group Comment Text:

Why has DOT&PF restricted its study to surface alternatives?

Group Comment Response:

The SEIS purpose and need statement identifies and describes problems with the current surface transportation system that need to be resolved. The surface transportation system provides service for a very different market of travel, with very different needs than the air transportation system. The current AMHS surface connection in Lynn Canal is part of the NHS. The NHS, through Lynn Canal, connects to the rest of Alaska and to the remainder of the Lower 48 states. Surface connectivity serving vehicles in Lynn Canal allows private and commercial vehicles access and connectivity to the entire NHS network. Improving air travel would not improve flexibility for travel or reduce State or user costs on this important NHS link. Problems with the air transportation system have not been identified and would be addressed under a separate purpose and need statement for a separate project.

Group 531

Topic/Subtopic: Purpose and Need/Completeness

Group Comment Text:

Residents and visitors from Haines and Skagway come to Juneau, without a car, to connect with Alaska Airlines and the air travel network. Improving freight and passenger connections to and from Auke Bay from downtown Juneau and the airport would represent a significant access improvement that has not been adequately addressed in the SEIS.

Group Comment Response:

Improving freight and ferry passenger connection to and from Auke Bay and downtown Juneau were not identified as part of the purpose and need for this project. The Auke Bay Terminal, airport, and downtown Juneau are already connected by a highly functioning highway with sufficient capacity. DOT&PF and FHWA developed alternatives to address the problems identified in the SEIS Chapter 1, Purpose and Need. This chapter identifies deficiencies in surface transportation provided to and from Juneau in the Lynn Canal corridor. For all alternatives, public transportation between Auke Bay and Juneau or the airport would be provided by the municipality or private sector.

Group 518

Topic/Subtopic: Purpose and Need/Existing Access

Group Comment Text:

The ferry system meets the purpose and need statement: “Provide the capacity to meet transportation demand in the corridor.”

Group Comment Response:

DOT&PF and FHWA data has demonstrated that there is considerably higher demand for travel than is currently met by the existing system. Due to high costs, slow travel times, and other inconveniences, the system does a poor job at serving corridor demand. These problems were documented in Chapter 1, Purpose and Need, of the Draft SEIS. The SEIS analysis included primarily ferry and road alternatives to improve flexibility, improve capacity, and reduce State and user costs to be better serve travel in the corridor.

Group 521

Topic/Subtopic: Purpose and Need/Flexibility and Opportunity for Travel

Group Comment Text:

A) Alternative 2B does not meet the project purpose and need, nor does it improve access to Juneau because it does not:

- (1) Reduce travel times;
- (2) Reduce costs to the State;
- (3) Provide greater opportunities for travel and capacity to meet demand; and
- (4) Have provisions for those traveling without a car.

B) It will reduce travel flexibility and opportunity and increase travel time because:

- (1) Traveling the road will be difficult, dangerous, or impossible in bad weather conditions;
- (2) Vehicle parking will not be available at the Katzehin Ferry Terminal, so travelers will incur the additional cost of transporting and parking their vehicles; and
- (3) Travel times will be long.

C) Alternative 2B does not provide the capacity to meet transportation demand in the corridor because there will be no safe, reliable, public transportation to the Katzehin Ferry Terminal for those without vehicles.

Group Comment Response:

A) (1) Alternative 2B does meet the purpose and need for the JAI Project, and all build alternatives reduce travel times, including Alternative 2B. See Table ES-1 and in Chapter 2 (subsections labeled "Travel Time" under each alternative).

(2) Only Alternative 4D reduces State costs compared to Alternative 1 – No Action. Because of the higher traffic volumes predicted to be generated, Alternatives 2B, 3, 4B, and 4D would have cost the State less than Alternative 1 – No Action on a per vehicle basis, with Alternative 2B having the lowest cost per vehicle.

(3) As explained in Sections 2.3.3, 2.4, and 4.3.7.2 of the Draft SEIS, Alternative 2B would not have provided improved transportation opportunities for Lynn Canal residents. Alternative 2B would have provided 56 ferry round trips per week from Katzehin to Haines during the summer. Under Alternative 1 – No Action, there are only 8 trips per week between Auke Bay and Haines. In the winter, there would only be 6 ferry round trips per week between Auke Bay and Haines under Alternative 1 – No Action compared to 42 under Alternative 2B. Similar increases for travel between Juneau and Skagway were also reported. Capacity would increase over Alternative 1 – No Action as reported in Table ES-1. Alternative 2B can carry 636 vehicles per day to/from Skagway in summer and 848 to/from Haines as compared to Alternative 1 – No Action, which can carry 61 vehicles per day to/from Skagway and 93 vehicles per day to/from Haines. Higher capacities were similarly reported for winter travel.

(4) Walk-on passengers would be accommodated on the ferries under Alternative 2B. The road alternatives (2B and 3), however, represent a shift in the way transportation would be provided in the corridor—away from a primarily public transportation mode that operates more like a public transit service, to a highway system where private vehicles provide most of the transportation (shorter, shuttle ferries would provide links connecting the roadways). It is true that DOT&PF and FHWA do not anticipate that walk-on passengers would continue to find it as convenient to have someone drive them to the Katzehin Ferry Terminal as they do Auke Bay.

B) (1) Alternative 2B would increase travel flexibility and opportunity for travel, in addition to providing reduced travel times. DOT&PF and FHWA have disclosed the impacts of potential road closures and have mitigated those effects to the extent that travel delay should be minimized. DOT&PF and FHWA believe the SEIS accurately discloses the most likely scenario (i.e., that the highway may be closed limited days each winter, and that if such closures were expected to be lengthy, one or more ferries would be available for transportation in Lynn Canal at levels similar to Alternative 1 – No Action). Thus, even during road closures, travel flexibility and travel time would be no worse than currently, and at all other times would be a substantial improvement.

(2) As already mentioned, DOT&PF and FHWA do not anticipate that current walk-on passengers would continue to walk-on with the same frequency at Katzehin. The cost of taking a vehicle would be considerably cheaper under Alternative 2B than under Alternative 1 – No Action; therefore, there would be less economic incentive to travel as a walk-on passenger. The user costs reported included the cost of transporting a vehicle on the ferry (and the cost of driving it there). Costs for parking were not included for any of the alternatives, as the end destination of travelers is not known, and that end destination may or may not have included parking costs. Parking would not be allowed at Katzehin. It is recognized that walk-on passengers would need to get to and from the Katzehin Ferry Terminal. The impacts of that change (including an estimate in costs for walk-ons) were reported in Section 4.3.7.5, Other Transportation Impacts, of the Final SEIS.

(3) Travel times would be considerably less under Alternative 2B than under Alternative 1 – No Action. Travel times were summarized for all alternatives in Table ES-1. In fact, travel time would be roughly half under Alternative 2B as compared to Alternative 1 – No Action.

C) The ferry capacity under Alternative 2B would be sufficient to accommodate the anticipated demand and the roadway capacity would be many times greater than projected demand. The road alternatives (2B and 3) would represent a shift in the way transportation would be provided in the corridor, away from a primarily public transportation mode that operates more like a public transit service, to a highway system where private vehicles provide most of the transportation. DOT&PF and FHWA recognize that this shift would have an effect on passengers who do not own vehicles (approximately 9 percent of the combined Juneau, Haines, and Skagway households). Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS described impacts to “Pedestrians and Bicyclists” for Alternatives 2B and 3, including walk-on passengers.

Group 523

Topic/Subtopic: Purpose and Need/Flexibility and Opportunity for Travel

Group Comment Text:

Southeast Alaska would be better served by a ferry alternative, which would give AMHS flexibility to improve access to all Southeast communities, not just people traveling to Juneau.

Group Comment Response:

The purpose of the JAI Project is to provide improved surface transportation to and from Juneau in Lynn Canal. This is developed in Chapter 1, Purpose and Need, of the Draft and Final SEIS. The project examines multiple ferry alternatives to solve the problems outlined in the purpose and need statement. The ferry alternatives include vessels that theoretically could be deployed elsewhere, but that is not anticipated because improving access to all Southeast Alaska communities is not a purpose or need for the project.

Group 638

Topic/Subtopic: Purpose and Need/Flexibility and Opportunity for Travel

Group Comment Text:

Flexibility seems an unfortunate purpose and need criteria as there are no threshold values, it is unmeasurable, and it is subjective.

Group Comment Response:

The frequency of service under Alternative 1 – No Action provides a minimum “threshold” for flexibility, meaning DOT&PF and FHWA want to find an alternative that does better than the existing system. Chapter 1, Purpose and Need (see Section 1.2.3), and Chapter 3, Affected Environment (see Section 3.1.7), indicated how often existing ferry service is available. Each alternative evaluated would have improved upon the frequency by providing the user more choices about when they want to travel. Chapter 4, Environmental Consequences, under Subsections on Transportation (e.g., see Section 4.3.7.2, for

Alternative 2B), indicated how often service would have been available under the various alternatives. A comparison showed increases between the existing conditions/Alternative 1 – No Action and the build alternatives. For example, summer service between Juneau and Haines under Alternative 2B would be available eight times per day, while existing ferry service is only available 1 to 2 times per day. These are objective measures, and they indicate that travelers would have greater opportunity for when they might choose to travel and therefore greater flexibility in planning their travel.

Group 604

Topic/Subtopic: Purpose and Need/General

Group Comment Text:

A) The purpose and need statement in the Draft SEIS is still flawed, and has not been changed since it was criticized by the EPA and rejected by USACE.

B) The Draft SEIS did not provide full transparency in discussing the purpose and need for safe, efficient Juneau access.

Group Comment Response:

A) The purpose and need statement for the project has not been found inadequate or flawed. The purpose and need addresses the transportation needs in Lynn Canal. DOT&PF and FHWA data have demonstrated that there is considerably higher demand for travel than is currently met by the existing system. However, due to high costs, slow travel times, and other inconveniences, the system does a poor job at serving corridor demand. These problems are documented in Chapter 1 of the Draft SEIS. CEQ directs federal agencies to grant substantial deference to the lead federal agency with expertise in the stated field, in this case, FHWA, in determining the purpose and need for transportation projects (see CEQ 2003, Letter to the Honorable Norman Y. Mineta from James L. Connaughton regarding purpose and need. Available on the internet at: <https://ceq.doe.gov/docs/ceq-regulations-and-guidance/regs/CEQPurpose2.pdf> and FHWA 2003, Guidance on “Purpose and Need” available on the internet at <https://www.environment.fhwa.dot.gov/guidebook/Gjoint.asp>). For this project, FHWA, as the lead agency, has deference for developing the transportation purpose and need for the project. It should be noted, however, that USACE does develop their own project purpose for their use in wetland permitting and analysis under the Clean Water Act. USACE’s overall project purpose is sometimes broader than that of the transportation agencies.

B) The purpose and need statement was developed with full transparency. The purpose and need is fully documented in Chapter 1. It was developed and shared as a draft for comments, revised, and submitted as final in the 2006 Final EIS and again in the Draft and Final SEIS. As is required, DOT&PF and FHWA published comments related to the purpose and need and their responses, providing full disclosure and transparency. Supporting documentation (appendices and technical reports) have been published and are available for review by the public and agencies.

Of note, safety is not an element of the purpose and need for the project. Safety is included in the purpose and need statement for a project only if there is a demonstrable safety problem on the transportation link being considered. An example would be where there is a

higher number of accidents than the State average for similar transportation links. Safety is not a problem with the current system; therefore, safety is not a stated purpose and need for this project.

The road alternatives are expected to function like other rural Alaska highways, which are designed to meet specific safety standards, and to be as safe as other roads in the State. Regarding efficient Juneau access, each of the alternatives were comprehensively evaluated in Chapter 2 of the SEIS, particularly in regards to capacity, travel times, flexibility, improved opportunity for travel, and costs.

Group 515

Topic/Subtopic: Purpose and Need/Relationship to SATP

Group Comment Text:

Alternative 2B does not help preserve ecosystem integrity, limit adverse environmental impacts, and provide safe and reliable transportation infrastructure as directed by the SATP.

Group Comment Response:

Alternative 2B is fully consistent with the SATP and its goals of preserving ecosystem integrity, limiting adverse environmental impacts, and providing safe and reliable transportation infrastructure. The Statewide Long Range Transportation Plan (LRTP), *Let's Get Moving 2030*, provides policies that direct statewide transportation development. The SATP is a component of the LRTP and as such makes recommendations consistent with the policies contained within the LRTP. These policies cover System Development, System Preservation, System Management and Operations, Economic Development, Safety, Security, Environment and Quality of Life, and Good Government: Openness and Accountability for Transportation System Performance.

The SATP recommends the JAI Project because a road connection can provide a higher frequency of service to the traveling public than is currently available and in a cost effective manner. Marine alternatives do not have the scalable capacity to provide access at costs affordable by both the State and user, especially when considering latent demand. All transportation alternatives have impacts, positive and negative, including impacts to mobility, access, the economy, and the environment. The SATP provides a plan that includes capital improvement recommendations that will improve resident mobility and access to essential goods with due consideration of a set of conflicting goals. While the SATP takes a high level assessment of projects, it does so with an understanding that every project will go through a stringent environmental process, which will ensure that projects are developed in such a way to address all policies included in the LRTP. The purpose of the environmental document that follows the plan is to vet the recommendations of the plan by identifying in detail the purpose and need, the impacts to the human environment, impacts that cannot be reasonably avoided, and mitigation measures to reduce and compensate for adverse impacts that cannot be avoided.

Group 516

Topic/Subtopic: Purpose and Need/Relationship to SATP

Group Comment Text:

The SATP should be revised to reflect the region’s top priorities of maintaining existing roads and replacing aging mainline ferries.

Group Comment Response:

Revising the SATP is not an EIS issue unless the selected alternative is not consistent with the SATP. The SATP recommends the JAI Project because a road connection can provide a higher frequency of service to the traveling public than is currently available and in a cost effective manner. The SATP does recommend replacing some mainline ferries as they reach the end of their service lives.

Group 598

Topic/Subtopic: Purpose and Need/State Costs

Group Comment Text:

A) Alternative 2B does not meet the project purpose and need because it does not save the State money with construction, maintenance, and operations and would cost more than maintaining or even enhancing ferry service with the current connections.

B) Why was the preferred alternative in the Draft SEIS the one that costs the State more?

Group Comment Response:

A) All the reasonable alternatives studied in detail in the SEIS satisfy the purpose and need to varying degrees. Some alternatives, however, do this better than others. None of the build alternatives would have reduced State M&O costs when compared to Alternative 1 – No Action. Because of the higher traffic volumes predicted to be generated, Alternatives 2B, 3, 4B, and 4D would have cost the State less than Alternative 1 – No Action on a per vehicle basis, with Alternative 2B having the lowest cost per vehicle. DOT&PF and FHWA have been consistent over the years in proposing a purpose and need that reflects the desire of the transportation agencies to satisfy that demand. Meeting transportation demand is a legitimate purpose for pursuing a transportation project. More generally, the purpose of investment in public transportation infrastructure is to improve transportation opportunities for the largest number of people in the most cost-effective manner.

B) The reasoning behind the identification of Alternative 2B as the preferred alternative in the Draft SEIS was provided in the Executive Summary and Chapter 2 (under the heading Identification of the Preferred Alternative). The decision was not made solely on cost, although cost was a consideration. The decision was strongly based on how well an alternative satisfied the purpose and need for the project, as stated in Chapter 1. As presented in Table ES-1, Alternative 2B would accommodate the highest demand, provides the greatest capacity, had the shortest travel times, provides the greatest frequency of service, has the lowest cost per vehicle transported, and has the second lowest operations and maintenance costs of any of the build alternatives. The decision balanced these benefits by taking into consideration the impacts described throughout the document and appendices. The Final SEIS identified Alternative 1 – No Action as the preferred

alternative.

Group 600

Topic/Subtopic: Purpose and Need/State Costs

Group Comment Text:

How can the State afford to have a dedicated ferry between Katzehin, Haines, and Skagway with multiple ferries per day when Skagway currently gets only get three to five ferries per week?

Group Comment Response:

A variety of factors figure into the projected service to be provided under any of the alternatives and the level of service in turn, equates to costs. DOT&PF has projected demand for each link, for each of the alternatives, and has planned service levels and ferry capacity to match.

The trip from Katzehin to Haines is approximately 8 miles and to Skagway is approximately 16.4 miles. In contrast, from Auke Bay, it is approximately 83.3 miles to Haines and an additional 15.1 miles to Skagway. As the sailing distance from Katzehin is much shorter, a ferry is able to make multiple trips in the same time it takes for a ferry to make one round trip from Auke Bay.

The Day Boat ACFs can be operated by fewer crew and offer fewer amenities than the mainliners. For example, the Day Boat ACFs do not have cabins, restaurants, crew quarters, etc., because they are not needed for the short sailings from Katzehin. This means the Day Boat ACFs have lower operating costs than the existing mainliners. As a result, they could provide more hours of service for the same cost.

By making operational efficiencies and capital improvements, each alternative is able to provide additional service at a better cost. See the Transportation section for each alternative in Chapter 4 for more information on costs. See also Appendix BB, *Revenues and Expenditures Report for Lynn Canal, Fiscal Years 2005–2015*, which presents State revenues and expenditures for the AMHS 2005–2015 as a basis for examining costs of the alternatives.

Group 593

Topic/Subtopic: Purpose and Need/Transportation Demand

Group Comment Text:

The Draft SEIS is based on an assumption that there is unmet demand in the Lynn Canal corridor that does not correlate with historic AMHS data. AMHS historical travel data does not correlate with the purpose and need elements (e.g., travel opportunity, travel time, and user costs). When these elements have been modified in the past, demand did not respond accordingly.

Group Comment Response:

Several commenters took one or two years of historic data from AMHS, attempting to make the argument that when costs or schedules changed in the past, demand did not

respond accordingly. It is not within accepted modeling practice or statistical analysis to rely on one or two years of data to surmise a statistically valid correlation (or the lack of one). Moreover, none of the past modifications by AMHS to schedule, cost, or travel time has replicated the kind of substantive changes being proposed by the alternatives in the SEIS. To try to equate AMHS experimental changes to one or two variables that ran for short periods, to the SEIS alternatives, is not a valid comparison.

All traffic demand models attempt to predict future demand based on assumptions and data available in the present. The total demand model used for this project was developed based on empirical data derived from actual travel conditions observed in Alaska and Western Canada from communities with similar geographic characteristics as Juneau. The model input analysis included Anchorage, Fairbanks, and Whitehorse (as regional centers like Juneau), and included analysis of similar coastal communities, including Prince Rupert and Port Hardy, British Columbia, and Seward, Homer, Valdez, Haines and Skagway, Alaska (see Appendix AA, *Traffic Forecast Report*). Based on the results from the communities listed above, a very strong correlation was found between the distance traveled from the edge of the community and the traffic volumes.

This predictive model was used, among other sources, to develop an unconstrained demand model for Lynn Canal. It is based on the assumption that people in Juneau, Haines, and Skagway would exhibit similar travel patterns given the opportunity to travel by road as other similarly situated communities. Based on the project team's research, there are no indicators that travel behavior in Juneau, Skagway, and Haines would differ substantially from that of other Alaskan and Canadian communities if full highway access were available. Based on the data collected, the project team is confident that Juneau residents would travel in a similar manner to other Alaskan residents.

The forecast only used the unconstrained demand as an upper bound to bracket the overall demand in the corridor. Each forecast, for each of the alternatives, scales down from the unconstrained demand based on factors of cost, travel time, schedule convenience, etc. Using such factors to predict traveler's choices and behavior amongst competing alternatives is a common modeling practice and is used in nearly every traffic model. By factoring the demand down from the unconstrained demand based on costs, travel time, and convenience the model predicts reasonable estimates of travel behavior based on the relative merits of the alternatives.

The results of the model were validated against the existing transportation system. In other words, as is standard modeling practice, the team developed the model and tested it to see how well it predicted travel on the existing system for a known year. Because the model was able to predict existing traffic within an acceptable range, it is considered valid as a starting point for use in predicting future conditions. This is a standard approach to truth-testing a model and its assumptions. The methodology and results of both approaches were fully disclosed in the associated technical report and summarized in the Draft SEIS.

Group 594

Topic/Subtopic: Purpose and Need/User Costs

Group Comment Text:

Alternative 2B will not reduce user costs for transportation in the corridor, especially for independent, walk-on passengers because they will be forced to drive a vehicle.

Group Comment Response:

For passengers who currently walk-on, the change in user cost depends on whether or not they remain a walk-on passenger. The Draft SEIS showed that, for most travelers, while some costs may be shifted to the individual, the cost of driving their own vehicle and paying a fare for the Alternative 2B short shuttle ferry would be lower than the cost of riding the ferry under Alternative 1 – No Action. Due to the reduced cost of taking a vehicle, many existing walk-on passengers would likely change their travel pattern and take their own vehicle. If an existing walk-on passenger chooses to remain a walk-on passenger, their cost depends on how they travel to/from the ferry terminals. For example, if they chose to use a privately operated bus service, their cost would be slightly higher than under Alternative 1 – No Action. However, if they chose to ride with family, friends, or acquaintances, their cost would be lower than under Alternative 1 – No Action.

The impacts to walk-on passengers for Alternatives 2B and 3, including costs, were addressed in Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS under the subheadings “Pedestrians and Bicyclists.” Based on the comment, additional information about the anticipated cost for the various travel markets (walk-ons, single drivers with a vehicle, etc.) were added to the Final SEIS.

For all alternatives, passengers would continue to be able to walk onto the ferry if they chose to do so. Similar to today, walk-on passengers would be responsible for finding transportation to/from the ferry terminals. Because of the distances to reach the remote ferry terminals, particularly at Katzechin, these alternatives would be less conducive to passengers walking onto the ferry (i.e., friends, shuttle or a cab would be needed to drive someone to Katzechin to catch the shuttle ferry). This would be a change in travel patterns. For some travelers, this would be an adverse impact, and for others it would be a beneficial impact.

7.20 Socioeconomic Resources

Group 451

Topic/Subtopic: Socioeconomic Resources/Community Infrastructure Impacts

Group Comment Text:

A) There is no cost estimate for infrastructure or services provided by DOT&PF or for the cost to others to keep services going. The project needs to consider and account for the costs of infrastructure improvements along the road corridor (e.g., fiber optic cable, electric service, cell towers, weather sensors, and gas stations), including utility and right-of-way needs for infrastructure.

B) The plan should outline critical path infrastructure and how the project will address the planning and permitting requirements for that infrastructure.

C) Infrastructure should also be designed (in-ground if possible) to protect against damage from avalanches and other hazards.

D) Having safe communication and electrification along the route will make it safer for the traveling public.

E) Planning for transmission and electrification along the highway will lead to increased communications that creates a positive cumulative effect.

F) Will there be adequate safe pullouts and parking for buses and vehicles?

Group Comment Response:

A) The cost for infrastructure provided by DOT&PF is included in the *2017 Update to Appendix D – Technical Alignment Report*, Attachment E. Annual maintenance costs for DOT&PF provided infrastructure is also included in the *Technical Alignment Report*, Attachment C. Costs related to other services such as private utilities and private improvements are not DOT&PF related infrastructure, are not a part of the proposed action, and have not been evaluated.

B) Other than bridges, no provisions for communication or electrical facilities, such as buried conduit, are included in the road alternatives. Although there are no known plans for public or private electrical service installations, DOT&PF policy and practice requires that all new bridges be provided with the ability to accommodate at least two 8-inch diameter utilities—one in each exterior girder bay. Specifically, 8-inch diameter utili-ducts (pipes) are provided under the approach slabs and through the concrete abutments, and 8-inch diameter holes are provided through the intermediate and pier diaphragms to accommodate future utilities. This approach has been included in the project bridge plans.

C) Utility owners would be responsible for utility infrastructure designs if they determined a need to construct. DOT&PF would work with utility owners to determine the most suitable installation for utility infrastructure to avoid known hazards.

D) Communication and electrification are not DOT&PF required infrastructure, are not a part of the proposed action, and have not been evaluated since there are no known plans for service to be installed. For emergency situations, the public may contact DOT&PF personnel at the proposed maintenance station who will be present full time, except when personnel are inspecting the highway. DOT&PF would then contact the appropriate response agencies via satellite phone to notify them of the situation. It is anticipated that no cell service will be available along the middle portions of the route, similar to other remote rural arterial highways throughout the State.

E) Utility operators will be able to permit their utilities within the road right-of-way if the need arises. Since these improvements are not DOT&PF related infrastructure, they have not been evaluated.

F) Locations for pullouts and scenic overlooks have been identified in consultation with USFS for the highway alternatives on the east and west sides of Lynn Canal and were

described in Sections 4.3 and 4.4 of the Draft SEIS.

Group 452

Topic/Subtopic: Socioeconomic Resources/Community Infrastructure Impacts

Group Comment Text:

A) Who would be responsible for routine police patrols and emergency response?

B) To meet the additional demand, do the responsible parties anticipate the need for additional resources?

C) Who will be responsible for non-emergency services such as trash collection?

Group Comment Response:

A) Statewide, the Alaska State Troopers are responsible for general policing, patrols, and emergency response along rural roads, particularly outside of the areas associated with individual local governments. Alternative 2B falls partially in the CBJ (approximately 30 road miles north of Echo Cove to Eldred Rock) and partially in the Haines Borough (from Eldred Rock northward). Within the CBJ, the Juneau Police Department (JPD) would be responsible for the primary response. The Alaska State Troopers based in Juneau would provide the primary response for the segment of road north of the CBJ boundary. The Alternative 3 road on the west side of Lynn Canal lies within the Haines Borough. Under Alternative 3, the primary response would come from State Troopers based in Haines.

The SEIS indicates it is likely that emergency medical response would come from these communities. Section 3.1.4 and corresponding Socioeconomic Resources sections in Chapter 4 for each alternative provide basic information about services provided at each community and disclose the potential impacts to the service providers of having more road miles and more traffic within their areas of responsibility. See also Appendix EE, *Socioeconomic Effects Technical Report*, Section 3.3. Fire protection outside local fire service areas (i.e., along these road routes) is by the Alaska Division of Forestry and Tongass National Forest. Haines, Skagway, and Juneau all have search and rescue capabilities either through separate organizations or through their fire/rescue departments or both. Overall, staffing of public safety is anticipated to remain the same as it is today under all alternatives. The text of the Final SEIS has been reviewed and clarifications made to ensure the information above is clearly represented.

B) The agencies with the most resources available (State Troopers, JPD, and Capital City Fire and Rescue [CCFR]) say they are operating at minimal staffing levels given the extent of their current responsibilities and service areas. The SEIS and Appendix EE disclose the potential that local agencies may require further resources to continue to provide the same level of service.

Alternative 2B falls partially in the CBJ (about 30 road miles north of Echo Cove to Eldred Rock) and partially in the Haines Borough (from Eldred Rock northward). Within the CBJ, the JPD would have been responsible for the primary response. The Alaska State Troopers based in Juneau would have provided the primary response for the segment of road north of the CBJ boundary. The Alternative 3 road on the west side of Lynn Canal lies within the

Haines Borough. Under Alternative 3, the primary response would come from State Troopers based in Haines.

C) DOT&PF sponsors an Adopt-a-Highway program in which organizations volunteer to pick up litter several times per year along a segment of road in exchange for postings/signs giving the organizations credit for their stewardship. Alaska State Troopers have responsibility for cases of dumping. While many areas of Alaska's most rural highway have little problem with litter, it is acknowledged that some areas have been used for dumping or are otherwise not kept clean. There is no program for monitoring, cleaning, or enforcement along every part of every road. At formal DOT&PF rest stops and facilities, DOT&PF would be responsible for all maintenance.

Additional detail regarding non-emergency services has been provided in Appendix EE of the Final EIS.

Group 453

Topic/Subtopic: Socioeconomic Resources/Community Infrastructure Impacts

Group Comment Text:

A) The Draft SEIS did not include costs to the communities from increased traffic, congested roads, limited parking, or for the additional demand for clean water and sanitation. How will those costs be evaluated, and who will be responsible for them?

B) What will the project's impacts on livability and sustainability be when Juneau is already at a saturation point for noise, traffic, and other pressures caused by tourism.

C) There is no parking or roadway capacity in the Juneau area to accommodate increased numbers of commercial vehicles, RVs, and cars.

Group Comment Response:

A) The SEIS discusses indirect traffic impacts qualitatively in Section 4.7.8, "Traffic," and the indirect effects of improved access on Municipal revenues and expenditures in Section 3.1.1.7 of Appendix EE, *Socioeconomic Effects Technical Report* (including a discussion on demand for parking and public utilities). The traffic, congestion, parking, and demand for public utilities are considered indirect effects, meaning they are anticipated to happen later in time and further removed from the project itself. The indirect effects commented on here are difficult to quantify, because it is unknown how local governments or other entities responsible for dealing with these impacts will respond. For instance, an entrepreneur could decide to build a parking garage, costing Municipalities nothing; or the city itself could decide to build a parking structure, charge money for parking, and cover its costs and even return revenue to city coffers. To try to quantify the resultant indirect costs would be speculative at best. The impacts are, however, discussed qualitatively in the sections of the SEIS referenced above.

B) The SEIS discusses the quality of life impacts for each of the alternatives, including the kinds of impacts caused by tourism growth pressures. See Section 4.1.4, Socioeconomic Resources, in the SEIS. Additional impact analysis on quality of life in Juneau is found in Appendix EE, *Socioeconomic Effects Technical Report*, Section 3.3.1.4, "General Effects

on Quality of Life,” and quality of life impacts to Juneau in Section 2.3.1.4. Specific requested information can be found under the subheading “Traffic Impacts” and “Other Quality of Life Impacts.” Regarding highway access, The East Lynn Canal Highway would have a much larger impact on traffic, but the impact would still be small relative to overall traffic in Juneau. The impact would be most noticeable in particular areas of town. Negative effects of traffic are most likely to be felt in the sparsely populated areas north of Auke Bay. The incremental increase in more populated areas, such as downtown Juneau, would be much less important. Indirect noise impacts are discussed in Section 4.7.7.3. The analysis indicates that exterior and interior noise exposure at sensitive receptors along Glacier Highway and Egan Drive would be the same as estimated for Alternative 1 – No Action. Alternative 2B would increase peak hour noise at the Adlersheim Wilderness Lodge near Yankee Cove.

C) The SEIS discloses the impacts associated with the limited parking in Juneau. Detailed information can be found in Appendix EE, *Socioeconomic Effects Technical Report*. The SEIS indicates that Alternative 2B would increase the number of summer vehicles and would, therefore, exacerbate the problem. For instance, traffic on Main Street is estimated to rise by approximately 2 percent, and the additional vehicles, particularly RVs, would increase the parking problem. Related to RV parking, the Draft SEIS reported that there is more RV capacity in Juneau than was anticipated to be needed under the road alternatives. Moreover, the private sector would respond to an increased demand, either through enlarging current parks or building new ones, and developing additional RV-related services, including increasing capacity, RV rental businesses, and RV supply services. See Section 3.1.4.2 in Appendix EE for more information.

Group 455

Topic/Subtopic: Socioeconomic Resources/Community Infrastructure Impacts

Group Comment Text:

There should be plans for emergency ferry service and for maintaining existing terminals.

Group Comment Response:

This comment appears to be largely premised on the concept of the East Lynn Canal Highway being extended all the way to Skagway, and ferry service being eliminated entirely north of Juneau. This project expressly rejected Alternative 2, which would have extended the road to Skagway, because historic landmark property around Skagway is protected by Section 4(f) of the Federal DOT Act and cannot be used for transportation projects when other prudent and feasible alternatives exist. All alternatives considered in the Draft SEIS would maintain ferry terminals at Haines, Skagway, and Auke Bay. For Alternatives 2B and 3, there would be provisions for providing ferry service between Juneau and Haines/Skagway in winter when avalanches close the road or when other emergencies make ferry service necessary.

Group 392

Topic/Subtopic: Socioeconomic Resources/Crime

Group Comment Text:

- A) Road accessibility will increase crime, vandalism, and drug/alcohol related incidents in all three communities and along the road.
- B) Vandalism and petty crime is a concern for the unattended terminal area.
- C) People would be out of cell phone range and unable to call police to report damage.
- D) Police resources would not be able to monitor the area or respond quickly.

Group Comment Response:

A) The Draft SEIS addressed impacts of each of the reasonable alternatives in Chapter 4, and specifically, subsections titled “Socioeconomic Resources” addressed crime. For example, Section 4.3.5 addressed Alternative 2B, and under the subheading “Utilities and Public Services” addressed crime, indicating that the JPD had discussed the potential for increased crime and believed “there is not enough evidence or precedents to suggest that simply improving access would affect the nature and rates of local crime.” The Final SEIS has been modified to add additional detail related to the concerns expressed.

B) There is the potential for petty crime and vandalism at proposed remote ferry terminal sites. While the ferry terminals may not be staffed continuously, they would be visited frequently. At the Katzehin Ferry Terminal under Alternative 2B, for example, in summer ferries (with staff) would arrive eight times per day from Haines and six times per day from Skagway, for a total of 14 visits per day. AMHS currently operates other unattended terminals and deals with vandalism. Final design and operating plans would address ways to minimize vandalism, littering, and loitering.

C) The GCI Inc. talk and text coverage map indicates service is available at the proposed Katzehin Ferry Terminal site and much of the Alternative 2B alignment. For Alternative 3, the map indicates service at the proposed Sawmill Creek and William Henry Bay Ferry Terminal sites. The map indicates coverage for Alternative 3 alignment is sparse. Sections of highway under Alternatives 2B or 3 with no phone coverage would be like any other remote rural highway in Alaska that does not have access to immediate communication. This is not unusual. If demand warranted, mobile phone service providers may provide service along the highway.

D) Alternative 2B falls partially in the CBJ (approximately 30 road miles north of Echo Cove to Eldred Rock) and partially in the Haines Borough (from Eldred Rock northward). Within the CBJ, the JPD would have been responsible for the primary response. The Alaska State Troopers based in Juneau would have provided the primary response for the segment of road north of the CBJ boundary. The Alternative 3 road on the west side of Lynn Canal lies within the Haines Borough. Under Alternative 3, the primary response would have come from State Troopers based in Haines. The ferry terminal areas under Alternatives 2B and 3 are much less remote than some other parts of Alaska. Nonetheless, it is acknowledged that response to those areas could take time.

Group 315

Topic/Subtopic: Socioeconomic Resources/Method of Analysis

Group Comment Text:

The use of the AASHTO methodology in the user benefit analysis was inappropriate as it was not intended to be used on projects that involve a new road in an undeveloped area or modes of travel other than roads and highways.

Group Comment Response:

Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*, acknowledges the challenges of employing a traditional AASHTO methodology in evaluating projects involving modes of transportation other than roads. However, the AASHTO methodology, customized for the JAI Project with the specific modifications noted in the User Benefit Analysis, remains the best available approach for measuring user benefits associated with each alternative. Further, sensitivity analysis allowed for testing of model inputs and results most closely related to problematic aspects of the AASHTO methodology, such as frequency delay costs.

Group 402

Topic/Subtopic: Socioeconomic Resources/Method of Analysis

Group Comment Text:

A) If the anticipated life of a ferry is 50 years, why is the economic study only 36 years?

B) Is the cost of replacing ferries and the associated lifetime upgrades/overhauls included in economic study?

Group Comment Response:

A) The economic analysis period of 36 years (under Alternative 2B, 6 years of construction and 30 years of operation) is based on the inability to project traffic substantially beyond 30 years.

B) The economic studies for the Draft SEIS include all costs within the 36-year period, including vessel maintenance, refurbishment, and replacement as well as highway maintenance.

Group 404

Topic/Subtopic: Socioeconomic Resources/Method of Analysis

Group Comment Text:

The economic and traveler statistics resulting from a flawed travel demand model are biased and unverifiable.

Group Comment Response:

The traffic forecast model is not flawed or biased. It was developed based on empirical data derived from actual travel conditions observed in Alaska and Western Canada from communities with similar geographic characteristics as Juneau. It was validated against

existing travel demand by ferry within Lynn Canal. To forecast traffic demand for each of the alternatives, the model considered various factors relating to travel time, cost, and convenience of travel. The impact analysis is not based on mere assumption. The analysis is done by professionals with expertise doing this type of analysis, is based on sound methodologies, and uses updated baseline data. Section 3.1.4.2 of Appendix EE, *Socioeconomics Effects Technical Report*, describes the methodology used to estimate the number of new visitors, and the resultant indirect effects are described throughout the document.

Group 654

Topic/Subtopic: Socioeconomic Resources/Method of Analysis

Group Comment Text:

The socioeconomic impacts in the Draft SEIS are out of date and not fully captured, and the methodology is not adequately explained. Specific issues include:

- A) The household survey data that is the basis for the socioeconomic effects is nearly 20 years old and does not capture online shopping.
- B) The survey conducted in 2003 asks the residents about their preferences of three potential access options, one of which is no longer viable under this project, and it does not ask about the preferred alternative identified in the Draft SEIS.
- C) Recreational and summer travel are stated uses for the project, but the survey did not include tourists or non-car/walk-on travelers.
- D) The *Socioeconomic Effects Technical Report* (Appendix EE) does not provide updated survey data, has vague methodology, and it does not point out what questions were asked and in what platform they were asked.

Group Comment Response:

A) The results of the 2003 household survey were provided as background information. These results were not used in developing the travel model for the Draft and Final SEIS, nor was the household survey used as the basis for the socioeconomic effects. As part of the preparation of the Draft SEIS, all socioeconomic baseline data and impacts were reviewed and updated where appropriate. As evidence, see the updated Appendix EE, *Socioeconomic Effects Technical Report*. This report is a revised assessment of the 2004 *Socioeconomic Effects Technical Report* documenting the potential socioeconomic effects of improved access to Juneau. It includes detailed socioeconomic baseline data for Juneau, Haines, and Skagway. This report was updated based on the latest U.S. Census information, comprehensive plans, and other relevant socioeconomic information.

B) The results of the 2003 household survey were provided as background information. These results were not used as the basis for the socioeconomic effects.

C) The commenter seems to be objecting to the use of survey data that was relied upon in the 2006 Final EIS. At that time, a household survey was used to provide information for the traffic forecast. In the 2014 Draft SEIS, a different methodology was used to forecast

traffic. As a result, no new surveys were conducted for the Draft and Final SEIS as they were not needed.

D) The commenter seems to be confusing interviews conducted for updating socioeconomic data with the more formal household survey method undertaken in 2003. It is true that the formal survey in 2003 had a more detailed methodology. Nonetheless, Section 1.2 of the 2014 *Socioeconomics Effects Technical Report* (Appendix EE of the Draft SEIS) describes the methodology used to conduct the interviews. It states “Primary research includes interviews with Juneau, Haines, and Skagway businesses, government, and other community representatives. In addition, executive interviews were conducted with State and local government agencies throughout the research process in order to gather data and assess the effects of the various transportation alternatives.” Moreover, in sections where direct interviews were cited, additional information is presented on what type of information was asked and gleaned from the interviews. Interview materials are cited in the reference list and are a part of the administrative record for the project.

Group 552

Topic/Subtopic: Socioeconomic Resources/Population/Income/Housing Impacts

Group Comment Text:

Senior citizens are an increasing demographic:

A) It is a hardship to expect them to drive the long distance on the road to get to things like medical appointments. What happens to senior citizens who cannot drive anymore?

B) Mainliners with accommodations for sleeping, eating, and shopping for miscellaneous over-the-counter medicines and comfort needs are important for seniors making the trip.

Group Comment Response:

A) Living in rural communities nationwide involves driving, sometimes long distances, to hub communities that typically have larger populations and greater services. Roads generally have been considered an improvement in access between communities that allow people access to the services and social outlets they need. For those who do not own cars or who no longer drive, alternate transportation services are typically available. Private transportation companies would have likely provided service on the road alternatives should demand have developed. Based on the comments, additional detail has been added related to senior citizens and other travelers that may not be able to drive. See Section 3.1 of Appendix EE, *Socioeconomic Effects Technical Report*, and Sections 4.3.5 and 4.4.5 of the SEIS for more information on the social effects from the road alternatives.

B) The change in mode from primarily ferry service to primarily road service in Lynn Canal would have had an effect on the conveniences to which ferry travelers have become accustomed. Similar to road travel elsewhere in Alaska, travelers would have needed to plan ahead and bring medications, food, and other personal items with them as those services would not have been available on the short ferry runs associated with the road alternatives. Sleeping arrangements will not be provided on the Alaska Class Ferries operating in Alternatives 2B and 3. It should be noted that mainliner ferries would still have operated routes between Juneau and points south and would have continued to

provide the same conveniences they do now.

Group 554

Topic/Subtopic: Socioeconomic Resources/Population/Income/Housing Impacts

Group Comment Text:

Haines population and services are at their limit. How will community services be able to accommodate the additional 90 people forecast?

Group Comment Response:

Section 4.3.5.3 of the SEIS discusses population, economics, housing, and municipal revenue for Haines and indicates a projected population increase of approximately 90 people as a result of Alternative 2B. The same discussion indicates an increase of 60 jobs, and those jobs would be expected to meet the needs of new residents for services. With the additional jobs, population, and economic activity, additional tax revenues are anticipated to rise commensurately to cover increases in service demand.

Group 555

Topic/Subtopic: Socioeconomic Resources/Population/Income/Housing Impacts

Group Comment Text:

Developable land is in short supply, as is residential housing. The project would destroy houses. Competition for land use will be high, especially between resident housing in Juneau versus need for increased RV camping infrastructure. The SEIS needs to reconsider limited current land use and housing issues before stating that “the private sector would respond to an increased demand and develop additional RV-related services, including increasing capacity...”

Group Comment Response:

An examination of Juneau housing stocks for this project indicated that there were several hundred vacant housing units, sufficient to accommodate the modest population increase that might occur under Alternative 2B. The project under any alternative would not destroy housing or relocate any people from their homes. The SEIS indicates that greater visitation to Juneau by RVs likely would result in greater demand for RV parks, discloses that current capacity is unlikely to meet demand, and discloses that suitable land for new RV parks may not be easy to find. The SEIS text has been modified slightly to further indicate that if the private sector were unable to develop enough new RV park capacity, the impacts likely would include (1) greater use of pullouts and commercial parking lots by RVs, and (2) an eventual reputation for lack of capacity (e.g., in online reviews and in guidebooks) that likely would dampen demand and reduce visitation by visitors in RVs. See the “Industry/Commercial Sectors” subheadings in the Socioeconomic Resources sections for each alternative in Chapter 4.

Group 558

Topic/Subtopic: Socioeconomic Resources/Population/Income/Housing Impacts

Group Comment Text:

The availability of ground-based ambulance service will be a time and cost benefit, as private air ambulance service from Haines or Skagway is prohibitively expensive. This cost savings is a quality of life benefit.

Group Comment Response:

The SEIS indicates that patients from outlying communities often are evacuated to Juneau for medical treatment and indicates that such transport from Haines and Skagway would be made easier with a road, although air evacuation may remain the method of choice when time is critical. This topic is addressed under “Utilities and Public Services” in the Socioeconomic Resources sections of Chapter 4, for each alternative.

Group 660

Topic/Subtopic: Socioeconomic Resources/Population/Income/Housing Impacts

Group Comment Text:

The Draft SEIS claimed that “improved access” from the project would make it “somewhat easier and faster to transport patients.” Helicopters or planes are utilized in emergency situations, so a road would provide no additional benefit in those situations. The Draft SEIS did not demonstrate how road access better meets the healthcare needs of people in Haines and Skagway.

Group Comment Response:

The quoted material is from the Socioeconomic Resources sections of Chapter 4. Implementation of all project alternatives would improve access to the communities in Lynn Canal; therefore, all of the alternatives would improve access to health care facilities. Most emergency medical situations are handled by air in Lynn Canal, and this would continue regardless of the alternative selected for the proposed project. The “easier and faster” sentence has been altered in the SEIS to clarify that the road would benefit the transport of patients more often on a routine basis than in emergency situations.

Group 440

Topic/Subtopic: Socioeconomic Resources/Quality of Life

Group Comment Text:

A) How is quality of life defined? What are its measures?

B) How is quality of life included in the economic case?

C) How are intrinsic qualities such as quality of life evaluated and considered?

Group Comment Response:

A) Quality of life is not defined for purposes of the SEIS but, as indicated by the text, is defined differently by different people. The SEIS discloses the socioeconomic impacts. Under the subheadings “Quality of Life” in Chapter 4 of the SEIS, results of surveys

conducted by others and the general trade-offs in values held by residents of affected communities are discussed. Whether the changes and tradeoffs are positive or negative to the quality of life will vary by reader.

B) Quality of life is not directly represented in economic discussion, such as the User Benefit study in Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*.

C) The entire SEIS is essentially a presentation of quality of life issues, allowing the public and decision makers to better understand and weigh the factors of adverse impacts and benefits of the various alternatives. Monetary costs of transportation, the quality of views, the ability to see or hunt wildlife, cultural attachment to places (and many other topics discussed in the SEIS) are all aspects of quality of life. The SEIS discusses the broad issues of quality of life inherent in a community's relative isolation under the subheadings "Quality of Life" referenced above.

Group 450

Topic/Subtopic: Socioeconomic Resources/Quality of Life

Group Comment Text:

How were costs/value of wild/undeveloped spaces and wildlife considered in estimating the cost of the road?

Group Comment Response:

DOT&PF and FHWA have disclosed the environmental consequences of the proposed alternatives in the Draft and Final SEIS, including the indirect effects described in the comment. A cost-benefit analysis that attempts to compute a dollar figure for the types of impacts identified above would be highly speculative and not a wise use of public funds. Consistent with NEPA regulations, the indirect impacts analysis provided in Chapter 4 discloses the potential impacts quantitatively when possible, and qualitatively when not. See in particular the discussion under Land Use, Visual Resources, Socioeconomic Resources, Noise, and Wildlife under the discussion of environmental consequences for each alternative in Chapter 4.

Group 550

Topic/Subtopic: Socioeconomic Resources/Safety - Highway/Ferry

Group Comment Text:

Increased access would prevent quarantine in case of disease.

Group Comment Response:

Quarantine would typically confine people to homes or health care facilities, not shut off an entire community from all contact with the outside world. If controls were necessary, they would be instituted by governments on advice of public health officials regardless of the transportation modes available at any given community. Increased access for each of the alternatives still includes a ferry link, so controlling a quarantine by limiting access would not be vastly different than the current situation.

Group 193

Topic/Subtopic: Socioeconomic Resources/Tourism/Economic Impacts

Group Comment Text:

Alternative 2B would improve/increase access to the Kensington Mine, resulting in future growth/expansion of the mine and increased opportunities for associated businesses, providing economic benefits to local communities.

Group Comment Response:

Section 4.3.1.3 of the Draft SEIS described changes to the Kensington Mine anticipated to result from road access under Alternative 2B. The anticipated effects are mostly related to improved access for workers. Conversations with the mine owners indicated that the presence of the road is unlikely to be the sole reason for development of new mineral deposits at the mine. Section 4.3.5.2 of the Draft SEIS, under the “Industry/Commercial Sectors” subheading, indicated no change to the overall operation of the mine was expected because barging in supplies and barging out mine products directly is likely to remain most cost-efficient.

Group 494

Topic/Subtopic: Socioeconomic Resources/Tourism/Economic Impacts

Group Comment Text:

The Draft SEIS statement that the road alternatives create more jobs is misleading:

- A) Ferry jobs are longer term than construction jobs.
- B) The road alternative would reduce the number of ferry jobs available for Alaska residents.
- C) Other than potential construction and maintenance jobs, the road would not result in overall economic benefits.

Group Comment Response:

The Socioeconomic Resources subsections of Chapter 4 address jobs. Section 4.3.5 addresses jobs for Alternative 2B (Section 4.3.5.2 for effects in Juneau).

- A) The document bases economic effects on projected traffic volumes and known spending patterns to determine that the additional traffic is likely to translate to additional permanent new jobs to serve the additional traffic. Likely new residents also would be based on the same numbers. These new jobs and new residents would occur after construction was complete and Alternative 2B was in operation. See also Response B, below.
- B) The concept that Alternative 2B would reduce the overall number of ferry jobs is not accurate. Table 12 in Appendix GG, *Marine Segments Technical Report*, indicates that the number of crew hours served in northern Lynn Canal under Alternative 1 – No Action would be fewer than the number of crew hours on the shuttle ferries (Day Boat ACFs) under Alternative 2B, and that overall ferry operating costs (of which staff time is a large component) would be higher under Alternative 2B than under Alternative 1 – No Action.

This indicates jobs would not be reduced under Alternative 2B. The locations of some jobs may change, as indicated in Section 4.3.5.

C) The analysis in the Draft SEIS has been re-examined and found to be reasonable. Increased traffic is expected to lead to a modest increase in jobs and population due to greater economic activity in Juneau, Haines, and Skagway. See responses above and Section 4.3.5 under subheadings for each community. Note that the purpose of the project, as stated in Section 1.4, is related to transportation demand, travel opportunity, travel times, and State and user costs of transportation in the corridor. The purpose of the project is not to provide explicit economic benefits to the State economy or to the economies of the communities served. The impacts are reflected in the Draft and Final SEIS.

Group 511

Topic/Subtopic: Socioeconomic Resources/Tourism/Economic Impacts

Group Comment Text:

The analysis in the Draft SEIS that the road will decrease freight costs is flawed and does not fully disclose information:

- A) It is inconsistent with what is reported in Appendix EE, *Socioeconomic Effects Technical Report*.
- B) It does not address changes in cost to items like groceries.
- C) It does not adequately address transportation costs as it does not recognize the reduction in marine transportation with the purchase of Northland and the lack of competition that has resulted in higher shipping costs to all of Southeast Alaska.
- D) It does not recognize that it costs twice as much in freight charges to ship via Alaska Marine Lines (AML) down the highway from Anchorage as it does to ship the same commodities from Seattle on the AML barge.
- E) It does not recognize that the availability of different modes of transportation can drive down the cost of shipment.
- F) It does not cite any specific evidence that the project will improve the transport of freight up and down Lynn Canal.
- G) It does not disclose existing rates for shipping goods via the AMHS.
- H) It does not estimate what the costs would be to deliver freight to Haines along the highway.
- I) It has an unrealistic assumption that hauling freight by truck for 91 miles to Katzehin and then transferring the freight to a day boat for final delivery to Skagway is cheaper than utilizing the current AMHS.

J) It fails to disclose and evaluate the fuel and time costs associated with loading and trucking freight from Juneau to Katzechin for transfer to a ferry for delivery to Skagway.

K) There should be a study of these distances from the ferry terminals to towns and how they affect the cost of living in these towns. The more centralized the shipping and receiving ports are, the lower the cost of living.

L) Freight from Juneau to Haines would not be a lower cost because AMHS does not require a driver for every container, while road transport would. The SEIS needs to consider the cost of the driver in the analysis.

M) A number of statements are not supported by any financial or analytical data.

N) Backhaul assumptions are not supported by data and are questionable.

Group Comment Response:

General Response: The Draft SEIS does evaluate the effects of the alternatives on freight movement. The Draft SEIS and the *Socioeconomic Effects Technical Report* (Appendix EE) explain that most freight would continue to move by barge under these alternatives. Barge transport has the advantage of being relatively low cost but has the disadvantage of being slow. Alternatively, air shipment is faster but has a higher cost. Highway transport under Alternatives 2B and 3 offers a third option with faster delivery times than a barge to Seattle or locations in other Lower 48 states at a lower cost than air freight. Neither of the highway alternatives evaluated in the SEIS (Alternatives 2B and 3) would provide a direct highway connection to the continental highway system. However, it is anticipated that the higher frequency and low costs of the short shuttle links associated with these alternatives would be advantageous to trucking some freight and would generate truck shipping of fresh fish and other products. Additional information regarding freight shipment changes resulting from the road alternatives has been added to Sections 4.3.7 and 4.4.7 of the Final SEIS and Sections 3.1.4 and 3.1.5 of the *Socioeconomic Effects Technical Report*.

A) The analysis and text has been checked and inconsistencies were not identified. The *Socioeconomic Effects Technical Report* (Appendix EE) and SEIS are consistent and have been updated with new information.

B) Based on the comment, additional information has been added to address changes in cost to items like groceries. The analysis indicates that for the more than 97% of containers shipped by barge, none of the alternatives will change those shipping costs. The SEIS inaccurately indicated that freight shipping costs would go down for containers shipped in Lynn Canal by ferry. For Alternatives 2B and 3, unaccompanied containers will not be allowed on the ACF shuttle ferries, requiring those containers to be driven on the proposed highway, and drivers would need to accompany those containers on the shuttle ferry. Because of the labor, this could increase costs by 5% to 10% for Alternative 2B (to Haines and Skagway, respectively) and 10% to 58% for Alternative 3 (costs to Skagway are higher, accounting for the need to take the Haines-Skagway shuttle ferry). These potential cost increases are for the 2.6% of containers that would be shipped in this manner.

- C) Consideration has been given to reflect the lack of marine transportation competition that has resulted in higher shipping costs to all of Southeast Alaska. The commenter is correct that the analysis does not address changes to freight competition because none of the alternatives are anticipated to create a substantive change in the methods of freight shipment. Therefore, little effect to freight shipment competition is anticipated.
- D) The SEIS does not identify a cost advantage for shipping over the road as compared to barging freight. In fact, the SEIS anticipates that freight delivery to Juneau will continue to be primarily by barge, with little change predicted even for Alternatives 2B and 3.
- E) Analysis was included to reflect that the different modes of transportation (air, trucking, and barge) have different cost structures. The SEIS anticipates that the proposed alternatives will have little effect on freight shipment modes.
- F) The SEIS does not predict that the alternatives will result in major changes to how freight is shipped in Lynn Canal. To the contrary, the SEIS anticipates that barges delivering container vans from Seattle will continue to be the primary mode of freight shipment to Lynn Canal communities under any of the alternatives.
- G) Existing rates for shipping goods via the AMHS have been included in Appendix EE, *Socioeconomic Effects Technical Report*.
- H) Estimates of costs to deliver freight to Haines via the highway and shuttle ferry have been included, with the most detail in Appendix EE (*Socioeconomic Effects Technical Report*) under discussion of the transportation industry.
- I) Evaluation of hauling freight by truck to Katzeihin and then transferring the freight to a Day Boat ACF for final delivery to Skagway as compared to use of the current AMHS has been supplemented, with most detail in Appendix EE, *Socioeconomic Effects Technical Report*.
- J) Information has been added to disclose and evaluate the fuel and time costs associated with loading and trucking freight from Juneau to Katzeihin for transfer to a ferry for delivery to Skagway, with most detail in Appendix EE, *Socioeconomic Effects Technical Report*.
- K) The JAI Project SEIS is addressing very specific transportation needs in Lynn Canal and is not a general study of effects ports may have on the cost of living in Southeast Alaska. The distance that freight needs to be trucked from the ferry terminals to town has been included in the analysis in Appendix EE, *Socioeconomic Effects Technical Report*. The SEIS indicates that none of the alternatives will have a major impact on how freight is shipped in Southeast Alaska or in Lynn Canal. Barging of containerized vans will continue to be the dominant method of freight shipping under any of the alternatives. Because freight shipment methods are not anticipated to change substantially, there would be little to no change in cost of living due to freight shipments.
- L) Discussion has been added to consider the cost of the driver in the analysis, with most detail in Appendix EE, *Socioeconomic Effects Technical Report*.

M) Where possible, the analysis has been updated to include financial or analytical data.

N) Appendix EE, *Socioeconomic Effects Technical Report*, does not indicate that “Lots more freight will be going by road instead of by air and instead of by a barge, and, therefore, backhaul rates should go down.” To the contrary, the SEIS predicts that barging would continue to be the dominant method of freight distribution. Similarly, the SEIS does not predict that lots of freight that currently travels by air would shift to trucking over the road. The SEIS does not indicate that back-haul rates would be reduced. What the SEIS anticipates is that for the fish processing industry, which currently flies fresh fish out of Juneau (or for other industries with time sensitive products), the ability to truck that product to markets would be less expensive than air freight and quicker than barging. This would create an opportunity and potential benefit to these industries (primarily anticipated to be the fresh fish market).

Group 514

Topic/Subtopic: Socioeconomic Resources/Tourism/Economic Impacts

Group Comment Text:

A) Alternative 2B will draw businesses from Haines and Skagway to Juneau.

B) Haines and Skagway would experience reduced tourism.

Group Comment Response:

A) The SEIS discloses the types of impacts described by the comment. See Section 4.3.5.3 for economic impacts to Haines and Section 4.3.5.4 for economic impacts to Skagway. The SEIS reports that on a regional basis, improved access would result in a net gain to Juneau’s local retail industry, and Haines and Skagway could realize some loss in certain types of retail sales such as durable goods. For Alternative 2B, increased spending in Juneau may be offset by increased visitor spending in Haines and Skagway, though a shift in consumer type may have an impact on the types of retail businesses in Haines. Additional information is presented in Appendix EE, *Socioeconomic Effects Technical Report*.

B) Economic impacts related to tourism are disclosed in the SEIS, primarily in Section 4.3.5, Socioeconomic Resources. Alternative 2B would substantially increase access to the east Lynn Canal coastline for recreation and tourism, and increase visitation to Haines and Skagway. Tables 4-20 and 4-21 report the “Projected Traffic and Resulting Visitor Economic Impacts” due to Alternative 2B to Haines and Skagway in 2020, respectively. The analysis suggests 89,000 new visitors annually in 2020 will visit Haines over the visitation anticipated with Alternative 1 – No Action (Table 4-20). For Skagway, new visitors in 2020 are anticipated to be 105,400 annually over the visitation estimated with Alternative 1 – No Action (Table 4-21). As discussed in the Draft SEIS, all of the project alternatives are projected to increase independent tourist visits to Lynn Canal communities; however, Alternatives 4A and 4C are anticipated to have the least effect on independent visitor traffic (Section 4.5.5). Alternatives 2B and 3 are projected to result in the largest increase in independent tourist visits (Section 4.3.5 and 4.4.5). Regarding concerns that the Haines-Skagway shuttle will affect the “Golden Circle Tour.” The ferry would be sized to

accommodate the forecast demand for this link. Additional information is presented in Appendix EE, *Socioeconomic Effects Technical Report*.

Group 551

Topic/Subtopic: Socioeconomic Resources/Tourism/Economic Impacts

Group Comment Text:

How will local hire be incorporated, especially when it is larger, Lower 48 construction firms that have the ability to construct projects of this magnitude?

Group Comment Response:

Section 4.8.4, Construction Impacts, Socioeconomic Resources, addresses the workforce. The Draft SEIS indicated the percentage of the workforce assumed to be from outside Juneau, Haines, or Skagway for Alternative 3 and not for others (for example 75% of the workforce is assumed to be from outside of Haines, for Alternative 3). For the Final SEIS, this kind of information has now been included for Alternative 2B, and a paragraph has been added to explain that the construction effort is not great enough under the other alternatives to create a substantial influx of construction workers from outside the region. In general, the Draft SEIS acknowledged that a large influx of workers from elsewhere would be likely for construction of the alternatives with substantial road components. Neither the Draft SEIS nor the Final SEIS suggest that the work could be completed entirely by a local workforce.

Moreover, there are restrictions on the use of local hiring when using FHWA funds. First, the Common Grant Rule contains a regulation prohibiting the use of geographic preferences. Thus, the USDOT does not allow grant recipients to use geographic hiring preferences in FHWA-assisted projects. Second, FHWA has general statutory mandates requiring full and open competition in the award of contracts. These statutes have been interpreted and applied as prohibiting all economic and social contracting requirements on FHWA federally-assisted projects that do not relate to the cost-effective use of federal funds.

Group 559

Topic/Subtopic: Socioeconomic Resources/Tourism/Economic Impacts

Group Comment Text:

The Draft SEIS underestimated the long-term economic benefits of the project. The ability to access and provide goods and services more rapidly and cheaply to and from Juneau will benefit all businesses and consumers in the Lynn Canal region. This will, in turn, expand the economy and provide opportunities for even more new businesses to flourish. The analysis needs to consider the cumulative economic benefits from the following activities:

- Independent traveler and/or visitor industry indirect growth and development;
- Social, cultural, commercial, and recreational interactions among Juneau, Haines, Skagway, and Whitehorse, including economic benefits from providing more options for shopping, cultural events, school, and general travel;
- Increased utilization of businesses and organizations along the road as a result of improved access;

- Opportunities for additional enterprises and employment in Juneau, Haines, and Skagway;
- Seafood industry access to markets and decrease in shipping costs;
- Shorter ferry lengths that are the most restrictive part of the transportation route;
- Reduction in prices and freight shipment for goods due to competitive shipping options; and
- Increased Municipal sales tax revenues (plus hotel, liquor and tobacco taxes).

Group Comment Response:

The *Socioeconomic Effects Technical Report* (Appendix EE) and the Socioeconomic Resources section of each alternative discussion in Chapter 4 of the SEIS explain the possible economic impacts of project alternatives. DOT&PF and FHWA have reviewed the suggestions and believe that the benefits described are already captured in the cited material. The alternatives that have the highest proportion of new roadway (Alternatives 2B and 3) are projected to have a greater beneficial effect on the economies of Lynn Canal communities than the predominately marine alternatives. This would result from a projected increase in tourist traffic, which would increase spending and jobs in Lynn Canal communities. Highway alternatives would also reduce transportation costs. Improved transportation resulting from Alternative 2B may impact some small businesses by providing access to competing businesses in other locations, but would also provide more potential customers for new and existing businesses. It is likely that the higher frequency and low costs of the short shuttle links associated with these alternatives would generate some truck shipping of fresh fish and other products. Both highway alternatives would have permanent ferry and highway jobs in addition to the temporary highway construction jobs created. Both alternatives would have a three-vessel shuttle system in Lynn Canal with permanent ferry crews in addition to permanent highway maintenance jobs and seasonal avalanche control jobs.

Group 560

Topic/Subtopic: Socioeconomic Resources/Tourism/Economic Impacts

Group Comment Text:

Would the terminal be better located closer to downtown Juneau? This would lower the cost of shipping more than the current proposed terminal location.

Group Comment Response:

Part of the purpose of the project (Section 1.4) is to reduce costs to users and costs to the State while better meeting demand in the corridor. Providing shorter ferry runs allows for more frequent ferry service at lower costs to users and reduces operating costs to the State per vehicle served. Reducing the ferry run time allows for use of Day Boat ACFs rather than ships that must house the entire crew and pay expensive overtime for shifts greater than 12 hours. It is for these reasons that the ferry terminals are moved north under the road alternatives. Most shipping (e.g., groceries and household goods) is by barge, not by ferry, and this would be expected to continue for all affected communities under all alternatives. Moving the Auke Bay Ferry Terminal south to the downtown Juneau area would add extra construction costs to the alternatives and extra operating costs because of the longer run up Lynn Canal.

Group 567

Topic/Subtopic: Socioeconomic Resources/Tourism/Economic Impacts

Group Comment Text:

A) The proposed road would ultimately reduce jet service to/from Juneau, shrinking an existing economy and increasing the cost of living in the project area even more.

B) The Draft SEIS claims that improved access to Lynn Canal is likely to have a negative impact on air taxi operators. This contradicts the previous claim that improved access will create a closer link to the communities. Currently, communities are as close as a 45-minute plane ride.

Group Comment Response:

A) The proposed road under Alternative 2B is not anticipated to have a measurable effect on jet service to/from Juneau. While the road would compete with commuter air travel between Juneau and Haines or Skagway it would not be an attractive modal option for travelers flying in and out of Juneau by jet. Jets do not serve Haines or Skagway, and the communities that are served by jet service from Juneau are too great a distance and the trips leaving Juneau by jet are likely too time sensitive to be affected by the road.

B) A statement that improved surface transportation in Lynn Canal would reduce business for air taxi operators does not contradict a statement that improved surface transportation would improve linkages for the affected communities. An important aspect of the SEIS is to describe both beneficial and adverse impacts. It is possible to have an overall benefit to travelers in general, while also having an adverse effect on one transportation industry, in this case, air taxi operators. As is explained in Section 4.4.7.5 of the Draft SEIS, construction of any of the build alternatives would divert some traffic from air taxis to the improved Lynn Canal surface transportation. The improved access in Lynn Canal would facilitate the movement of goods and people through and to the northern Southeast Alaska region. This would create closer social, cultural, and economic links between the communities of Juneau, Haines, Skagway, and Whitehorse. However, air taxi operators could see reduced activity and business.

Group 570

Topic/Subtopic: Socioeconomic Resources/Tourism/Economic Impacts

Group Comment Text:

A) What are the economic impacts to the commercial and sport fisheries due to the potential adverse effect to the five species of Pacific salmon?

B) How will impacts to local commercial fishermen be mitigated?

Group Comment Response:

A) Per the comment, Section 4.3.13 of the Final SEIS describes the effects of Alternative 2B on fish habitat and potential impacts to the commercial and sport fisheries. The five species of Pacific salmon were identified as potentially affected species during preliminary consultation with NMFS to determine the scope of field surveys in 2003 (Section 3.3.2.1 of the Draft SEIS). The impact analysis for marine and freshwater habitat and species,

including EFH, under the build alternatives determined there would be no measurable effect on regional populations of any fish species.

B) The analysis provided in the Draft SEIS indicates that no loss to the commercial or sport fishery would occur (Sections 4.3.13, 4.4.13, 4.5.13, and 4.6.13 of the Draft SEIS); therefore, no additional mitigation is proposed beyond the measures agreed to by the NMFS related to impacts to EFH.

Group 571

Topic/Subtopic: Socioeconomic Resources/Tourism/Economic Impacts

Group Comment Text:

A) How will the proposed road result in economic gains/losses for Juneau, Haines, and Skagway?

B) Under Alternative 2B, the increase in trade and commerce in the region could provide significant new revenue into the local governments of Juneau, Haines, and Skagway.

Group Comment Response:

A) The economic impacts of the alternatives, both positive and negative, are disclosed in the SEIS. See in particular Section 4.3.5 and 4.8.4, “Socioeconomic Resources.” The improved access in Lynn Canal that would result from Alternative 2B would facilitate the movement of goods and people through and to the northern Southeast Alaska region. On a regional basis, improved access would result in a net gain to Juneau’s local retail industry, and Haines and Skagway could realize some loss in certain types of retail sales such as durable goods. Population and the overall demographics of Juneau, Haines, and Skagway would not be substantially affected by the improved access resulting from Alternative 2B. As presented in Section 4.8.4 of the Draft SEIS, all project alternatives would create construction jobs, with Alternatives 2B and 3 creating the most jobs. All project alternatives except Alternatives 4A and 4C are projected to increase employment in Juneau (Section 4.8.4.3 of the Draft SEIS), and, depending on the alternative, Haines and/or Skagway primarily as a result of increased visitors (Sections 4.3.5, 4.4.5, and 4.5.5 of the Draft SEIS).

B) The effects of Alternative 2B related to local government revenues are discussed in the SEIS and Appendix EE, *Socioeconomic Effects Technical Report*. See SEIS Section 4.3.5.2 for Juneau impacts, Section 4.3.5.3 for Haines impacts, and 4.3.5.4 for Skagway impacts. Appendix EE, Section 3.1.4.2 reports the effects of the East Lynn Canal Highway on Juneau, Section 3.1.4.3 reports effects on Haines, and Section 3.1.4.4 reports the effects on Skagway. In 2020, as reported in the Draft SEIS total additional visitor spending in Juneau would generate approximately \$630,000 in additional sales tax revenues, approximately \$380,000 in Haines, and approximately \$190,000 in Skagway.

Group 572

Topic/Subtopic: Socioeconomic Resources/Tourism/Economic Impacts

Group Comment Text:

In regards to impacts to Skagway from the proposed project:

A) How was the figure of 105,000 more visitors determined? These are likely summer visitors only. Are they tourists or Alaskans?

B) What is the source of the projected \$3 million in new payroll and the 85 new jobs?

C) Why does the Draft SEIS assume all additional ferry crew personnel and families would choose to relocate from Juneau to Skagway?

Group Comment Response:

A) The increase of up to 105,400 annual visitors is extrapolated from the annual average daily traffic projection for Alternative 2B. Appendix EE, *Socioeconomic Effects Technical Report*, describes how the figure was calculated. The term “visitors” refers to non-local trips and includes trips made by tourists from out of State and Alaska residents that do not reside in the community being visited. Like the general distribution of all trips across the year, more “visitors” are anticipated in summer months (May to September) and fewer in winter months. The Draft SEIS reported (Appendix AA, *Traffic Forecast Report*) that summer average daily travel demand is anticipated to be 1.61 times the annual average daily travel demand.

B) The 85 new jobs and \$3 million in new payroll in Skagway are economic calculations based on the traffic projection and the pattern of spending by visitors. These are projections based on assumptions and visitor spending data, and the multiplier effect of such spending experienced in Southeast Alaska. Such calculations are fairly typical and are tools for comparing alternatives using a consistent system. Details on the calculations and sources of information can be found in Appendix EE, *Socioeconomic Effects Technical Report*.

C) Alternative 2B would change the home port of a Day Boat ACF from Auke Bay (Juneau) to Skagway. There would not be crew quarters on the vessel, and the expectation would be that crew would need to find their own lodging in Skagway. The economic assumption is that the crew would no longer find it conducive to live in Juneau and pay for a hotel or other lodging in Skagway.

Group 665

Topic/Subtopic: Socioeconomic Resources/Tourism/Economic Impacts

Group Comment Text:

A) Ferry service will be reduced to a point where Juneau will be extremely difficult to reach for outsiders, and Southeast Alaska residents will find it more inconvenient and expensive to buy in Juneau stores. Online buying will take out another piece of Juneau's economy.

B) Cost of goods coming into Juneau have risen anywhere from 10 to 20 percent. These costs are not mentioned or considered in the Draft SEIS.

Group Comment Response:

A) This comment is made based on the assumption that the road under Alternative 2B will not be available for most of the months of the year (presumably due to winter conditions), and that ferry service, being reduced, will make Juneau more difficult to reach. The basic assumption is flawed. DOT&PF and FHWA believe the SEIS accurately discloses the most likely scenario—that the highway may be closed limited days each winter, and that if such closures were expected to be lengthy, one or more ferries would be available for transportation in Lynn Canal (at levels similar as Alternative 1 – No Action). The project would not affect ferry services currently offered outside Lynn Canal to and from communities to the south and west. Overall, under Alternative 2B, Juneau would be easier to reach. It is unlikely that this project would be responsible for a shift to online buying instead of visiting Juneau.

B) Barge service and the changes in costs of items barged to Juneau would be unlikely to be affected by the project. These changes are driven by market forces and the decisions of barge and transportation companies. The Socioeconomic sections of Chapter 4 indicate that barge service would likely remain the mode by which most freight would be shipped to Juneau under any alternative.

Group 669

Topic/Subtopic: Socioeconomic Resources/Tourism/Economic Impacts

Group Comment Text:

The Draft SEIS claimed that with the project’s improved access, there will be an increased demand for public services (at a greater cost to local governments), but it will be offset by higher property tax revenues (at a greater cost to the local residents). How would that benefit anyone?

Group Comment Response:

The Draft SEIS discloses impacts on local government, including the demand for public services. It does not claim this is a benefit. Benefits are derived by travelers who would use the project alternatives in the form of lower costs, increased flexibility and opportunities to travel, and shorter travel times. See Appendix EE, *Socioeconomic Effects Technical Report*, for more detailed information on impacts to local government expenditures. Appendix EE estimates the amount of additional sales tax revenue that could be generated by each alternative, but other expenditures are not quantified.

The SEIS does not indicate the proposed alternatives result in a “great cost” to local governments. In Section ES 1, describing effects common to all alternatives, Appendix EE of the SEIS explains that “local governments would be affected by improved access in several ways. These include increased demand for public services in remote areas of the Juneau and Haines boroughs as well as outlying Skagway areas, and increased demand for public utilities associated with increased traffic and population growth. Expenditures in these areas would be offset by increases in sales tax revenues from travel-related spending and increases in property tax revenues an increased cost to residents. Other tax revenues,

such as bed taxes, would also increase.”

7.21 Subsistence

Group 545

Topic/Subtopic: Subsistence/Existing Conditions

Group Comment Text:

The Draft SEIS lacks sufficient subsistence harvest and use data for herring and other subsistence resources.

Group Comment Response:

The Draft SEIS relied on the latest available information and data. Reporting of subsistence use in the Draft and Final SEIS is based on the USFS *Tongass Resource Use Cooperative Survey* (1988), ADF&G, Division of Subsistence, *Subsistence Resource Use Patterns in Southeast Alaska: Summaries of 30 Communities* (1994), and Scoping comments. Existing levels of subsistence harvest are discussed in Section 3.1.6 of the Draft SEIS and Section 3.2.4 in Appendix DD, *Land Use Technical Report*, of the Draft SEIS.

Customary and traditional use of herring is noted in Section 3.1.6 of the Draft SEIS and Section 3.2.4 in Appendix DD. Except where specifically called out, herring is included on the subsistence figures and in the text under the general category of finfish.

Project impacts to subsistence resources are discussed in Section 4.2B.6, 4.3.6, 4.4.6, 4.5.6, and 4.6.6 of the Draft SEIS and Sections 4.1.4.2, 4.1.5.2, and 4.1.6.2 of Appendix DD. FHWA has determined that none of the reasonable alternatives would significantly restrict subsistence uses.

Group 544

Topic/Subtopic: Subsistence/Method of Analysis

Group Comment Text:

FHWA has not fulfilled its obligations under the Alaska National Interest Lands Conservation Act of 1980 (ANILCA).

Group Comment Response:

FHWA has met its obligations under ANILCA. Section 810 of ANILCA (16 USC Section 3120) requires an evaluation of the effects on subsistence uses of projects located on federal lands. ANILCA (Section 803) defines subsistence uses as the “customary and traditional uses by rural Alaska residents of wild, renewable resources for direct personal or family consumption as food, shelter, fuel, clothing, tools, or transportation; for the making and selling of handicrafts articles out of non-edible byproducts of fish and wildlife resources taken for family or personal consumption; for barter, or sharing for personal or family consumption; and for customary trade.” As defined in ANILCA, “rural” residents live in a community or area that is “substantially dependent on fish and wildlife for nutritional and other subsistence uses.”

Title VIII of ANILCA (Section 810(a)) requires that an evaluation of subsistence uses and needs be completed as part of any federal agency determination to “withdraw, reserve,

lease, or otherwise permit the use, occupancy, or disposition of public lands.” Specifically, ANILCA 810(a) requires an evaluation based on three specific issues:

- 1) the effect of use, occupancy or disposition on subsistence uses and needs;
- 2) the availability of other lands for the purpose sought to be achieved; and
- 3) other alternatives that would reduce or eliminate the use, occupancy, or disposition of public lands needed for subsistence purposes (16 USC § 3120).

The Draft SEIS evaluated potential impacts to subsistence uses protected under ANILCA and concluded that no alternative would significantly restrict subsistence usage. Project impacts to subsistence resources were discussed in Sections 4.2B.6, 4.3.6, 4.4.6, 4.5.6, and 4.6.6 of the Draft SEIS and Sections 4.1.4.2, 4.1.5.2, and 4.1.6.2 in Appendix DD, *Land Use Technical Report*, of the Draft SEIS. FHWA has determined that none of the reasonable alternatives would significantly restrict subsistence uses.

Group 546

Topic/Subtopic: Subsistence/Operation/Maintenance Impacts

Group Comment Text:

A) What regulatory changes are DOT&PF and other agencies recommending to address increased competition for subsistence and recreational hunting and fishing resources that will result from Alternative 2B?

B) How will these regulations be enforced?

C) What will enforcement cost the municipalities/boroughs and the State?

D) How will already problematic/restrictive harvest regulations further target indigenous people harvesting resources in the area?

Group Comment Response:

Note: regulatory/management changes for recreational/commercial hunting/fishing is discussed in Group #126.

A) FHWA and DOT&PF are not aware of any agency proposing regulatory changes. It is not anticipated that regulatory changes will be needed to address increased competition for subsistence and recreational hunting and fishing resources as a result of Alternative 2B. Communication with ADF&G in January 2016 confirmed that no additional staff will be required to manage additional harvests that may occur as a result of Alternative 2B. Section 4.3.15.3 of the Final SEIS has been updated to address ADF&G management of several wildlife species due to the Alternative 2B road.

As discussed in Section 4.1.4.2 of Appendix DD, *Land Use Technical Report*, increased access from the project could result in ADF&G considering management actions to ensure sustainable harvests of some species (e.g., moose). Possible management actions could include shortening of seasons, reduction in bag limits, the use of drawing permits, and more active monitoring and enforcement duties by State and federal agencies. It is unknown at this time if these actions would occur or exactly what they would entail.

B) Harvests in Alaska are dually managed by the State and federal governments, and both have their own legislation and enforceable regulations (see Section 3.1.6 of the SEIS and Section 3.2.4 of Appendix DD, *Land Use Technical Report*). However, as discussed under Response A, no new regulations have been identified at the time of this SEIS, so additional enforcement is not foreseeable.

C) As no new regulations have been identified at the time of this SEIS, the change in cost of regulation enforcement cannot be quantified.

D) The Draft SEIS and Appendix DD, *Land Use Technical Report*, note that some resources are already strictly regulated. This will not change as a result of this project. As there have been no new regulations proposed at the time of this SEIS, the potential impact to users from this project are not reasonably foreseeable.

Group 547

Topic/Subtopic: Subsistence/Operation/Maintenance Impacts

Group Comment Text:

How will construction, increased traffic, and access from the road alternatives affect competition and impacts to subsistence resources?

Group Comment Response:

The Draft SEIS and Appendix DD, *Land Use Technical Report*, provide a summary of subsistence analysis completed for the project. Section 3.1.6 of the Draft SEIS and Section 3.2.4 of Appendix DD includes a discussion of subsistence harvests and use areas for each community. Project impacts to subsistence resources are discussed in Section 4.2B.6, 4.3.6, 4.4.6, 4.5.6, and 4.6.6 of the Draft SEIS and Sections 4.1.4.2, 4.1.5.2, and 4.1.6.2 of Appendix DD. FHWA has determined that none of the reasonable alternatives would significantly restrict subsistence uses.

7.22 Terrestrial Habitat

Group 47

Topic/Subtopic: Terrestrial Habitat/Operation/Maintenance Impacts

Group Comment Text:

A) Construction of a highway alternative would increase invasive species and damage habitat. Once invasive species are established, eradication can be expensive and difficult.

B) The Draft SEIS did not address/incorporate information on the current presence or effects of invasive species and fungal and insect-vectored diseases, or provide measures to prevent their spread. Invasive plants such as reed canarygrass and knotweed are spreading in Southeast Alaska.

C) The SEIS should examine the potential for invasive species to spread as a result of project activities and identify management measures to prevent the spread of invasive species.

D) How will roadside vegetation and invasive species be controlled during construction and operation of the highway alternatives?

E) The SEIS should include a commitment to controlling roadside vegetation and invasive plants.

Group Comment Response:

A) As stated in the Draft SEIS in Section 4.3.14, 4.4.14, 4.6.14, and 4.8.10, invasive plant species could be introduced from visitors, vehicles, and pets for the road alternatives during construction and operation. Sections 5.4 and 5.12.1 of the Draft SEIS included measures employed during construction to reduce the spread of invasive species. Once the project is complete, road maintenance activities would be subject to the DOT&PF BMPs for controlling the spread of invasive species.

B) The Final SEIS addresses invasive plant species in Section 3.3.3. DOT&PF's commitment to mitigating, reducing, or eliminating vectors for invasive species to colonize areas affected by project activities is included in Section 5.4. Per the comment, NMFS's personal observation of infestations of reed canarygrass and Japanese knotweed have been incorporated into Section 3.3.3.

C) The potential for invasive species spread during construction is discussed in Section 4.8.10 of the Draft SEIS. As standard practice during construction, equipment and materials are expected to be free of invasive species. All road materials are expected to be generated from within the project limits. Any new materials brought into to the site would be from a quarry or commercial processing yard and would be free of invasive species. Once the project is completed, road maintenance activities would be subject to the DOT&PF BMPs for controlling the spread of invasive species.

D) During construction, DOT&PF would employ mitigation measures to avoid and minimize the potential for invasive species encroachment by not utilizing soils or seed mixes containing invasive species and cleaning construction equipment prior to use on the project. DOT&PF employs an integrated vegetation management plan to control vegetation along the highways post construction. The plan provides for the use of herbicides in locations where they may be cost effective and safe for the environment. Any use of herbicides by DOT&PF would be done in accordance with all applicable State and federal rules and would use BMPs to protect the environment. DOT&PF would provide advanced notice to the public prior to using herbicides on any highways.

E) DOT&PF commitments to controlling vegetation and invasive plant species during construction and long-term use of the highway are provided in Chapter 5 of the Draft SEIS.

Group 51

Topic/Subtopic: Terrestrial Habitat/Operation/Maintenance Impacts

Group Comment Text:

A road running through the root system of the Tongass National Forest will damage the health of the forest and endanger all living things in it.

Group Comment Response:

The potential effects of alternatives with highway development on the overall health of the Tongass National Forest ecosystem are evaluated and disclosed in the Draft SEIS under the section headings for Terrestrial Habitat (Sections 4.3.13, 4.4.14, and 4.6.13). As noted in those sections, FHWA and DOT&PF did not determine that the proposed highway through forest lands would damage the overall health of the forest or endanger all living things in it. In addition, USFS, the agency charged with the management of the forest, has accounted for the possibility of a road along Lynn Canal in their forest planning. Management direction for the forest is set forth in the 2016 *Tongass Land and Resource Management Plan* (TLMP). The 2008 TLMP and its predecessor, the 1997 TLMP, designated two possible road corridors (one on the west side and one on the east side of Lynn Canal) as Transportation and Utility Systems.

7.23 Threatened and Endangered Species

Group 150

Topic/Subtopic: Threatened and Endangered Species/General

Group Comment Text:

USFWS has determined that the Alexander Archipelago wolf may have to be listed as endangered under the ESA due to a dwindling population, reduced habitat quality, and availability of their primary prey, Sitka black-tailed deer. The Draft SEIS did not adequately address these impacts to Alexander Archipelago wolf populations.

Group Comment Response:

On January 5, 2016, the USFWS published a “not warranted” 12-month finding in the Federal Register. The finding determined that the Alexander Archipelago wolf does not warrant federal protection under the federal ESA.

Section 4.3.15 of the Draft SEIS provided an assessment of project effects on terrestrial mammals, including wolves and Sitka black-tailed deer, due to habitat loss, avoidance of roads, and vehicle collisions. Per the comment, Section 4.3.15 of the Final SEIS includes the pertinent information from the 2004, 2005, and 2014 wildlife technical reports and incorporates recent information on the effects of increased hunting and trapping pressures on Alexander Archipelago wolves, as well as wolf habitat use and loss as a result of Alternative 2B.

Group 685

Topic/Subtopic: Threatened and Endangered Species/General

Group Comment Text:

Berners Bay is world-renowned for spring runs of eulachon and Pacific herring, and attracts record numbers of marine mammals like humpback whales and Stellar sea lions. Areas of Berners Bay have been designated by Congress as special management areas because of their critical importance to wildlife and human recreation. The project will put that in jeopardy.

Group Comment Response:

The potential impacts of project alternatives to the Berners Bay ecosystem are documented in the Draft SEIS. Sections 5.6, 5.9, and 5.12 of the Draft SEIS included mitigation measures to minimize and offset potential impacts to eulachon, Pacific herring, and marine mammals. These measures include timing in-water work activities to avoid critical timing for spawning and migrating fish species, as well as monitoring marine mammals during construction.

Group 55

Topic/Subtopic: Threatened and Endangered Species/Mitigation

Group Comment Text:

A) What monitoring and mitigation measures are in place for Steller sea lion displacement at Gran Point and Met Point during construction?

B) What measures will be taken to prevent public access to Gran Point and Met Point post construction?

C) Will real-time reporting results be available to the public during noise monitoring for Steller sea lions?

D) Why does the Draft SEIS provide a specific number of days listed to “record noise levels”?

Group Comment Response:

A) Measures described in Section 5.12 of the Draft SEIS were intended to minimize and mitigate potential displacement of Steller sea lions at the haulouts during construction of Alternative 2B. These measures included: not allowing barge landings within 1,000 of the haulouts; monitoring noise levels from blasting; and visually monitoring during blasting within 3,135 feet of the haulouts.

B) Sections 4.3.17.1 and 5.12 of the Draft SEIS noted that highway design elements have been incorporated into Alternative 2B to prevent motorists from leaving the highway corridor and approaching the haulouts. Post construction video monitoring at Grand Point would continue for 5 years to determine the extent of human access to the haulout and disturbance of Steller sea lions.

C) The noise monitoring proposed for Alternative 2B in Section 5.12 of the Draft SEIS would not involve real time reporting to the public. Information would have been recorded and reported to NMFS.

D) Noise monitoring proposed in Section 5.12 of the Draft SEIS for Alternative 2B that would have occurred at the haulouts during blasting would be conducted to verify the boundaries of the airblast zone of influence (the area where noise levels could disturb sea lions). The 10 days of monitoring would be sufficient for this verification.

Group 59

Topic/Subtopic: Threatened and Endangered Species/Sea lions - Impacts

Group Comment Text:

A) The Draft SEIS did not adequately consider environmental effects to Steller sea lions:

(1) The effects to estuarine habitat supporting prey species; and

(2) Impacts of blasting and other loud construction noises on sea lions hauled out in the Gran Point critical habitat area.

B) Acoustic effects of Day Boat ACFs on marine mammals in Berners Bay are a concern, especially during the spring months.

C) Evaluations of Alternative 3 should include an assessment of effects to marine mammals from acoustical disturbances from helicopter use, marine vessel use, pile driving, and construction noise near the coast or in marine waters. Impacts will be greater during the spring months when large aggregations of humpback whales and Steller sea lions occur in Berners Bay in association with schooling/spawning forage fish (e.g., eulachon and herring).

Group Comment Response:

A) FHWA and DOT&PF have been consulting with NMFS regarding the project and potential effects to Steller sea lions since 1994. Information and collaboration from consultation with NMFS is incorporated into the Final SEIS. The Final SEIS addresses impacts to Steller sea lions from Alternative 2B, including effects to prey species from impacts on estuarine habitat (Section 4.3.13) and effects from blasting and other loud construction noise at the Gran Point haulout (Section 4.8.12.7). Industry standard methods have been used to determine the potential impacts from blasting and other construction activities on Steller sea lions at Gran Point. Monitoring during blasting activities and underwater pile driving for the construction of Alternative 2B, as described in Section 5.9 of the Draft SEIS, would be used to minimize the potential effects to Steller sea lions.

B) Per the comment, Sections 4.4.15.1 and 4.6.15.1 of the Final SEIS address the impacts of acoustic disturbances to marine mammals from ferry vessel operations in Berners Bay. Alternative 3 would operate year round in Berners Bay while Alternatives 4B and 4D would operate in Berners Bay only in summer (May 15 to September 30).

C) Sections 4.4.15.1, 4.4.17, and 4.8.12 of the Draft SEIS addressed the impacts of noise disturbances to marine mammals. Per the comment, impacts related to noise from ferry operations are addressed in those sections of the Final SEIS. Impacts of construction of facilities in Berners Bay for Alternative 3 are addressed in the Section 4.8.12 of the Draft SEIS.

7.24 Transportation

Group 116

Topic/Subtopic: Transportation/Ferry Foot Passengers

Group Comment Text:

- A) The Draft SEIS did not adequately address the impacts to walk-on passengers.
- B) The Draft SEIS did not adequately consider costs to foot passengers. The SEIS analysis should consider the travel time and costs for walk-on passengers as well as vehicles.
- C) Walk-on traffic is not addressed equally under all alternatives.
- D) The analysis should include a forecast of walk-on traffic.
- E) How is access improved for walk-on passengers?
- F) Information about the projected change in the number of walk-on passengers is not provided.
- G) The Draft SEIS analysis highlighted the disproportionate treatment of federally mandated multi-modal solutions. Those choosing to walk-on or whoever cannot afford a vehicle will have fewer fare incentives. Pedestrian-transit traffic will be further displaced from multi-modal options as vehicle owners/users are advantaged via fare elasticity.
- H) Alternative 2B would have an adverse impact on a segment of the population that relies on pedestrian access. How will the transportation system support those who are unable to drive?
- I) The SEIS should address how walk-on passengers will get to the proposed Katzehin Ferry Terminal. While the Draft SEIS suggested private shuttles may be available, what will happen if they are not? Will they be safe, reliable, convenient, and affordable?
- J) DOT&PF should provide a shuttle and consider the additional expense of a shuttle bus (with driver).
- K) The Draft SEIS did not address impacts to airport travelers, including the logistics of traveling from Katzehin to the airport, parking at the airport or storage of vehicles, and scheduling issues for coordinating ferry and flight schedules.
- L) Using a family of four in a 19-foot vehicle as the basis for analysis ignores walk-on passengers. The reasons for walk-on travel can be very different than family travel (e.g., medical appointments, sports team travel, business trips, etc.).

M) The McDowell 2000 study estimated 45 percent of ferry passengers were foot passengers. This is the percentage that should be used in the SEIS as it is the most recent data.

Group Comment Response:

A) DOT&PF and FHWA recognize that Alternatives 2B and 3 will change how walk-on passengers will access and use the transportation system and that these changes will have impacts. The impacts to walk-on passengers for Alternatives 2B and 3 are addressed in Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS under the subheadings “Pedestrians and Bicyclists.” Based on the detailed comments and questions related to walk-on passengers, additional information has been included in the Final SEIS.

B) The impacts to walk-on passengers for Alternatives 2B and 3, including costs, are addressed in Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS under the subheadings “Pedestrians and Bicyclists.” Based on the comment, additional information about the anticipated fares for the various travel markets (walk-ons, single drivers with a vehicle, etc.) have been added to the Final SEIS.

The User Benefit Analysis reasonably accounts for walk-on costs. For example, an estimate of 2 to 4 percent of daily users for Alternative 2B would be walk-on passengers. Doubling or tripling the user cost (to account for shuttle service cost) of this small segment of the total traffic would have no consequential effect on the results of the User Benefit Analysis.

For Alternatives 2B and 3, DOT&PF and FHWA anticipate that current walk-on passengers will be in vehicles and are represented by the travel times reported in SEIS. For those who continue to choose to travel as walk-ons, they will need to obtain a ride to Berners Bay or Katzehin (whether via taxi, bus, or a friend), and thus are also represented by the travel times reported in the SEIS. Some commenters suggested that waiting for cabs, or friends, etc., to pick them up should be reported as part of the travel time for Alternatives 2B and 3. Under the current system and Alternative 1 – No Action (in fact, all the alternatives), walk-on passengers need to get to or from the terminals (whether via taxi, bus, or a friend), and therefore would have similar wait times.

C) From a walk-on passenger perspective, the marine alternatives (1B, 4A, 4B, 4C, or 4D) will operate very similar to Alternative 1 – No Action. Walk-on passengers are not anticipated to experience substantive changes or impacts under the marine alternatives as compared to the roadway alternatives (2B and 3), and therefore the discussion of impacts focuses on Alternatives 2B and 3 (Sections 4.3.7.5 and 4.4.7.5 of the Final SEIS). Clarification has been added to the SEIS to make these distinctions clearer.

D) Estimates of numbers of walk-on passengers affected by the changes anticipated under Alternatives 2B and 3 are reported in Sections 4.3.7.5 and 4.4.7.5 of the Final SEIS. The total amount of demand in the corridor (both walk-ons and vehicles) is captured and represented in the forecasts. As is discussed in the SEIS, DOT&PF and FHWA anticipate that with the primarily road alternatives, most of the travel would be via vehicle (i.e., not walk-on) and those that were accustomed to making their trip as a walk-on passenger

would use a vehicle. Under Alternative 2B, a substantial segment of current walk-on traffic would be expected to convert to personal vehicle travel.

Cost is currently the principal deterrent for ferry travel with a vehicle. As described in the Draft SEIS User Benefit Analysis, under the No Action and Enhanced Service alternatives, the roundtrip cost for a driver and standard vehicle is \$242. Under Alternative 2B, round-trip ferry costs for a driver and vehicle would be \$39 (Table A-13). Adding vehicle operating costs to the comparison results in \$244 for No Action and Enhanced Service and \$80 for Alternative 2B. This substantial decrease in the cost of travel would prompt many more travelers to take their own vehicles. Further, the substantial increase in overall traffic associated with Alternative 2B would represent many more opportunities for walk-ons to travel with family, friends, and acquaintances. Additional explanation has been added to Appendix AA, *Traffic Forecast Report*.

E) The road alternatives (2B and 3) represent a shift in the way transportation would be provided in the corridor—away from a primarily public transportation mode that operates more like a public transit service, to a highway system where private vehicles provide most of the transportation (shorter, publicly owned shuttle ferries would provide links connecting the roadways). It is true that DOT&PF and FHWA do not anticipate that walk-on passengers would continue to find it as convenient to travel as a walk-on. Passengers that want to continue to travel as walk-ons would need to drive or be driven for most of the route. The Draft SEIS anticipated that many current walk-on passengers that own vehicles would likely choose to travel by car if a highway were available in the Lynn Canal corridor. While they would need to drive or get a ride to the ferry terminal, they would benefit from the improved frequency of service (14 round trip ferries leaving from Katzehin) and travel times that are roughly half of Alternative 1 – No Action travel time. While it might be possible to assess in more detail how walk-on passenger costs could vary between the project alternatives, the analysis would have no meaningful impact on overall measures of each alternative’s economic efficiency or cost effectiveness because the number of walk-ons would be a small portion of overall traffic for the road alternatives. The number of walk-ons would be a relatively small part of Alternative 2B traffic because if that alternative truly represents a diminishment of service quality for walk-on travelers (as asserted in the comments), then none of the increase in traffic would be walk-on passengers.

F) For the marine alternatives, DOT&PF and FHWA expect that walk-on passenger levels would be similar under the build and no build alternatives. For the road alternatives, DOT&PF and FHWA do not anticipate that walk-on passengers would continue to find it convenient to travel as walk-on passengers, and therefore they anticipate most would drive. The vast majority of Lynn Canal region households have cars. For example, according to the U.S. Census Bureau’s 2010–2014 American Community Survey 5-Year Estimates, 7.6 percent of Haines households do not have a vehicle available, 33 percent have one vehicle, 37 percent have two vehicles, and 23 percent have three or more vehicles. In Juneau, 8.5 percent of households do not have a vehicle available, 35 percent have one vehicle, 39 percent have two vehicles, and 18 percent have three or more vehicles. Moreover, because the cost of taking a vehicle would be considerably less (because the trip length is so much shorter), there would not be the same economic incentive as there is now to travel as a walk-on passenger, and therefore few parking spaces are planned for Katzehin. For all of

these reasons, few walk-on passengers are anticipated.

G) While multi-modal solutions are not federally mandated, all of the build alternatives presented in the SEIS are multi-modal options. The anticipated fares for those choosing to walk-on or those who cannot afford a vehicle have been updated and disclosed in the Final SEIS. Based on the comments, the social impacts to those who cannot drive, including those to low income travelers who may not be able to afford a vehicle, have been updated in the Final SEIS.

H) DOT&PF and FHWA recognize there would be an adverse impact on passengers that do not or cannot drive. These impacts are disclosed in Sections 4.3.7.5 and 4.4.7.5 of the Draft and Final SEIS and in Appendix EE, *Socioeconomic Effects Technical Report*. For those unable to drive, the potential for bus/van service to develop between Katzehin and Juneau with Alternative 2B was evaluated and DOT&PF finds it likely that Alternative 2B would result in daily summer coach service linking Juneau, Haines, Skagway, and possibly Whitehorse. Winter service would be less frequent, with bus service offered perhaps every other day between Juneau, Haines, and Skagway.

I) As is disclosed in Sections 4.3.7.5 and 4.4.7.5 of the Draft and Final SEIS and in Appendix EE, *Socioeconomic Effects Technical Report*, passengers that want to continue to travel as walk-on passengers would need to drive or be driven to the Katzehin Ferry Terminal. Travelers without vehicles would be required to rent vehicles (or get a ride with a taxi or a friend), or travel on private carriers (if they develop). For those unable to drive, the potential for bus/van service to develop between Katzehin and Juneau with Alternative 2B was evaluated, and DOT&PF finds it likely that Alternative 2B would result in such service as the market develops.

J) DOT&PF will not provide a shuttle bus. FHWA and DOT&PF acknowledge that the highway alternatives would change an AMHS system that currently operates much like a public transportation system; however, as is explained in Section 1.4.1.1 of the Draft SEIS, the State's primary responsibility is to provide a transportation facility for vehicles, not the transportation itself. In summary, regarding the impact of Alternative 2B on walk-on travelers, ultimately if the number of unaccommodated walk-ons were a significant portion of the traveling public, the private sector would respond with commercial service. If the number of unaccommodated walk-ons were relatively small, commercial service may be less convenient and more costly. It is DOT&PF's responsibility to provide infrastructure that serves the largest number of travelers in the most efficient way possible, not fully serve the needs of every member of every segment of the traveling public. The user costs for Alternative 2B includes base mileage costs for the roadway component of that alternative.

K) Per the comment, additional information has been added to the SEIS in Sections 4.3.7.5 and 4.4.7.5 of the Final SEIS and in Appendix EE, *Socioeconomic Effects Technical Report*, discussing impacts to travelers who currently use the ferry as walk-on passengers to get to the Juneau Airport.

L) A family of four in a 19-foot vehicle was used as an example in the Draft SEIS to illustrate the relative out-of-pocket costs of alternatives. It was not the basis of calculating all user costs, nor was it the basis for the impact analysis. In Chapter 4, under the State and

User Costs section of each alternative discussion, the Final SEIS has been updated to show costs for other travelers, including walk-on passengers.

M) Walk-on passengers are included in the forecast of traffic in Appendix AA, *Traffic Forecast Report*, and the impacts to walk-ons are described in Appendix EE, *Socioeconomic Effects Technical Report*. The estimate of walk-on traffic suggested by commenters (45 percent) is from a study that is 16 years old. A comparison of the 2000 and 2015 AMHS *Annual Traffic Volume Reports* indicates vehicle traffic declined 14 percent between those years and pedestrian traffic declined 26 percent. These changing traffic levels result in a 2015 Lynn Canal walk-on rate of approximately 30 percent for the calendar year and approximately 34 percent for the summer.

If the same raw number of passengers that walked on in 2015 were to walk on under Alternative 2B, the resulting walk-on rate would be only 7 percent. It is anticipated under Alternative 2B that a number of current walk-on passengers will travel with their vehicle, reducing the percentage of walk-on passengers further.

Group 238

Topic/Subtopic: Transportation/Flexibility and Opportunity for Travel

Group Comment Text:

A) The proposed alternative would be more weather dependent and less reliable than existing AMHS service. No one can be certain how often the road will be closed.

B) The Draft SEIS failed to acknowledge potential road closures other than those caused by avalanches.

C) The Draft SEIS was misleading when it stated "Flying...is often the most practical way of getting around the region" because it failed to mention that flying is often not possible, even in summer.

D) Alternative 2B would not make travel more convenient, especially in winter.

E) If the Katzehin ferry sails on a space available basis, it may result in lineups and long delays. Can ferry service be adjusted to meet peak demand and avoid long delays? How can the system respond to changes in demand?

F) DOT&PF should reconsider the lack of reservation system because users are now at risk of missing flights, events, etc. as there is no guarantee they can board a specific sailing.

G) How will travelers know when to properly queue into the staging lanes prior to boarding?

H) Drivers will not be able to predict accurate arrival times to make a schedule deadline. This will result in hastened travel to reach the new terminal on time and will cause dangerous driving conditions, especially during inclement weather.

- I) Because of Juneau's remote location, improved roadway access may not alter travel logistics or induce more frequent travel.
- J) Alternative 2B unnecessarily complicates travel for thru-travelers (off loading at Auke Bay and then traveling to Katzehin).
- K) The 12-day avalanche closure is untested/unknown.
- L) There is no explanation in the Draft SEIS for moving from 35 closure days to 12 closure days.
- M) Winter driving would reduce travel opportunities because people would likely choose to stay home.

Group Comment Response:

A) DOT&PF and FHWA have disclosed the anticipated road closure effects due to weather and avalanches. Section 4.3.7.2, “Travel Flexibility and Opportunity,” of the SEIS describes the effects for Alternative 2B. The Draft SEIS reported that Alternative 2B could be closed an average of approximately 12 days per year. Service to and from Juneau during a road closure would be by one or more of the Day Boat ACFs that would be part of Alternative 2B.

B) The Draft SEIS does acknowledge and evaluate the potential for the road to be closed for other reasons. Landslides and other geological hazards for the roadway alternatives are discussed in Sections 4.3.8.3 and 4.4.8.1 of the SEIS. The likelihood of a slide event has been assessed and would be mitigated to the extent possible during highway design. Geotechnical studies during detailed design would identify appropriate locations for further alignment adjustments, rockfall barriers, and slope stabilization. These measures, along with the normal maintenance action of removing slide material from catchment ditches and shoulders, would make road closure due to slides an infrequent event. DOT&PF is staffed and equipped to repair damage from slides and to maintain the highway in operable condition.

C) The Draft SEIS does not indicate that flying is the “most practical way of getting around the region.” In fact, the Draft SEIS identified the very issues with air travel mentioned by the commenter. Section 1.2.4 stated: “Because of the relatively short travel times and schedule frequency, business travelers generally prefer air travel to the ferry system. Air service in the Lynn Canal corridor plays an important role in transporting passengers, freight, and mail; however, travel is often constrained by fog, high winds, or snowstorms and can be delayed up to several days in the fall, winter, and spring.”

D) The SEIS purpose and need does not specifically use the term “convenient.” However, an aspect of the purpose and need is to improve the flexibility and opportunity for travel. Under Alternative 2B, travelers would be able to make 8 round trips per day to Haines and 6 round trips per day to Skagway. In winter, 6 round trips per day are planned to Haines and 4 to Skagway. This flexibility to travel is compared to Alternative 1 – No Action, which has 1 round trip per day, 6 days per week (plus two mainline trips) to Haines, and in winter, three trips per week are anticipated to Haines (the second day boat travels between

Haines and Skagway). Essentially, travelers would be able to get to Haines the same number of times each day as they can get to Haines each week under Alternative 1 – No Action.

E) The Draft SEIS indicated that for the shuttle ferries at Katzechin, “some ferries may be at maximum capacity, resulting in travelers having to wait for the next ferry or change their preferred ferry time.” This is anticipated to occur during peak times (e.g. Friday afternoon on a 3-day weekend in the summer). The Draft SEIS indicated that during peak times and for specific events, additional sailings would be provided to meet the demand. In such cases, AMHS would add ferry trips by operating on longer daily schedules.

F) A reservation system is not proposed for Alternative 2B because it would increase cost and travel time. To accommodate reservations, Alternative 2B would require an AMHS staff person to be at Katzechin to check in travelers. It would also increase travel time because the ferry would have to load all reservations to determine how many standby travelers it could accommodate. This would have to be done late in the boarding process to accommodate late arrivals. The number of late arrivals is expected to increase because of the frequency of service. If a traveler misses their planned ferry connection, they would only have to wait a few hours for another sailing. Similarly operated systems throughout North America (e.g., in Washington State and British Columbia) and elsewhere typically do not use reservations on short ferry links like those in Alternative 2B and 3.

G) Because of the frequent, drive through loading and unloading nature of the ferry trip under Alternatives 2B and 3, travelers would not need reservations and would not need to arrive as early. It is anticipated that the ferries would operate on a first-come, first-serve basis, and travelers would queue as they arrive. Signage and instructions on queuing at the terminal would explain the procedures.

H) DOT&PF anticipates that ferries would be full only during peak times in summer. This may require those that miss the ferry to wait for the next shuttle. Drivers would need to plan their trips with sufficient time in their schedules.

I) The demand model used for this project was developed based on empirical data derived from actual travel conditions observed in Alaska and Western Canada from communities with similar geographic characteristics as Juneau. The model was based on the assumption that people in Juneau, Haines, and Skagway would exhibit similar travel behavior, given the opportunity to travel by road, as other similarly situated communities. Based on the project team’s research, there are no indicators that travel behavior in Juneau, Skagway, and Haines would differ substantially from that of other Alaskan and Canadian communities. Based on the data collected, DOT&PF and FHWA are confident that Juneau residents would travel in a similar manner to other Alaskan residents. Even today, Juneau residents travel only slightly less on a per household basis than the average Alaskan household, even though they do not have full road access.

Moreover, more than one approach to predicting future travel behavior was used by the study team. Two methods were selected as being most representative of likely conditions along Lynn Canal. Each of these two different models was developed independently and resulted in similar estimates of travel volume along Lynn Canal.

J) Chapter 2 of the Draft SEIS described Alternatives 2B and 3 as discontinuing mainline service in Lynn Canal and disclosed the effects caused by those travelers as a component of the overall traffic demand. Additional explanation has been added to Sections 4.3.7 and 4.4.7 of the Final SEIS to more clearly define the change in travel patterns that would be experienced by thru-travelers using mainline vessels in Alternatives 2B and 3.

K) DOT&PF has examined the maintenance issues and risk associated with avalanches using the best information available and appropriate analysis techniques, and has included avalanche risk mitigation in its design (avalanche sheds) and in its operating plan for Alternatives 2B and 3. DOT&PF and FHWA have disclosed the impacts of potential road closures and would mitigate those effects to the extent necessary so that travel delay would be minimized. DOT&PF and FHWA believe the SEIS discloses the most likely scenario—that the highway may be closed limited days each winter, and that if such closures were expected to be lengthy, one or more ferries would be available for transportation in Lynn Canal (at levels similar to Alternative 1 – No Action). Thus, even during road closures, travel flexibility and travel time would be no worse than currently, and at all other times would be a substantial improvement.

L) The estimated days of road closure was reduced for the Draft SEIS because the threat of road closures from some of the largest and or most frequent occurring avalanches has been mitigated by including snow sheds and other features in the design.

M) Adverse weather conditions makes any highway driving challenging. The project road alternatives would be similar during adverse weather conditions to many other highways in Southeast Alaska. Alternative 2B includes a new maintenance station facility that would be staffed full time, which would improve maintenance response times to address adverse weather conditions. DOT&PF and FHWA have disclosed the impacts of potential road closures and have mitigated those effects to the extent that travel delay should be minimized. DOT&PF has committed to running ferries in Lynn Canal if the road were to be closed for extended periods.

Group 634

Topic/Subtopic: Transportation/Flexibility and Opportunity for Travel

Group Comment Text:

The Draft SEIS did not discuss the link between Bellingham and Haines or Skagway. Will the existing ferry terminal still be used for ferries traveling south of Juneau?

Group Comment Response:

This project is focused on travel in Lynn Canal from Juneau northward. Mainline service south to Bellingham would be unaffected. The Draft and Final SEIS describe the alternatives in Chapter 2 and indicate that mainline ferry service would continue but would end at the Auke Bay Ferry Terminal and would no longer operate in Lynn Canal for Alternatives 2B and 3. Mainline ferry service would continue in Lynn Canal under Alternatives 1–No Action, 1B, and 4A through 4D.

Group 524

Topic/Subtopic: Transportation/General

Group Comment Text:

A) Why was the fast ferry taken off the northern Lynn Canal route?

B) How can DOT&PF be sure the Day Boat ACFs will succeed where the fast ferries failed?

Group Comment Response:

A) The engines of the FVFs (*Fairweather* and *Chenega*) were not designed to run at the speeds needed to make the two runs between Juneau and Haines/Skagway in a 12-hour window, seven days a week, as needed for day boat service in Lynn Canal. Having an FVF make only one round trip per day (which it could easily do) was considered unreasonable since there are other vessels that can also make one trip per day and there are other routes that need the speed of the FVF. Extending the operating day beyond 12 hours is not possible without crew quarters. Also, the FVFs were not designed for Lynn Canal and did not provide sufficient capacity.

B) The Day Boat ACFs are being designed to better meet AMHS needs in Southeast Alaska and can be used on several different AMHS routes. Following the AMHS's decision to construct the ACFs, each ferry segment was evaluated to determine if the Day Boat ACF could successfully function as a part of any of the alternatives developed for this project. Following this evaluation, the Day Boat ACFs were incorporated as components of alternatives where they would function appropriately. Also, the FVFs incorporated new technology resulting in ongoing maintenance challenges. The Day Boat ACFs are conventional ferries that rely on proven existing technology.

Group 525

Topic/Subtopic: Transportation/General

Group Comment Text:

How much more ship traffic can the Lynn Canal sustain? With water taxis, tiny tour ships, large cruise ships, barges, and ore ships, is there room for many more ship sailings on the canal?

Group Comment Response:

The travel frequency of ferries proposed to be operating in Lynn Canal is reported in Chapter 2 for each of the alternatives (under the subheading "Travel Frequency"). Lynn Canal is a large body of water and can sustain more vessel traffic than it receives today from a capacity standpoint. The impacts of the proposed ferry service under each of the alternatives are discussed throughout the Draft and Final SEIS. No alternative proposed ferry service frequency that would jeopardize or limit current uses in Lynn Canal.

Group 526

Topic/Subtopic: Transportation/General

Group Comment Text:

Was there a plan to tie Southeast Alaska together with roads and use short route ferries where bridges could not be built?

Group Comment Response:

The 2004 SATP was adopted by the Murkowski Administration and remains the current adopted SATP as DOT&PF continues to work on an update. The 2004 SATP does focus on extending roads where practicable, allowing for shorter ferry routes.

Group 279

Topic/Subtopic: Transportation/Method of Analysis

Group Comment Text:

A) The methodology for assigning fares is never explained in the Draft SEIS.

B) The supporting marine highway fare document referenced in the *Traffic Forecast Report* (Appendix AA) is not included in the Draft SEIS.

C) The Draft SEIS should have used the AMHS fare equalization study when developing the fares.

D) DOT&PF should consider reducing fares as it may increase ridership.

Group Comment Response:

A) The methodology for assigning fares is described in Appendix C of the *Traffic Forecast Report* (Appendix AA of the Final SEIS).

B) The Draft SEIS *Traffic Forecast Report* (Appendix AA) cited an “HDR Ferry Fares Memo” as an attachment. The cover page indicating this memo was to be an attachment was in error. The memo in question was not intended to be published as it was an internal HDR record of a telephone meeting between the DOT&PF project manager and HDR staff. The intention of the memo, written by an HDR staff member, was to provide internal communication to other project team members on the direction provided.

The original basis for all project fares was a referenced document available in the 2006 FEIS. The methodology was not changed for the 2014 Draft SEIS. A Marine Segment Fare Structures memo documenting the ferry fares has been developed and included in Appendix C of the *Traffic Forecast Report* (Appendix AA of the Final SEIS).

C) The AMHS Tariff Analysis was not finalized at the time of the public release of the Draft SEIS. The tariff analysis has been reviewed and considered in setting ferry fares in preparation of the Final SEIS. The tariff analysis may be viewed at [www.dot.state.ak.us/amhs/doc/reports/rate study 15.pdf](http://www.dot.state.ak.us/amhs/doc/reports/rate%20study%2015.pdf).

D) DOT&PF has considered reducing fares to increase ridership in the past but has concluded that increased ridership would not offset revenue lost. The 2015 AMHS Tariff Analysis determined AMHS fares were low compared to other ferry systems. Failure to raise fares to reflect inflation resulted in the need for increased State funding as the revenue to cost ratio decreased. Due to this result and the insistence of the Legislature that users bear a greater share of the costs, DOT&PF has raised fares. The Final SEIS reflects fare increases with the exception of Alternative 1B, which includes a 20 percent fare decrease to illustrate the likely effects of this approach.

Group 296

Topic/Subtopic: Transportation/Method of Analysis

Group Comment Text:

A) The 2014 McDowell *North Lynn Canal Ferry Service Analysis* indicated that the per-mile Lynn Canal costs for the *FVF Fairweather* fast vehicle ferry were lower than any other Lynn Canal vessel, but the Draft SEIS indicated that the fast vehicle ferry is the most expensive. Furthermore, the cost differential should be more carefully scrutinized; it seems unlikely that the *M/V Malaspina* wage per hour cost would be less than half that of the *M/V Matanuska*.

B) Different methods were used to estimate costs for mainline segments in the Draft SEIS; therefore, alternatives cannot be compared.

C) In Appendix GG, *Marine Segments Technical Report* (page 1 of Attachment A “AMHS Mainline Operating Costs”), the results for the Comparison of Vessel Operating Days Chart appear to be incorrect. The chart lists a total of 40.9 Mainline Days for the number of days the mainliners operate in North Lynn Canal. The number should be 55.5 days.

Group Comment Response:

A) The 2014 McDowell study indicating a low cost per mile for the *FVF Fairweather* is in error due to faulty data. The data is from year 2012 supplied by AMHS. Specifically, the *FVF Fairweather* is credited with 2,728 nautical miles in 5.8 days, resulting in approximately 470 miles per day. This inflated mileage for 6 days of expenses results in an artificially low cost/mile. The Final SEIS incorporates data supplied by AMHS for 2013. The *FVF Fairweather* is credited for 2,838 miles in 22.8 days for a daily average of 140 miles in Lynn Canal.

The commenter compared the *M/V Matanuska*'s hourly operating rate (wages and the operating expenses) against the *M/V Malaspina*'s hourly operating wage rate only.

B) Cost calculations for mainliner and day boat operations require separate methods because they are two different types of systems. The day boats are dedicated to project alternatives and can be thought of as stand-alone systems. The mainline vessels (part time operating in Lynn Canal) are tied to a much larger system and operate on schedules not necessarily optimized for Lynn Canal traffic. For calculating the dedicated day boat operating costs, cost estimate models were created that estimated annual vessel costs components, including crew cost, fuel cost, maintenance cost, vessel lay-up, and administrative overhead costs (see Chapter 5 of Appendix GG, *Marine Segments Technical*

Report). For the mainliner cost analysis, the cost component categories are non-fuel operating expenditures, fuel expenditures, shoreside costs and overhaul costs (see Chapter 6 of Appendix GG, *Marine Segment Technical Report*).

C) After the Draft SEIS was issued, it was discovered that the AMHS supplied data did not include a full 12 months of data. New mainline operating costs calculations using data from a complete fiscal year have been included in the updated Appendix GG, *Marine Segments Technical Report*.

Group 313

Topic/Subtopic: Transportation/Method of Analysis

Group Comment Text:

A) The Draft SEIS did not include an objective cost-benefit analysis. The assumptions and methods of the analysis are not valid.

B) The use of a "typical family of four" as the unit of analysis in the Draft SEIS does not reflect the majority of travelers.

C) Ferry travel time is only considered a cost when it should be considered a benefit. The Draft SEIS did not differentiate between the quality of time spent on a ferry versus time spent driving.

D) The User Cost discussion in Chapter 1 and Appendix FF (*User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*) of the Draft SEIS are at variance with each other.

E) The benefit-to-cost for Alternative 2B would be much lower if the analysis included a more realistic cost contingency calculation, AMHS capital and operating costs affected by taking Lynn Canal service out of the system, external costs, and the cost to ADF&G for fish and game management.

F) The analyses of user benefit, demand, and subsidy identification were skewed and favorable fares were selectively applied in the Draft SEIS to justify the selection of Alternative 2B.

G) The Draft SEIS overstated user costs.

H) A cost-benefit analysis or return on investment evaluation should be done in the SEIS. It needs to take into account whether indirect benefits (e.g., taxes from mining) outweigh indirect costs (e.g., increased costs of emergency services).

I) The cost-benefit analysis needs to take into account quality of life experiences for visitors and residents.

J) How does DOT&PF justify their selection of Alternative 2B as the preferred alternative in the Draft SEIS based on the results of the cost-benefit analysis?

K) Why was cost-effectiveness not used as an evaluation criteria in the Draft SEIS?

L) Contrary to law, it appears that FHWA gave no weight to cost benefit in its decision.

Group Comment Response:

A) The economic analyses in Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*, were completed by professionals using AASHTO methods as a starting point, but the analysis notes clearly that there were limitations because of the types of alternatives in this project. The analysis states how the methods were modified and why. DOT&PF and FHWA believe that such analyses represent the most valid approach to analyzing the economics of the alternatives given the challenges described. The assumptions and methods used in the analysis were reasonable and valid and were not biased toward the road alternatives.

DOT&PF and FHWA did not identify the Draft SEIS preferred alternative based solely on the economic analyses, nor are they required to. The analysis acknowledges that none of the action alternatives shows that economic benefits outweigh costs, and the alternative identified in the Draft SEIS as preferred is not better on this measure than other alternatives.

B) The cost scenario for a family of four was meant as an example of the travel costs; it was not meant to suggest that was the majority of the users. The word “typical” has been removed in Chapter 1. To help clarify, additional information about the anticipated fares for the various travel markets (e.g., walk-ons, single drivers with a vehicle, etc.) has been added to the Final SEIS. This appears under the “State and User Costs” subsections under Transportation for each alternative in Chapter 4.

Of note, user costs were calculated for all users, not just a family of four. Regarding the cost/value of travel time, assigning dollar costs to travel time is a reflection of the fact that all time has value. And all time has a cost in terms of trade-offs with other ways that time could be spent. If ferry travel were purely a benefit, then slower trips would have greater value than faster trips. Clearly, many Lynn Canal ferry travelers enjoy aspects of the ferry ride, but it is also true that most travelers prefer shorter travel times (fast ferry) to longer travel times (conventional ferry), all other things being equal. It is also true that some travelers would prefer driving their own vehicles to riding a ferry over the same route.

C) People value travel times differently based on various factors: work versus pleasure, weather conditions, etc. As used in the travel model coefficients, ferry travel time was not penalized the same as automobile travel time. The model gave 20 percent less weight to the ferry travel time compared to automobile travel time. In other words, the model coefficient was adjusted to account for the benefits of riding the ferry described by the comments. This relationship was derived from other regions that have ferry service and driving options and was used to validate the travel model results to existing ferry demands within the corridor. While tourists and some recreationalists may ride the ferry strictly for the pleasure of the ride, it is unlikely that people pay to ride the ferry in order to have a social experience or to do office work on their computer. They may enjoy the social aspects of the ferry or may get work done, but these are side benefits of ferry travel when the direct benefit is transportation between locations. Nonetheless, the 20 percent adjustment was made to account for differences in the perceived costs of time spent on ferries versus automobiles.

D) There is not a contradiction between the User Cost discussion in Chapter 1 and the analysis in Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*. Chapter 1 is designed to set the stage for discussion of adverse and beneficial impacts of the various alternatives in later chapters and is not derived from or connected to the detailed economic analyses in Appendix FF. The out-of-pocket family of four expenses shown in Chapter 1 is meant to illustrate the relative costs of ferry service and costs to drive one's own car and does not distinguish between alternatives. Table 33, Evaluation Summary, in Appendix FF, compiles data for all of the alternatives and is a much more detailed calculation than the material in Chapter 1. Examining all of Appendix FF, it is possible to see that each of the alternatives ranks higher or lower than others on different measures. None of the action alternatives is consistently "good" or consistently "bad." DOT&PF and FHWA took this into account when identifying a preferred alternative in the Draft SEIS.

E) Cost-benefit analyses could include a very wide array of inputs. Many of them are very difficult to monetize and would potentially make the cost-benefit analysis more controversial and more difficult to understand rather than less. The project used a reasonable approach consistent with accepted economic practices. DOT&PF and FHWA believe the cost-benefit analysis is a reasonable approach for comparing the economics of the alternatives, but it is just one consideration among an array of others addressed qualitatively and quantitatively in the SEIS. Benefit cost ratios described in the Draft SEIS are not intended to represent a full measure of all benefits and costs associated with project alternatives. In fact, benefit cost ratios described in Appendix FF, *Use Benefit, Life-cycle Cost, and Total Project Life Cost Analysis*, of the Draft SEIS are narrowly based on user (traveler) benefits alone and do not consider a wide range of other potential household, commercial, industrial, and community benefits associated with improved Lynn Canal access. The purpose of the economic efficiency and cost-effectiveness analysis conducted as part of the Draft SEIS was to determine which alternatives serve the largest number of travelers and the lowest possible cost.

F) DOT&PF and FHWA employed professionals and had them conduct economic analyses using accepted practices and reasonable assumptions. No favorable fares or other "skewed" inputs were used to favor Alternative 2B. Note, Appendix C of Appendix AA, *Traffic Forecast Report*, which describes the fare methodology. All "action" alternatives are shown to have a negative net present value, as shown in tables in the Transportation sections of Chapter 4, with greater detail in Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*. In fact, Alternative 2B does not rank best on most of the economic metrics reported in Appendix FF; if the economic analysis were skewed, one would expect a better outcome to have been reported for Alternative 2B. Please refer to the documentation added to Appendix AA.

G) Commenters indicate that the Draft SEIS overstated user costs for the ferry alternatives and understated user costs for the road alternatives, especially because of use of a hypothetical family of four. The Draft SEIS and Appendices AA and FF (*Traffic Forecast Report* and *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*) assessed costs for all users and were not dependent on a "hypothetical family of four." The family of four was only used as an example to illustrate user costs. Additions to the Final SEIS

present a broader range of example cost scenarios. See State and User Costs subsections in Sections 4.2B.7.4, 4.3.7.4, 4.4.7.4, 4.5.7.4, and 4.6.7.4.

(H) A cost-benefit analysis was completed for the Draft SEIS. However, it did not attempt to monetize every possible input. The SEIS addresses many topics qualitatively because they are difficult and controversial to monetize. DOT&PF and FHWA have disclosed the environmental consequences of the proposed alternatives in the Draft and Final SEIS, including the indirect effects described in the comments. A cost-benefit analysis that attempts to compute a dollar figure for the types of indirect effects identified in the comments would be highly speculative and not a wise use of public funds. Consistent with NEPA regulations, the indirect impacts have been disclosed quantitatively where possible, and qualitatively elsewhere.

(I) Quality of life is a broad concept without a standard and accepted definition and is difficult to monetize in a cost-benefit analysis (see also Response I, above). In general, the entire SEIS is meant to address topics relevant to quality of life. Regarding time spent on the ferry versus time spent in an automobile, see Response C, above. Minimizing time spent and costs incurred for travel are also elements that figure into quality of life for many.

(J) DOT&PF and FHWA considered the entirety of the Draft SEIS to identify their preferred alternative in the Draft SEIS. The decision was not made solely on the basis of the benefit-cost analysis.

(K) The cost-benefit analysis (see Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*) is one part of the entire SEIS, and it was considered in identifying the preferred alternative. The primary considerations are the elements of the purpose and need statement discussed in Chapter 1. The preferred alternative identified in the Draft SEIS balanced these benefits, taking into consideration the impacts described throughout the document and appendices. These are among the measures DOT&PF was looking for in this project, as identified in Chapter 1, Purpose and Need.

(L) NEPA and its regulations do not require a benefit-cost analysis to be completed but indicate that if such an analysis is completed, it must be attached to the EIS, and the EIS must treat it in context with other, non-quantified discussion. The Draft SEIS did attach the analysis in Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*, and included discussion in the “State and User Costs” subsections under Transportation for each alternative in Chapter 4. The material from Chapter 4 was summarized in the Executive Summary and Table ES-1. For greater clarity, the Final SEIS has been revised to include reference to Appendix FF (e.g. in footnotes to tables) in the “State and User Costs” subsections. The Final SEIS also has been revised to discuss in Section 4.1 (“Methods for Analyzing Impacts”) the relationship between the cost-benefit analysis and the Final SEIS analyses of other unquantified environmental impacts, values, and amenities.

Group 326

Topic/Subtopic: Transportation/Method of Analysis

Group Comment Text:

A) What price of gasoline was used to calculate the trip costs in the Draft SEIS?

B) Did DOT&PF consider increases in gas prices since 2009 in the Draft SEIS analysis (i.e., higher gas prices might affect traffic volumes)?

Group Comment Response:

A) Appendix AA, *Traffic Forecast Report*, was prepared in 2014 and used American Automobile Association (AAA) nationwide data from 2012 inflated to reflect Alaska gasoline prices. Vehicle operating costs were also tailored for local conditions. The final vehicle operating cost used was 26 cents per mile. The Final SEIS was updated using AAA 2015 data resulting in an operating cost of 25.7 cents per mile.

B) Economic modeling is sensitive to changeable costs such as gasoline costs and makes a reasonable assumption based on available data and trends. Even though gas prices have dropped as of late, the forecasting takes into consideration trends over the long term. Section 2.3 of Appendix AA, *Traffic Forecast Report*, notes limitations on predicting traffic for multiple alternatives over a 30-year timeline. The process uses traffic projection as a tool—a method that is as consistent as possible across alternatives for comparing alternatives at the time the decision needs to be made. Note that fuel prices affect not only the cost of travel by automobile but by ferry. If fuel costs increase or decrease substantially, it would affect the price of ferry passage as well, which in turn would affect demand for travel. However, the relative differences among alternatives are anticipated to remain generally consistent.

Group 614

Topic/Subtopic: Transportation/Method of Analysis

Group Comment Text:

The meteorological analysis' use of wind data from Eldred Rock in the Draft SEIS is wrong due to an equipment malfunction. The data from 2007 and 2008 should not have been included in the analysis as the data is likely to be inaccurate.

Group Comment Response:

Based on the comment, the project team contacted the National Weather Service (NWS). NWS does not have any records of the Eldred Rock Weather Station malfunctioning in the 2007-2008 time frame. The NWS indicated that invalid data is typically removed from the published data sets prior to it being published. In addition, wind data from Eldred Rock was not the only dataset used in the analysis. Published wind data from Skagway Airport, Eldred Rock, Point Retreat, and Cape Decision were all used as the basis to consider extreme value wind speed extrapolations to gauge sailing conditions. Because multiple data sets for multiple years have been used, DOT&PF and FHWA are confident that the resulting analysis acceptably describes the conditions for the purpose it was presented. Additional information would be collected as part of the final design process for the ferry terminals should the project's final design go with that solution. Project engineers would

consider new data from nearby wind stations in context of local topographic effects, and may set up project specific instrumentation to collect design-level data, if warranted.

Group 619

Topic/Subtopic: Transportation/Method of Analysis

Group Comment Text:

Why was “average daily ridership” used? It does not reflect which days there were ferries on a given route.

Group Comment Response:

“Average daily traffic” is a standard unit of measurement in traffic studies and helps to make commensurate comparisons between intermittent service options (ferries) and continuous service options (roads). Appendix AA, *Traffic Forecast Report*, addresses existing Lynn Canal traffic in Section 3, and “link volume” appears in Table 3-3 for the Juneau-Haines, Juneau-Skagway, and Skagway-Haines links. Volume of passengers and vehicles is given as an annual traffic total and as average daily passenger and average daily vehicles. Data also are shown in total for summer and summer peak week, and these too are broken down into average daily values. See also Table ES-1 in the Executive Summary of Appendix AA.

Group 620

Topic/Subtopic: Transportation/Method of Analysis

Group Comment Text:

Instead of using a model to predict how demand changes as a result of lowering fares, why were actual fares not lowered to test demand?

Group Comment Response:

Modifying fares only to generate data for an EIS is not justifiable or responsible stewardship of the AMHS. Over the years, AMHS has modified fares with incentives like a 30 percent discount for round trip purchases and driver goes free promotions. Increase in ridership was generally consistent with demand models. However, the percent increase in ridership was not enough to offset the fare discount, resulting in less revenue and, therefore, increased net cost. Recently the legislature mandated that fares be increased, as fares have not kept up with inflation and the State support required to keep the system operational has increased, even as ridership has grown.

Group 66

Topic/Subtopic: Transportation/Safety

Group Comment Text:

A) Why does DOT&PF want to pursue an alternative that is less safe and reliable than the existing AMHS?

B) The analysis in the SEIS should include greater detail on safety and the hazards and risks associated with traveling the proposed roadway.

C) Projections for fatalities and injuries on the proposed road are understated. The calculated death total is incorrect. Please provide the corrected information and revise to include fatalities and injuries associated with avalanches and other conditions.

D) The cost of fatalities needs to be considered in the cost-benefit analysis. What value does DOT&PF put on an individual life?

E) The analysis did not account for major and minor accidents and property damage.

Group Comment Response:

A) The purpose and need for the project was presented in Chapter 1 of the Draft SEIS and indicated why DOT&PF is pursuing this project. DOT&PF and FHWA have evaluated a range of alternatives to meet transportation needs that are designed to provide for safe and reliable transportation. The road portions of alternatives are expected to function like other rural Alaska highways and be as safe and reliable as other roads in the State. However, roads and ferries operate differently, and often due to human error, vehicle crashes do occur. The SEIS acknowledges that AMHS operations have historically resulted in fewer fatalities than Alaska roads.

Regarding reliability, the Draft SEIS acknowledges that adverse driving conditions would occur on the East Lynn Canal Highway in winter, but anticipates that State maintenance crews would keep the highway open under all but the most severe conditions. Such severe weather conditions may call for road closures. DOT&PF and FHWA have disclosed the impacts of potential road closures and have mitigated those effects to the extent that travel delays and closures would be minimized. In the event of road closures, ferries would be available for transportation in Lynn Canal at levels similar to Alternative 1 – No Action. Therefore, even during road closures, the reliability for travel under the proposed road alternatives would be at least as good as Alternative 1 – No Action.

B) The Draft and Final SEIS disclose the expected safety implications of driving, including fatalities and crashes. It also presents discussion of risks from avalanche, terrain, winter weather, and rockfall. The Final SEIS provides updates and corrections where necessary and discloses impacts that decision makers need to be aware of when ultimately selecting an alternative for funding and construction. Comments about safety have made clear that this is an issue the public is concerned about and that decision makers should consider carefully. Some commenters suggested that an information system and signs should be part of Alternative 2B to indicate ferry cancellations or winter driving conditions. DOT&PF already has a 511 road conditions system that the road alternatives would use. Other commenters suggested that the Seward Highway south of Anchorage and the East Lynn Canal Highway would be quite similar and that the East Lynn Canal Highway should have the safety features of the Seward Highway built in. DOT&PF identifies formal safety corridors based on use statistics. The Seward Highway had years of use with growing traffic before additional safety enhancements were installed. The East Lynn Canal Highway is projected to have 10 times less traffic than the Seward Highway; the much lower traffic would make for a statistically safer road. DOT&PF would continually monitor the new road and make safety improvements if warranted. The level of safety upgrades planned for the Seward Highway are not anticipated to be needed for the project given the much lower traffic forecasted.

C) Information on traffic related accidents and fatalities has been updated for the road alternatives in the Final SEIS. Sections 4.3.7.5 and 4.4.7.5 discuss traffic safety associated with Alternatives 2B and 3. The Draft SEIS contained a calculation error computing the number of fatalities that has been corrected for the Final SEIS. In 2025, Alternative 2B is anticipated to have approximately 39 crashes per year in the full 76 miles between Auke Bay and the Katzehin Ferry Terminal. During the 30-year operating period (2025–2055), it is estimated that Alternative 2B would result in approximately 1,156 crashes and 14 traffic fatalities in this area. Similar updates have been made for Alternative 3.

Trained, experienced avalanche technicians would monitor the project route on a daily basis. The technicians would use observations, weather station data, weather forecasts, and snow telemetry data to determine the hazard. The technicians would identify times when avalanche hazard is high and recommend avalanche control operations or preventative road closures when the hazard is high. Careful monitoring of avalanche conditions and preventative closures of the highway should prevent people from being in danger. Identified high risk avalanche locations have been effectively mitigated with the use of bridges, snow sheds, and elevated fills. All avalanche sites have been individually evaluated, and appropriate mitigation is proposed for each. Avalanche mitigation measures are described in the *Update to Appendix J – Snow Avalanche Report*.

D) There is no generally accepted “value” of an individual life in transportation economics or public policy economic analysis, in general. However, the cost of fatalities is considered in the Draft SEIS use benefit analysis. The cost of fatal accidents is one component of the 14.8 cents per vehicle-mile used to model traveler accident costs (see page 47 of Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses* in the Draft SEIS. This figure is a national average for all vehicle and accident types, including fatal accidents, injury (non-fatal) accidents, and property damage-only accidents. Incorporated into this cost per vehicle-mile average, the cost of a fatal accident is \$5.2 million, as measured in 2013 dollars.

E) The analysis does account for all accident types. As noted on page 47 of Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses* in the Draft SEIS, accident costs are calculated at 14.8 cents per vehicle-mile traveled. This figure is a national average for all vehicle and accident types, including fatal accidents, injury (non-fatal) accidents, and property damage-only accidents. (Sources: USDOT, National Highway Traffic Safety Administration, *Traffic Safety Facts 2008* and USDOT, FHWA, *Highway Statistics 2000*. Data are provided in AASHTO’s 2010 *User and Non-User Benefit Analysis for Highways*. Costs figures were adjusted for inflation to 2013 dollars.)

Group 67

Topic/Subtopic: Transportation/Safety

Group Comment Text:

A) How will people be able to contact help along the road? Will there be cell phone coverage along the route?

B) The proposed road should include safety enhancements, including: (1) cellular phone service along the route, (2) additional avalanche barriers and tunnels, and (3) DOT&PF web cameras to report road conditions.

C) Is the design appropriate for the type of vehicles that will use the road (e.g., oversized vehicles)?

D) When there is an accident in the tunnels, will there be enough room for movement and repairs?

Group Comment Response:

A) The published GCI cellular phone coverage map indicates there is talk and text coverage for approximately 80 percent of the Alternative 2B route. In addition, as a component of Alternative 2B, DOT&PF is proposing to construct a new maintenance station at Comet (MP 66) that will be staffed full time. Emergency services will be able to be contacted from the station.

B) (1) Cell phone service is not be provided by the State. The private sector could elect to provide additional service based on demand.

(2) Avalanche mitigation measures are described in the *Update to Appendix J – Snow Avalanche Report*. All avalanche sites have been individually evaluated and appropriate mitigation proposed for each. Identified high risk avalanche locations will be effectively mitigated with the use of bridges, snow sheds, and elevated fills. The high cost of additional snow sheds or avalanche barriers are not cost effective for the remaining avalanche sites.

(3) Two weather stations are included with road Alternatives 2B and 3, and their construction would be included in the highway construction contract. The weather stations include web cameras. The details on locations have not been identified; however, the costs for these stations have been included in the cost estimates for Alternatives 2B and 3, as shown in Attachment E to the *Update to Appendix D – Technical Alignment Report*.

C) The design proposed is appropriate for the type of vehicles that would use the road and could accommodate vehicles that exceed legal size or load limits. All elements of the roadway have been designed to support legal size and load limits. Vehicles that exceed legal limits require a permit issued by DOT&PF. The limiting road component for excessive weight is bridges. All bridges in Alaska are designed in accordance with the national bridge design code, the AASHTO *Bridge Design Specifications*. The current bridge design load is approximately 125 percent greater than the State’s legal highway load as defined in the Alaska Administrative Code (17 ACC 25.013, Legal Vehicle Weight). As

such, DOT&PF is able to permit, on a case by case basis, loads that exceed State legal limits.

D) If an accident occurred within the tunnels, the road may be closed depending on the extent of the accident. The width and height of the tunnels would be designed in accordance with the AASHTO *Technical Manual for Design and Construction of Road Tunnels*. Based on this reference, the pavement width within the tunnel would be a minimum of 2 feet wider than the pavement width at the highway, for a total pavement width of 34 feet. Pavement width includes travel lanes and shoulders. An additional 1.5-foot buffer would be included from the edges of pavement to the tunnels' edges. This is sufficient room to manage an accident site or perform tunnel repairs.

Group 78

Topic/Subtopic: Transportation/Safety

Group Comment Text:

A) The SEIS should provide additional information about how wind and/or waves have been addressed as there are concerns about the ferry and its ability to operate safely during high winds and winter months.

B) There is no information on the number of days that the ferry would not be able to dock at the Katzehin Ferry Terminal due to weather.

Group Comment Response:

A) Significant research was conducted on the wind and wave climatology in the Lynn Canal, as seen in the referenced “Lynn Canal Wind and Wave Climatology Study for Vessel Operations.” This study is based on the results of software that uses historical wind and geographic data to forecast nearshore wave heights.

The wind and wave data was used to analyze vessel operation in the referenced “Seakeeping and Motion Sickness Incidence” study. This study examined the chance of seasickness occurring on different sized vessels operating in Lynn Canal during the worst month of the year using a 95th percentile maximum wave height. (Vessels running between Auke Bay-Sawmill Cove-Katzehin and Haines-Skagway). Study results indicate, for vessels the size of the Day Boat ACFs, vessel motions would result in an acceptable level of seasickness, and at no time would vessel safety be compromised.

A third study, “Seakeeping and Motion Sickness Incidence - Sawmill Cove to William Henry Bay,” evaluated vessel operation on the Sawmill Cove to William Henry Bay route during the worst month of the year using the 95th percentile maximum wave height. Results of the study indicate that operation in the most severe weather would result in seasickness concerns and at no time would vessel safety be compromised. Specific to the Katzehin Ferry Terminal, a preliminary ferry terminal layout is presented in Attachment D of the *Update to Appendix D – Technical Alignment Report*. The design contains a breakwater to protect vessels from waves. The final terminal design will use the climatology study as a design basis for aligning and protecting the terminal. The three noted studies can be found on the JAI Project website.

B) For Alternative 2B, missed ferry sailings would likely be the result of wind and wave conditions in the middle of Lynn Canal and not at the ferry terminal sites. From the current data, an assumption of 1 to 6 days per year can be reasonably expected for days vessel cancellations may occur.

The upper magnitude wind speeds (1 minute average) in the middle of Lynn Canal in the Haines/Katzehin vicinity can vary 30 to 68 knots, causing mid-canal wave conditions that could potentially prevent ferry sailings. Based on the Glosten reports, these wind events can be expected to occur 1 to 5 percent of the time, primarily during the months of November through February. Assuming a period of 4 months, or 120 days, for the worst weather conditions, it can be assumed that 1 to 6 days per year may be subject to weather conditions that could prevent a ferry crossing. The projected number of sailings that would be missed depends on the number of sailings per day and if the inclement weather occurs during those sailing times.

Current data for the north and south wind directions suggests relatively low wave height (under 2 feet) near the Katzehin Ferry Terminal regardless of the magnitude of the wind event. The Katzehin Ferry Terminal is somewhat exposed to the westerly direction. There is no current data presented for the westerly direction. However, the fetch distance is short and wave heights should be relatively low.

While winds may be strong, causing difficulty in berthing, the ferry mooring structures at the Katzehin and Haines Ferry Terminals would not likely be significantly affected by wave and wind conditions from any direction. The ferry can safely weather storms at either port assuming the moored vessel is properly safeguarded and monitored during extreme storm events.

Group 79

Topic/Subtopic: Transportation/Safety

Group Comment Text:

A) Does the proposed road meet AASHTO standards?

B) The SEIS should analyze the costs/benefits of making the road to Katzehin a divided highway.

C) DOT&PF should consider wider travel lanes (12 feet), wider shoulders, slow vehicle turnouts, passing lanes, or scenic pull outs.

D) DOT&PF should change the road design as the proposed design is not adequate for safety or for other users (e.g., cyclists).

E) Has the design of the road where it will link into the Juneau road system been addressed? For example, the length of the turning lane from Egan Expressway onto the Loop via the north entrance is inadequate.

F) As currently planned, the road will need additional enhanced safety features in the future similar to what is occurring on the Seward Highway.

Group Comment Response:

A) Regulations require that the design of highways on the NHS meets AASHTO standards. The highway design for all alternatives meets the AASHTO standards for rural arterials for the traffic volumes projected, with the exception of shoulder width for Alternatives 2B and 3. For Alternatives 2B and 3, AASHTO recommends a minimum shoulder width of 6 feet, and 4 feet was proposed. The proposed travel way and shoulder width matches the recently reconstructed portion of Glacier Highway from Amalga Harbor Road to Bessie Creek. This deviation from the standard will require a design exception. Exceptions to design standards are allowed for an individual project element or a segment of the project where design criteria does not satisfy applicable design standards. Justification for an exception may include: high cost of construction, negative environmental impacts, difficulty or cost of obtaining right-of-way, and sensitivity to context or community values. In this case, justification for an exception to the shoulder width includes a higher cost of construction and more impacts to the environment. A more detailed discussion of the design standards is included in the *Update to Appendix D – Technical Alignment Report*.

B) A cost-benefit analysis for a divided highway will not be performed. The main criterion for considering a separated highway is traffic volume, closely followed by speed. Crash frequency is also a consideration. The projected traffic volume on the JAI Project does not warrant a separated highway, so the SEIS does not evaluate this design. Portions of the Seward Highway and Egan Drive are good examples of when separated highways are warranted.

C) The additional 4- to 6-foot increase in roadway width (widened travel way and shoulders) suggested by the commenter would unnecessarily increase the construction cost of the project and would result in an increase in environmental impacts. The commenter's proposed 12-foot travel lanes exceed the 11-foot AASHTO recommended standard as proposed for the project. The highway design for all alternatives meets the AASHTO standards for rural arterials for the traffic volumes projected, with the exception of shoulder width for Alternatives 2B and 3. The commenter's suggestion for widened shoulders is consistent with AASHTO recommendation of a minimum shoulder width of 6 feet (Alternatives 2B and 3) as opposed to the 4 feet proposed. However, AASHTO guidelines note that 4 feet is the minimum recommended shoulder width to accommodate bikes and pedestrians. The paved shoulders are wide enough for use by bicyclists given the projected traffic volumes for the project.

Safety amenities such as widened embankments, guardrail, recessed pavement markers, paint, and signage are also incorporated into the design and cost estimate. The widened embankment would extend 8 feet beyond the paved shoulders at a grade of 4:1 to 6:1 in non-guardrail areas. Slopes in this range are considered traversable and would allow errant vehicles to safely recover to the road. The paved shoulders and traversable slope are wide enough for emergency pull-off.

Slow vehicle turnouts were considered, but are not proposed. Turnouts are most frequently used on lower volume roads where passing lanes are rare, steep grades are present, and more than 10 percent of the vehicle volumes are large trucks or recreational vehicles. None of these criteria apply to Alternatives 2B or 3. Passing lanes were considered, but are not

included in the project. However, DOT&PF estimates that passing zones that include broken yellow centerline stripes would exist on approximately 25 percent of the Alternative 2B route. No estimate has been done for Alternative 3, but it is assumed that Alternative 3 would provide more opportunities for passing. Pullouts and scenic overlooks are proposed with Alternatives 2B and 3. The location of these features is discussed in Sections 4.3 and 4.4 of the SEIS.

D) The proposed design is adequate for the safety of all users. 23 CFR 625.3 requires design of highways on the NHS to meet AASHTO standards. The highway design for all alternatives meets AASHTO standards for rural arterials for the traffic volumes projected, with the exception of shoulder width for Alternatives 2B and 3. For Alternatives 2B and 3, AASHTO recommends a minimum shoulder width of 6 feet, and 4 feet is proposed. However, AASHTO guidelines note that 4 feet is the minimum recommended shoulder width to accommodate bikes and pedestrians. The paved shoulders are wide enough for use by bicyclists given the projected traffic volumes for the project. As an example of application, Glacier Highway (Tee Harbor to Besse Creek) has similar shoulder width and has no recorded accidents involving bikes or pedestrians between 2011 and 2015. The future traffic growth projection is anticipated to be static and enhancements are not likely to be needed.

Safety amenities such as widened embankments, guardrail, recessed pavement markers, paint, and signage are also incorporated into the design and cost estimate. The widened embankment for the road would extend 8 feet beyond the paved shoulders at a grade of 4:1 to 6:1 in non-guardrail areas. Slopes in this range are considered traversable and will allow errant vehicles to safely recover to the road. The paved shoulders and traversable slope are wide enough for emergency pull-off.

E) The existing Juneau road system south of the proposed project road extension would not require any improvements as a result of this project to function as intended.

F) The highway design for the alternatives meets the AASHTO standards for rural arterials for the traffic volumes projected for the proposed project, with the exception of shoulder width for Alternatives 2B and 3. The highway design does include safety measures such as widened embankments, guardrail, recessed pavement markers, paint, and signage. The Draft SEIS Alternative 2B 2050 traffic projection was 825 average daily traffic (ADT). The roadway design being used on the project are appropriate for a rural arterial highway with less than 2,000 ADT—substantially more traffic volume than forecast. Extensive safety upgrades are not anticipated. Further, to compare Seward Highway, which carries close to 10,000 vehicles per day, to Alternative 2B, which would carry less than 1,000 vehicles per day, is not an equitable comparison.

Group 86

Topic/Subtopic: Transportation/Safety

Group Comment Text:

A) The road will not be safe during adverse weather conditions.

B) The Draft SEIS did not adequately address the hazards of icing, high tides encroaching on the road, freezing rain, avalanches, rock slides, icing on bridge decks, and wind conditions.

C) DOT&PF should use fixed, automated, anti-icing technology (FAST) and use the most effective, least toxic de-icing agent.

Group Comment Response:

A) Any road during adverse weather conditions makes driving challenging. The project road alternatives will be no different during adverse weather conditions than any other road in Southeast Alaska. Alternative 2B includes a new maintenance station that will be staffed full time, which will improve maintenance response times to address adverse weather conditions. Alternative 3 includes a maintenance staging site. Further details of these locations is discussed in Attachment C to the *Update to Appendix D – Technical Alignment Report*.

B) Sections 4.3.7.5, 4.4.7.5, and 4.6.7.5 of the Final SEIS have been updated to explain the hazards of icing, high tides, freezing rain, icing on bridge decks, and wind conditions with respect to the road segments included in Alternatives 2B, 3, 4B, and 4D. Avalanche hazards and mitigation are discussed in the *2017 Update to Appendix J - Snow Avalanche Report*. The *2017 Update to Appendix D - Technical Alignment Report* has been updated to include a detailed discussion of the geologic hazards, such as rock slides, and the proposed mitigation measures to address the hazards. Impacts due to icing, freezing rain, icing on bridge decks, and wind conditions on the highway alternatives are no different than for any other road in Southeast Alaska. These conditions are difficult to predict and evaluate. The road alternatives will be maintained by DOT&PF when these hazardous conditions are encountered. High tides are not a concern as the driving surface elevation for the road alternatives has been designed to account for extreme high tides and extreme storm events.

C) The use of automated de-icing systems on bridges will be considered during the design phase based upon the technical and economic feasibility. However, FAST systems are not common in Alaska, and there is no crash data in Alaska that suggests icing on bridges causes a higher crash rate than other portions of the roadway. Through an experimental project, de-icing systems were installed on two of the Knik River bridges in Southcentral Alaska. These systems were expensive to install and even more so to maintain. It is unlikely that any project road component will include these installations. The roadway and bridges will be treated similarly to other roads throughout Alaska. This treatment includes applying salt for de-icing and sand for traction.

Group 94

Topic/Subtopic: Transportation/Safety

Group Comment Text:

The proposed road will improve disaster preparedness for Juneau residents by providing an alternative means of leaving Juneau.

Group Comment Response:

This potential evacuation benefit was mentioned for Alternatives 2B (private properties adjoining the road and for Juneau) and 3 (for properties adjoining the road and for Haines) under Hydrology and Water Quality-Floodplains in Sections 4.3.9 and 4.4.9 of the Draft SEIS. The benefit would also occur for emergency evacuation scenarios besides flooding.

Group 227

Topic/Subtopic: Transportation/State Costs

Group Comment Text:

A) If AMHS is no longer the NHS-designated route between Auke Bay and Katzeihin or other future ferry terminal locations, does this reduce the percentage of NHS funds that DOT&PF will allocate to AMHS?

B) How does DOT&PF allocate NHS funds for AMHS?

Group Comment Response:

A) DOT&PF's allocation of NHPP funds to AMHS is based on identified need. There are no formulas determining this allocation. All of the alternatives have an AMHS component, and all alternatives would be considered an NHS-designated route. Information on the NHPP is available at <http://www.fhwa.dot.gov/map21/factsheets/nhpp.cfm>.

B) There is no formula for allocation of NHPP funds to AMHS. Allocation of funds is based on system needs analyses as a part of the transportation planning process. AMHS receives Ferry Boat formula funds and is also eligible for other types of FHWA funding.

Group 229

Topic/Subtopic: Transportation/State Costs

Group Comment Text:

The cost estimates do not accurately reflect the true cost of the project. Specific concerns include:

A) The contingency assumed is too low.

B) Safety costs and the cost of potentially required safety upgrades are not fully disclosed.

C) Cost information is outdated.

D) The cost estimate is not transparent.

- E) The cost estimate does not include costs associated with the Day Boat ACFs, terminal modifications, etc.
- F) The project will be a High Risk Rural Road (HRRR), so the cost of safety improvements should be considered.
- G) DOT&PF should analyze the State cost of each alternative based on the cost per vehicle multiplied by the capacity of the alternative.
- H) Costs associated with controlling invasive species needs to be addressed.

Group Comment Response:

A) The construction contingency for Alternative 2B is appropriate given the level of design development. The segment from Echo Cove to Sweeny Creek was developed through final design in 2006 after the 2006 ROD, which justifies the 5 percent contingency amount.

A geotechnical investigation that identified all geologic hazards for Alternative 2B within the segment from Independence Creek to the south bank of the Katzehin River was completed in 2006, and was subsequently updated in 2012 in support of the Draft SEIS. Preliminary geotechnical recommendations were developed to address all identified geologic hazards in response to comments and are reflected in the updated cost estimate in Attachment E of the *2017 Update to Appendix D – Technical Alignment Report* in the Final SEIS. Although additional costs due to geotechnical hazard mitigation have been included in the cost estimate, the final design has not been completed, so a 10 percent contingency is appropriate.

From the south bank of the Katzehin River to the proposed Katzehin Ferry Terminal, the contingency amount of 5 percent is appropriate because this section of roadway is located on relatively flat terrain, and the potential for unforeseen circumstances is low. The greatest portion of the cost for this segment is the Katzehin Bridge. The bridge amounts to more than 70 percent of the cost estimate for this segment. Bridge superstructures are well defined with a low potential for unforeseen conditions that would impact cost. The bridge piling size and length estimates are based upon preliminary geotechnical results within the corridor. In addition, there is substantial historic cost data throughout the State that was used to estimate bridge construction costs. This further justifies the 5 percent contingency amount.

The original survey data collection for Alternative 2B was completed in 2002. DOT&PF elected to collect updated survey data for the entire Alternative 2B alignment in 2013 and 2014 to strengthen final design activities. Since 2002, there have been substantial improvements to LiDAR sensors and collection/processing techniques that improve the bare earth surface modeling for design. This updated data collection effort further validated the estimated quantities contained within the construction cost estimate for Alternative 2B. For this reason, the contingency amounts were left unchanged from the Draft SEIS.

B) Appropriate safety amenities such as widened embankments, guardrail, recessed pavement markers, paint, and signage are fully disclosed in the design and cost estimate. The Draft SEIS 2050 Alternative 2B traffic projection was 825 ADT. The roadway design being used on the project is appropriate for a rural arterial highway with less than 2000 ADT, which is substantially more traffic volume than forecast. DOT&PF does not anticipate Alternative 2B would need substantial additional safety improvements during the 2025 to 2055 timeframe. Adequate safety features and mitigation have already been incorporated into the preliminary design of Alternative 2B.

C) The cost estimate included in the Draft SEIS reflects 2012 costs. In 2008, the cost estimate was updated to reflect 2008 construction costs. In 2009, a cost report was completed which included an independent estimate completed by FHWA’s Western Federal Lands Highway Division that validated the estimate. This report is available for public viewing at www.juneauaccess.alaska.gov. In 2012, prior to the release of the Draft SEIS, the cost estimate was updated to 2012 construction costs. This was done by applying an inflation rate to the unit prices in the engineer’s estimate. The inflation rate was obtained by comparing the Construction Cost Indices for years 2008 and 2012 provided by the Washington State Department of Transportation. The Final SEIS has been updated to reflect 2016 costs using the same methodology. A detailed discussion of the engineer’s estimate is included in Section 4.1 of the *Update to Appendix D – Technical Alignment Report*.

D) The detailed cost estimates for the ferry terminal components and road components of all alternatives are disclosed in Attachments D and E to the *Update to Appendix D – Technical Alignment Report*.

E) The Day Boat ACFs and proposed modifications to the Haines Ferry Terminal were not included in the cost estimates for the project’s alternatives because they were proposals that were programmed independent of the JAI Project. Their design and/or construction is currently in progress at the time of this Final SEIS. As is typical in transportation NEPA analyses, all reasonable alternatives incorporate programmed and existing elements of the transportation system.

F) The road is not defined as a HRRR per the FHWA definition. FHWA defines HRRR as “any roadway functionally classified as a rural major or minor collector or rural local road:

- A. on which the accident rate for fatalities and incapacitating injuries exceeds the statewide average for those functional classifications or roadway; or
- B. that will likely have increases in traffic volumes that are likely to create an accident rate for fatalities and incapacitating injuries that exceeds the statewide average for those functional classifications of roadway.”

The road is not classified as a collector or local road and neither of the conditions A or B listed above apply. In addition, per 23 CFR 625.3, design of highways on the NHS are required to meet AASHTO standards. The highway design for the alternatives meets the AASHTO standards for rural arterials based on the traffic volumes projected for the proposed project, with the exception of shoulder width for Alternatives 2B and 3. DOT&PF does not anticipate Alternative 2B would need substantial additional safety

improvements during the 2025 to 2055 timeframe.

G) For each alternative, the Final SEIS does present an estimated State Net Cost Per Vehicle. The vehicle count for each alternative is output from the traffic model. To use the alternative capacity count is speculative, as capacity is greater than anticipated demand in all but peak demand days. Also, State costs are not dependent on vehicle numbers but on highway and ferry operational costs.

H) Costs for controlling invasive species are included in the highway operational and maintenance costs.

Group 230

Topic/Subtopic: Transportation/State Costs

Group Comment Text:

A) How can DOT&PF justify Alternative 2B? It would cost users and the State more than the existing system. It is too expensive and fiscally irresponsible. It is not economically feasible as it costs more money, has a negative net present value, and does not have the lowest life cycle cost.

B) Alternative 2B is a detriment to the rest of the AMHS by directing construction funds to building a road rather than vessel replacement and reducing the annual system revenue. The revenue needed to support the road option and maintain ferries that cannot be eliminated will divide an already limited revenue stream.

C) DOT&PF should consider spending the money that would be used for the project for other transportation purposes.

D) DOT&PF should consider spending the money that would be used for the project for other non-transportation services (e.g., education, public safety, prisons, etc.).

E) What other projects would be negatively impacted?

F) As the State does not have dedicated revenues, the Draft SEIS incorrectly reported that revenues from gas taxes and licensing/registration fees would reduce the overall State cost for road and highway maintenance.

G) The population forecast in the Draft SEIS showed clear bias in stating how revenue should be raised in the State of Alaska and the politics in the State should be directed, and by claiming that the State is not able to properly provide for the safety of the public in remote areas.

Group Comment Response:

A) The reasoning behind the identification of Alternative 2B as preferred in the Draft SEIS was provided in the Executive Summary and in Chapter 2 under the heading, “Identification of the Preferred Alternative.” Alternative 2B does not cost users more and costs the State considerably less per vehicle transported. The out-of-pocket user cost under Alternative 1 – No Action for a one-way trip would be \$216 between Juneau and Haines

and \$286 between Juneau and Skagway. The State cost per vehicle would be \$286. The out-of-pocket user cost for Alternative 2B for a one-way trip would be \$47 between Juneau and Haines and \$67 between Juneau and Skagway. The State cost per vehicle would be \$52. The decision, however, is not made solely on cost. Regarding the net present value and life cycle costs, DOT&PF and FHWA did not identify the preferred alternative based solely on the economic analyses, nor are they required to. The analysis indicates that none of the build alternatives show that economic benefits outweigh costs, and the alternative identified in the Draft SEIS as preferred is not better on every measure.

The decision was strongly based on how well an alternative satisfies the purpose and need for the project as stated in Chapter 1. As presented in Table ES-1, Alternative 2B accommodates the highest demand, provides the greatest capacity, has the shortest travel times, provides the greatest frequency of service, has the lowest cost to users, has the lowest cost to the State per vehicle transported, and has the second lowest operations and maintenance costs of any of the build alternatives. The decision balanced these benefits, taking into consideration the impacts described throughout the document and appendices.

B) Alternative 2B is not a detriment to the rest of the AMHS and would not reduce the annual system revenue. There is a misconception in the region that the Lynn Canal service covers its costs and generates excess revenue that helps to subsidize other less profitable runs in the system (and therefore taking that service away would somehow be a detriment to revenues in the system). While traffic and revenue studies indicate higher demand in Lynn Canal, and therefore higher revenues, the current ferry system in Lynn Canal still requires a State subsidy. Thus, while Lynn Canal service may come closer to covering its costs than some other routes, it still requires State funds each year to subsidize that service. Directing transportation funds to build a road under Alternative 2B is forecast to increase revenue compared to Alternative 1 – No Action (\$10.7 million per year versus \$7.7 million per year) and would reduce the required State subsidy by \$0.5 million per year (see Table 4-26 of the Draft SEIS).

In addition to the above information presented in the Draft and Final SEIS, an update to the Lynn Canal Corridor Revenues and Expenditures reports was included in the Draft (Appendix BB, *Revenues and Expenditures Report for Lyn Canal, Fiscal Years 2005–2012*) and Final (Revised Appendix BB, *Revenues and Expenditures Report for Lyn Canal, Fiscal Years 2005–2015*) SEIS. This report details revenues, costs, and subsidies. Of note, the referenced document by one commenter is from the 1970s—it is outdated and does not provide relevant information.

C) Prioritizing the use of NHS transportation funds is the responsibility of the DOT&PF. That prioritization is done through the four-year STIP, which is published in draft form for public review and comment before approval. The STIP is modified each year to account for shifting priorities and project schedules around the State. The STIP is approved by the DOT&PF Commissioner and federal funding partners. The Legislature provides DOT&PF with authority to spend federal money and allocates funding for the State’s match through the capital budget. FHWA funds are not available to be spent on routine maintenance on existing highways. AMHS receives Ferry Boat formula funds and is also eligible for other types of FHWA funding. It is not possible to indicate specifically which other State transportation projects may be postponed or cancelled if STIP funds had been allocated for

the construction of the JAI Project. Alternative 1 – No Action has been selected as the preferred alternative and programmed funding will be allocated to other projects. DOT&PF’s 2016–2019 STIP (Amendment 3, June 28, 2017) does not include funding for any JAI Project build alternatives.

D) This project is a federal-aid highway project, which can include the AMHS and highways. The federal government would fund approximately 90 percent, with the State matching the balance. The federal highway funds may be used only for surface transportation (i.e., capital expenditures). They cannot be used for non-transportation expenses (e.g., education or public safety). If the State wishes to receive the federal funds, it must match them with State funds. DOT&PF prioritizes the limited funding available through an ongoing evaluation process; see response C, above.

E) See Response C, above, for background. It is not possible to indicate specifically which other State transportation projects may be postponed or canceled if STIP funds were allocated for the construction of Alternative 2B for the JAI Project.

F) The Draft SEIS stated on page 1-17: “Revenues from gas tax receipts and licensing/registration fees were about \$84.5 million in 2011, some of which reduces the overall State cost for road and highway maintenance.” This has been rewritten in the Final SEIS to make clearer that the State receives motor fuel taxes into the General Fund from purchases of gasoline for highway travel, and allocations from the General Fund pay for highway maintenance and operations. Elsewhere in the Draft SEIS, reference to the State motor fuels tax were already clear.

G) FHWA and DOT&PF have undertaken the SEIS for the JAI Project in an objective and unbiased manner. The quote pulled from Appendix EE, *Socioeconomic Effect Technical Report*, does not describe a “bias” or “elude [sic] to the report writer’s preference as to how revenue should be raised...” The sentence merely describes the challenge in forecasting Juneau’s population given the current difficult budget situation. The sentence quoted is not stating a preference, but rather is reporting the kinds of remedies that have been discussed to stem the budget shortfall for funding State government. In Alaska, there is a strong connection between economic activity and population. Because Juneau’s economic activity is heavily tied to State government, the Draft SEIS acknowledged the potential for certain issues to result in substantial changes to the City’s population. The population forecast used for the project was founded on a base case population developed by the Alaska Department of Labor and Workforce Development. It was completed by Northern Economics, a firm that has the experience and expertise to be qualified in Alaska for conducting such a forecast. The forecast showed flat to declining population in Southeast Alaska. If there had been an attempt to bias the results, it would not make sense to identify a flat to declining population.

The report does not indicate that the “State is not able to properly provide for the safety of the public in remote areas,” as is suggested by the comment. The Draft SEIS disclosed effects on local communities and described the effects to local emergency service providers. The State funding for the project would need to compete with State funding elsewhere in the State. DOT&PF and FHWA acknowledge that project alternatives would have an impact on emergency service providers; however, as has been done across the

State on other stretches of rural highway, emergency service providers respond and provide proper assistance. The Draft SEIS disclosed that this will come with a financial cost to the providers.

Any transportation project proposed by DOT&PF and FHWA must meet established engineering standards and practices for safety and reliability. Therefore, all project alternatives would be safe and reliable.

Group 231

Topic/Subtopic: Transportation/State Costs

Group Comment Text:

The Draft SEIS did not adequately address maintenance costs, including road and recreation area maintenance, law enforcement, and snow removal. Specific concerns include:

- A) The cost is underestimated.

- B) Where will the money come from, and can the State of Alaska afford to pay for the maintenance of the proposed road?

- C) Is additional equipment and staffing proposed for the new maintenance station, or will it compete for existing resources?

- D) There will be increased maintenance cost due to geological hazards and the potential for road closures and delays associated with bad weather, avalanches, and landslides.

- E) Periodic dredging of the Katzehin Ferry Terminal area (i.e., the Katzehin delta is extremely shallow and changeable) should be included in the estimate for Alternative 2B operations and maintenance costs.

Group Comment Response:

A) The maintenance costs included in the Draft SEIS reflect the maintenance of State assets only. Expenses borne by others, such as the USFS maintaining the adjacent National Forest or by the State Troopers is not included. The maintenance cost for the highway was estimated using actual costs incurred by DOT&PF for highway maintenance. Additional personnel, equipment, and materials were included in the estimate to provide for responses to avalanches and landslides. Because of the addition of extra resources to address conditions expected on the project highway, the estimate shows the cost per mile to maintain the highway to be approximately 190 percent higher than DOT&PF's current average maintenance cost per mile in Southeast Alaska.

B) The maintenance would have been funded by State General Funds and administered by the Southcoast Region of DOT&PF. The funding is subject to the Alaska legislature to annually identify, allocate, and authorize.

C) The project cost estimate proposes new staffing and equipment in addition to existing resources to maintain the project highway, and the cost of those assets is included in the

maintenance cost estimate. See Appendix D of the *2017 Update to Appendix D – Technical Alignment Report*.

D) The JAI Project’s planning process included extensive study of the geological conditions and weather on the proposed route. Highway design engineering will mitigate many of the hazards. Significant additional assets have been added to the maintenance concept to provide personnel and equipment to deal with potential road closures. These assets and their associated cost are listed in the maintenance plan in Appendix D of the *2017 Update to Appendix D – Technical Alignment Report*.

E) No sedimentation studies have been conducted to date. Additional design and analysis work is needed to ascertain if periodic dredging is needed or not. Design of the new basin and breakwater/jetty features would have been optimized to minimize sedimentation effects. The minimum required depth of this basin is elevation -25-foot mean lower low water (MLLW). However, the preliminary design and associated cost estimate has been revised to include the cost of dredging an additional 5 feet to elevation -30 feet MLLW to account for sedimentation over the projected life of the facility (30 years). As such, no additional cost allowances for future dredging are presently included.

Topic/Subtopic: Transportation/State Costs

Group Comment Text:

Has DOT&PF considered tolls on the proposed roads?

Group Comment Response:

During scoping for the original DEIS in the early 1990s, tolling was suggested as a possible revenue source for highway construction and/or maintenance. A decision was made by the DOT&PF Commissioner after the 1997 DEIS was released that tolls would not be part of the project description. The decision was based, in part, on the fact that the State had no toll roads and none were anticipated in the future. No subsequent commissioner has changed this position. There is no basis for saying a toll road is likely. The State has other road segments that have high maintenance costs due to issues such as terrain and weather, and no tolls have been instituted.

Group 250

Topic/Subtopic: Transportation/State Costs

Group Comment Text:

A) Would new ferries make the system cheaper to operate? The existing ferries are aging, with higher maintenance costs.

B) If less funding is available, will AMHS not have to reduce service even further?

Group Comment Response:

A) Given the high cost of new vessels, it is not fiscally realistic to think the State can acquire all new ferries for Lynn Canal service. The selection of existing and new assets for the Draft SEIS alternatives was made to reflect the practical necessities of using available

AMHS ferries where possible, and acquiring new vessels when necessary (see Attachment B, AMHS Vessel Replacement Costs, of Appendix GG, *Marine Segments Technical Report*). The Day Boat ACFs, which are already under construction at the time of this Final SEIS, are included in Alternatives 1 – No Action, 1B, 2B, 3, 4C and 4D; thus, each of the alternatives that use these two ferries will essentially be using new ferries. For Alternatives 4A and 4B, new fast ferries would be purchased. New ferries are cheaper to maintain initially because there is little long-term repair needed. However, new ferries are not significantly more efficient from an operational standpoint, such as fuel consumption, although some efficiency can be gained by designing the new ferry to be optimized for its new service. Appendix GG includes calculations for the cost of the ferry alternatives, including impacts of vessel age. Vessel operation costs are based on a ferry's operational characteristics, and vessel capital repair costs are based on the age of a ferry using a vessel capital refurbishment program.

B) AMHS evaluates its service levels each year and adjusts them to demand and available funding. AMHS is beholden to the State Legislature to make up the gap between what is collected in fares and what it costs to operate and maintain the ferry system. If less funding is available, service levels may face further cuts. The analysis in the SEIS is based on the most current assessment of anticipated funding and service levels.

Group 688

Topic/Subtopic: Transportation/State Costs

Group Comment Text:

The Draft SEIS did not fully consider the environmental costs of the project alternatives. For example, the loss of wildlife and loss of wilderness values have a monetary cost.

Group Comment Response:

DOT&PF and FHWA have disclosed the environmental consequences of the proposed alternatives in the Draft and Final SEIS, including the indirect effects described in the comment. Transportation EIS documents are not required to and do not typically present impacts to the environment in financial terms. The “costs” to the physical, natural, economic, and social environment are the main topic of the entire EIS, however, and the EIS discloses all known impacts, both beneficial and adverse, as required by NEPA. A cost-benefit analysis that attempts to compute a dollar figure for the types of impacts identified above would be highly speculative and subjective, and not a wise use of public funds. Because the indirect impacts have been disclosed quantitatively where possible, and qualitatively elsewhere, FHWA has met its requirements under NEPA. Commitments to manage, mitigate, or avoid environmental damage are part of the project, and its costs are disclosed in the SEIS.

Group 258

Topic/Subtopic: Transportation/Transportation Demand

Group Comment Text:

A large number of comments and questions pertained to the approach and methodology in the Draft SEIS for developing travel demand estimates for the alternatives, including the following:

- A) The traffic model and/or model development is flawed. The traffic demand forecast is overestimated/overstated, cannot be substantiated, or is too uncertain due to flawed assumptions and methodology.
- B) Ferry travel assumptions are unsupported or unrealistic.
- C) Past forecasts and assumptions are flawed. Traffic results were not consistent with past analysis or were not accurate.
- D) Incorrect baseline data was used.
- E) Model inputs are unrealistic.
- F) The reason why people travel is not valid or is disputed.
- G) The transportation demand study did not adequately address impacts.

Group Comment Response:

A) Traffic Model/Model Development Flawed

The modeling for the project was developed by travel modelers at Fehr & Peers. This firm was specifically identified and hired for its expertise in the travel modeling field, and its approach and results were peer reviewed by an independent university professor with expertise in travel modeling and travel behavior prior to the results being accepted for use in the Draft SEIS. The methodology and results are fully disclosed in Appendix AA, *Traffic Forecast Report*, and summarized in the Draft SEIS.

All traffic demand models attempt to predict future demand based on assumptions and data available in the present. To the extent that they are predicting a future, unknown condition, all demand models are “hypothetical.” Because there is no road linking communities in Lynn Canal, a forecast of surface transportation demand cannot be conducted in a conventional manner. The previous forecast for the 2006 SEIS was partially based on the results of two household surveys. While surveys can provide important travel behavior inputs, in this case, they indicate people’s perceived behavior but may not reflect actual travel behavior. Moreover, because of the controversy and notoriety of the project within the region, modelers were not confident they could get unbiased responses if they were to use an approach that again relied on survey data. For these reasons, a different forecasting approach was used for the 2014 Draft SEIS.

Contrary to some commenters' assertion, the modelers of the current effort used quantitative methods to validate the model and estimated demand using more than one methodology to provide greater certainty that the forecast was grounded on real data and based on repeatable, valid methodologies. The traffic demand model used for this project was developed based on empirical data derived from actual travel conditions observed in Alaska communities and similar locations.

The modeling uses multiple steps. The first step was to develop a "Total Demand Model" to estimate overall demand in the corridor, assuming there were no constraints (termed unconstrained demand). From this unconstrained demand, "Choice Models" were developed to predict the percentage of total demand that would utilize each alternative. These models work by calculating the attractiveness of each choice based on time, cost, and convenience variables. The following describes these models in greater detail.

Total Demand Model

The Total Demand Model starts out defining a condition that the modelers called "unconstrained demand." This level of demand predicts how many people would want to travel between Juneau and Haines/Skagway if there were a road the entire way. This predictive condition was based on the assumption that people in Juneau, Haines, and Skagway would exhibit similar travel behavior given the opportunity to travel by road as other similarly situated communities. Based on the project team's research, there are no indicators that travel behavior in Juneau, Skagway, and Haines would differ substantially from that of other Alaskan and Canadian communities if full highway access were available. Based on the data collected, DOT&PF and FHWA are confident that Juneau residents would travel in a similar manner to other Alaskans. Even today, Juneau residents travel only slightly less on a per household basis than the average Alaska household, even though they do not have full road access in or out of the community. Vehicle ownership per capita in Juneau, Haines, and Skagway is also comparable to other Alaska areas.

To be additionally assured of the results, more than one approach to predicting future travel behavior was used by the study team in developing the Total Demand Model. Two methods were selected as being most representative of likely conditions along Lynn Canal. Each of these two different models was developed independently and resulted in similar estimates of travel volume in Lynn Canal. The first total demand model was based on household survey data to estimate trip generation and dissipation. The second model was based on actual highway traffic volumes observed near similar communities. Fehr & Peers did not use other roads to "validate" the model. Fehr & Peers used other similarly situated communities in Alaska (both regional center communities like Juneau and other, more isolated coastal communities like Haines and Skagway) and Western Canada with similar geographic characteristics as Juneau, and examined their trip-making patterns on the highways leaving those communities. The analysis found a strong correlation between the distance traveled from the edge of the community and the traffic volumes. This predictive model was used, among other sources, to develop the total (unconstrained) demand model for Lynn Canal. That model was used to bracket an upper end (or total demand) for travel in Lynn Canal.

Choice Models

The Traffic Forecast Model was specifically designed to compare the travel characteristics among the marine and road/ferry alternatives. Two choice models were developed to predict the percentage of total demand that would utilize each alternative. The first model was a “travel choice model,” followed by application of a “mode choice model.” Essentially, demand was scaled down from the total demand based on factors that influence people’s decisions (choices) to make a trip. These factors include items like cost, travel time, schedule convenience, etc. Using such factors to predict traveler’s choices and behavior among competing alternatives is a common modeling practice and is used in nearly every traffic model. None of the alternatives would have the same level of demand as was calculated for “unconstrained demand.”

By factoring the demand down from the unconstrained demand, the choice models predict reasonable estimates of travel behavior based on the relative merits of the alternatives. The models were “validated” against a known existing data point in time for the existing ferry system in Lynn Canal (i.e., travel time, cost, convenience, etc. were applied to the model, and the models were calibrated to be able to predict demand for an existing known data point). Such procedures are a standard step in every valid modeling process.

It should be noted that all of the alternatives include roads at both ends with a ferry link in the middle. The length of the road link versus the ferry link varies. For Alternatives 2B and 3, the ferry links are short shuttle ferries, with the greatest length traversed via road in a private vehicle, while the other alternatives have a long ferry link with relatively short road links at each end. For these reasons, the forecast for each alternative deals with road travel times, waiting time, ferry travel time, and transfer time, with different frequencies of service as modeling inputs.

B) Disagreement over Ferry Travel Assumptions

Regarding estimates of ferry ridership demand, the travel choice model is sensitive to several variables, including travel time, travel cost, and frequency of travel. The model was calibrated to match empirical evidence from the 1997-1998 and 2004-2007 as closely as possible. The evidence suggests that cost and convenience of travel are more likely to affect travel behavior than ferry travel time when compared with existing service levels. In response, the project team modified one of the model variables (i.e., the service index) from its initial formulation to reflect the reduced effect of travel times on the forecasted demand. While the alternatives under consideration include more substantial changes in service than have been experienced previously in Lynn Canal, it is possible that the demand forecasts are conservatively high for some of the marine alternatives. However, the fact that the model did a good job of matching existing Lynn Canal ridership means that the travel choice model was reasonably validated and applied.

Regarding the cost/value of travel time, assigning dollar costs to travel time is a reflection of the fact that all time has value. People value travel times differently based on various factors: work versus pleasure, weather conditions, etc. In selecting the choice model coefficients, ferry travel time was deemed not as onerous as automobile travel time (there is typically considered to be less stress, plus other activities can be accomplished during

the trip). For these reasons, the model gives 20 percent less weight to the ferry travel time compared to automobile travel time. In other words, the model coefficient was adjusted to account for “benefits” associated with ferry travel, described by some of the commenters in this group of comments. This relationship was derived from other regions that have ferry service and driving options, and was used to validate the travel model results to existing ferry demands within the corridor. All time has a cost in terms of trade-offs with other ways that time could be spent. If ferry travel were purely a benefit, then slower trips would have greater value than faster trips. Clearly many Lynn Canal ferry travelers enjoy aspects of the ferry ride, but it is also true that most travelers prefer shorter travel times (fast ferry) to longer travel times (conventional ferry), all other things being equal. It is also true that some travelers would prefer driving their own vehicles to riding a ferry over the same route.

C) Past Forecasts and Assumptions Flawed

Several commenters suggested that travel assumptions were not valid based on observable demand responses to past AMHS service changes or because past forecasts did not result in accurate predictions. Such assertions ignore the complexity and numerous factors that go into people’s decision to travel. Pulling individual years out of past AMHS travel data, to suggest a correlation to a service change involving one factor, is not statistically valid. For example, citations to past changes in AMHS frequency of service do not take into account the other factors affecting traveler’s decisions, including schedule, costs, travel time, or how the economy was doing in the given year cited. Taking a forecast prepared in 1996 for a specific alternative and comparing it to vastly different conditions in select years many years later is misleading. The alternatives identified and forecast in 1996 were not implemented. To suggest that other improvements and operational tests made in Lynn Canal should somehow have generated the same traffic forecast is inaccurate. Unless the same alternatives identified in 1996 were built and operated the same, the comparisons are meaningless. Moreover, modifications made to a schedule or fare, and only run for a year or two, would not lead to a fair comparison of the forecast estimate. As discussed above, pulling one or two years of data to try to prove a correlation is inappropriate.

D) Incorrect Baseline Data

One commenter suggested that baseline data was incorrect, and therefore overstated demand. It appears that commenter used incorrect AMHS numbers in generating their calculation. The error is related to the two types of data reported by AMHS: (1) link volume data for city pairs, and (2) on-off data for each port of call, also known as “port-to-port volume data.” The link volume data includes all ‘local’ persons and vehicles beginning and ending in Juneau, Haines, or Skagway plus all passengers who passed through Juneau, Haines, or Skagway northbound or southbound on their way to destinations outside Lynn Canal. In contrast, on-off data only includes trips that embarked or disembarked within Lynn Canal (i.e., no through travel).

The data reported in Appendices AA (*Traffic Forecast Report*) and FF (*User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*) represent link volume data. These data are summarized as ADT in Table 3-1 of Appendix AA (and are adjusted to annual traffic in Tables A-6 and A-10 of Appendix FF). Table A-10 shows the 9,954 total annual link

volumes for Juneau-Skagway reported by the commenter (adding summer ADT of 6,732 to winter ADT of 3,222). The link volume number is the correct number for calculating the total travel between Juneau and Skagway, in that it includes the through-traffic.

It appears that the commenter used an average of 5 years' worth of port-to-port volume data. Looking at on-off data only, Fehr & Peers examined the AMHS on-off data for Juneau-Skagway for three years: 2011, 5,825 vehicles; 2012, 6,586 vehicles; and 2013, 6,558 vehicles. This produces a 3-year average of 6,323 vehicles, which is close to the commenter's value of 6,412 vehicles. Therefore, we believe that the commenter used on-off data in the calculation. These port-to-port volume data do not account for the through-trips on the ferry within Lynn Canal. Similar comparisons account for the differences in the Juneau-Haines data.

The source of the daily link volume data was the *AMHS 2011 Annual Traffic Volume Report*. Fehr & Peers went back and examined comparable data from the 2010 through 2014 traffic reports. The passenger and vehicle counts are virtually unchanged on an annual basis over the last 5 years for which data is available. DOT&PF and FHWA are confident that the link volume data used in the analysis accurately reflects ferry usage within the Lynn Canal. By relying on the port-to-port data, the commenter is incorrectly under-representing the actual travel because the through-traffic is not included.

E) Model Inputs Unrealistic

Road and ferry input data into the current forecast model is based on adopted standards, policies, or observed conditions and was fairly applied to the alternatives.

- Road travel times are based on the posted travel speed and are consistently applied to all alternatives.
- Ferry travel times were based on average operating conditions, observed wait and loading times, and AMHS policies (e.g., check-in times).
- Similar to road travel being delayed by weather, ferries can also break down or have mechanical delays. No time penalty has been added to any alternatives. All alternatives are forecast based on an annual average basis, and all alternatives were treated equally.
- AMHS policy is that passengers traveling without vehicles must check in 2 hours prior to departure in Bellingham and Juneau, and 1 hour prior to departure at all other ports. These policies were used in the traffic forecast analysis for existing ferries (see Appendix AA, *Traffic Forecast Report*).
- The “Ferry Delay” values used in Appendix AA were derived from the work done for the project by contractors knowledgeable about ferry operations, as overseen by DOT&PF. The wait times are considered realistic. Note that the ferry shuttle operations under Alternatives 2B and 3 would operate differently than existing ferry service—that is, reservations would not be required, and drivers would load without check-in or long processing times. Vehicles would be accommodated on a first-come, first-served basis, as indicated under Travel Time in the description of reasonable alternatives in Chapter 2 of the Draft and Final SEIS.

F) Why people travel not valid or not understood

Motivations for travel are the typical reasons anyone would travel in other corridors—recreation/tourism, business, industry/freight, social, medical, catching a flight, shopping, etc. The “average daily traffic” numbers reported, represent point-to-point traffic—that is vehicles that make the connection between two communities (even if they started their trip north or south of the project area. Juneau, Haines, or Skagway residents who might travel only part way out the new highway for recreation/hunting/fishing without connecting to a community at the other end would be additional traffic affecting some segments and are not reported in Appendix AA, *Traffic Forecast Report*.

G) Impacts Not Addressed in Appendix AA

Appendix AA is the *Traffic Forecast Report*—it is not an impact assessment. The Draft and Final SEIS address impacts that result from the forecast.

- Impacts derived from the forecast are found in the SEIS. Tourism impacts and economic development are discussed under Socioeconomic Resources in Chapter 4 of the SEIS.
- Appendix AA addresses all traffic in Lynn Canal that uses the AMHS, including people who travel for all reasons, including tourism and business/industry/freight. Most tourism is directly related to cruise ships and is not directly traveling between communities on the AMHS. Barges and freight are discussed in Section 3.3 of Appendix AA.
- DOT&PF and FHWA have disclosed the potential for road closures and have developed a plan to mitigate those effects to the extent that travel delay would be minimized. Service to and from Juneau during a road closure would be provided by running a ferry in Lynn Canal.
- In Section 4.1.5 of the Final SEIS, in discussion of methods used for traffic forecasting and economic factors, a statement acknowledging that there is uncertainty inherent in forecasting has been added to the text. This reflects Section 2.3 of Appendix AA, which is dedicated to Notes and Limitations.
- As explained in the Draft and Final SEIS and Appendix AA, there are a number of reasons that Alternative 2B would have greater travel demand than Alternative 1 – No Action. Alternative 2B offers more opportunities to travel and provides greater flexibility to leave and arrive, which coincides more closely with the time of the traveler’s choosing. It provides this opportunity at a greatly reduced user cost in terms of time and money.

Group 260

Topic/Subtopic: Transportation/Transportation Demand

Group Comment Text:

Demand assumptions in the Draft SEIS are flawed because Lynn Canal communities are not comparable to communities in the Lower 48 or Southcentral Alaska. The selection of city pairs in Appendix AA, *Traffic Forecast Report*, is not comparable to Lynn Canal. For example, Denali National Park is a major destination between Anchorage and Fairbanks. There is no comparable destination in Lynn Canal.

Group Comment Response:

The model analysis looked at travel patterns of a number of cities, including Anchorage, Fairbanks, and Whitehorse (as regional centers like Juneau), and included analysis of similar coastal communities, including Prince Rupert and Port Hardy, British Columbia, and Seward, Homer, Valdez, Haines, and Skagway, Alaska (see Appendix AA, *Traffic Forecast Report*). The model did not use Anchorage and Fairbanks as endpoints as an example of city pairing. The data from these communities was only used to generate a trip dissipation model. Based on the data from the communities listed above, a very strong correlation was found between the distance traveled from the edge of the community and the traffic volumes. This predictive model was used, among other sources, to develop an unconstrained demand model for Lynn Canal. In other words, what kind of trip-making pattern would be expected if Juneau were connected to the road system? It is based on the assumption that people in Juneau, Haines, and Skagway would exhibit similar travel patterns given the opportunity to travel by road as other similarly situated communities. Based on the project team’s research, there are no indicators that travel behavior in Juneau, Skagway, and Haines would differ substantially from that of other Alaskan and Canadian communities if full highway access were available.

The forecast only used the unconstrained demand estimate as an upper bound to bracket the overall demand in the corridor. Each forecast, for each of the alternatives, scales down from the unconstrained demand based on factors of cost, travel time, schedule convenience, etc. Using such factors to predict traveler’s choices and behavior among competing alternatives is a common modeling practice and is used in nearly every traffic model. By factoring the demand down from the unconstrained demand based on costs, travel time, and convenience, the model predicts reasonable estimates of travel behavior based on the relative merits of the alternatives.

Data examined for traffic modeling was derived from actual travel conditions observed in Alaska and Western Canada from communities with similar geographic characteristics as Juneau. The model does not estimate or rely on trips interchanging “between” Anchorage and Fairbanks or between an intermediate stop like Denali Park. As is explained in Appendix AA, the cities were used to gauge the edge effect of travel from these centers. Using multiple locations and several modeling approaches strengthens the modeling effort.

Group 261

Topic/Subtopic: Transportation/Transportation Demand

Group Comment Text:

A) The demand estimate is not realistic because it will not change travel patterns. The proposed road would generate few additional vehicular trips with origin/destination beyond Haines and Skagway because ferry or air travel provides more economical or more dependable service.

B) Traffic forecasts for the Haines-Skagway link are missing from the Draft SEIS.

Group Comment Response:

A) If Alternative 2B were built, there would not be a competing ferry option in Lynn Canal that travelers with vehicles could choose to take, so inevitably traffic patterns would change. The model used to estimate demand for this project was developed based on empirical data derived from actual travel conditions observed in Alaska and Western Canada from communities with similar geographic characteristics as Juneau. Two methods were used as being most representative of likely conditions along Lynn Canal. Each of these two different models was developed independently and resulted in similar estimates of travel volume along Lynn Canal. These approaches were developed by travel modelers at Fehr & Peers. This firm was specifically identified and hired for its expertise in the travel modeling field, and its approach and results were peer reviewed by an independent university professor with expertise in travel modeling and travel behavior prior to the results being accepted for use in the Draft SEIS. The methodology and results of both approaches are fully disclosed in the associated technical report and summarized in the Draft SEIS.

B) The purpose of the project is improved access to and from Juneau in Lynn Canal; the Draft SEIS did not evaluate the Haines-Skagway connection in detail. The Haines-Skagway shuttle information was provided to illustrate the potential impact each alternative would have on this travel link. The Haines-Skagway traffic forecast and method to accommodate the traffic is located in the 30-year Traffic Projections table located in Attachment E of Appendix GG, *Marine Segments Technical Report*. Based on this comment and others, additional information on the Haines-Skagway shuttle, including the traffic forecast, has been added to Chapter 4 of the Final SEIS.

Group 264

Topic/Subtopic: Transportation/Transportation Demand

Group Comment Text:

DOT&PF should consider changing the pricing system used on the ferries (e.g., dynamic, variable, or demand-based pricing).

Group Comment Response:

The reservation system used for the last 15 years was not capable of variable pricing. AMHS is renovating the reservation system and enhancing its capabilities and functionality. However, AMHS demand-based pricing must be justified on the basis of balancing service and cost.

AMHS will not be implementing a variable pricing system for the near term. However, in May 2016, as a result of the 2015 Rate Study, AMHS implemented a variable leveling tariff increase on all routes. The tariff increase will vary by route and will be divided out over a 5-year implementation period. The purpose of this action is to level the AMHS tariff structure. Once the tariff structure has been leveled, then AMHS may consider further modifying the tariff structure consistent with recommendations from the 2015 AMHS Rate Study.

Group 266

Topic/Subtopic: Transportation/Transportation Demand

Group Comment Text:

A) How many cars/riders would it require to sustain an acceptable traffic flow?

B) Would short ferry trips always be full?

Group Comment Response:

A) The Draft and Final SEIS describe the ferry and road alternatives and the number of vehicles projected to use each of them. Each of the alternatives are considered as “sustaining an acceptable traffic flow,” and each are considered reasonable alternatives even though the numbers of users varies. Alternative 2B is projected to be used by more vehicles than the other alternatives evaluated, and this use projection makes it more “acceptable” (i.e., it would better satisfy the project purpose and need) and this contributes to it being identified as the preferred alternative in the Draft SEIS.

B) Shuttle ferries associated with Alternatives 2B and 3 operate what would be considered “short ferry trips.” It is not anticipated that the ferry would always be full. The Draft SEIS indicated that “Some ferries may be at maximum capacity, resulting in travelers having to wait for the next ferry or change their preferred ferry time.” This is anticipated to occur during peak times (e.g. Friday afternoon on a 3-day weekend in the summer).

Group 340

Topic/Subtopic: Transportation/Transportation Demand

Group Comment Text:

Did DOT&PF do any substantive demand study, monitoring, or data analysis of fast ferry service? If so, what were the results?

Group Comment Response:

While there is data for the fast ferries, overall demand for improved access in the Lynn Canal corridor cannot be extrapolated from it. The current latent corridor demand projection is not based on 1994 or 2003 surveys. Nor is the current project purpose and need based on them. The biggest indication of project need is the low percentage of overall demand met by current service and the low demand relative to traffic on all other nearby routes. Monitoring for demand of fast ferry service in Lynn Canal was a recommendation from the 1986 SATP. The 1986 SATP and 1994 and 2003 telephone and household surveys were included in the SEIS to disclose what was either done or thought about the project in the past.

Topic/Subtopic: Transportation/Travel Times

Group Comment Text:

- A) The Draft SEIS travel times did not factor in sufficient time for check-in, ferry turnaround, ferry waiting, or ferry delays. The assumptions used in the analysis of wait times at the Katzehin Ferry Terminal should be reconsidered.
- B) The lack of a reservation system will result in different travel times than that used in the Draft SEIS and will be problematic for certain users such as business travelers.
- C) The project should include a reservation system to provide schedule certainty for the traveler.
- D) The analysis should consider that people will leave earlier to help ensure they can board their desired sailing.
- E) The analysis should consider travel times for passengers having to wait due to the ferry being full.
- F) The Mooring and Loading Operations (MLOPS) times used are unrealistic and should be changed to more realistic times.
- G) The travel times in the Draft SEIS did not address transportation for pedestrians or cargo.
- H) The ferry travel times cited in Appendix CC, *Development of Alternative 1B – Enhanced Service with Existing Alaska Marine Highway System (AMHS) Assets*, of the Draft SEIS contradicted “travel time improvements.” In some instances, current travel times were faster than projected times.
- I) Has DOT&PF investigated any means to reduce the 2-hour check-in time at Auke Bay?

Group Comment Response:

A) Ferry travel times are based on AMHS experience and documented wait times, loading and unloading times, and AMHS policies. The times assumed in the Draft SEIS for Alternatives 2B and 3 are based on proven examples of similarly operated ferry systems that load and unload quickly, based on terminal and vessel design and drive through loading and unloading operations. The times expressed in the Draft SEIS are achievable. The operating model for Alternative 2B and 3, in particular, would be different than existing AMHS operations. No check-in would be required. Vehicles would drive straight on without turning or backing into position and would drive straight off. Such measures coupled with simpler ticketing and security procedures would help to make loading and unloading efficient. Each of the alternatives has a ferry link and none of the alternatives’ travel times were penalized for potential ferry delays. Travel times (including average wait time) were computed for average operating conditions, expected to occur most of the time.

B) The roadway alternatives (2B and 3) would operate differently than the rest of the AMHS and would be more like the shuttle ferry to the Ketchikan Airport. People would drive a longer road with a relatively short transit on the ferry (approximately 27 minutes for the Katzehin-Haines shuttle under Alternative 2B). While it is possible that a traveler could arrive at the terminal only to find the ferry had just departed or to find the ferry full and unable to take another vehicle, such scenarios are anticipated to be rare. Once a pattern was established, it is likely that travelers would self-select to days or times anticipated to be less busy. Most of the time, space would be available. See also Response C, below. For business travelers with tight timelines and little flexibility, private air carriers are available. Even if such travelers missed their desired ferry, they would likely be able to catch the next one a short time later. Under such a scenario, the travel time would still be much less than the current system.

C) The first-come/first-served operations model would not provide schedule certainty in the same way a reserved ticket for a specific departure time would. However, the certainty would be similar to driving virtually anywhere that a traffic jam or accident could slow progress. The ferry capacities and number of sailings were calculated to provide for the projected summer ADT on the road. It is anticipated that patterns would develop, and travelers would learn when “rush hour” would be, and enough people would avoid those times that few would be delayed. Removing the need for a reservation system speeds up the overall travel time by removing the associated check-in process. The shuttle ferries will run frequently, thereby reducing the inconvenience.

D) The analysis in Appendix AA, *Traffic Forecast Report*, indicates that average wait times were used to account for some people arriving well ahead of the ferry sailing and some arriving just in time.

E) The analysis of all alternatives is based on average conditions. The wait times do not consider passengers having to wait due to a full ferry. The ferry size and frequency of service are designed to accommodate projected demand on the summer average. Only at peak times in summer would the ferry be anticipated to be full. Because alternatives other than 2B and 3 have more limited frequency, their system capacity is lower, resulting in a greater chance that travelers may not be able to travel on their chosen date than under Alternatives 2B and 3. However, travel times for all alternatives are based on average conditions.

F) The MLOPS times used in the Draft SEIS for alternatives employing a first come/first serve drive through loading approach are aggressive but achievable and realistic as demonstrated by actual measured times of existing public ferry systems. The MLOPS (as detailed in Appendix GG, *Marine Segments Technical Report*) was revised for the Final SEIS to reflect a more conservative timing given the proposed terminal and vessel configurations. Ultimately, the final configuration of terminals and ferries will be determined by the operator, AMHS, as NEPA documents do not dictate operational decisions. For the SEIS, what is important is that all alternatives be designed for realistic efficiency so they can be compared on an equal basis.

G) Travel times for walk-on passengers and cargo trucks would be similar to those reported in the Draft SEIS. Except in very limited circumstances, AMHS does not transport cargo-wheeled vehicles only as it functions as a highway, not a freight shipping service. Most travelers who today are walk-on ferry passengers do not walk for the entire Lynn Canal trip; most walk-on passengers get a ride to and from the ferry terminals via a taxi or a friend, or with somebody known to be taking a car. Under Alternatives 2B and 3, they will need to do the same. Thus, they are represented in the reported travel time calculations. People who do not own a car and have little means for getting a ride because of the longer distance from Juneau to the new ferry terminal would be impacted. The Draft SEIS discloses this impact stating: “Travelers without vehicles would be forced to rent vehicles, take a commuter flight, or travel on private carriers.” Because these passengers would still arrive in a vehicle, their travel time would be similar as that reported in the Draft SEIS. Some commenters suggested extra time should be added for such travelers to wait for their ride; however, such passengers currently need to wait for their ride to the ferry terminal. Alternatives 2B or 3 would not change that requirement. Under Alternatives 2B and 3, the system would operate the same for trucks hauling cargo as for other passenger vehicles. The travel times for cargo carrying trucks would be the same as those reported in the Draft SEIS.

H) It is not clear from the comment, but it appears the commenter may be comparing personal knowledge of ferry transit times with travel times indicated in Appendix CC, *Development of Alternative 1B – Enhanced Service with Existing Alaska Marine Highway System (AMHS) Assets*. Appendix CC documents the development and operation of the Court mandated alternative using existing assets. Note that travel times for all alternatives are presented as total travel time, including loading and unloading time, check-in time, etc., in addition to time that the ferry vessel would be underway. The times do not represent just the ferry sailing time.

I) AMHS has investigated means to reduce the two hour check in time at Auke Bay. Current Auke Bay check in times are based on requirements developed over time to make the check-in, sorting, and loading/unloading as efficient as possible for AMHS operations. Such times are necessary to deal with ticketing and reservations, security, and allowing for sufficient loading and unloading time. Based on years of experience, AMHS has developed their check-in time into a policy to minimize delays in the operations. Cutting time out of the check-in time increases the risk of delayed departures.

Group 252

Topic/Subtopic: Transportation/Travel Times

Group Comment Text:

The Draft SEIS did not factor in roadway travel time delays caused by weather, winter road conditions, public transit use, road maintenance, or traffic. This should be considered as part of the SEIS analysis.

Group Comment Response:

Travel speeds did factor in roadway travel time delays caused by weather, winter road conditions, public transit use, road maintenance, or traffic. However, the modeled traffic speed was based on average conditions and average drivers, and have been applied

consistently across all of the alternatives. For both the road and ferry links, the extreme conditions are part of the averaged modeled travel times. All alternatives are forecast based on annual average basis, and all alternatives are treated equally. Roadway travel times are based on a travel speed of 45 mph. Ferry travel times were based on average operating conditions, observed wait and loading times, and AMHS policies (e.g., check-in times). Weather also affects travel speed for marine vessels, and they can be delayed for mechanical problems or maintenance. Heavy seas or head winds can and do affect travel times for the vessels.

For Alternative 2B, DOT&PF and FHWA have disclosed the impacts of potential road closures and have developed plans to mitigate those effects to the extent that travel delay should be minimized. DOT&PF has committed to running ferries in Lynn Canal if the road were to be closed for extended periods. Travelers without vehicles would need to rent vehicles, take a commuter flight, or travel on private carriers if they develop to accommodate this demand. Information about walk-on passengers was included in the Draft SEIS and has been augmented in the Final SEIS (see Sections 4.3.7.5 and 4.4.7.5).

Group 222

Topic/Subtopic: Transportation/User Costs

Group Comment Text:

A) The Draft SEIS cost analysis did not include all user travel costs, such as taxi or shuttle service, parking fees, fuel, travel time, vehicle maintenance, strandings, and inconvenience.

B) The Draft SEIS was incorrect in stating road alternatives will decrease user costs. The road alternative would cost travelers more money than using the existing ferry system.

Group Comment Response:

A) Appendix FF (*User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*) of the Draft SEIS described in detail all of the traveler costs included in the economic analysis, including travel time, fuel, vehicle maintenance, accident costs, insurance, etc. It is important to recognize that the travel cost figures used in the User Benefit Analysis are averages intended to represent a broad range of individual cost scenarios ranging from the individual sharing personal vehicle expenses with three or four other travelers to the solo traveler who might have to hire some form of ground transportation to make a trip between Haines and Juneau. It is not possible to know with any degree of certainty how many travelers will fall into these and other categories of travelers. Because it is not possible to credibly predict the number of travelers who might be seeking commercial transportation services to and from ferry terminals under various project alternatives, it is not possible to predict the cost of such services.

The Draft SEIS gave an example for purposes of illustrating user cost. It was not meant to illustrate every possible scenario of vehicle type, number of occupants, or walk-on users. DOT&PF and FHWA recognize that there would be cost implications due to changes in travel patterns like those mentioned in the comments, including: costs to individuals traveling to Juneau to access the airport using Alternatives 2B or 3; costs to those travelers who may have used the existing ferry like a bus rather than as a highway; and cost savings for travelers coming or going beyond Haines or Skagway who do not wish to spend the

night in a hotel (due to border closure or ferry schedule). Based on this comment, additional information has been added to the Final SEIS in Sections 4.3.7.5 and 4.4.7.5. See also Section 4.3.7.5, Other Transportation Impacts, under the Pedestrians and Cyclists subheading, and see parallel subsections under the other alternatives.

B) Section 4.3.7.4 and Table 4-24 of the Draft SEIS included information about the total and out-of-pocket costs (fuel and fares) for a family of four in a 19-foot vehicle for Alternative 1 – No Action and Alternative 2B. Parallel sections under other alternatives presented similar information. The out-of-pocket cost for Alternative 2B would be approximately 80 percent less than for Alternative 1 – No Action under this example. To help clarify, additional information about the anticipated fares for the various travel markets (walk-ons, single drivers with a vehicle, etc.) has been added to the Final SEIS. See also Response A, above.

Group 225

Topic/Subtopic: Transportation/User Costs

Group Comment Text:

A) The benefits of the project for travelers is not convincing. How will this plan reduce costs to the traveler? Costs will be transferred to the passenger (e.g., the cost of fuel to get to the Katzehin Ferry Terminal).

B) Why are ferry passengers subsidizing the system?

Group Comment Response:

A) Appendix AA, *Traffic Forecast Report*, and Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*, provide the underpinnings for the discussion of economic user benefits presented in the Draft and Final SEIS. The Draft and Final SEIS discuss the methods used in Section 4.5.1, Transportation, and present results under the heading “Transportation” and the subheading “State and User Costs” for each alternative in Chapter 4. The results show that, for most travelers, while some costs may be shifted to the individual, the cost of driving their own vehicle and paying a fare for the short shuttle ferry would be lower than the cost of riding the ferry under Alternative 1 – No Action. The cost per vehicle served would be lower for the State, the costs to users would be lower, and the number of vehicles served would be higher. DOT&PF and FHWA acknowledge that those accustomed to using the ferry as walk-on passengers would have to adjust. See discussion under the “Other Transportation Impacts” heading and “Pedestrian and Cyclists” subheading for each alternative in Chapter 4 for a discussion of impacts to those users. Additional discussion of walk-on passengers has been added to the Final SEIS in these same sections and in Appendix EE, *Socioeconomic Effects Technical Report*, in Section 3.1.4.

B) It is common at expensive links in roads—such as especially large bridges, ferries, and tunnels—to charge a fare or toll for passage. This is generally to help cover the costs of operating the expensive link, not the roads that approach the link. Section 2.5, Funding Considerations, of the Draft SEIS indicates that maintenance and operation of the road portions would be funded through the State’s General Fund, which is fed by a State fuel tax. This is the same as all other DOT&PF roads in Alaska. Maintenance and operation of

the marine portion of any alternative would be funded by a combination of fares and the State’s General Fund. All portions or all alternatives would continue to be subsidized by the State of Alaska. Ferry passengers’ fares would not subsidize the road. Ferry passengers would not be “subsidizing” any aspect of the system. In all alternatives, ferry travelers would be paying a portion of the cost of providing ferry service.

Group 424

Topic/Subtopic: Transportation/User Costs

Group Comment Text:

The Draft SEIS did not adequately address impacts to school districts that will occur as a result of the project. Regional competitions are important to all Southeast communities, and these impacts must be assessed:

A) There will be increased costs because students will require additional transportation for regional events as most students currently travel as walk-on ferry passengers. Costs would include the bus to and from the Katzehin Ferry Terminal and/or flights to/from Juneau.

B) There is an additional safety risk to students as a result of the drive from Juneau to the Katzehin Ferry Terminal. Parents will be concerned about sending their kids to tournaments and competitions if it involves travelling on the road. The road would decrease opportunities for student activities, especially for Haines and Skagway due to the reliability and safety of the road.

C) How would a road impact how many school days are included in a student’s academic year? Currently, students traveling for activities spend days away from school simply because they are dependent on the ferry schedule to leave town and get back home.

Group Comment Response:

FHWA and DOT&PF acknowledge that student transportation between Southeast Alaska communities would change as a result of the project if Alternative 2B or 3 were selected. In terms of transportation to extracurricular activities, Juneau, Haines, and Skagway schools would operate more like schools in most of rest of the road-connected communities in Alaska and likely would bus students between communities. More specific responses follow.

A) Additional information on costs under Alternatives 2B and 3 has been added to the Final SEIS. This includes cost of the shuttle ferries (fares) for a wider variety of travelers, not just a family of four, and the total cost of a trip between origin and destination (including costs for operating a vehicle). Costs would depend on the specifics of the given school or district regarding transportation of students for activities, but the Final SEIS acknowledges in both Sections 4.3.5.2 and 4.4.5.2 that change would occur that may affect logistics and costs for schools, school districts, and parents sending students to interschool events. AMHS currently provides discounted tickets for school groups, and that is expected to continue. As the existing cost of students traveling to Juneau from Haines/Skagway depend on many factors such as the number of students, the need to overnight away from home, etc. it is anticipated that some trips would cost less on the existing ferry system and some trips may cost more as compared to Alternative 2B.

B) Under Alternatives 2B and 3, the roads would increase the opportunity to travel with more frequent ferry sailings. As indicated in the Draft SEIS, road closures due to snow clearing and weather would be several days per year for relatively short durations, and ferries would be available (on a more limited schedule, more like today’s service schedule) to transport travelers if extended road closures were anticipated. The road will meet all standards for road safety. Wintertime driving conditions will be similar to other Southeast Alaska roads.

C) The road alternatives would increase the opportunity to travel and would reduce dependency on a ferry schedule. Although days in school/days out of school due to travel for extracurricular activities is outside of DOT&PF’s control, the time savings and greater opportunity for travel could mean time away from school for activities and events requiring travel should be reduced. For instance, it may be possible to get back and forth between Lynn Canal communities within the same day, depending on the time of day the event is scheduled, meaning less time away from school for some events.

7.25 Visual Resources

Group 542

Topic/Subtopic: Visual Resources/Method of Analysis

Group Comment Text:

A) The Draft SEIS did not include an analysis of visual impacts from the vantage point of the water traveler.

B) The visual assessments, environmental consequences, and simulations in the Draft SEIS are inadequate, incomplete, and misleading because they do not account for the movement of vehicles on the roadway.

Group Comment Response:

A) The Draft and Final SEIS do include visual analysis from the vantage point of the water traveler. The Draft and Final SEIS in Section 3.1.2, and for each alternative in the Visual Resources sections of Chapter 4, describe characteristic views, and these specifically and often include views from Lynn Canal/vessels on the water.

Subheadings for the road alternatives specifically break down “Views from Lynn Canal” and “Views from the Highway.”

B) DOT&PF and FHWA have reviewed the Visual Resources section of the Draft SEIS and the technical reports—Appendix G to the 2005 EIS, entitled *Visual Resources Technical Report*, and Appendix Z 2014 Update to Appendix G – *Visual Resources Technical Report* in the Draft SEIS. Visual assessments, environmental consequences, and simulations do not appear to be inadequate, incomplete, or misleading. Impacts are disclosed. Environmental consequences are frequently listed as high or very high, and compatibility with Visual Quality Objectives/Scenic Integrity Objectives for lands adjacent to the Transportation and Utility Systems (TUS) corridor often are noted as unlikely. Photo simulations show a variety of views, mostly from the water, and often clearly illustrate the

line of the highway as a new element in the view. Because consequences often are noted as high even without mention of movement on the road, movement would not change the analysis. However, movement of vehicles as an element that may draw attention to visual contrasts has been added to the Visual Resources sections of Chapter 4 and in the Appendix Z 2014 Update to Appendix G – Visual Resources Technical Report and 2017 Errata in the Final SEIS.

Group 541

Topic/Subtopic: Visual Resources/Operations/Maintenance Impacts

Group Comment Text:

A) Building a road would create a visual scar that would impact the beauty of the Lynn Canal landscape.

B) It is inaccurate that the road will hug the shoreline, blending into the coastline.

C) Will the visual degradation of the landscape have an impact on tourism?

D) The Draft SEIS was grossly deficient in failing to conduct a survey of visitors' impressions of the scenic landscape and to attempt to assign dollar values to the degree to which it helps draw visitors. This omission invalidates the State's economic analyses of the costs and benefits of the proposed road.

E) What is the value to the State and the region of the natural views this scenic landscape?

Group Comment Response:

A) Visual impacts of highway alternatives are addressed in the sections on visual resources in Chapter 4 of the Draft SEIS and Appendix Z 2014 Update to Appendix G – Visual Resources Technical Report. These documents acknowledge that a highway would be visible at numerous locations from boats, ferries, and cruise ships on Lynn Canal.

B) As noted in the Draft SEIS and its Appendix Z 2014 Update to Appendix G – Visual Resources Technical Report, portions of the proposed Alternative 2B road, viewed at key viewpoints, would blend with features of the coastline because they would occur in visual transition areas (e.g., at ELVP7 discussed in Section 5.2.2 of Appendix Z 2014 Update to Appendix G; at ELVP10 in Section 5.2.5; and Section 4.3.3.2 [Point St. Mary to Eldred Rock] in the Draft SEIS). As can be seen in the visual simulations, the closer the road is to the coastline, and the less of a cut into the mountain slopes that occurs, the more the road would blend into the natural setting. Depending on the distance from the highway, the road would either be a co-dominant or subordinate feature (with the natural setting dominant) in these areas. The Draft SEIS and Appendix Z 2014 Update to Appendix G report that there are other areas where the proposed road would dominate views over the natural setting.

As stated in Section 4.3.3.4 of the Draft SEIS, the alignment has been located to maintain a buffer between the highway and the shore, reducing the visibility of the highway from Lynn Canal. Vegetation within the buffer would be maintained and shot rock slopes would be covered with overburden and seeded to reduce their visibility to the extent practicable.

C) The impacts to visitors due to the changes anticipated from the alternatives are described in the Draft SEIS and Appendix EE, *Socioeconomic Effects Technical Report*. The proposed alternatives are expected to have little impact on the cruise ship industry in Lynn Canal. As reported in the Draft SEIS and Appendix EE (Section 3.1.4.4), cruise operators stated that a visible highway would have little or no effect on cruise itineraries. Because the cruise ships generally sail at night and visit port during the day, the aesthetic impact of a highway would not be an issue for the cruise industry (Section 4.3.5.4 of the Draft SEIS and Section 3.1.4.4 of Appendix EE). As stated in Section 4.3.5 of the Draft SEIS, the cruise ship industry is primarily affected by facilities at points of origin and destination, and is projected to grow at an annual average rate of 1 to 2 percent over the next 20 years. In addition, it is anticipated that while the proposed project would impact independent (non-cruise) visitors, the cruise visitor market will not be impacted, and is expected to grow independent of the project (Section 4.3.5.2 of the Draft SEIS).

D) The Draft SEIS included Alaska Visitor Statistics Program data as well as information from the Skagway and Juneau Convention and Visitor's Bureaus and the cruise ship industry. As reported in the Draft SEIS and Appendix EE, *Socioeconomics Effects Technical Report*, the proposed project would not be likely to greatly impact the visitor industry, which has already shown a decrease due to economic factors.

DOT&PF and FHWA do not intend to conduct a visitor survey, as other entities have conducted them in the past and it would be outside the scope of this NEPA analysis. It should be noted that USFS visual impacts guidance (*Landscape Aesthetics: A Handbook for Scenery Management*, Handbook 701) that was relied on in the analysis, cautions against the use of monetary estimates of value for scenic attributes in visitor surveys. In addition, the National Cooperative Highway Research Program *Evaluation of Methodologies for Visual Impact Assessment* (Report 741) states that visual impact assessments do not rely on monetary value to create a common framework because scenic qualities are not well represented or valued through an economic/market approach. This NEPA analysis does not assign a quantitative or monetary value to visual quality.

DOT&PF and FHWA have reviewed the Visual Resources sections of the Draft SEIS and the technical reports—Appendix G to the 2005 EIS (*Visual Resources Technical Report*) and Appendix Z *2014 Update to Appendix G – Visual Resources Technical Report* in the Draft SEIS. Visual assessments, environmental consequences, and simulations do not appear to be inadequate, incomplete, or misleading. Impacts were fully disclosed and analyzed. Environmental consequences were frequently listed as high or very high, and compatibility with Visual Quality Objectives/Scenic Integrity Objectives for lands adjacent to the TUS corridor often were noted as unlikely. Photo simulations in the Draft SEIS and Appendix Z *2014 Update to Appendix G* showed a variety of views, mostly from the water, and often clearly illustrated the line of the highway as a new element in the view. The Draft SEIS stated that Alternative 2B would not affect visual resources to a level that would greatly detract from scenic values and impact the visitor industry.

E) Scenic values and impacts from the project on visual resources are addressed in the Draft SEIS and Appendix Z *2014 Update to Appendix G– Visual Resources Technical Report*. The NEPA analysis addresses impacts to visual resources, on a qualitative basis, per USFS guidance. As discussed under Response D, above, the NEPA analysis does not

assign a quantitative or monetary value because scenic qualities are not well represented or valued through an economic/market approach.

7.26 Water Quality, Hydrology, and Floodplains

Group 60

Topic/Subtopic: Water Quality, Hydrology, and Floodplains Resources/Method of Analysis

Group Comment Text:

Appendix Z (2014 Update to K – Hydrology and Water Quality Technical Report) must have a defined, site-specific baseline to be scientifically relevant. Sampling must follow a standard protocol for sampling and analysis for water quality.

Group Comment Response:

The water quality study for the Draft SEIS (Appendix Z 2014 Update to K – Hydrology and Water Quality Technical Report) is intended to document existing conditions in the study area and identify potential impacts resulting from each alternative as well as mitigation measures sufficient for a NEPA evaluation. The study is not intended to document a baseline for future water quality monitoring that might be required as part of separate federal or State processes. As stated in Section 4.3.9.3 of the Draft SEIS, all stormwater and wastewater treatment facilities will be designed, managed, and treated to meet federal and State water quality standards.

Wastewater facilities undergo a separate permitting process under the Clean Water Act Section 402 National Pollutant Discharge and Elimination System regulations. During the permitting process, sampling protocols for the facility are established. If exceedances of federal and State water quality standards occurs, corrective action is required.

Water quality facilities for stormwater runoff also undergo a separate permitting process as part of local regulations and the Clean Water Act Section 401 regulations. Alternative 2B received a Certificate of Reasonable Assurance from the Alaska Department of Natural Resources (DNR) under the Clean Water Act Section 401.

Group 57

Topic/Subtopic: Water Quality, Hydrology, and Floodplains Resources/Mitigation

Group Comment Text:

A) Where will the ferry wastewater holding tank be emptied for Alternative 2B?

B) How will toilet waste materials be addressed along the road and at the terminal for Alternative 2B?

Group Comment Response:

A) Section 4.3.9.3 of the Final SEIS is revised to clarify that sanitary waste from the ferries would be treated at the home ports in Skagway and Haines at the existing treatment facilities for Alternative 2B.

B) At the Katzehin Ferry Terminal, sanitary waste from the terminal restrooms would be treated at a new facility constructed at the terminal. The new permitted facility would meet all federal and State water quality requirements. No restroom facilities are proposed along the road alignment.

Group 61

Topic/Subtopic: Water Quality, Hydrology, and Floodplains Resources/Operation/
Maintenance Impacts

Group Comment Text:

The Draft SEIS did not evaluate the effects of vehicular road pollution on aquatic species, particularly for zinc, copper, polynuclear aromatic hydrocarbons, and mercury. Recent scientific studies show that even low levels of polycyclic and polynuclear aromatic hydrocarbons and copper are dangerous for fish such as salmon and herring, and low levels of mercury may pose greater risks when added to an environment (e.g., wetlands) predisposed to foster methylation. A full environmental review requires consideration not only of compliance with water quality standards, but also of effects that may occur at concentrations lower than existing standards.

Group Comment Response:

The Draft SEIS examined the potential effects of vehicle pollution on the environment in sections related to air quality, water quality, habitat, and wildlife. Specific to water quality, the Draft SEIS evaluated the potential effects of vehicles traveling on the East and West Lynn Canal highways in Sections 4.3.9 (Alternative 2B) and 4.4.9 (Alternative 3). The evaluation included consideration of pollutants in stormwater runoff and associated water quality of receiving waters. DOT&PF and FHWA have reviewed your comments and reference documents and maintain that the mitigation measures described in Chapter 5 of the Draft and Final SEIS provide reasonable and adequate protection of terrestrial and aquatic systems.

7.27 Wetlands

Group 63

Topic/Subtopic: Wetlands/Method of Analysis

Group Comment Text:

A) The analysis for wetland effects should be consistent and rigorous for all alternatives.

B) Site-specific/localized effects to wetlands were not described in the Draft SEIS.

C) The Draft SEIS did not consider effects of the broader ecosystem, and instead segmented the review of impacts to wetlands, EFH, wildlife, and Steller sea lions.

Group Comment Response:

The analysis of wetland impacts for all alternatives in Appendix Z *2014 Update to Appendix O – Wetland Technical Report* of the Draft SEIS follows established methods under NEPA. The 2004 Appendix O, *Wetlands Technical Report*, identified the individual wetlands potentially impacted by all alternatives, described their functions, and detailed the impacts to the functions and values of each wetland. The 2004 document provided the

basis for the analysis of all the alternatives and was updated to incorporate additional information in 2005 (*Appendix W – Addendum to Appendix O Wetlands Technical Report*) and 2014 (*Appendix Z 2014 Update to Appendix O – Wetlands Technical Report*).

After Alternative 2B was identified as the preferred alternative in the 2006 ROD, additional engineering design and field investigations occurred on Alternative 2B as required by the USACE Section 404 permit process. Because that additional analysis is available, it has been incorporated into the Draft SEIS but it does not skew the overall NEPA analysis for all alternatives.

A) The analysis for wetland impacts is sufficiently rigorous and provided an appropriate level of information for all alternatives for a NEPA alternative comparison. The analysis presented in *Appendix Z 2014 Update to Appendix O – Wetlands Technical Report* describes the potential impacts to wetlands from all current project alternatives. The wetland mapping refinements that occurred for Alternative 2B after the 2006 ROD were minimal and did not change the order of magnitude of wetlands present. The minor refinements made to the alignment of Alternative 2B during the USACE permitting process were based primarily on other environmental constraints (i.e., bald eagle nests, geotechnical surveys, etc.). Due to the abundance of wetland resources in the region, these changes do not alter the degree of wetland impacts. Small-scale refinements that may result from additional ground surveys of wetlands for Alternative 3 (as completed for the permitting process for Alternative 2B) would not substantially change the practicability or degree of wetland impacts for Alternative 3.

B) Impacts to wetlands are discussed by subregion of East Lynn Canal in Section 4.2 of *Appendix Z 2014 Update to Appendix O – Wetlands Technical Report* to provide an analysis of wetlands in their respective areas. The subregions include: Berners Bay, Slate Cove to Sherman Point, Sherman Point to Katzehin River, and Katzehin River to Katzehin Ferry Terminal. For each subregion, an evaluation of impacts to functions and values as well as footprint acreage is provided. Analysis of wetland impacts that overlaps with other natural resources is noted, and a reference to those respective reports or chapters/sections in the Draft SEIS is provided.

The additional field delineation work completed near the Lace and Antler Rivers provided more refined boundary information for the wetlands in the Berners Bay area but did not affect the assessment of functions and values of the wetlands. Functions and values of wetlands across all alternatives, in consideration of their entire footprint and not just at Berners Bay, are assessed in Section 4.2 of *Appendix Z 2014 Update to Appendix O – Wetland Technical Report* of the Draft SEIS.

C) Wetland impacts that overlap with other natural resource impacts were noted in the Draft SEIS, and references to those respective reports or chapters/sections in the Draft SEIS were provided. Impacts to the broader ecosystem are evaluated based on the components that make up the ecosystem itself. This provided a more detailed assessment of the potential impacts that would occur for a higher level approach. Ecosystem impacts were evaluated under headings for terrestrial habitat, wildlife, EFH, and freshwater habitat and species for Alternative 2B in Sections 4.3.13 through 4.3.15 of the Draft SEIS and in *Appendix Z 2014 Update to Appendix N – Essential Fish Habitat Assessment, 2014*

Update to Appendix Q – Wildlife Technical Report, and 2014 Update to Appendix O – Wetlands Technical Report.

Group 65

Topic/Subtopic: Wetlands/Method of Analysis

Group Comment Text:

The impact site assessment in the Draft SEIS is inadequate for wetlands resources. The Draft SEIS assigned replacement values to different types of wetlands but did not explain how these values were calculated.

Group Comment Response:

Wetland functions and values are evaluated and detailed for each wetland in Appendix Z 2014 Update to Appendix O – Wetlands Technical Report of the Draft SEIS. Attachment 3 of Appendix Z 2014 Update to Appendix X – Draft Section 404/10 Permit Application and Draft Section 404(b)(1) Analysis in the Draft SEIS summarizes the wetland and waterbody rating system used. Although the rating system developed is applicable to all wetlands across all alternatives, Attachment 3 focuses on the ratings specific to Alternative 2B as part of the Draft 404/10 Permit Application. To rate wetlands and waterbodies for the purpose of determining appropriate compensatory mitigation ratios that comply with current regulations, a qualitative assessment was performed to classify wetlands and waterbodies into the following four categories: Category I, II, III, and IV. Category I wetlands and waterbodies are generally less common and high functioning. Category IV wetlands and waterbodies are more common with limited or degraded functions. Impacts of Alternative 2B would be limited to Category II and III wetland and waterbodies.

Group 69

Topic/Subtopic: Wetlands/Compensatory Measures

Group Comment Text:

A) The mitigation for effects to wetlands described in the Draft SEIS for Alternative 2B is inadequate and does not accurately portray the potential costs of compensatory mitigation. A detailed mitigation plan should be included that describes both the Yankee Cove project as well as the additional mitigation proposed. A clear description of the debit/credit ratio and costs should be provided.

B) Wildlife underpasses should not be considered wetland mitigation.

Group Comment Response:

A) With identification of Alternative 1 – No Action as the preferred alternative for the Final SEIS, DOT&PF notified USACE that it was withdrawing its Section 404/10 Permit Application for the JAI Project. Mitigation costs for all reasonable alternatives were provided in the Appendix Z 2014 Update to Appendix D – Technical Alignment Report. Had the ROD selected an alternative requiring a USACE 404/10 permit, calculations of credits from potential permittee-responsible mitigation projects, as well as the amount of credits to be purchased from an In-Lieu Fee provider would have been detailed in the Compensatory Mitigation Plan approved by the USACE during the Section 404/10 permitting process for a build alternative.

B) Section 5 of Appendix Z *2014 Update to Appendix O – Wetlands Technical Report* of the Draft SEIS stated that the underpasses are out-of-kind mitigation to offset losses to a portion of the terrestrial wildlife habitat impacted by Alternative 2B. The remaining palustrine and estuarine wetlands (0.2 acre) would be mitigated through In-Lieu Fee compensation based on market value of mitigation costs.

Group 64

Topic/Subtopic: Wetlands/Operation/Maintenance Impacts

Group Comment Text:

A) Alternative 2B would compromise wetland values for groundwater recharge, wildlife habitat, and nutrient transport. Fill in wetlands would reduce these functions to zero.

B) Alternative 2B violates EO 11990 because other practicable alternatives with less impacts to wetlands are available.

Group Comment Response:

A) Wetland impacts that overlap with other natural resource impacts were noted in the Draft SEIS and references to those respective reports or chapters/sections in the Draft SEIS are provided below. Impacts to the broader ecosystem were evaluated based on the components that make up the ecosystem itself. This provided a more detailed assessment of the potential impacts that would occur for a higher level approach. Ecosystem impacts were evaluated under headings for terrestrial habitat, wildlife, EFH, and freshwater habitat and species for Alternative 2B in Sections 4.3.13 through 4.3.15 of the Draft SEIS and in Appendix Z *2014 Update to Appendix N – Essential Fish Habitat Assessment, 2014 Update to Appendix Q – Wildlife Technical Report*, and *2014 Update to Appendix O – Wetlands Technical Report*. In addition, Section 4.3.12 of the Draft SEIS described impacts to groundwater from Alternative 2B and noted that “effects would be minimized through the use of porous fill material and cross-drainage structures” to minimize effects to shallow groundwater. This section also states the importance of wetlands to wildlife habitat, particularly the Berners Bay wetlands. As stated in the section, wildlife habitat functions would be reduced due to loss of habitat, but an abundance of similar habitat is adjacent to the alignment. Nutrient transport could be disrupted from construction of the alignment through wetlands but as stated in the section, large areas of similar habitat in the surrounding areas, and adequate ditching and drainage structures, would moderate loss of these functions. Impacts from fill in wetlands would reduce, but not eliminate, functions. Unavoidable impacts to wetlands and reductions of wetland functions are proposed to be offset through mitigation.

B) The Draft SEIS included an evaluation in accordance with EO 11990 that identified Alternative 2B as the only practicable alternative that comprehensively best meets the purpose and need for the project. The FHWA and DOT&PF have identified Alternative 1 – No Action as the preferred alternative for the Final SEIS. It would not result in impacts to wetlands and is consistent with EO 11990.

Group 72

Topic/Subtopic: Wetlands/Section 404 Consultation

Group Comment Text:

The information provided in the Draft SEIS and the draft application for a Clean Water Act § 404 permit fails to satisfy the agencies' NEPA obligations and improperly restricts the analysis of the least environmentally damaging practicable alternative. The Clean Water Act Section 404(b)(1) analysis is based on unreliable traffic calculations and the assessment of practicability of alternatives varies by alternative. Alternative 2B is not the least environmentally damaging practicable alternative; it is the most environmentally damaging practicable alternative.

Group Comment Response:

FHWA has met its requirements under NEPA by evaluating a range of alternatives in accordance with CEQ guidance (40 CFR 1500) and FHWA regulations (23 CFR 771.130).

An evaluation of practicability of the alternatives is required pursuant to USACE guidelines at 40 CFR 230.10(a). A practicable alternative “is available and capable of being done after taking into consideration cost, existing technology, and logistics...” For the JAI Project Draft Section 404(b)(1) Analysis Update presented in Attachment 4 of the *2014 Update to Appendix X – Draft Section 404/10 Permit Application and Draft Section 404(b)(1) Analysis*, provided in Appendix Z of the Draft SEIS, the criteria used to evaluate practicability include project purpose, capital and operating costs, travel time, daily traffic, travel demand accommodated, wetland impacts, and EFH impacts. The USACE performs their own analysis and makes the final determination regarding the least environmentally damaging practicable alternative.

7.28 Wildlife

Group 74

Topic/Subtopic: Wildlife/Existing Conditions

Group Comment Text:

A) The description of Slate Cove in Section 3.3.2.1 of the Draft SEIS should be revised to describe its importance as habitat for marine mammals, fish spawning, birds, etc.

B) The SEIS should recognize the importance of Berners Bay spring herring and eulachon runs to bald eagles, surf scoters, and Thayer's gulls because it is a significant proportion of the region or, in the case of Thayer's gulls, a significant portion of the world population of a given species at a crucial point in its lifecycle.

C) Short eared owls are particularly dependent on Alaska coastal wetlands and natural grasslands.

D) The rocky shores along Lynn Canal could be suitable nesting, foraging, or migration habitat for Black Oystercatchers.

Group Comment Response:

A) The description of Slate Cove in Section 3.3.2.1 of the Draft SEIS is a summary of the results of the intertidal and subtidal surveys described in Section 4.1.1.2 of the 2004 Appendix N, *Essential Fish Habitat*. While it may be used by marine mammals, fish, and birds, the surveys did not indicate it should have status as important habitat.

B) Section 3.3.2 and 3.3.4 of the Draft SEIS recognized the importance of Berners Bay for herring and eulachon and the species that depend on them. These sections did not describe every species that uses Berners Bay, rather they focused on USFS management indicator species, species of concern, and sensitive species, as well as State species of special concern and other species identified by resource agencies in Scoping (see Draft SEIS Section 3.3.5.1). To avoid overwhelming the public and decision makers with an assessment of impacts on hundreds of species, much of which would be repetitive or based on very little data, a subset of species was selected for analysis. This subset represents the overall species that occur in Lynn Canal, although Thayer's gull and surf scoters are not specifically referenced. The ultimate list of species used in the analysis was approved through consultation with the wildlife resource agencies.

C) As described in Section 3.2 of the 2004 Appendix Q, *Wildlife Technical Report*, some species are more likely to be affected by the project alternatives than others. To avoid overwhelming the public and decision makers with an assessment of impacts on hundreds of species, much of which would be repetitive or based on very little data, a subset of species was selected for analysis. This subset represents the overall species that occur in Lynn Canal, including short eared owls. The list of species used in the analysis was approved through consultation with the wildlife resource agencies.

D) Section 3.3.1.1 of the Appendix Z *2014 Update to Appendix Q – Wildlife Technical Report* discussed black oystercatchers. Although surveys were not conducted, reliable sources were used to determine population numbers in Lynn Canal.

Group 87

Topic/Subtopic: Wildlife/General

Group Comment Text:

The SEIS and *Wildlife Technical Report* should be updated/revised with edits from ADF&G (see comment letter from ADF&G 11/25/2014). Please note that edits addressed under this comment group may pertain to wildlife issues addressed under other comment groups.

Group Comment Response:

FHWA and DOT&PF have updated the Final SEIS and associated appendices to respond to ADF&G comments. See also FHWA's response letter to ADF&G, which is provided in this Final SEIS (Attachment B of this appendix), for specific responses to each of the editorial comments made by ADF&G.

Group 99

Topic/Subtopic: Wildlife/Method of Analysis

Group Comment Text:

- A) How were the high-use wildlife corridors mapped?
- B) Were the mapping studies reviewed by the scientific community?
- C) A survey for amphibian ponds should be completed for the SEIS to allow for comparison between alternatives.
- D) What sampling was done for benthic invertebrates, which are important food for shorebirds, waterfowl, fish and mammals?
- E) Were seasonal observations made for feeding shorebirds and waterfowl?

Group Comment Response:

- A) The high-use wildlife corridors along Alternative 2B are based on data gathered by ADF&G as part of the wildlife monitoring studies funded by DOT&PF pursuant to FHWA's 2006 ROD. These studies were intended to facilitate ADF&G game management after project construction. The wildlife studies collected baseline population and range information to formulate the high-use wildlife corridors identified in Section 3.3.5 of the Draft SEIS.
- B) The studies conducted by ADF&G to determine high-use wildlife corridors were published in a series of white papers described in Section 3.3 of the *Appendix Z 2014 Update to Appendix Q – Wildlife Technical Report* in the Draft SEIS. The scientific community has an opportunity to review the SEIS and supporting documents as part of the NEPA review process.
- C) A specific survey for amphibian ponds potentially affected by each alignment was not conducted for the Draft and Final SEIS. Rather, DOT&PF and FHWA assumed that the open water and emergent wetlands identified in the wildlife habitat studies were sufficiently representative of potential amphibian habitat to determine and compare potential impacts of the project alternatives. The alignment of Alternative 2B was shifted to avoid open water and emergent wetlands. As stated in Section 4.3.15.5 of the Draft and Final SEIS, if Alternative 2B had been selected, a pre-construction survey would have been conducted to confirm the highway would not impact amphibian ponds.
- D) As described in the 2004 Appendix N, *Essential Fish Habitat Assessment*, DOT&PF surveyed intertidal and subtidal areas on the east and west sides of Lynn Canal for benthic communities and wildlife supported by benthic invertebrates.
- E) Shorebird and waterfowl surveys were not conducted specific to the project. Habitat usage by shorebirds and waterfowl was assessed for each alternative based on literature review from published sources. A description of each bird species assessed is included in Section 3.3.2 of the 2004 Appendix Q, *Wildlife Technical Report*, and Section 3.3.1 of the *2014 Update to Appendix Q – Wildlife Technical Report*.

Group 126

Topic/Subtopic: Wildlife/Mitigation

Group Comment Text:

Construction of a highway alternative would increase hunting, angling, and wildlife harassment from human access and disturbance:

A) Increased use of these resources, and the resultant management needs, was not adequately considered in the Draft SEIS:

1) Deferring to ADF&G and Fish and Game Boards to mitigate adverse effects on wildlife populations through measures such as seasons and bag limits is not adequate because these entities are politically influenced and cannot increase wildlife populations or make up for habitat loss or degradation.

2) Board of Game manages species over an entire Game Management Unit (GMU), and population numbers for the GMU might not reflect local population impacts.

3) The SEIS should analyze the costs to ADF&G to manage hunting and fishing or to employ additional staff as a result of improved access.

B) How will the mitigation plans adequately balance wildlife protection with the advantages given to hunters, tourism, and others?

Group Comment Response:

A 1) As discussed in Section 3.1.6 of the Draft SEIS, harvests in Alaska are dually managed by the State and federal governments, and both have their own legislation and enforceable regulations. As discussed in Section 4.1.4.2 of Appendix DD, *Land Use Technical Report*, increased access from the project could result in ADF&G considering management actions to ensure sustainable harvests of some species (e.g., moose). Possible management actions could include shortening of seasons, reduction in bag limits, the use of drawing permits, and more active monitoring and enforcement duties by State and federal agencies. It is unknown at this time if and exactly what these actions could entail. FHWA and DOT&PF do not assume ADF&G would be responsible for mitigating the direct impacts of the project on wildlife habitat.

2) Section 3.2.6.2 of Appendix DD, *Land Use Technical Report*, noted that the project area is in GMU 111 and 115. GMUs are designed to improve wildlife management and simplify hunting and trapping regulations. Each GMU is defined based on the land use and ownership, habitat, and human density and is managed for the overall health of the species within the GMU, including accounting for localized impacts.

3) ADF&G confirmed in January 2016 that no additional staff is anticipated to manage additional harvests that may occur as a result of Alternative 2B. Section 4.3.15 of the Final SEIS has been updated to reflect this input from ADF&G.

B) As stated in Sections 4.3.1.3, 4.4.1.3, 4.6.1.3, 4.3.15.3, 4.4.15.3, and 4.6.15.3 of the Draft SEIS for Alternative 2B, hunting and fishing pressure has increased along every highway in Alaska that has opened a formerly remote area. Increases in recreational hunting and recreational and personal use fishing would be expected along Alternative 2B. As in other readily accessible regions of the State, ADF&G would monitor the resources along Lynn Canal and make recommendations to the Board of Fish and Game to adjust fish and game regulations, as necessary, to protect those resources from over utilization, including limits on season duration, take limits, lottery drawings, etc. Therefore, it is expected that this increased pressure would not result in undesirable population-level effects to wildlife.

In addition, Section 5.9 and 5.12 of the Draft SEIS provided mitigation measures to balance the potential impacts to wildlife from the project, including hunters and tourism. These measures included:

(1) Wildlife crossing signage in areas of high brown bear, moose, and mountain goat use as determined by the ADF&G would be incorporated into the road design.

(2) In areas of high moose use as identified by the ADF&G, roadside seeding would use only non-palatable species to discourage browsing near the roadways.

(3) Specific to Alternative 2B, no pullouts or parking areas would be constructed in the area between the Lace and Antler Rivers to minimize habitat degradation and wildlife disturbance from pedestrians as well as to provide for public safety. Vegetative openings adjacent to the highway corridor on the Berners Valley floor would be blocked with large boulders to discourage uncontrolled access by off-road vehicles, in order to minimize wildlife disturbance.

(4) No parking places would be provided in areas that may provide pedestrian access to the Gran Point and Met Point haulouts.

(5) No boat launches or structures that enhance boat access points (other than the new ferry terminal north of the Katzehin River and terminal improvements at Skagway) would be constructed by DOT&PF.

Group 128

Topic/Subtopic: Wildlife/Mitigation

Group Comment Text:

A) The Draft SEIS did not provide adequate wildlife corridors and underpasses for brown bears in Berners Bay and at the Katzehin River.

B) In wintertime, goats come close to the shore to feed. Are there provisions for goats? What is being done to facilitate goat passage?

C) The SEIS should describe mountain goat hazing during avalanche maintenance and whether information would be available in real-time.

D) What provisions have been made to protect wolverines?

Group Comment Response:

A) For Alternative 2B, the number and general location of underpasses for brown bears has been coordinated extensively with ADF&G. FHWA and DOT&PF believe the proposed mitigation is adequate to address impacts. In Berners Bay, the Antler and Lace River bridges would be extended 50 feet at each end to facilitate wildlife passage. There would be two wildlife underpasses located between the two rivers. There are also four anadromous streams in Berners Bay that would have bridges with extended span lengths allowing for wildlife passage. The Katzehin River bridge would be extended 100 feet north, and an underpass would be placed between the river and the ferry terminal.

B) Along Lynn Canal between Berners Bay and Katzehin River, there would be 21 bridges that would facilitate wildlife movement. Wildlife crossing signs would be placed as recommended by ADF&G, and the project would incorporate sight lines in the final design to enable drivers to better see mountain goats in close proximity of the road.

C) DOT&PF has decided not to attempt to haze goats in advance of helicopter bombing. This is the prudent approach given safety considerations of personnel considering that the effectiveness of hazing has not proven effective. Note that goats are not a protected species.

D) Section 4.3.15.3 of the Draft SEIS stated that impacts to wolverines from habitat loss, vehicular collisions, and avalanches would be minimal. As such, no mitigation measures specific to wolverines are proposed.

Group 130

Topic/Subtopic: Wildlife/Mitigation

Group Comment Text:

A) Who reviews the effectiveness of the barge access area restoration effort after construction?

B) Does the scientific community (e.g., university, management agencies, hunting groups, fishermen) accept the effort in Compensatory Mitigation as adequate to maintain wildlife numbers?

Group Comment Response:

A) Section 5.5 of the Draft and Final SEIS address mitigation at intertidal and subtidal areas for all build alternatives. As stated in that section, temporary beach access points would be restored after project completion to conditions similar to those that existed previously. The process of restoration would be a requirement written into the DOT&PF construction contract and would be the responsibility of the contractor. DOT&PF would oversee the contractor's work in general, including the mitigation work, to ensure it was satisfactorily completed.

B) Chapter 5 of the Draft SEIS described the proposed mitigation to offset potential impacts from the build alternatives. Regulatory agencies, as well as academia and the general public, provided comments on the proposed mitigation as part of the NEPA

process. In addition, the USACE Clean Water Act Section 404 permit process included a Public Notice period to solicit comments on the project and potential mitigation. These public comment periods allowed the scientific community to comment on the project mitigation. Whether there is overall acceptance from the scientific community, however, is unknown and outside of the NEPA and USACE approval processes. Comments and information received during these processes are incorporated into the Final SEIS. With identification of Alternative 1 – No Action as the preferred alternative for the Final SEIS, the USACE approval process has been discontinued.

Group 684

Topic/Subtopic: Wildlife/Mitigation

Group Comment Text:

What provisions have been made to protect orcas?

Group Comment Response:

As stated in Sections 5.9 and 5.12 of the Draft SEIS, mitigation measures to protect marine mammals, including orcas, have been included for construction and operation of the project. Although numerous measures are proposed, mitigation measures applicable to orcas in Lynn Canal include:

- (1) Pile driving at ferry terminals and multi-span bridge construction sites would be done with vibratory hammers to the extent practicable to minimize impacts to marine mammals;
- (2) During all piling installations, a trained observer would monitor for the presence of marine mammals and pile driving would be halted if a marine mammal comes within 660 feet of the activity; and
- (3) To further protect marine mammals from human disturbance, no boat launches or structures that enhance boat access points (other than the new ferry terminal north of the Katzehin River and terminal improvements at Skagway) would be constructed by DOT&PF.

Group 84

Topic/Subtopic: Wildlife/Operation/Mitigation Impacts

Group Comment Text:

A) The effects of a road alternative on wildlife species and habitat have been underestimated or not fully disclosed in the Draft SEIS.

B) Habitat fragmentation and human disturbance will have long-term negative effects on fish and wildlife in the corridor.

C) The Draft SEIS did not address the effects of habitat fragmentation on prey accessibility for wolves.

D) The Draft SEIS ignored that building a road increases both legal and illegal hunting and trapping pressures on wolves.

E) The Draft SEIS was contradictory by stating that Alternative 2B would be a barrier to wildlife movement while stating that moose would not be affected by construction of the highway.

F) The analysis of impacts to wolverines should consider ADF&G studies that characterize their home ranges and vulnerability to trapping.

G) The Draft SEIS did not utilize the brown bear study information to site the highway through Berners Bay. The highway proposed for Alternative 2B would increase hunting and mortality of brown bears from human access and disruptions during the breeding season.

H) Alternative 2B would provide human access and increase legal and illegal hunting of wolverines.

I) The Draft SEIS did not evaluate effects to wolverines from avalanche maintenance activities.

J) Alternative 2B would increase traffic collisions for moose and mountain goats. How many animals are estimated to be killed or injured by vehicles on the highway alternatives?

K) DOT&PF stated that the funds provided for the ADF&G study were to allow ADF&G to better manage the wolverine population if Alternative 2B was built. However, there are no additional funds to allow for additional study to evaluate the population as a road is built. Thus, the burden to manage the increased wolverine harvest is on ADF&G with no additional funds.

L) The description and evaluation of effects to mountain goats in the Draft SEIS did not account for/was lacking:

(1) How blasting for avalanche mitigation can be compatible with mountain goat populations in the area.

(2) Where mountain goats winter use areas intersect Alternative 2B and how that overlap would affect mountain goats. The SEIS should be updated to reflect that studies show 25.3 kilometers of the highway would intersect moderate to high use mountain goat wintering areas. How will construction and operation of a highway alignment in their winter range disturb mountain goats?

(3) The three genetically distinct populations of mountain goats in Lynn Canal and impacts to these populations.

(4) The mountain goats place in the ecosystem as prey for bears and wolves or scavenged species for wolverine.

(5) Hazing and its impacts on goats.

M) The Draft SEIS claimed that the road alternatives (2B, 3, 4B, and 4D) would have a minor effect on wildlife because they would result in less than 1 percent loss of the available habitat in the project study area, oversimplifying the issue. It also contradicted a later claim that “Alternative 2B would create a potential barrier between upland habitats and important marine fringe along the east side of Lynn Canal that would fragment the habitat of animals that tend to avoid roads.”

N) The Draft SEIS did not account for the genetic differences in brown bear populations in Berners Bay.

O) The Draft SEIS did not consider all of the locations of high brown bear use that would intersect the new highway in Alternative 2B.

P) The Draft SEIS did not explain if the road would result in an increase in Defense of Life and Property kills.

Q) Mitigation should be put into monetary terms and factored into the costs of Alternative 2B.

R) The Draft SEIS lacks an assessment of cumulative impacts to bear, mountain goats, wolverine, and wolf.

Group Comment Response:

A) DOT&PF and FHWA have fully disclosed the effects of the road alternatives on wildlife species and habitat. Impacts to wildlife species from a road alternative are addressed in Sections 4.3.13, 4.4.13, 4.6.13, and 4.8.12 of the Draft SEIS. Additional information has been added to the Final SEIS, based on the comments in this comment group, as described below.

B) DOT&PF and FHWA recognize that road alternatives will fragment habitat and have disclosed those effects. Chapter 4 of the Draft SEIS describes the effects of each alternative on wildlife and fish from habitat fragmentation and human disturbance. Wildlife undercrossings and bridge extensions are proposed to help mitigate for these effects to wildlife. Bridges are included over all anadromous streams to avoid impacts to fish habitat.

C) Section 4.3.15 of the Final SEIS includes a discussion on the prey accessibility impacts for wolves from habitat fragmentation from Alternative 2B.

D) Information regarding hunting and trapping pressures on wolves that would have resulted from Alternative 2B is incorporated in Section 4.3.15 of the Final SEIS.

E) The Draft SEIS is not contradictory in the assessment of barriers between habitat and impacts to moose. The road alternatives would fragment habitat but would not create an uncrossable barrier that prevents wildlife movement and thereby results in the loss of all fragmented habitat. Section 4.8.12.3 of the Draft SEIS included analysis of construction impacts to moose from the alternatives, including Alternative 2B. As stated in Section 4.3.15 of the Draft SEIS, undercrossings to minimize potential effects of fragmentation from the road are incorporated in the design of Alternative 2B. Section 4.8.10 describes

potential impacts during construction to moose from noise, human disturbance, and vehicular collisions. Moose are known to adapt to human disturbances and construction noise, reducing the likelihood that moose would be adversely displaced or disturbed by construction noise and human presence during construction. Construction vehicles operate at relatively slow speeds, and generate loud noise, which greatly reduces the likelihood of collisions with moose because moose would move away from the vehicles and noise.

F) Trapping pressures resulting from Alternative 2B on wolverines are incorporated in Section 4.3.15 of the Final SEIS.

G) Section 4.3.13 of the Draft SEIS referenced Figure 3-21, which illustrated these potential high use areas as they relate to project alternatives based on information from the studies. Alternative 2B was modified in several locations to avoid sensitive resources. Between the Lace and Antler Rivers, the alignment was determined by resource agencies input and wetland permitting requirements to avoid wetlands. Wildlife undercrossings are incorporated into the design as discussed in Section 4.3.13 of the Draft SEIS.

As described in Section 4.3.1.3 of the Draft SEIS, hunting and fishing pressure has increased along every highway in Alaska that has opened formerly remote areas. Increases in hunting and fishing would occur along the project alignment. As in other readily accessible regions of the State, ADF&G would monitor the resources along Lynn Canal and adjust fish and game regulations, as necessary, to protect these resources from over utilization. ADF&G would consider management actions to ensure sustainable harvests including more active monitoring and enforcement duties by State and federal agencies. Furthermore, the effects of increased hunting and trapping pressure could be controlled by ADF&G and the Board of Game through season duration, take limits, lottery drawings, etc. Therefore, it is expected that this increased pressure would not result in undesirable population-level effects. Description of hunting and trapping pressures relative to brown bear are incorporated in Section 4.3.15 of the Final SEIS.

H) Per the comment, Section 4.3.15 of the Final SEIS includes the pertinent information from the 2004, 2005, and 2014 wildlife technical reports and incorporates recent information on the effects of increased hunting and trapping pressures on wolverines as well as wolverine habitat use and loss as a result of Alternative 2B. As described in Section 4.3.1.3 of the Draft SEIS, hunting and fishing pressure has increased along every highway in Alaska that has opened formerly remote areas. Increases in hunting and fishing would occur along the alignment. As in other readily accessible regions of the State, ADF&G would monitor the resources along Lynn Canal and adjust fish and game regulations, as necessary, to protect these resources from over utilization. ADF&G would consider management actions to ensure sustainable harvests including more active monitoring and enforcement duties by State and federal agencies. Furthermore, the effects of increased hunting and trapping pressure could be controlled by ADF&G and the Board of Game through season duration, take limits, lottery drawings, etc. Description of hunting and trapping pressures relative to wolverines are incorporated in Section 4.3.15 of the Final SEIS.

I) Section 4.3.4.5 of the *2014 Update to Appendix Q – Wildlife Technical Report* addresses the potential impacts to wolverines as result of avalanche maintenance activities.

Avalanche control could result in mortality to wolverines because avalanche chutes are preferred habitat for foraging; however, the probability of mortality related to avalanche control for Alternative 2B is likely low due to low wolverine densities in the area. The information has been incorporated into Section 4.3.15.3 of the Final SEIS.

J) Section 4.3.15.3 of the Draft SEIS includes a description of the impacts of vehicular collisions on moose and mountain goat. Due to poor visibility in winter, the proposed highway could create the potential for vehicle collisions. Wildlife crossing signage in areas of high brown bear, moose, and mountain goat use as identified by ADF&G would be incorporated into the road design. Quantitative estimates of collisions were not completed, but given the population levels and anticipated traffic volumes mortality from vehicular collisions is not expected to have population level effects.

K) The studies conducted by ADF&G were funded by DOT&PF as mitigation to determine population densities to aid ADF&G in harvest analysis. ADF&G confirmed in January 2016 that no additional staff would have been anticipated to manage additional harvests that may occur as a result of Alternative 2B. The Final SEIS updates Section 4.3.15 to address the ADF&G management of several wildlife species due to a new road.

L) Mountain goat habitat loss, impacts from avalanche control, and prey species effects were addressed in Section 4.3.4.4 of *Appendix Z 2014 Update to Appendix Q – Wildlife Technical Report*, provided in the Draft SEIS.

(1) Section 4.3.15 of the Final SEIS is updated to reflect that avalanche control activities will likely occur during the spring and could result in mortality to mountain goats because avalanche chutes are in steep habitat preferred by goats, and are occasionally used for forage. The noise from avalanche detonation would be noticeable to mountain goats. Although mountain goats may react to sounds from avalanche detonation, they return to their previous behavior within an hour or so after isolated disturbances. The noise created by the resulting avalanche would be no different than that from naturally occurring avalanches.

(2) The Draft SEIS considered all identified locations of high mountain goat use that would intersect the Alternative 2B alignment. Section 4.3.13 of the Draft SEIS referenced Figure 3-21, which illustrated potential high use areas as they relate to project alternatives based on information from the studies. Section 4.13.3 of the Draft SEIS identified that the Alternative 2B alignment would intersect winter habitat for mountain goats. As requested by ADF&G, wildlife crossing signage in areas of high mountain goat use as identified by ADF&G would be incorporated into the road design.

(3) FHWA recognizes that genetically distinct populations of mountain goats are found along the alignment of Alternative 2B. However, the overall impacts to the population in Lynn Canal were evaluated in Section 4.3.13 of the Draft SEIS because mountain goat populations are managed by the ADF&G at the game unit level for populations in Lynn Canal, not at the genetic level.

(4) The analysis and ecological importance of mountain goats in the project area was discussed in Section 4.3.15 of the Draft SEIS and in Appendix Z *2014 Update to Appendix Q – Wildlife Technical Report*. Per the comment, details on mountain goats as a prey species has been added to Section 4.3.15 of the Final SEIS.

(5) Section 5.9 of the Final SEIS has been updated to reflect that no hazing of mountain goats would occur prior to avalanche control activities.

M) The Draft SEIS is not contradictory in the assessment of habitat loss and barriers between habitat. The road alternatives would fragment habitat but not create an uncrossable barrier that prevents wildlife movement, resulting in the loss of all fragmented habitat. To offset potential impacts from the Alternative 2B road on wildlife as described in Section 4.3.13 of the Draft SEIS, several wildlife undercrossings and extended bridges are proposed along the road alignment. The loss of 1 percent of the available habitat is described in the context of overall habitat. Species specific impacts from habitat loss are reported in detail in Section 4.3.15 of the Draft SEIS and in Appendix Z *2014 Update to Appendix Q – Wildlife Technical Report*.

N) The Draft SEIS did not account for genetic populations. FHWA recognizes that genetically distinct populations of brown bear are found along the alignment of Alternative 2B. However, the overall impacts to the population in Lynn Canal were evaluated for effects in Section 4.3.13 of the Draft SEIS, as bear populations are managed by the ADF&G at the game unit level for populations in Lynn Canal, not at the genetic level.

O) The Draft SEIS did consider all identified locations of high brown bear use that would intersect the Alternative 2B alignment. Section 4.3.13 of the Draft SEIS referenced Figure 3-21, which illustrated potential high use areas as they relate to project alternatives based on information from the studies. Mitigation is proposed to address these effects. Several wildlife undercrossings were incorporated into the design as discussed in Section 4.3.13 of the Draft SEIS. Section 5.9 of the Draft SEIS included design measures for road crossings and signage to minimize potential impacts to wildlife with Alternative 2B.

For Alternative 2B, the number and general locations of undercrossings, alignments, and bridge extensions as detailed in the Draft SEIS has been coordinated with resource agencies, including ADF&G. FHWA and DOT&PF believe the proposed mitigation is adequate to address impacts.

P) Sections 4.3.15.3, 4.4.15.3, and 4.6.15.3 of the Final SEIS are updated to include an assessment of Defense of Life and Property incidents that may occur as a result of the road alternatives.

Q) Section 5.12.5 of the Draft SEIS included costs anticipated for the mitigation relative to Alternative 2B.

R) Cumulative impacts to terrestrial species were addressed in Section 4.9.2.12 of the Draft SEIS. Additional details have been included in the Final SEIS.

Group 89

Topic/Subtopic: Wildlife/Operation/Mitigation Impacts

Group Comment Text:

A) The Draft SEIS underestimates the effects of Alternative 2B on fish and wildlife species using shoreline areas (particularly in Berners Bay) and salmon streams.

B) The Draft SEIS ignored that blasting the road and subsequent landslides will dump large quantities of rubble/debris/sediment into ocean basin habitat.

Group Comment Response:

A) Sections 4.3.13 and 4.3.15 of the Draft SEIS appropriately describe and estimate the potential effects of Alternative 2B on fish and wildlife species from roadway development and placement of fill in the subtidal and intertidal areas. Effects from placement of fill and dredging, loss of habitat, increased sedimentation and nutrient loading, spills, and increased hunting/fishing pressures are assessed for shoreline areas as well as anadromous streams. The analyses presented in these sections account for the construction and long-term use of the roadway and recognizes that these will result in negative effects to wildlife and fish species.

B) Sections 4.8.11, 4.8.12, and 5.9 of the Final SEIS have been updated to explain that the contractor would implement measures to reduce the potential for rubble/debris/sediment from blasting and other construction activities entering subtidal or intertidal areas during construction.

Group 111

Topic/Subtopic: Wildlife/Operation/Mitigation Impacts

Group Comment Text:

The Draft SEIS did not state how the alternatives would comply with the Migratory Bird Treaty Act.

Group Comment Response:

As required by the Migratory Bird Treaty Act, Section 5.8 of Final SEIS has been augmented to clarify that no clearing of vegetation would occur during the USFWS approved nesting window without a pre-nesting survey. Pre-nesting surveys would be conducted immediately prior to clearing activities by a qualified biologist.

Group 121

Topic/Subtopic: Wildlife/Operation/Mitigation Impacts

Group Comment Text:

A) The SEIS should evaluate the effects to migrating waterfowl from loss of habitat, human access to shoreline areas, and vehicle bird strikes with Alternative 2B.

B) The Draft SEIS included unsubstantiated claims and faulty logic regarding impacts to birds, including:

- (1) Heron use in urban and rural areas is the same, and habituation would occur for all individuals with construction of a road;
- (2) Alternative habitat will be available for species displaced by human activity; and
- (3) Low population levels may be an indication of a longer-term population trend or territorial characteristics, or may indicate that low density is normal.

Group Comment Response:

A) Section 4.3.15 of the Final SEIS has been updated to include more detail on the effects of Alternative 2B on migrating waterfowl, including impacts from more people accessing the Katzehin River delta and Berners Bay shoreline and the effects of wetland habitat loss. The effects of vehicle traffic and vehicle bird strikes on waterfowl are also described in Section 4.3.15 of the Final SEIS.

B) Additional analysis of potential impacts of highway alternatives on birds has been provided in Sections 4.3.15, 4.4.15, and 4.6.15 of the Final SEIS. The analysis includes further assessment of changes in bird activity with changes in human activity, impacts from loss of habitat, and population trends.

Group 124

Topic/Subtopic: Wildlife/Operation/Mitigation Impacts

Group Comment Text:

The Draft SEIS did not provide scientific evidence to support the assertion that harbor seals would not be affected by vehicle traffic on the Alternative 2B road because it is at least 100 yards from the shoreline, or that seals may habituate to traffic at the Katzehin River bridge or choose to use areas further downstream.

Group Comment Response:

The information in Section 4.3.15.1 of the Draft SEIS concerning impacts to harbor seals from Alternative 2B is derived from Appendix Q, *Wildlife Technical Report*, which was appended to the 2004 Draft SEIS. The scientific evidence in Appendix Q supporting the analysis of impacts to harbor seals is in Section 4.3.15.1 of the Final SEIS.

Group 676

Topic/Subtopic: Wildlife/Operation/Mitigation Impacts

Group Comment Text:

It is not clear from the Draft SEIS if FHWA conducted an analysis to determine the environmentally preferred alternative that included a review of road construction impacts to marine mammals. Impacts to marine mammals are expected to be less with the alternatives that rely exclusively on ferry transportation than those that include road construction and associated activities in and around haulouts and Berners Bay.

Group Comment Response:

Draft EIS for agency/public review does not typically identify the environmentally preferred alternative. Per 40 CFR 1505.2(b) and FHWA Technical Advisory 6640.8A Section VIII (ROD), the ROD will include the environmentally preferred alternative. The JAI Project ROD identifies Alternative 4C as the environmentally preferred alternative due, in part, to it having a lower potential for impacts to marine mammals (see Section III.G of the ROD). The Final SEIS identifies Alternative 1 – No Action as the preferred alternative (see Section 2.5 of the Final SEIS).

Group 683

Topic/Subtopic: Wildlife/Operation/Mitigation Impacts

Group Comment Text:

The data collected and analyzed in wildlife studies since 2006 is important to inform decision makers of the effects of Alternative 2B, but the studies should be expanded to cover habitat affected by Alternative 3 to allow a reasoned comparison among all alternatives. The Draft SEIS lacked information on whether the west side population is as vulnerable as the east side population of mountain goats, moose, or any other wildlife. Without similar data for moose on the west side of Lynn Canal, it is difficult to assess the effects of Alternative 3 relative to the level of detail available for Alternative 2B. Additionally, information pertaining to wolverines is insufficient on both sides of the Lynn Canal.

Group Comment Response:

The ADF&G studies in the East Lynn Canal project area were not conducted to provide information to support an evaluation of potential effects of Alternative 2B in the SEIS. Rather, they were conducted as mitigation required in the FHWA 2006 ROD for the JAI Project to assist ADF&G manage those populations. Extrapolation of regional data to areas in proximity and with similar topography and habitat types is appropriate for an alternatives analysis under NEPA and is commensurate with other NEPA evaluations.

Additionally, Section 4.4 of Appendix Z *2014 Update to Appendix Q – Wildlife Technical Report*, in the Draft SEIS, uses several broad conclusions from the ADF&G studies to develop a reasonable analysis of potential effects from the construction, operation, and maintenance of Alternative 3 on the west side of Lynn Canal. To not apply these conclusions in the JAI Project NEPA evaluation would limit a reasonable analysis of these effects due to the lack of region-specific information.

RE: EPA comments on the Juneau Access Draft Supplemental Environmental Impact Statement (SEIS), EPA Project #92-091-FHW.

Dear Mr. Haugh:

We have reviewed the above-referenced EIS (CEQ No. 20140281) proposed for the Lynn Canal corridor in southeast Alaska. Our review was conducted in accordance with our responsibilities under the National Environmental Policy Act (NEPA) and Section 309 of the Clean Air Act, as well as a NEPA cooperating agency. Section 309, independent of NEPA, specifically directs EPA to review and comment in writing on the environmental impacts associated with all major federal actions. Under our policies and procedures, we evaluate the document's adequacy in meeting NEPA requirements.

The draft SEIS proposes a no action alternative and seven action alternatives that include various proposals to provide improved surface transportation to and from Juneau, Alaska within the Lynn Canal corridor. This SEIS specifically updates the previous Final SEIS issued in 2006 in response to a 2009 District Court decision finding that the Final SEIS did not appropriately include evaluation of an alternative utilizing existing Alaska Marine Highway System (AMHS) assets. This supplement also provides additional and updated information pertaining to resources, alternatives and relevant analyses.

We recognize and appreciate that the Draft SEIS includes several components that we requested based on our review of the PDSEIS, namely, an Executive Summary, the inclusion of a functional assessment and proposed compensatory mitigation for affected wetlands (Appendix Z-2013 Update to Appendix O-Wetlands Technical Report). We also commend FHWA for clearly highlighting updated or changed information in the document.

We do, however, continue to object to the preferred alternative, Alternative 2B-East Lynn Canal, based on the same reasons we identified in our previous comments on past EISs. Alternative 2B would have the most environmental impacts, including significant adverse effects on special aquatic sites (e.g., wetlands and mud flats); essential fish habitat; critical habitat for endangered species (i.e., Steller sea lion); wildlife (e.g., bald eagle, brown bear, marten, mountain goat); and special areas (e.g., inventoried roadless areas, ANILCA Section 508 Berners Bay LUD II Management Area; and old growth forest reserves). We have specifically stated that we believe Alternatives 1, 3, 4A, 4B, 4C and 4D are environmentally preferable to Alternative 2B. We also assert this to be the case with the new alternative, Alternative 1B-Enhanced Service with Existing AMHS Assets.

In light of the 404(b)(1) Guidelines, only the least environmentally damaging practicable alternative (LEDPA) may be authorized for a Section 404 permit. We believe Alternatives 1, 1B, 3, 4A, 4B, 4C and 4D are all less environmentally damaging than Alternative 2B, and one or more of these alternatives to the proposed action may be practicable, and therefore, the LEDPA. However, the EIS states that these alternatives are not practicable due to the lower travel capacity compared to an unconstrained traffic forecast model. We believe that practicability should be reconsidered since unconstrained traffic is not currently possible (due to ferry segments in all alternatives) and options 1B, 3, 4A, 4B, 4C and 4D do substantially increase capacity between Juneau, Haines, and Skagway. Instead of measuring each alternative against a theoretical, unattainable standard (i.e., unconstrained demand), we recommend using the no action alternative as the baseline or benchmark, and then comparing each action alternative to the no action alternative.

The EPA has previously identified Berners Bay watershed as an ecologically important area due to the abundance and diversity of fish and wildlife which inhabit this area. We commend FHWA and ADOT&PF for incorporating a variety of mitigation measures into your preferred alternative to reduce impacts on aquatic resources in the Berners Bay area. However, we request the same level of effort to mitigate the adverse effects of Alternatives 3, 4B and 4D on Berners Bay. Therefore, we recommend that the Final SEIS consider the following mitigation measures (or an appropriate combination thereof) for Alternatives 3, 4B and 4D:

- 1) move the Sawmill Cove ferry terminal to a suitable site outside of Berners Bay (e.g., Tee Harbor, Amalga Harbor, Pearl Harbor, Yankee Cove, Sunshine Cove, Bridget Cove);
- 2) if that is not practicable, move the Sawmill Cove ferry terminal to Cascade Point and remove the road segment from Cascade Point to Sawmill Cove (see pages 10 and 24 of the "Draft Design Concept Report for the Day Boat ACF" and page 6 of the "Day Boat ACF Design Study Report");
- 3) move the Berners Bay ferry operations to the Auke Bay ferry terminal during the eulachon and herring spawning period, which is approximately two weeks in late April and early May (note that Alternatives 4B and 4D already meet this goal);
- 4) impose an AMHS ferry speed limit within Berners Bay during the eulachon and herring spawning period to reduce the risk of collision with humpback whales;
- 5) establish an AMHS ferry lane within Berners Bay that is at least one nautical mile from Point Bridget and Point Saint Mary to minimize adverse effects on herring spawning habitat, Steller sea lions and Point Bridget State Park; and
- 6) designate a trained marine mammal observer on board each Berners Bay ferry during the eulachon and herring spawning period.

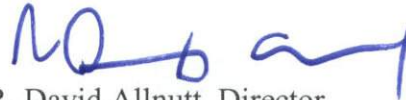

We request that FHWA, as the lead agency, arrange an interagency meeting with the cooperating agencies and other agency experts from NMFS, FWS and ADFG to discuss these mitigation measures prior to the Final SEIS and Record of Decision.

We have also previously stated that if these alternatives 1, 3, 4A 4B, 4C and 4D (and now 1B) are not practicable, we recommend changes to Alternative 2B, namely the relocation of the ferry terminal to the south side of the Katzechin River delta, thus eliminating the bridge crossing and road segment north of the Katzechin River. If this is not practicable, then we recommend avoiding the proposed discharge of 64,480 cubic yards of fill material into 3.15 acres on the south shore of the Katzechin River. This area appears to include mud flats that are functionally similar to the Berners Bay mud flats and the McClellan Flats (between the Chilkat River and Chilkat Inlet). Mud flats are special aquatic sites under the 404(b)(1) Guidelines (see 40 CFR 230.42), and as such, they are subject to the presumptive restrictions on discharge set forth at 40 CFR 230.10(a)(3).

We have assigned a rating of "EO" (Environmental Objections) to the Draft SEIS because: 1) there may be a practicable alternative to the proposed action which would have less adverse impact on the aquatic ecosystem [see 40 CFR 230.10(a)]; 2) the preferred alternative may result in the likelihood of the destruction or adverse modification of critical habitat under the ESA [see 40 CFR 230.10(b)]; 3) the preferred alternative may cause or contribute to significant degradation of the waters of the United States [see 40 CFR 230.10(c)]; and 4) appropriate and practicable steps may be taken which will minimize the potential adverse impacts on the aquatic ecosystem [see 40 CFR 230.10(d)]. We have changed the numeric rating from previous draft documents to a "1" (Adequate Information) due to the additional information presented in the current SEIS. A description of our rating system is enclosed.

Please contact Jennifer Curtis of my staff in Anchorage at (907) 271-6324 or curtis.jennifer@epa.gov with any questions you have regarding our comments.

Sincerely,

A handwritten signature in blue ink, appearing to read "R. David Allnutt".

R. David Allnutt, Director
Office of Ecosystems, Tribal and Public Affairs

Enclosure:

1. U.S. EPA Rating System

**U.S. Environmental Protection Agency Rating System for
Draft Environmental Impact Statements
Definitions and Follow-Up Action***

Environmental Impact of the Action

LO – Lack of Objections

The U.S. Environmental Protection Agency (EPA) review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

EC – Environmental Concerns

EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce these impacts.

EO – Environmental Objections

EPA review has identified significant environmental impacts that should be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no-action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

EU – Environmentally Unsatisfactory

EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potential unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the Council on Environmental Quality (CEQ).

Adequacy of the Impact Statement

Category 1 – Adequate

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis of data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

Category 2 – Insufficient Information

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses or discussion should be included in the final EIS.

Category 3 – Inadequate

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analyzed in the draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the National Environmental Policy Act and or Section 309 review, and thus should be formally revised and made available for public

comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

R. David Allnut
Director, Office of Environmental Review and Assessment
U.S. Environmental Protection Agency, Region 10
1200 Sixth Ave, Suite 900
Seattle, WA 98101-3140

Dear Mr. Allnut:

Thank you for your letter, dated November 25, 2014, with your agency's comments on the Juneau Access Improvements (JAI) Project, Draft Supplemental Environmental Impact Statement (SEIS). We appreciate the continued participation of the U.S. Environmental Protection Agency (EPA) in the JAI Project as a cooperating agency.

I am writing to you for two primary reasons. First, I have reviewed your letter in detail and have provided responses and/or revised the SEIS in response to your comments, as incorporated into the Preliminary Final SEIS. For ease of reference, the attached comment-response letter contains responses that have been imbedded in a reprint of your original comment letter. Secondly, as a Cooperating Agency, I am providing you the JAI Project Preliminary Final SEIS for your review and comment. Due to its preliminary nature, this document is provided for Cooperating Agency review only. It is not a public document, and its information should not be shared with other agencies or individuals. FHWA and DOT&PF will consider your agency's comments, as well as comments by the other Cooperating Agencies, in preparation of the JAI Project Final SEIS for public release (as noted previously and consistent with 23 U.S.C. 193(n)(2), FHWA intends to issue a combined Final SEIS and Record of Decision). Please let me know if you would like additional copies of the document. I ask that you provide any further written comments within 30 days of receipt of this correspondence.

Briefly, FHWA has identified the "No Build Alternative" as the Preferred Alternative in the JAI Preliminary Final SEIS. Governor Walker announced on December 15, 2017, that the "No Build Alternative" is the State's Preferred Alternative. See Section 2.4 of the Preliminary Final SEIS for discussion.

Please do not hesitate to contact me at (907) 586-7430 or Gary Hogins (907) 465-8143, DOT&PF Project Manager, if you have any questions or concerns.

Sincerely,

Tim A. Haugh
Environmental Program Manager

RE: EPA comments on the Juneau Access Draft Supplemental Environmental Impact Statement (SEIS), EPA Project #92-091-FHW.

Dear Mr. Haugh:

1 We have reviewed the above-referenced EIS (CEQ No. 20140281) proposed for the Lynn Canal
2 corridor in southeast Alaska. Our review was conducted in accordance with our responsibilities
3 under the National Environmental Policy Act (NEPA) and Section 309 of the Clean Air Act, as
4 well as a NEPA cooperating agency. Section 309, independent of NEPA, specifically directs
5 EPA to review and comment in writing on the environmental impacts associated with all major
6 federal actions. Under our policies and procedures, we evaluate the document's adequacy in
7 meeting NEPA requirements.

8 The draft SEIS proposes a no action alternative and seven action alternatives that include various
9 proposals to provide improved surface transportation to and from Juneau, Alaska within the
10 Lynn Canal corridor. This SEIS specifically updates the previous Final SEIS issued in 2006 in
11 response to a 2009 District Court decision finding that the Final SEIS did not appropriately
12 include evaluation of an alternative utilizing existing Alaska Marine Highway System (AMHS)
13 assets. This supplement also provides additional and updated information pertaining to resources,
14 alternatives and relevant analyses.

15 We recognize and appreciate that the Draft SEIS includes several components that we requested
16 based on our review of the PDSEIS, namely, an Executive Summary, the inclusion of a
17 functional assessment and proposed compensatory mitigation for affected wetlands (Appendix Z-
18 2013 Update to Appendix 0- Wetlands Technical Report). We also commend FHWA for clearly
19 highlighting updated or changed information in the document.

20 **RESPONSE:** Your previous comments were helpful in providing a more thorough document.
21 Thank you for your continued participation as a cooperating agency.

22 We do, however, continue to object to the preferred alternative, Alternative 2B-East Lynn Canal,
23 based on the same reasons we identified in our previous comments on past EISs. Alternative 2B

24 would have the most environmental impacts, including significant adverse effects on special
25 aquatic sites (e.g., wetlands and mud flats); essential fish habitat; critical habitat for endangered
26 species (i.e., Steller sea lion); wildlife (e.g., bald eagle, brown bear, marten, mountain goat); and
27 special areas (e.g., inventoried roadless areas, ANILCA Section 508 Berners Bay LUD II
28 Management Area; and old growth forest reserves). We have specifically stated that we believe
29 Alternatives 1, 3, 4A, 4B, 4C and 4D are environmentally preferable to Alternative 2B. We also
30 assert this to be the case with the new alternative, Alternative 1B-Enhanced Service with
31 Existing AMHS Assets.

32 **RESPONSE:** Governor Walker announced on December 15, 2017, that the “No Build
33 Alternative” is the State’s Preferred Alternative due to Alaska’s current fiscal challenges. FHWA
34 agreed that this was a prudent course of action. The primary reason for the decision was the
35 plight of Alaska’s economy and its effect on the State government’s overall budgetary health.
36 This fiscal environment, in turn, has affected DOT&PF’s budget and their ability to advance a
37 transportation solution at this time. Controversy regarding the project was also a contributing
38 factor. Much of the controversy surrounding this project, which has persisted for many years, is
39 related to the potential impacts to the natural and social environment associated with alternatives
40 with substantial road components. Some of the controversy has been related to the basic modal
41 choice reflected in the build alternatives (i.e., ferries versus roads). The level of controversy is
42 further reflected in the intense interest from the public as expressed in the comments generated
43 for and against the various alternatives through past scoping processes, public hearings,
44 submitted on draft versions of the EIS, and reflected in surveys. It should be noted that there
45 have been no environmental impacts identified at this time that would preclude selection of a
46 build alternative.

47 However, DOT&PF and FHWA have identified the No Action Alternative as the Preferred
48 Alternative. See Section 2.4 of the Preliminary Final SEIS for discussion.

49

50 In light of the 404 (b)(1) Guidelines, only the least environmentally damaging practicable
51 alternative (LEDPA) may be authorized for a Section 404 permit. We believe Alternatives 1, 1B,
52 3, 4A, 4B, 4C and 4D are all less environmentally damaging than Alternative 2B, and one or
53 more of these alternatives to the proposed action may be practicable, and therefore, the LEDPA.
54 However, the EIS states that these alternatives are not practicable due to the lower travel capacity
55 compared to an unconstrained traffic forecast model. We believe that practicability should be
56 reconsidered since unconstrained traffic is not currently possible (due to ferry segments in all
57 alternatives) and options 1B, 3, 4A, 4B, 4C and 4D do substantially increase capacity between
58 Juneau, Haines, and Skagway. Instead of measuring each alternative against a theoretical,
59 unattainable standard (i.e., unconstrained demand), we recommend using the no action
60 alternative as the baseline or benchmark, and then comparing each action alternative to the no
61 action alternative.

62 **RESPONSE:**

63

64 Comparing alternatives to the No Action Alternative provides limited information (as any
65 increase in travel would qualify as an increase in capacity). Under that logic, providing even one
66 additional trip in Lynn Canal would render an alternative practicable. Doing better than the no

67 action is not the overall purpose of the project. The overall purpose is about meeting the demand
68 for travel. In the 2008, the USACE defined an overall project purpose that aligned with the
69 FHWA purpose for the project and was focused on meeting the demand for travel.

70 The unconstrained traffic model is the measure of demand in the corridor. It represents the
71 number of trips desired to be made by the traveling public – in other words it is the demand.
72 Only by evaluating alternatives against this measure, can FHWA determine if they are providing
73 capacity to meet demand. Comparing alternatives to the unconstrained travel demand not only
74 identifies how well the alternatives meet demand, but it also identifies the number of trips not
75 occurring due to operational or logistical constraints. This is important for DOT&PF and FHWA
76 in their goal of "providing fast, safe, efficient, and convenient transportation at the lowest cost
77 (49 USC §101)".

78 The EPA has previously identified Berners Bay watershed as an ecologically important area due
79 to the abundance and diversity of fish and wildlife which inhabit this area. We commend FHW A
80 and ADOT&PF for incorporating a variety of mitigation measures into your preferred alternative
81 to reduce impacts on aquatic resources in the Berners Bay area. However, we request the same
82 level of effort to mitigate the adverse effects of Alternatives 3, 4B and 4D on Berners Bay.
83 Therefore, we recommend that the Final SEIS consider the following mitigation measures (or an
84 appropriate combination thereof) for Alternatives 3, 4B and 4D:

- 85 1) move the Sawmill Cove ferry terminal to a suitable site outside of Berners Bay (e.g., Tee
86 Harbor, Amalga Harbor, Pearl Harbor, Yankee Cove, Sunshine Cove, Bridget Cove);
- 87 2) if that is not practicable, move the Sawmill Cove ferry terminal to Cascade Point and
88 remove the road segment from Cascade Point to Sawmill Cove (see pages 10 and 24 of
89 the "Draft Design Concept Report for the Day Boat ACF" and page 6 of the "Day Boat
90 ACF Design Study Report);
- 91 3) move the Berners Bay ferry operations to the Auke Bay ferry terminal during the
92 eulachon and herring spawning period, which is approximately two weeks in late April
93 and early May (note that Alternatives 4B and 4D already meet this goal);
- 94 4) impose an AMHS ferry speed limit within Berners Bay during the eulachon and herring
95 spawning period to reduce the risk of collision with humpback whales;
- 96 5) establish an AMHS ferry lane within Berners Bay that is at least one nautical mile from
97 Point Bridget and Point Saint Mary to minimize adverse effects on herring spawning
98 habitat, Steller sea lions and Point Bridget State Park; and
- 99 6) designate a trained marine mammal observer on board each Berners Bay ferry during the
100 eulachon and herring spawning period.

101 RESPONSE: It is unnecessary to apply the same level of minimization to all the alternatives,
102 especially considering that Alternative 2B advanced through the USACE Clean Water Section
103 404 and Rivers and Harbors Act Section 10 permitting process and has had a USACE permit
104 issued previously. The same level of minimization is not necessary for all of the alternatives and
105 therefore further evaluations are unwarranted. The following provide specific responses to parts
106 1 through 6 of the EPA's comment above.

- 107 1) Sites along the road system south of Berners Bay were considered and dismissed during
108 alternative screening due to basin characteristics and exposure to weather that would make those
109 potential sites less suitable for a ferry terminal.

110 2) If the Final SEIS had identified an alternative requiring a terminal in Berners Bay
111 (Alternatives 3, 4B and 4D) as the Preferred Alternative, the Final SEIS would have evaluated
112 Cascade Point as an alternative ferry terminal site to Sawmill Cove.

113 3) Alternatives 4B and 4D would accommodate the recommendation for the eulachon and
114 herring spawning timeframe. Relocating ferry service from Berners Bay to Auke Bay during the
115 eulachon and herring spawning period for Alternative 3 was evaluated in the USACE 2008
116 Record of Decision and Permit Evaluation. The alternative was labeled 3M and was determined
117 to be not practicable for logistical considerations.

118 4) Travel in Berners Bay would not exceed the service speed of the specific ferry vessel for each
119 alternative, which ranges from 15 to 30 knots. As described in the Final SEIS, Chapter 4.4.17,
120 and 2004 *Appendix Q Wildlife Technical Report*, whale collisions with ferries are rare, and whale
121 densities are low along the ferry routes; therefore, the increased risk of associated collisions
122 would not adversely affect whales in Lynn Canal.

123 5) AMHS has not established actual ferry lanes for any alternative outside of their current
124 operations. Currently, Alternative 1 – No Action has been identified as the Preferred Alternative.
125 Should another alternative which potentially effects these locations be selected, AMHS will take
126 this into consideration when developing the route. There are approximately 4 miles between
127 Point Saint Mary and Point Bridget. It should be noted that adverse impacts to herring spawning
128 at Point Saint Mary are unlikely, since spawning has not been observed there since 1981.¹ As
129 stated in the 2014 *Update to Appendix S – Steller Sea Lions*, Steller sea lions are very agile and
130 successfully avoid encounters in the water. Because the ferry traffic associated with Alternative 3
131 would be relatively slow and consistent in both direction and speed, it is expected that sea lions
132 at Point Saint Mary would be unaffected by these vessels because they have habituated to other
133 large commercial vessels in Lynn Canal. The potential for sea lion and ferry contact is
134 considered minimal.

135 6) FHWA has made a determination that ferry operations are not likely to adversely affect Steller
136 sea lions. As a result of consultation, the NMFS has concurred with this determination; the
137 measure of placing observers on ferry boats has been considered and they are not proposed
138 aboard ferries under any alternative.

139 We request that FHWA, as the lead agency, arrange an interagency meeting with the cooperating
140 agencies and other agency experts from NMFS, FWS and ADFG to discuss these mitigation
141 measures prior to the Final SEIS and Record of Decision.

142 **RESPONSE:** Technical input from the various agencies is important in mitigating environmental
143 impacts from the alternatives. If the Final SEIS had selected a build alternative as the Preferred
144 Alternative, FHWA would have conducted additional meetings with federal and state agencies
145 during the Final SEIS and permitting processes.

146 We have also previously stated that if these alternatives 1, 3, 4A 4B, 4C and 4D (and now 1B)
147 are not practicable, we recommend changes to Alternative 2B, namely the relocation of the ferry
148 terminal to the south side of the Katzehin River delta, thus eliminating the bridge crossing and
149 road segment north of the Katzehin River. If this is not practicable, then we recommend avoiding

¹ Juneau Group of the Sierra Club. 2007. Petition to List the Lynn Canal Distinct Population Segment of the Pacific Herring (*Culpea pallasi*) Under the Endangered Species Act. Juneau, Alaska. April 2007.

150 the proposed discharge of 64,480 cubic yards of fill material into 3.15 acres on the south shore of
151 the Katzehin River. This area appears to include mud flats that are functionally similar to the
152 Berners Bay mud flats and the McClellan Flats (between the Chilkat River and Chilkat Inlet).
153 Mud flats are special aquatic sites under the 404(b)(1) Guidelines (see 40 CFR 230.42), and as
154 such, they are subject to the presumptive restrictions on discharge set forth at 40 CFR 230.1
155 O(a)(3).

156 RESPONSE: DOT&PF considered placement of the Alternative 2B ferry terminal south of the
157 Katzehin River. This modification is not practicable largely due to the constant deposition of
158 glacial silt from the Katzehin River on the delta. The 5-fathom contour extends more than a mile
159 offshore on the south side of the river. To construct a terminal there, extensive dredging would
160 be required initially, and maintenance dredging would be required periodically. The Katzehin
161 Ferry Terminal location was also chosen for its proximity to Haines and Skagway. Siting a
162 terminal south of the Katzehin River would add at least 4 miles of travel distance to both
163 communities. Based on increased ferry route lengths, all round trips would be at least 24 minutes
164 longer and annual operating costs would be approximately \$1.8 million higher (2006 dollars).
165 Larger boats or longer operating hours would be needed to achieve the necessary capacity to
166 meet Alternative 2B projected traffic volume. Either change would involve higher operating
167 costs, which would mean higher user costs and greater state funding. Longer loading times (for
168 larger boats) and travel times as well as higher user costs would tend to decrease the very
169 demand we are trying to accommodate.

170 The 2014 *Wetlands Report* and Draft SEIS Appendix Z 2014 Update to Appendix O – *Wetlands*
171 *Technical Report* do not identify the Katzehin Ferry Terminal or the Katzehin River delta as a
172 mudflat. The field data and wetland mapping used are based on 2006 efforts as part of the 2006
173 Final EIS and 2008 USACE Section 404/10 Permit Authorization. DOT&PF studied the
174 Katzehin area for the presence of mudflats using 2014 high-resolution digital orthomosaic
175 photography, photographs and video clips from Alaska ShoreZone, and Alaska ShoreZone
176 Coastal Mapping. A memorandum describing the 2015 mudflats reevaluation is attached.
177 According to the analysis, both sites (Katzehin Ferry Terminal and Katzehin River delta) have
178 rock and gravel visible on the 2014 aerials and are not classified as mudflats by ShoreZone;
179 therefore, these areas would not be characterized as a special aquatic site according to Section
180 404(b)(1) Guidelines (40 CFR Part 230).

181 Alternative 2B was modified as part of the 2006 Final SEIS to avoid fill of estuarine wetlands
182 north of the Katzehin River. The alignment has been moved uphill and the slopes steepened to
183 avoid all but one area (0.2 acre) of estuarine wetlands where a steep cliff and an eagle nest tree
184 prevent moving out of the intertidal area. Some placement of fill in the Katzehin River is not
185 avoidable as the cost of a bridge structure at this location is 15 times the cost of the proposed
186 embankment fill.

187 We have assigned a rating of "EO" (Environmental Objections) to the Draft SEIS because: 1)
188 there may be a practicable alternative to the proposed action which would have less adverse
189 impact on the aquatic ecosystem [see 40 CFR 230.10(a)]; 2) the preferred alternative may result
190 in the likelihood of the destruction or adverse modification of critical habitat under the ESA [see
191 40 CFR 230.10(b)]; 3) the preferred alternative may cause or contribute to significant
192 degradation of the waters of the United States [see 40 CFR 230.1 O(c)]; and 4) appropriate and
193 practicable steps may be taken which will minimize the potential adverse impacts on the aquatic
194 ecosystem [see 40 CFR 230.1 O(d)]. We have changed the numeric rating from previous draft

195 documents to a "I" (Adequate Information) due to the additional information presented in the
196 current SEIS. A description of our rating system is enclosed.

197 **RESPONSE:** Thank you for your continued participation as a cooperating agency.

198 Please contact Jennifer Curtis of my staff in Anchorage at (907) 271-6324 or
199 curtis.jennifer@epa.gov with any questions you have regarding our comments.

200 Sincerely,

201

202 R. David Allnut

203 Office of Ecosystems, Tribal and Public Affairs

204

205 Enclosure:

206 1. U.S. EPA Rating System

**U.S. Environmental Protection Agency Rating System for
Draft Environmental Impact Statements
Definitions and Follow-Up Action***

Environmental Impact of the Action

LO - Lack of Objections

The U.S. Environmental Protection Agency (EPA) review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

EC - Environmental Concerns

EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce these impacts.

EO - Environmental Objections

EPA review has identified significant environmental impacts that should be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no-action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

EU - Environmentally Unsatisfactory

EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potential unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the Council on Environmental Quality (CEQ).

Adequacy of the Impact Statement

Category 1 - Adequate

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis of data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

Category 2 - Insufficient Information

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses or discussion should be included in the final EIS.

Category 3 - Inadequate

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analyzed in the draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts, EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the National Environmental Policy Act and or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

Attachment
JAI Project 2015 Mudflats Analysis

Memo

Date: Thursday, January 29, 2015

Project: Juneau Access Improvements Project

To: Gary Hogins, DOT&PF

From: Mac Salway, HDR

Subject: Reevaluation of mudflats at the Katzeihin Ferry Terminal site and Katzeihin River bridge crossing

Introduction

In the U.S. Army Corps of Engineers' (USACE) comment letter dated November 25, 2014 on the Draft Supplemental Environmental Impact Statement (DSEIS) for the Juneau Access Improvements (JAI) Project, the USACE requested more information on the potential presence of mudflats in and adjacent to the proposed Katzeihin River bridge and the Katzeihin Ferry Terminal location (USACE 2014). The U.S. Environmental Protection Agency (USEPA) similarly noted the potential for mudflats along the south shore of the Katzeihin River in their comment letter, also dated November 25, 2014 (USEPA 2014). The purpose of this memorandum is to examine the potential for mudflats or other special aquatic sites within these two areas using newly available information.

Existing Information

Mudflats are classified as special aquatic sites under the *Section 404(b)(1) Guidelines for the Specification of Disposal Sites for Dredged or Fill Material* (Guidelines; 40 CFR Part 230, U.S. Federal Register 2010). The Guidelines define them as follows:

Mud flats are broad flat areas along the sea coast and in coastal rivers to the head of tidal influence and in inland lakes, ponds, and riverine systems. When mud flats are inundated, wind and wave action may resuspend bottom sediments. Coastal mud flats are exposed at extremely low tides and inundated at high tides with the water table at or near the surface of the substrate. The substrate of mud flats contains organic material and particles smaller in size than sand. They are either unvegetated or vegetated only by algal mats.

The Katzeihin Ferry Terminal location and the southern Katzeihin River bridge embankment were originally mapped in the 1994 *Wetlands Technical Report*, and mapping was subsequently updated in 2004, 2006, and 2014 (DOT&PF 1994, 2004, 2006, 2014a). Mapping was completed using National Wetland Inventory (NWI) codes according to the *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin et al. 1979). Field work was completed in 2003 and 2006. The 2006 field effort resulted in a refined boundary for the estuarine emergent wetland located at the Katzeihin Ferry Terminal site. Neither the Katzeihin Ferry Terminal location nor the Katzeihin River delta was mapped for the JAI Project with an NWI code that would indicate the presence of mudflats. Typical NWI codes characterizing mudflats begin with E2US3 (estuarine, intertidal, unconsolidated shore composed of mud). No mudflats were mapped in these two areas during the original effort or any of the subsequent updates. Wetland mapping performed in 2004 and subsequent years occurred on a digital orthomosaic aerial image taken in 2003 with a pixel resolution of 1.5 feet. The 2003 aerial photography appears to be collected during high tide. Exhibit 1 shows a photograph of the Katzeihin ferry terminal site taken during the 2003 field work (DOT&PF 2004).

Exhibit 1. Photograph taken July 27, 2003 of the Katzeihin Ferry Terminal site.

2015 Reevaluation of Mudflats

The potential for mudflats at the Katzeihin Ferry Terminal location and Katzeihin River delta were reevaluated in 2015. New information used for this reevaluation includes:

- Alaska ShoreZone Coastal Mapping (National Oceanic and Atmospheric Administration [NOAA] 2014)
- Photographs and video clips from Alaska ShoreZone (NOAA 2014)
- High-resolution digital orthomosaic photography flown in summer 2014 with 3-inch pixel resolution

The Alaska ShoreZone Coastal Mapping project (ShoreZone website) is sponsored by NOAA Fisheries and includes a standardized system for cataloguing high-resolution geomorphic and biological resources. The ShoreZone website includes low-tide oblique aerial images and access to the biophysical data. The area around the Katzeihin River was flown for the ShoreZone website on June 4, 2004; however, these data were not evaluated for previous JAI wetland mapping efforts. The ShoreZone mapping resources, along with the new high-resolution 2014 aerial imagery, allow for detailed analysis of the intertidal areas sufficient to determine the current presence of mudflats. Each area, the Katzeihin Ferry Terminal location and the southern embankment of the Katzeihin River bridge, is examined separately below.

Katzeihin Ferry Terminal Location

The wetland and waterbody mapping was updated in 2014 for the entire study area for the DSEIS (DOT&PF 2014a) and was used to calculate impacts for the project's USACE Section 404 permit

application (DOT&PF 2014b) currently under review. Mapping for Katzeihin Ferry Terminal location included the following two NWI codes:

- **E2US1N/E2RS2N** – Estuarine, Intertidal, Unconsolidated Shore with Cobble-Gravel, Regularly Flooded/Estuarine, Intertidal, Rocky Shore, Rubble, Regularly Flooded
- **E2EM1N** – Estuarine, Intertidal, Emergent Vegetation, Regularly Flooded

Exhibit 2 shows the Katzeihin Ferry Terminal site along with the 2014 aerial imagery, the 2014 JAI wetland mapping, and the 2004 ShoreZone classification (NOAA 2014). The relevant ShoreZone mapping codes are described in Table 1.

Table 1. ShoreZone mapping at the proposed Katzeihin Ferry Terminal site

ID	Habitat Class	Shore Type	Environmental Sensitivity Index*
1	Semi-Protected/ Immobile/Rock	Cliff with gravel beach	Sheltered rocky rubble shores
2	Semi-Protected/ Partially Mobile/ Sediment or Rock Sediment	Gravel beach - narrow	Gravel beaches (cobbles and boulders)
3	Semi-Protected/ Mobile/Sediment	Organics/fines	Sheltered tidal flats
4	Semi-Protected/ Mobile/Sediment	Sand and gravel flat fan	Sheltered tidal flats

*Environmental Sensitivity Index is a shore type classification that provides a concise summary of coastal resources that are at risk if an oil spill occurs nearby (NOAA 2014).

Rocks and gravels are visible in the 2014 aerial photography and in the ShoreZone photograph (Exhibit 3) throughout the area where the proposed ferry terminal would be sited. The shore types mapped by ShoreZone generally describe rocky/gravel beaches. No part of the Katzeihin Ferry Terminal area is mapped as mudflat by ShoreZone (NOAA 2014). One section of ShoreZone mapping (ID# 3) identifies organics and fines in its mapping. This code represents vegetation and fines that can be located either in the intertidal or supratidal region. Additional information from the ShoreZone website was collected for the across-shore components of this area (Table 2; NOAA 2014). This mapping zone (ShoreZone ID# 3) covers an area mapped as E2EM1N in the DSEIS and USACE permit application.

Table 2. Additional information on across-shore components of ShoreZone ID# 3 (from land waterward)

Beach, storm ridge-Anthropogenic, logs (cut trees)/Clastic, pebbles (0.5 to 6cm), sand (very fine to very coarse, 0.5 to 2mm)
Beach, berm-Clastic, pebbles (0.5 to 6cm), sand (very fine to very coarse, 0.5 to 2mm)
Marsh, mid to low (discontinuous)-Biogenic, grass on dunes/Clastic, sand (very fine to very coarse, 0.5 to 2mm), pebbles (0.5 to 6cm)
Tidal Flat, flats-Clastic, sand (very fine to very coarse, 0.5 to 2mm), pebbles (0.5 to 6cm)

Exhibit 2. 2014 aerial imagery, JAI wetland mapping, and 2004 ShoreZone mapping of the Katzehin Ferry Terminal site.

Exhibit 3. Photograph of the Katzeihin Ferry Terminal site from the ShoreZone website (NOAA 2014). Photo taken June 4, 2004 looking southeast.

The discontinuous marsh documented in the third across-shore component of ShoreZone ID# 3 accounts for the emergent estuarine wetland currently mapped. Rocks and gravel are present in all across-shore components in all areas where the proposed ferry terminal would be located. The smallest particle size mapped by ShoreZone in the area is sand.

Rocks and gravel are visible throughout the area on the 2014 aerial photography. The ShoreZone mapping does not identify mudflats and classifies the area as being dominated by pebbles and sand. Consequently, this area would not meet the definition of mudflats and therefore would not be characterized as a special aquatic site according to Section 404(b)(1) Guidelines (40 CFR Part 230).

Katzeihin River South Shore Embankment

The southern embankment of the Katzeihin River bridge was mapped for the DSEIS and Section 404 permit application with the following two NWI codes:

- **E1UBL** – Estuarine, Subtidal, Unconsolidated Bottom
- **E2EM1N** – Estuarine, Intertidal, Emergent Vegetation, Regularly Flooded

Exhibit 4 shows the southern embankment for the Katzeihin River bridge with the 2014 aerial photography and the 2004 ShoreZone mapping. No part of the Katzeihin River south shore embankment is mapped as mudflat by ShoreZone (NOAA 2014). The ShoreZone mapping near the proposed embankment is described in Table 3. Two ShoreZone types are mapped in the area, both describing the area as sand flats.

Exhibit 4. 2014 aerial imagery, JAI wetland mapping, and 2004 ShoreZone mapping of the Katzehin River bridge southern embankment.

Table 3. ShoreZone mapping at proposed southern Katzeihin River bridge embankment

ID	Habitat Class	Shore Type	Environmental Sensitivity Index*
5	Very Protected/Estuary	Sand flat	Sheltered tidal flat
6	Very Protected/Partially Mobile/Sediment or Rock and Sediment	Sand flat	Sheltered tidal flat

* Environmental Sensitivity Index is a shore type classification that provides a concise summary of coastal resources that are at risk if an oil spill occurs nearby (NOAA 2014).

Additional information from the ShoreZone website was collected for the across-shore components of the two ShoreZone types (Table 4; NOAA 2014). These components are described in Table 4. Aside from the cliff component on ShoreZone ID# 6, all other components list sand before mud or fines, meaning that sand is present in greater abundance than mud or fines. Rocks and gravel are visible on the 2014 aerial imagery directly adjacent to the river channel and sporadically throughout the entire area that would be impacted.

Table 4. Additional information on across-shore components of ShoreZone ID#s 5 and 6 (from land waterward)

ShoreZone ID# 5	ShoreZone ID# 6
Delta, fan, bars, multiple channels-Clastic, sand (very fine to very coarse, 0.5 to 2mm), fines or mud (mix of silt or clay, < 0.5mm)	Cliff, eroding, inclined (20 to 35deg), low (<5m)-Bedrock
Tidal Flat, flats, bar, ridge, multiple tidal channels-Clastic, sand (very fine to very coarse, 0.5 to 2mm), fines or mud (mix of silt or clay, < 0.5mm)	River Channel, single channel-Clastic, sand (very fine to very coarse, 0.5 to 2mm), fines or mud (mix of silt or clay, < 0.5mm)
River Channel, multiple channels-Clastic, sand (very fine to very coarse, 0.5 to 2mm), fines or mud (mix of silt or clay, < 0.5mm)	Tidal Flat, flats, bar, ridge, multiple tidal channels-Clastic, sand (very fine to very coarse, 0.5 to 2mm), fines or mud (mix of silt or clay, < 0.5mm)??
	Delta, fan, multiple channels-Clastic, sand (very fine to very coarse, 0.5 to 2mm), fines or mud (mix of silt or clay, < 0.5mm)
	River Channel, multiple channels-Clastic, sand (very fine to very coarse, 0.5 to 2mm), fines or mud (mix of silt or clay, < 0.5mm)

Due to the presence of rocks and gravel visible on the 2014 aerials and the classification of the area as sand flats by ShoreZone, this area would not meet the definition of mudflats and therefore would not be characterized as a special aquatic site according to Section 404(b)(1) Guidelines (40 CFR Part 230).

Summary

The 2014 wetland mapping used in the 2014 DSEIS and USACE permit application was reevaluated using new information to determine the presence of mudflats in two locations: the Katzeihin Ferry Terminal location and the south shore embankment of the Katzeihin Ferry Terminal. The information evaluated included site photographs, video, and coastal mapping from a 2004 low-altitude flyover from the ShoreZone website and high-resolution aerial photography taken during summer 2014.

The ShoreZone coastal mapping does not identify mudflats in either area in any across-shore component. The coastal mapping identifies the Katzeihin Ferry Terminal site to be dominated by pebbles and sand and the bridge embankment site to be dominated by sand. Rocks and gravel are also visible in both locations in the 2014 aerial photography.

Upon reevaluation, it appears that the areas were correctly identified as waters of the U.S. and not mudflats. These areas would not be characterized as a special aquatic site according to Section 404(b)(1) Guidelines (40 CFR Part 230).

PO Box 112500
Juneau, AK 99811-2500

Dear Mr. Haugh and Mr. Hogins:

Thank you for the opportunity to review the Preliminary Final Supplemental Environmental Impact Statement for the Juneau Access Improvement Project in southeast Alaska (EPA Region 10 Project No. 92-091-FHW).

We understand the PFSEIS identifies the No Build Alternative as the Preferred Alternative, consistent with Governor Walker's announcement of the No Build Alternative as the State of Alaska's preferred alternative in December 2016. We appreciate the additional discussion regarding this decision in Section 2.4 of the PFSEIS. This discussion notes the current fiscal challenges within the state, as well as current controversy regarding the best path forward, as the primary reasons for the selection of the No Build Alternative at this time.

We also appreciate the responses to our November 25, 2014, comment letter on the Supplemental Draft EIS. Due to the continuing concerns related to the previously preferred alternative (Alternative 2B), we support the decision to select the No Build Alternative at this time. Should the project be proposed again in the future, we look forward to engaging with the appropriate parties on this project under our applicable authorities.

Again, we appreciate the opportunity to review the PFSEIS. Please contact Jennifer Curtis of my staff in Anchorage at (907) 271-6324 or curtis.jennifer@epa.gov, or you may contact me at (206) 553-1841 or nogi.jill@epa.gov, for any further discussion regarding this project.

Sincerely,

Jill A. Nogi

Post Office Box 21648
Juneau, Alaska 99802-1648

Dear Mr. Haugh:

This letter provides the U.S. Army Corps of Engineers (Corps) comments on the Draft Supplemental Environmental Impact Statement (DSEIS) dated September 2014, for the proposed Juneau Access Improvements Project (JAI), in Juneau, Alaska. At this time, the Corps is participating as a cooperating agency in development of the DSEIS, as well as beginning an evaluation of a Department of the Army (DA) permit application for this project. Although these processes may run concurrently, there are some distinct differences between information required under the National Environmental Policy Act (NEPA) and information/evaluation required under the DA permit evaluation process. The following comments address the NEPA elements for continued SEIS development.

Special Aquatic Sites: Characterization of the wetland special aquatic sites that occur within the proposed project area is well described in the DSEIS. Available ShoreZone¹ photography for the Katzeihin River delta, as well as survey information referenced in the DSEIS, indicates that there may be areas of mudflats in and adjacent to the proposed Katzeihin River bridge approach and ferry terminal locations.

The Corps requests clarity on the presence or absence of mudflats at this location, and that further measures be explored to reduce impacts to the aquatic ecosystem at this location. If mudflats are found to occur within the project area, a description and delineation of these special aquatic sites should be included in the Final SEIS. This information would also be needed for the DA permit evaluation.

Like wetlands, mudflats are considered special aquatic sites in the Environmental Protection Agency's (EPA) 404(b)(1) Guidelines (Guidelines)². The Guidelines are an integral part of the Corps' permit evaluation compliance requirements. The Guidelines describe special aquatic sites as "possessing special ecological characteristics of productivity, habitat, wildlife protection, or other important and easily disrupted ecological values". The Corps wants to ensure all special aquatic sites are adequately reflected in the FSEIS and DA permit evaluation.

Alternatives: With the exception of the no action alternative, all of the alternatives carried forward for analysis in the DSEIS meet the project purpose and need to varying degrees, as summarized in the JAI DSEIS, Appendices Volume 6, Appendix Z, Table 1. Tables like this are very effective at identifying the degree to which the various alternatives meet the project purpose and need and the associated environmental footprints. This table includes environmental impacts in the form of the number of river/stream crossings, acres and types of waters of the U.S. (WOUS) filled, and acres of WOUS

¹ NOAA Fisheries, Alaska ShoreZone Coastal Mapping and Imagery website.

² 40 CFR 230.

impacted. Although summaries such as this are useful for quantifying WOUS size and type, they fall short of capturing the quality of those WOUS and the associated impacts, such as essential fish habitat and use by threatened/endangered species. We appreciate that Appendix Z further discusses these considerations.

In making a future determination of the least environmentally damaging practicable alternative for the JAI project, the Corps will use: applicable information from our previous record of decision in light of the changes reflected in the SEIS; information provided in the EIS and SEIS; an independent Guidelines review and compliance determination; and an evaluation of the public interest review factors and comments received during the DA permit evaluation process.

Based on the information provided in the DSEIS and available to us, an alternative ferry terminal site could be located on the eastside of Lynn Canal within the vicinity at Cascade Point. The Guidelines establish that to be available, alternative sites need not be under the ownership of the permit applicant. The sites must merely be reasonably available for purchase, use or management. The Corps has issued a DA permit, POA-1997-245-M5, Berners Bay, to Goldbelt Incorporated on November 29, 2012, to construct a marine dock and breakwater. The use of the site would provide an opportunity to co-locate with an already permitted project. We note that the Federal Highway Administration has committed to investigating the use of this site.³ The Corps requests that the Final SEIS evaluate an alternative within the vicinity of Cascade Point to minimize impacts to aquatic resources as required by the Guidelines. Additionally, this would have the benefit of reducing the ferry travel distance and roundtrip time.

Additionally, the Corps requests that the Federal Highway Administration include information in the Final SEIS that evaluates the potential for a suitable alternative ferry terminal site on the west side of Lynn Canal that may exist south of William Henry Bay but north of Saint James Bay.

Mitigation Sequence: Under the Corps' substantive evaluation criteria for all Section 404 Clean Water Act (CWA) permits, the Guidelines, mitigation is a sequential process of avoidance, minimization, and compensation. Compensatory mitigation is not considered until after all appropriate and practicable steps have been taken to first avoid and then minimize adverse impacts to the aquatic ecosystem.

The mitigation regulations at 33 CFR Part 332 establish standards and criteria for the use of appropriate and practicable compensatory mitigation for unavoidable functional losses of aquatic resources authorized by Corps permits.

Avoidance measures are the planning strategies that entirely eliminate the discharge of fill material into the aquatic ecosystem to achieve the project purpose. A key requirement of compliance with the avoidance sequence of the Guidelines is to show whether or not an aquatic resource can be completely avoided. Minimization entails measures to reduce or diminish the impacts to aquatic resources. The fundamental objective of compensatory mitigation is to offset environmental losses resulting from unavoidable impacts to waters of the United States authorized by DA permits.

Although the burden of proof for satisfying these steps rests with the permit applicant, the Corps must rely upon its own analysis in making a finding of compliance or non-compliance with the Guidelines. The applicant must provide information that is sufficient to determine compliance, so the Corps can make a timely permit decision. The information provided in the mitigation section of the DSEIS is not specific to the proposed work for the Corps' Guidelines analysis, and we understand this more specific information is forthcoming.

The DSEIS states that the Alaska Department of Transportation and Public Facilities intends to coordinate with the Corps to develop a compensatory mitigation plan to offset impacts to waters of the

³ The Draft Design Concept Report for the Day Boat ACF dated February 25, 2013, states that ADOT&PF has committed to the consideration of Cascade Point as a terminal for north Lynn Canal ferry service.

United States, and that proposed compensatory mitigation for unavoidable impacts to waters of the United States would consist of: 1) A previously constructed artificial reef project located in Juneau at Yankee Cove; 2) The proposed riprap breakwater for the Katzehin Ferry Terminal; and 3) An in-lieu-fee payment.

The proposed ferry terminal fill would be an impact resulting in a loss of aquatic function and thus would not qualify for compensatory mitigation credit. However, it may be possible that as a by-product, the proposed breakwater may provide some benefit to the aquatic environment, and may affect the permit applicant's overall compensatory mitigation obligation. A mitigation plan would be required that addresses the objectives, baseline information, performance standards, etc.

In developing the proposed compensatory mitigation plan, the guidelines and requirements outlined in the regulations at 33 CFR 332 should be followed. It should include sufficient information about how the proposed compensatory mitigation relates to the individual and cumulative impacts to aquatic resources within the proposed project area, including an assessment to quantify debits and credits for aquatic resource impacts and compensation.

We appreciate the opportunity to comment and look forward to working with you further. In the spirit of cooperation, as the SEIS process comes to a close, the Corps requests a meeting with FHWA, ADOT&PF, and the commenting resource agencies. The purpose of the meeting would be to enhance interagency coordination and ensure that issues of concern are clearly identified for consideration in the FSEIS.

Thank you for the opportunity to comment. Please contact Randy Vigil via email at Randal.P.Vigil@usace.army.mil; or by phone at (907) 790-4490, Linda Speerstra at linda.speerstra@usace.army.mil; (907) 747-0658, or myself at Shannon.R.Morgan@usace.army.mil; (907) 753-5552 if you have questions.

Sincerely,

Shannon Morgan

RE: Request to withdraw Department of the Army Individual Section 404/10 Permit Application for the Juneau Access Improvements Project, POA-2006-597-2

Dear Mr. Vigil,

The Alaska Department of Transportation and Public Facilities (DOT&PF) is requesting to withdraw the Department of the Army Individual Section 404/10 Permit Application for the Juneau Access Improvements Project, POA-2006-597-2 submitted September 17, 2014. This is due to Governor Walker's recent change of preferred alternative, selecting Alternative 1, No-Action as the new State of Alaska's preferred alternative.

If you have any questions or require additional information, please contact Gary Hogins, Project Manager at (907) 465-8143 or at gary.hogins@alaska.gov.

Sincerely,

A handwritten signature in blue ink, appearing to read "T. Horne", with a date "12/20/16" written below it.

Ms. Shannon Morgan
Chief, South Branch, Alaska District
U.S. Army Corps of Engineers
P.O. Box 6898
JBER, Alaska 99509

Dear Ms. Morgan:

Thank you for your letter, dated November 25, 2014, with your agency's comments on the Juneau Access Improvements (JAI) Project, Draft Supplemental Environmental Impact Statement (SEIS). We appreciate the continued participation of the U.S. Army Corps of Engineers (USACE) in the JAI Project as a cooperating agency.

I am writing to you for two primary reasons. First, I have reviewed your letter in detail and have provided responses and/or revised the SEIS in response to your comments, as incorporated into the Preliminary Final SEIS. For ease of reference, the attached comment-response letter contains responses that have been imbedded in a reprint of your original comment letter. Secondly, as a Cooperating Agency, I am providing you the JAI Project Preliminary Final SEIS for your review and comment. Due to its preliminary nature, this document is provided for Cooperating Agency review only. It is not a public document, and its information should not be shared with other agencies or individuals. FHWA and DOT&PF will consider your agency's comments, as well as comments by the other Cooperating Agencies, in preparation of the JAI Project Final SEIS for public release (as noted previously and consistent with 23 U.S.C. 193(n)(2), FHWA intends to issue a combined Final SEIS and Record of Decision). Please let me know if you would like additional copies of the document. I ask that you provide any further written comments within 30 days of receipt of this correspondence.

Briefly, FHWA has identified the "No Build Alternative" as the Preferred Alternative in the JAI Preliminary Final SEIS. Governor Walker announced on December 15, 2017, that the "No Build Alternative" is the State's Preferred Alternative. See Section 2.4 of the Preliminary Final SEIS for discussion.

Please do not hesitate to contact me at (907) 586-7430 or Gary Hogins (907) 465-8143, DOT&PF Project Manager, if you have any questions or concerns.

Sincerely,

Tim A. Haugh
Environmental Program Manager

Mr. Tim Haugh
U.S. Department of Transportation
Federal Highway Administration
Post Office Box 21648
Juneau, Alaska 99802-1648

Dear Mr. Haugh:

1 This letter provides the U.S. Army Corps of Engineers (Corps) comments on the Draft
2 Supplemental Environmental Impact Statement (DSEIS) dated September 2014, for the proposed
3 Juneau Access Improvements Project (JAI), in Juneau, Alaska. At this time, the Corps is
4 participating as a cooperating agency in development of the DSEIS, as well as beginning an
5 evaluation of a Department of the Army (DA) permit application for this project. Although these
6 processes may run concurrently, there are some distinct differences between information
7 required under the National Environmental Policy Act (NEPA) and information/evaluation
8 required under the DA permit evaluation process. The following comments address the NEPA
9 elements for continued SEIS development.

10 **Special Aquatic Sites:** Characterization of the wetland special aquatic sites that occur within
11 the proposed project area is well described in the DSEIS. Available ShoreZone¹ photography for
12 the Katzehin River delta, as well as survey information referenced in the DSEIS, indicates that
13 there may be areas of mudflats in and adjacent to the proposed Katzehin River bridge approach
14 and ferry terminal locations.

15 The Corps requests clarity on the presence or absence of mudflats at this location, and that
16 further measures be explored to reduce impacts to the aquatic ecosystem at this location. If
17 mudflats are found to occur within the project area, a description and delineation of these special
18 aquatic sites should be included in the Final SEIS. This information would also be needed for the
19 DA permit evaluation.

20 Like wetlands, mudflats are considered special aquatic sites in the Environmental Protection
21 Agency's (EPA) 404(b)(1) Guidelines (Guidelines)². The Guidelines are an integral part of the
22 Corps' permit evaluation compliance requirements. The Guidelines describe special aquatic sites

¹ NOAA Fisheries, Alaska ShoreZone Coastal Mapping and Imagery website.

² 40 CFR 230.

23 as "possessing special ecological characteristics of productivity, habitat, wildlife protection, or
24 other important and easily disrupted ecological values". The Corps wants to ensure all special
25 aquatic sites are adequately reflected in the FSEIS and DA permit evaluation.

26 **RESPONSE:** The 2014 *Wetlands Report* and Draft SEIS Appendix Z 2014 *Update to Appendix*
27 *O – Wetlands Technical Report* do not identify the Katzehin Ferry Terminal or the Katzehin
28 River delta as a mudflat. The field data and wetland mapping used are based on 2006 efforts as
29 part of the 2006 Final EIS and 2008 USACE Section 404/10 Permit Authorization. FHWA
30 reevaluated the Katzehin area for the presence of mudflats using 2014 high-resolution digital
31 orthomosaic photography, photographs and video clips from Alaska ShoreZone, and Alaska
32 ShoreZone Coastal Mapping. A memorandum describing the 2015 mudflat reevaluation is
33 attached. According to the analysis, both sites (Katzehin Ferry Terminal and Katzehin River
34 delta) have rock and gravel visible on the 2014 aerials and are not classified as mudflats by
35 ShoreZone; therefore, these areas would not be characterized as a special aquatic site according
36 to Section 404(b)(1) Guidelines (40 CFR Part 230).

37 **Alternatives:** With the exception of the no action alternative, all of the alternatives carried
38 forward for analysis in the DSEIS meet the project purpose and need to varying degrees, as
39 summarized in the JAI DSEIS, Appendices Volume 6, Appendix Z, Table 1. Tables like this are
40 very effective at identifying the degree to which the various alternatives meet the project purpose
41 and need and the associated environmental footprints. This table includes environmental impacts
42 in the form of the number of river/stream crossings, acres and types of waters of the U.S.
43 (WOUS) filled, and acres of WOUS impacted. Although summaries such as this are useful for
44 quantifying WOUS size and type, they fall short of capturing the quality of those WOUS and the
45 associated impacts, such as essential fish habitat and use by threatened/endangered species. We
46 appreciate that Appendix Z further discusses these considerations.

47 **RESPONSE:** The tables provided in the Draft SEIS Appendix Z 2014 *Update to Appendix X*
48 *Draft Section 404/10 Permit Application Draft Section 404(b)(1) Analysis* are intended to
49 summarize the environmental impacts to WOUS consistent with a USACE permit application.

50 Detailed information regarding the quantity of the impacts to essential fish habitat and
51 threatened/endangered species of each project alternative is provided in Draft SEIS Appendix Z
52 *2014 Update to N– Essential Fish Habitat Assessment, 2014 Update to S – Steller Sea Lion*
53 *Technical Report, and 2014 Update to Q – Wildlife Technical Report.*

54 In making a future determination of the least environmentally damaging practicable
55 alternative for the JAI project, the Corps will use: applicable information from our previous
56 record of decision in light of the changes reflected in the SEIS; information provided in the EIS
57 and SEIS; an independent Guidelines review and compliance determination; and an evaluation of
58 the public interest review factors and comments received during the DA permit evaluation
59 process.

60 **RESPONSE:** Thank you for your comment.

61 Based on the information provided in the DSEIS and available to us, an alternative ferry
62 terminal site could be located on the eastside of Lynn Canal within the vicinity at Cascade Point.
63 The Guidelines establish that to be available, alternative sites need not be under the ownership of
64 the permit applicant. The sites must merely be reasonably available for purchase, use or
65 management.

66 The Corps has issued a DA permit, POA-1997-245-MS, Berners Bay, to Goldbelt
67 Incorporated on November 29, 2012, to construct a marine dock and breakwater. The use of the
68 site would provide an opportunity to co-locate with an already permitted project. We note that
69 the Federal Highway Administration has committed to investigating the use of this site.³ The
70 Corps requests that the Final SEIS evaluate an alternative within the vicinity of Cascade Point to
71 minimize impacts to aquatic resources as required by the Guidelines. Additionally, this would
72 have the benefit of reducing the ferry travel distance and roundtrip time.

73 **RESPONSE:** If the Final SEIS had identified an alternative requiring a terminal in Berners Bay
74 (Alternatives 3, 4B and 4D) as the Preferred Alternative, the Final SEIS would have evaluated
75 Cascade Point as an alternative site to Sawmill Cove.

76 Additionally, the Corps requests that the Federal Highway Administration include
77 information in the Final SEIS that evaluates the potential for a suitable alternative ferry terminal
78 site on the west side of Lynn Canal that may exist south of William Henry Bay but north of Saint
79 James Bay.

80 **RESPONSE:** If the Final SEIS had identified Alternative 3 as the Preferred Alternative, the Final
81 SEIS would have evaluated the potential for a suitable alternative ferry terminal site between
82 Saint James Bay and William Henry Bay on the West side of Lynn Canal.

83 **Mitigation Sequence:** Under the Corps' substantive evaluation criteria for all Section 404
84 Clean Water Act (CWA) permits, the Guidelines, mitigation is a sequential process of avoidance,
85 minimization, and compensation. Compensatory mitigation is not considered until after all
86 appropriate and practicable steps have been taken to first avoid and then minimize adverse
87 impacts to the aquatic ecosystem.

88 The mitigation regulations at 33 CFR Part 332 establish standards and criteria for the use of
89 appropriate and practicable compensatory mitigation for unavoidable functional losses of aquatic
90 resources authorized by Corps permits.

91 Avoidance measures are the planning strategies that entirely eliminate the discharge of fill
92 material into the aquatic ecosystem to achieve the project purpose. A key requirement of
93 compliance with the avoidance sequence of the Guidelines is to show whether or not an aquatic
94 resource can be completely avoided. Minimization entails measures to reduce or diminish the
95 impacts to aquatic resources. The fundamental objective of compensatory mitigation is to offset
96 environmental losses resulting from unavoidable impacts to waters of the United States
97 authorized by DA permits.

98 Although the burden of proof for satisfying these steps rests with the permit applicant, the
99 Corps must rely upon its own analysis in making a finding of compliance or non-compliance
100 with the Guidelines. The applicant must provide information that is sufficient to determine
101 compliance, so the Corps can make a timely permit decision. The information provided in the
102 mitigation section of the DSEIS is not specific to the proposed work for the Corps' Guidelines
103 analysis, and we understand this more specific information is forthcoming.

104 **RESPONSE:** If the Final SEIS had identified a build alternative as the Preferred Alternative,
105 FHWA and DOT&PF would have coordinated with the USACE to develop a Compensatory

³ The Draft Design Concept Report for the Day Boat ACF dated February 25, 2013, states that ADOT&PF has committed to the consideration of Cascade Point as a terminal for north Lynn Canal ferry service.

106 Mitigation Plan that would outline the 12 elements required by the Federal Rule on
107 Compensatory Mitigation: Compensatory Mitigation for Losses of Aquatic Resources; Final
108 Rule (33 CFR Parts 325 and 332 and 40 CFR Part 230, Subpart J), dated April 10, 2008 for any
109 permittee-responsible mitigation projects. The mitigation section (Chapter 5) of the Final SEIS
110 includes a brief discussion of the avoidance, minimization, and mitigation measures for the JAI
111 project build alternatives. A more detailed discussion is included in Draft SEIS Appendix Z *2014*
112 *Update to Appendix X Draft Section 404/10 Permit Application Draft Section 404(b)(1) Analysis*.
113 Attachment 3 of that document includes an evaluation of the project design for Alternative 2B
114 that avoids and minimizes impacts to aquatic resources wherever practicable, as directed in the
115 Final Rule.

116

117 The DSEIS states that the Alaska Department of Transportation and Public Facilities intends
118 to coordinate with the Corps to develop a compensatory mitigation plan to offset impacts to
119 waters of the United States, and that proposed compensatory mitigation for unavoidable impacts
120 to waters of the United States would consist of: 1) A previously constructed artificial reef project
121 located in Juneau at Yankee Cove; 2) The proposed riprap breakwater for the Katzehin Ferry
122 Terminal; and 3) An in-lieu-fee payment.

123 RESPONSE: As part of the 2008 USACE permit (POA-2006-597-2), DOT&PF committed to
124 paying \$780,000 as an ILF to offset the loss of 32.1 acres of estuarine and marine shores.
125 Through 2014, DOT&PF has paid \$324,000 (2006 dollars) as mitigation for anticipated estuarine
126 and marine shore impacts. This money was used to construct two artificial reefs at Yankee Cove
127 in cooperation with the National Marine Fisheries Service. In a letter to FHWA from the USACE
128 on February 21, 2014, the USACE requested proposed mitigation in accordance with the 2008
129 Final Rule on Compensatory Mitigation.

130 If the Final SEIS had identified a build alternative as the Preferred Alternative, the FHWA and
131 DOT&PF would have coordinated with the USACE to develop a Compensatory Mitigation Plan
132 that would outline the 12 elements required by the Final Rule for permittee-responsible
133 mitigation projects.

134 The proposed ferry terminal fill would be an impact resulting in a loss of aquatic function
135 and thus would not qualify for compensatory mitigation credit. However, it may be possible that
136 as a by-product, the proposed breakwater may provide some benefit to the aquatic environment,
137 and may affect the permit applicant's overall compensatory mitigation obligation. A mitigation
138 plan would be required that addresses the objectives, baseline information, performance
139 standards, etc.

140 RESPONSE: The DOT&PF believes the area created from the riprap breakwater for the
141 Katzehin Ferry Terminal provides an opportunity for permittee-responsible aquatic resource
142 enhancement that may be included in the Compensatory Mitigation Plan. If the Final SEIS had
143 identified Alternative 2B as the Preferred Alternative, the FHWA and DOT&PF would have
144 coordinated with the USACE to develop a Compensatory Mitigation Plan that would outline the
145 12 elements required by the Final Rule for permittee-responsible mitigation projects.

146 In developing the proposed compensatory mitigation plan, the guidelines and requirements
147 outlined in the regulations at 33 CFR 332 should be followed. It should include sufficient
148 information about how the proposed compensatory mitigation relates to the individual and

149 cumulative impacts to aquatic resources within the proposed project area, including an
150 assessment to quantify debits and credits for aquatic resource impacts and compensation.

151 **RESPONSE:** If the Final SEIS had identified a build alternative as the Preferred Alternative, the
152 Compensatory Mitigation Plan would have included the 12 elements required by the Final Rule
153 for permittee-responsible mitigation projects. This would include information on individual and
154 cumulative impacts to aquatic resources, as well as an assessment to quantify debits and credits
155 for aquatic resource impacts and compensation.

156 We appreciate the opportunity to comment and look forward to working with you further. In
157 the spirit of cooperation, as the SEIS process comes to a close, the Corps requests a meeting with
158 FHWA, ADOT&PF, and the commenting resource agencies. The purpose of the meeting would
159 be to enhance interagency coordination and ensure that issues of concern are clearly identified
160 for consideration in the FSEIS.

161 **RESPONSE:** Technical input from the various agencies is important in minimizing and
162 mitigating environmental impacts from the alternatives. If the Final SEIS had identified a build
163 alternative as the Preferred Alternative, FHWA would have continued to conduct meetings with
164 federal and state agencies during the Final SEIS and permitting processes.

165 Thank you for the opportunity to comment. Please contact Randy Vigil via email at
166 Randal.P.Vigil@usace.army.mil; or by phone at (907) 790-4490, Linda Speerstra at
167 linda.speerstra@usace.army.mil; (907) 747-0658, or [myself at Shannon.R.Morgan@usace.army.mil](mailto:myself@Shannon.R.Morgan@usace.army.mil);
168 (907) 753-5552 if you have questions.

169 Sincerely,
170 Shannon Morgan

Attachment
JAI Project 2015 Mudflats Analysis

Memo

Date: Thursday, January 29, 2015

Project: Juneau Access Improvements Project

To: Gary Hogins, DOT&PF

From: Mac Salway, HDR

Subject: Reevaluation of mudflats at the Katzehin Ferry Terminal site and Katzehin River bridge crossing

Introduction

In the U.S. Army Corps of Engineers' (USACE) comment letter dated November 25, 2014 on the Draft Supplemental Environmental Impact Statement (DSEIS) for the Juneau Access Improvements (JAI) Project, the USACE requested more information on the potential presence of mudflats in and adjacent to the proposed Katzehin River bridge and the Katzehin Ferry Terminal location (USACE 2014). The U.S. Environmental Protection Agency (USEPA) similarly noted the potential for mudflats along the south shore of the Katzehin River in their comment letter, also dated November 25, 2014 (USEPA 2014). The purpose of this memorandum is to examine the potential for mudflats or other special aquatic sites within these two areas using newly available information.

Existing Information

Mudflats are classified as special aquatic sites under the *Section 404(b)(1) Guidelines for the Specification of Disposal Sites for Dredged or Fill Material* (Guidelines; 40 CFR Part 230, U.S. Federal Register 2010). The Guidelines define them as follows:

Mud flats are broad flat areas along the sea coast and in coastal rivers to the head of tidal influence and in inland lakes, ponds, and riverine systems. When mud flats are inundated, wind and wave action may resuspend bottom sediments. Coastal mud flats are exposed at extremely low tides and inundated at high tides with the water table at or near the surface of the substrate. The substrate of mud flats contains organic material and particles smaller in size than sand. They are either unvegetated or vegetated only by algal mats.

The Katzeihin Ferry Terminal location and the southern Katzeihin River bridge embankment were originally mapped in the 1994 *Wetlands Technical Report*, and mapping was subsequently updated in 2004, 2006, and 2014 (DOT&PF 1994, 2004, 2006, 2014a). Mapping was completed using National Wetland Inventory (NWI) codes according to the *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin et al. 1979). Field work was completed in 2003 and 2006. The 2006 field effort resulted in a refined boundary for the estuarine emergent wetland located at the Katzeihin Ferry Terminal site. Neither the Katzeihin Ferry Terminal location nor the Katzeihin River delta was mapped for the JAI Project with an NWI code that would indicate the presence of mudflats. Typical NWI codes characterizing mudflats begin with E2US3 (estuarine, intertidal, unconsolidated shore composed of mud). No mudflats were mapped in these two areas during the original effort or any of the subsequent updates. Wetland mapping performed in 2004 and subsequent years occurred on a digital orthomosaic aerial image taken in 2003 with a pixel resolution of 1.5 feet. The 2003 aerial photography appears to be collected during high tide. Exhibit 1 shows a photograph of the Katzeihin ferry terminal site taken during the 2003 field work (DOT&PF 2004).

Exhibit 1. Photograph taken July 27, 2003 of the Katzeihin Ferry Terminal site.

2015 Reevaluation of Mudflats

The potential for mudflats at the Katzeihin Ferry Terminal location and Katzeihin River delta were reevaluated in 2015. New information used for this reevaluation includes:

- Alaska ShoreZone Coastal Mapping (National Oceanic and Atmospheric Administration [NOAA] 2014)
- Photographs and video clips from Alaska ShoreZone (NOAA 2014)
- High-resolution digital orthomosaic photography flown in summer 2014 with 3-inch pixel resolution

The Alaska ShoreZone Coastal Mapping project (ShoreZone website) is sponsored by NOAA Fisheries and includes a standardized system for cataloguing high-resolution geomorphic and biological resources. The ShoreZone website includes low-tide oblique aerial images and access to the biophysical data. The area around the Katzeihin River was flown for the ShoreZone website on June 4, 2004; however, these data were not evaluated for previous JAI wetland mapping efforts. The ShoreZone mapping resources, along with the new high-resolution 2014 aerial imagery, allow for detailed analysis of the intertidal areas sufficient to determine the current presence of mudflats. Each area, the Katzeihin Ferry Terminal location and the southern embankment of the Katzeihin River bridge, is examined separately below.

Katzeihin Ferry Terminal Location

The wetland and waterbody mapping was updated in 2014 for the entire study area for the DSEIS (DOT&PF 2014a) and was used to calculate impacts for the project's USACE Section 404 permit

application (DOT&PF 2014b) currently under review. Mapping for Katzeihin Ferry Terminal location included the following two NWI codes:

- **E2US1N/E2RS2N** – Estuarine, Intertidal, Unconsolidated Shore with Cobble-Gravel, Regularly Flooded/Estuarine, Intertidal, Rocky Shore, Rubble, Regularly Flooded
- **E2EM1N** – Estuarine, Intertidal, Emergent Vegetation, Regularly Flooded

Exhibit 2 shows the Katzeihin Ferry Terminal site along with the 2014 aerial imagery, the 2014 JAI wetland mapping, and the 2004 ShoreZone classification (NOAA 2014). The relevant ShoreZone mapping codes are described in Table 1.

Table 1. ShoreZone mapping at the proposed Katzeihin Ferry Terminal site

ID	Habitat Class	Shore Type	Environmental Sensitivity Index*
1	Semi-Protected/ Immobile/Rock	Cliff with gravel beach	Sheltered rocky rubble shores
2	Semi-Protected/ Partially Mobile/ Sediment or Rock Sediment	Gravel beach - narrow	Gravel beaches (cobbles and boulders)
3	Semi-Protected/ Mobile/Sediment	Organics/fines	Sheltered tidal flats
4	Semi-Protected/ Mobile/Sediment	Sand and gravel flat fan	Sheltered tidal flats

*Environmental Sensitivity Index is a shore type classification that provides a concise summary of coastal resources that are at risk if an oil spill occurs nearby (NOAA 2014).

Rocks and gravels are visible in the 2014 aerial photography and in the ShoreZone photograph (Exhibit 3) throughout the area where the proposed ferry terminal would be sited. The shore types mapped by ShoreZone generally describe rocky/gravel beaches. No part of the Katzeihin Ferry Terminal area is mapped as mudflat by ShoreZone (NOAA 2014). One section of ShoreZone mapping (ID# 3) identifies organics and fines in its mapping. This code represents vegetation and fines that can be located either in the intertidal or supratidal region. Additional information from the ShoreZone website was collected for the across-shore components of this area (Table 2; NOAA 2014). This mapping zone (ShoreZone ID# 3) covers an area mapped as E2EM1N in the DSEIS and USACE permit application.

Table 2. Additional information on across-shore components of ShoreZone ID# 3 (from land waterward)

Beach, storm ridge-Anthropogenic, logs (cut trees)/Clastic, pebbles (0.5 to 6cm), sand (very fine to very coarse, 0.5 to 2mm)
Beach, berm-Clastic, pebbles (0.5 to 6cm), sand (very fine to very coarse, 0.5 to 2mm)
Marsh, mid to low (discontinuous)-Biogenic, grass on dunes/Clastic, sand (very fine to very coarse, 0.5 to 2mm), pebbles (0.5 to 6cm)
Tidal Flat, flats-Clastic, sand (very fine to very coarse, 0.5 to 2mm), pebbles (0.5 to 6cm)

Exhibit 2. 2014 aerial imagery, JAI wetland mapping, and 2004 ShoreZone mapping of the Katzehin Ferry Terminal site.

Exhibit 3. Photograph of the Katzeihin Ferry Terminal site from the ShoreZone website (NOAA 2014). Photo taken June 4, 2004 looking southeast.

The discontinuous marsh documented in the third across-shore component of ShoreZone ID# 3 accounts for the emergent estuarine wetland currently mapped. Rocks and gravel are present in all across-shore components in all areas where the proposed ferry terminal would be located. The smallest particle size mapped by ShoreZone in the area is sand.

Rocks and gravel are visible throughout the area on the 2014 aerial photography. The ShoreZone mapping does not identify mudflats and classifies the area as being dominated by pebbles and sand. Consequently, this area would not meet the definition of mudflats and therefore would not be characterized as a special aquatic site according to Section 404(b)(1) Guidelines (40 CFR Part 230).

Katzeihin River South Shore Embankment

The southern embankment of the Katzeihin River bridge was mapped for the DSEIS and Section 404 permit application with the following two NWI codes:

- **E1UBL** – Estuarine, Subtidal, Unconsolidated Bottom
- **E2EM1N** – Estuarine, Intertidal, Emergent Vegetation, Regularly Flooded

Exhibit 4 shows the southern embankment for the Katzeihin River bridge with the 2014 aerial photography and the 2004 ShoreZone mapping. No part of the Katzeihin River south shore embankment is mapped as mudflat by ShoreZone (NOAA 2014). The ShoreZone mapping near the proposed embankment is described in Table 3. Two ShoreZone types are mapped in the area, both describing the area as sand flats.

Exhibit 4. 2014 aerial imagery, JAI wetland mapping, and 2004 ShoreZone mapping of the Katzehin River bridge southern embankment.

Table 3. ShoreZone mapping at proposed southern Katzeihin River bridge embankment

ID	Habitat Class	Shore Type	Environmental Sensitivity Index*
5	Very Protected/Estuary	Sand flat	Sheltered tidal flat
6	Very Protected/Partially Mobile/Sediment or Rock and Sediment	Sand flat	Sheltered tidal flat

* Environmental Sensitivity Index is a shore type classification that provides a concise summary of coastal resources that are at risk if an oil spill occurs nearby (NOAA 2014).

Additional information from the ShoreZone website was collected for the across-shore components of the two ShoreZone types (Table 4; NOAA 2014). These components are described in Table 4. Aside from the cliff component on ShoreZone ID# 6, all other components list sand before mud or fines, meaning that sand is present in greater abundance than mud or fines. Rocks and gravel are visible on the 2014 aerial imagery directly adjacent to the river channel and sporadically throughout the entire area that would be impacted.

Table 4. Additional information on across-shore components of ShoreZone ID#s 5 and 6 (from land waterward)

ShoreZone ID# 5	ShoreZone ID# 6
Delta, fan, bars, multiple channels-Clastic, sand (very fine to very coarse, 0.5 to 2mm), fines or mud (mix of silt or clay, < 0.5mm)	Cliff, eroding, inclined (20 to 35deg), low (<5m)-Bedrock
Tidal Flat, flats, bar, ridge, multiple tidal channels-Clastic, sand (very fine to very coarse, 0.5 to 2mm), fines or mud (mix of silt or clay, < 0.5mm)	River Channel, single channel-Clastic, sand (very fine to very coarse, 0.5 to 2mm), fines or mud (mix of silt or clay, < 0.5mm)
River Channel, multiple channels-Clastic, sand (very fine to very coarse, 0.5 to 2mm), fines or mud (mix of silt or clay, < 0.5mm)	Tidal Flat, flats, bar, ridge, multiple tidal channels-Clastic, sand (very fine to very coarse, 0.5 to 2mm), fines or mud (mix of silt or clay, < 0.5mm)??
	Delta, fan, multiple channels-Clastic, sand (very fine to very coarse, 0.5 to 2mm), fines or mud (mix of silt or clay, < 0.5mm)
	River Channel, multiple channels-Clastic, sand (very fine to very coarse, 0.5 to 2mm), fines or mud (mix of silt or clay, < 0.5mm)

Due to the presence of rocks and gravel visible on the 2014 aerials and the classification of the area as sand flats by ShoreZone, this area would not meet the definition of mudflats and therefore would not be characterized as a special aquatic site according to Section 404(b)(1) Guidelines (40 CFR Part 230).

Summary

The 2014 wetland mapping used in the 2014 DSEIS and USACE permit application was reevaluated using new information to determine the presence of mudflats in two locations: the Katzeihin Ferry Terminal location and the south shore embankment of the Katzeihin Ferry Terminal. The information evaluated included site photographs, video, and coastal mapping from a 2004 low-altitude flyover from the ShoreZone website and high-resolution aerial photography taken during summer 2014.

The ShoreZone coastal mapping does not identify mudflats in either area in any across-shore component. The coastal mapping identifies the Katzeihin Ferry Terminal site to be dominated by pebbles and sand and the bridge embankment site to be dominated by sand. Rocks and gravel are also visible in both locations in the 2014 aerial photography.

Upon reevaluation, it appears that the areas were correctly identified as waters of the U.S. and not mudflats. These areas would not be characterized as a special aquatic site according to Section 404(b)(1) Guidelines (40 CFR Part 230).

Mr. Jim Helfinstine
District Bridge Program Administrator
Commander 17th Coast Guard District
P.O. Box 25517
Juneau, AK 99802-5517

Dear Mr. Helfinstine:

I am writing to you for two primary reasons. First, thank you for the continued participation of the U.S. Coast Guard (USCG) in the Juneau Access Improvement (JAI) Project as a cooperating agency. Secondly, as a Cooperating Agency, I am providing you the JAI Project Preliminary Final SEIS for your review and comment. Due to its preliminary nature, this document is provided for Cooperating Agency review only. It is not a public document, and its information should not be shared with other agencies or individuals. FHWA and DOT&PF will consider your agency's comments, as well as comments by the other Cooperating Agencies, in preparation of the JAI Project Final SEIS for public release (as noted previously and consistent with 23 U.S.C. 193(n)(2), FHWA intends to issue a combined Final SEIS and Record of Decision). Please let me know if you would like additional copies of the document. I ask that you provide any further written comments within 30 days of receipt of this correspondence.

Briefly, FHWA has identified the "No Build Alternative" as the Preferred Alternative in the JAI Preliminary Final SEIS. Governor Walker announced on December 15, 2017, that the "No Build Alternative" is the State's Preferred Alternative. See Section 2.4 of the Preliminary Final SEIS for discussion.

Please do not hesitate to contact me at (907) 586-7430 or Gary Hogins (907) 465-8143, DOT&PF Project Manager, if you have any questions or concerns.

Sincerely,

Tim A. Haugh
Environmental Program Manager

General Comments

Old Growth Reserves

The Old Growth Reserve (OGR) modification review is underway. Although we don't have specific OGR information to offer at this time, it is possible that OGR modifications will be needed and that will require a forest plan amendment and a separate Forest Service decision. If that is the case, the Forest Service will adopt the FHWA FEIS, and that means that the adopted FEIS will have to be consistent with Forest Service policy, handbook guidance, and regulations for items such as the biological evaluation (BE), subsistence, and roadless areas. A separate Forest Service decision will also be subject to the 36 CFR Part 218 Objection regulations and its resultant timeframes. When the OGR review is complete, we will work with you to discuss how to incorporate this information into the FHWA FEIS, and how the Forest Service timeline fits within the larger Juneau Access decision timeline.

In addition, there appears to be a misinterpretation of the 50 percent POG application that will need to be corrected. The VCU bullets in Section 4.3.14 need to be clear whether old-growth forest or productive old-growth forest is being discussed. Productive old-growth forest has a distinct meaning with respect to Tongass NF management and Old-growth LUD standards (TLRMP, pages 7-28: Old-growth forest capable of producing at least 20 cubic feet of wood fiber per acre per year, or having greater than 8,000 board feet per acre).

Subsistence

As noted during the Agency review of the preliminary Draft SEIS, the subsistence analysis (ANICLA 810) for this project does not conform to Forest Service standards presented in Forest Service Handbook (FSH) 2090.23. Portions of the required analysis are in the Draft SEIS and technical reports, but these are incomplete. For example, the 2006 FEIS and other documents in the record discuss access and competition (FEIS, pages 4-37 and 4-85), areas of subsistence use (Appendix DD), and notes there were public comments (Appendix Y, pages 40, 105, 108 and 127). Other subsistence documents are cited as well, such as the 1988 USFS subsistence study and a 1994 ADF&G analysis. There does not appear to be a clear rationale for how all this information ties together in the effects section and how that supports a determination of "would not significantly restrict subsistence uses."

In addition, the analysis for each alternative needs to address each evaluation criteria (access, abundance, and competition) and to present a finding (FSH 2090.23.11). Depending on the finding, notices, hearings, and determinations may be necessary. The appropriate finding language is given in FSH 2090.23.12. As stated at FSH 2090.23.22.1: "The evaluation and findings shall be made and clearly identified for the proposed action and for each alternative."

Biological Assessment

No revised Biological Assessment was provided for review since the Forest Service review of the preliminary Draft SEIS. For the FEIS, the status of some candidate species has changed this year, and the

Attachment A – Comments on FHWA SDEIS

document needs to be consistent with those changes (Kittlitz's murrelet, yellow-billed loon, and Pacific herring). See <http://www.fws.gov/alaska/fisheries/endangered/species.htm>

Biological Evaluation

No Biological Evaluation (BE) for this project, that meets the standards detailed in the Forest Service Manual 2670 and R-10 supplement number R-10 2600-2005-1, was submitted for review. While this Draft SEIS updated the Forest Service review of the preliminary Draft SEIS to include current Forest Service R10 sensitive species in the analysis, much of the required analysis is in the Draft SEIS and/or technical reports. Most noticeably, the analyses lack determinations for all sensitive species (see FSM 2672.42 for BE standards, and R10 supplement FSM 2672.42.5 for determination language).

Historic, Traditional and Cultural Sites

The Forest Service received a copy of a letter from the Douglas Indian Association dated 11/25/14 to ADOT with what appears to be new information about historic, traditional, and cultural sites in the project area. This information should be evaluated and included in the FEIS.

Specific Comments

Page 3-5, fourth paragraph: The document states that the Roadless Rule "...applies generally to the National Forest System..." and that "...it is the USFS's position that the Roadless Rule remains in effect on the Tongass National Forest because the U.S. Court of Appeals for the Ninth Circuit's order...." In reality, the Roadless Rule is a regulation that applies to the National Forest System and to the Tongass National Forest. The Forest Service is not "generally selecting to implement," but is implementing the Roadless Rule because it is regulation. The word "generally" should be deleted. Until the courts have made a final decision, the Roadless Rule is in effect on the Tongass. After the words "At the present time", delete the words "it is the Forest Service's position" and continue with the rest of the sentence.

Page 3-5, fifth full paragraph: delete "typically." The same paragraph states that "IRAs on federal lands are a resource potentially available for future designation as wilderness under the Wilderness Act of 1964." While this is true, it's not the sole reason for roadless area designation. The *Federal Register* notice for the 2001 Roadless Rule identifies other roadless area values and characteristics (page 3245). This same comment applies to other locations in the SDEIS.

Page 3-6, second full paragraph in middle of page: The sentence starting with "Because" should be changed to read: "It is the State of Alaska's position that the JAI Project easement is provided by statute and an analysis of other reasonable and prudent alternatives need not be conducted prior to the USFS issuance of the 4407 easement."

Page 3-63, first paragraph below bullets: "Where the Non-Development LUDs do not fulfill size, spacing, and composition criteria of Old-Growth Habitat reserves, it would be necessary to add or modify old-growth reserves to meet the criteria." This paragraph should also include a statement that a Forest Plan amendment would be required to add or modify old-growth reserves.

Attachment A – Comments on FHWA SDEIS

Page 4-3, first paragraph: The sentence starting with “If” should be changed to read: “If it becomes necessary...the Federal Highway Administration (FHWA) **could seek to** secure a transportation easement....” This same comment applies to other locations in the SDEIS.

Page 4-3, Roadless Areas as a Resource: see comment for page 3-5. The Tongass is not exempt from the Roadless Rule; the agency is currently in litigation, but at the present time the Roadless Rule remains in effect on the Tongass.

Page 4-3, Roadless Areas as a Resource: the SDEIS notes the nine roadless area characteristics and states that most of the characteristics are addressed elsewhere in the SDEIS. The cross-references mentioned should be identified here so the reader can easily find them elsewhere in the document. In addition, the SDEIS needs to include a discussion of those resources not addressed in other resource effects sections.

Page 4-3, Roadless Areas as a Resource: Delete “The State of Alaska believes an analysis under the Roadless Rule (of whether other reasonable and prudent alternatives exist that do not use Inventoried Roadless Areas) is not required for this project because Congress authorized the granting of the SAFETEA-LU 4407 transportation easements mentioned in the “note” above to the State of Alaska.” In our previous comments dated 8/1/14, the Forest Service specifically requested that the analysis should not go into detail regarding the type of easement to be granted and only focus on the environmental effects. Regardless of the type of easement, the Chief of the Forest Service would still need to make a determination that the easement can be granted to authorize the ROW within a roadless area.

Page 4-34, Land Use: change “the” to “a” directly in front of the wording about the 4407 easement.

Page 4-35, Consistency with Land Use and Management Plans: Change the wording to “If Alternative 2b were the selected alternative, the Forest Service would apply the TUS prescription upon initiation of construction and during system operation (TLRMP, page 3-128).”

Page 4-35, Section 4.3.1.2: “The USFS, in consultation with ADF&G and USFWS, would adjust the boundaries of the affected Old-Growth Habitat LUDs in accordance with old-growth reserve (OGR) standards in the TLRMP (see OGR discussion in Section 4.3.14).” This would require a Forest Plan amendment and a separate NEPA document signed by the Forest Supervisor. This requirement should be added to the document.

Page 4-202, Section 4.8, lines 3-5: The text mentions temporary facilities “such as borrow sources....” In actuality, the conversion of forest land to a borrow source is a permanent action. The following sentence goes on to say that the “specific location and sizes of these temporary facilities would be determined by the construction contractors.” It should be recognized that the Tongass Forest Plan requires an interdisciplinary team process for the planning of quarry and borrow sites (page 4-84).

Page 4-121, Section 4.4.9.3: “Alternative 3 would have summer ADT volumes of approximately 1,060 in 2020 and 1,055 in 2050. During winter, ADT would be less than 500 vehicles per day.” These numbers do not match those on page 4-123.

Attachment A – Comments on FHWA SDEIS

Page 4-223, second full paragraph: we did not understand this paragraph, and the forest plan reference on page D-17 is to a section on lakes and ponds.

Page 5-2, Section 5.5, Intertidal and Subtidal Areas section: This section should include the mitigation change for herring spawning dates discussed on page 4-177.

Page 5-3, Section 5.6: There should be a timing window identified for putting culverts in anadromous fish streams, and note that a Title 16 Permit from ADF&G is required.

Ms. Beth Pendleton
Regional Forester, United States Department of Agriculture
U.S. Forest Service, Alaska Region
P.O. Box 21628
Juneau, Alaska 99802

Dear Ms. Pendleton:

Thank you for your letter, dated November 25, 2014, with your agency's comments on the Juneau Access Improvements (JAI) Project, Draft Supplemental Environmental Impact Statement (SEIS). We appreciate the continued participation of the U.S. Forest Service (USFS) in the JAI Project as a cooperating agency.

I am writing to you for two primary reasons. First, I have reviewed your letter in detail and have provided responses and/or revised the SEIS in response to your comments, as incorporated into the Preliminary Final SEIS. For ease of reference, the attached comment-response letter contains responses that have been imbedded in a reprint of your original comment letter. Secondly, as a Cooperating Agency, I am providing you the JAI Project Preliminary Final SEIS for your review and comment. Due to its preliminary nature, this document is provided for Cooperating Agency review only. It is not a public document, and its information should not be shared with other agencies or individuals. FHWA and DOT&PF will consider your agency's comments, as well as comments by the other Cooperating Agencies, in preparation of the JAI Project Final SEIS for public release (as noted previously and consistent with 23 U.S.C. 193(n)(2), FHWA intends to issue a combined Final SEIS and Record of Decision). Please let me know if you would like additional copies of the document. I ask that you provide any further written comments within 30 days of receipt of this correspondence.

Briefly, FHWA has identified the "No Build Alternative" as the Preferred Alternative in the JAI Preliminary Final SEIS. Governor Walker announced on December 15, 2017, that the "No Build Alternative" is the State's Preferred Alternative. See Section 2.4 of the Preliminary Final SEIS for discussion.

Please do not hesitate to contact me at (907) 586-7430 or Gary Hogins at (907) 465-8143, DOT&PF Project Manager, if you have any questions or concerns.

Sincerely,

Tim A. Haugh
Environmental Program Manager

General Comments

Old Growth Reserves

The Old Growth Reserve (OGR) modification review is underway. Although we don't have specific OGR information to offer at this time, it is possible that OGR modifications will be needed and that will require a forest plan amendment and a separate Forest Service decision. If that is the case, the Forest Service will adopt the FHWA FEIS, and that means that the adopted FEIS will have to be consistent with Forest Service policy, handbook guidance, and regulations for items such as the biological evaluation (BE), subsistence, and roadless areas. A separate Forest Service decision will also be subject to the 36 CFR Part 218 Objection regulations and its resultant timeframes. When the OGR review is complete, we will work with you to discuss how to incorporate this information into the FHWA FEIS, and how the Forest Service timeline fits within the larger Juneau Access decision timeline.

RESPONSE: Regarding the OGR review provided by USFS since submitting this comment, modifications to small OGR boundaries have been recommended by the interagency team; therefore, for Alternative 2B based on this comment, a Forest Plan amendment and associated USFS NEPA decision will be needed. The Final EIS acknowledges this with updated information on OGRs; see especially Sections 4.3.14 and 4.4.14 (also related wildlife sections of chapter 4).

Regarding the SEIS's consistency with USFS policy, in the event the project Record of Decision selects an alternative requiring an USFS NEPA action, FHWA will consult with USFS regarding content and format necessary to meet agency guidelines for subsistence and Biological Evaluation. DOT&PF has provided all subsistence information the Forest Service has requested. The Final EIS contains all the information necessary for the FHWA determination. These topics are addressed in more detail below under specific comments.

In addition, there appears to be a misinterpretation of the 50 percent POG application that will need to be corrected. The VCU bullets in Section 4.3.14 need to be clear whether old-growth forest or productive old-growth forest is being discussed. Productive old-growth forest has a distinct meaning with respect to Tongass NF management and Old-growth LUD standards (TLRMP, pages 7-28:Old-growth forest capable of producing at least 20 cubic feet of wood fiber per acre per year, or having greater than 8,000 board feet per acre).

RESPONSE: The information in Terrestrial Habitat sections of the SEIS (Sections 3.3.3, 4.3.14, and 4.4.14) was originally based entirely on USFS geospatial data and, specifically, on 2013 Size Density data. All old-growth forest indicated as low-volume, medium-volume, and high-volume is Productive Old Growth forest habitat. The Final SEIS incorporates the results of the interagency review of small OGRs. Per your comment, and based on the interagency team's report, the text of Sections 4.3.14 and 4.4.14 of the Final SEIS has been revised, and the updates reflect the impacts identified in that report. FHWA assumes the OGR review provided by the interagency team of USFS, USFWS, and ADF&G is the most up-to-date analysis and that it correctly identifies what is and is not "productive old growth." FHWA appreciates the input of the old-growth habitat and terrestrial wildlife experts from the interagency team.

Subsistence

As noted during the Agency review of the preliminary Draft SEIS, the subsistence analysis (ANICLA 810) for this project does not conform to Forest Service standards presented in Forest Service Handbook (FSH) 2090.23. Portions of the required analysis are in the Draft SEIS and technical reports, but these are incomplete. For example, the 2006 FEIS and other documents in the record discuss access and competition (FEIS, pages 4-37 and 4-85), areas of subsistence use (Appendix DD), and notes there were public comments (Appendix Y, pages 40,105, 108 and 127). Other

subsistence documents are cited as well, such as the 1988 USFS subsistence study and a 1994 ADF&G analysis. There does not appear to be a clear rationale for how all this information ties together in the effects section and how that supports a determination of "would not significantly restrict subsistence uses."

In addition, the analysis for each alternative needs to address each evaluation criteria (access, abundance, and competition) and to present a finding (FSH 2090.23.11). Depending on the finding, notices, hearings, and determinations may be necessary. The appropriate finding language is given in FSH 2090.23.12. As stated at FSH 2090.23.22.1: "The evaluation and findings shall be made and clearly identified for the proposed action and for each alternative."

RESPONSE: The SEIS and its appendices, especially Appendix DD, the *Land Use Technical Report* and its sections on subsistence, taken together with the 2006 Final EIS contain all the required information about subsistence. The FSEIS document is sufficient for FHWA's needs under Section 810 of ANILCA. The document includes findings that no alternative would "significantly restrict subsistence uses." For the Final SEIS, see Sections 4.3.6. and 4.4.6 to cross reference to Appendix DD, which in turn cross references to FHWA's findings in the 2006 FEIS.

At the request of the Forest Service, DOT&PF previously provided all cited and requested material on this topic to Mr. Ken Post of the Forest Service Region Office in Juneau.

Biological Assessment

No revised Biological Assessment was provided for review since the Forest Service review of the preliminary Draft SEIS. For the FEIS, the status of some candidate species has changed this year, and the document needs to be consistent with those changes (Kittlitz's murrelet, yellow-billed loon, and Pacific herring). See <http://www.fws.gov/alaska/fisheries/endangered/species.htm>

RESPONSE: The Biological Assessment (BA) was not issued with the Draft SEIS. Since publication of the Draft SEIS, FHWA has withdrawn the BA since the No Action Alternative has been identified as the Preferred Alternative.

Biological Evaluation

No Biological Evaluation (BE) for this project, that meets the standards detailed in the Forest Service Manual 2670 and R-10 supplement number R-10 2600-2005-1, was submitted for review. While this Draft SEIS updated the Forest Service review of the preliminary Draft SEIS to include current Forest Service R10 sensitive species in the analysis, much of the required analysis is in the Draft SEIS and/or technical reports. Most noticeably, the analyses lack determinations for all sensitive species (see FSM 2672.42 for BE standards, and R10 supplement FSM 2672.42.5 for determination language).

RESPONSE: In the event the project Record of Decision selects an alternative requiring an USFS NEPA action, FHWA will consult with USFS regarding the format and content of a Biological Evaluation. A BE and associated determinations are not required at this time since FHWA has identified the No Action Alternative as the Preferred Alternative.

Historic, Traditional and Cultural Sites

The Forest Service received a copy of a letter from the Douglas Indian Association dated 11/25/14 to ADOT with what appears to be new information about historic, traditional, and cultural sites in the project area. This information should be evaluated and included in the FEIS.

RESPONSE: It is understandable that a review of the Draft SEIS could lead to confusion regarding the summary of historic site information presented, and that it might appear some site locations were missing. To protect sensitive site information, the data and analyses are only summarized in the SEIS, although all of the information available was used in making determinations of eligibility and findings of effect. To protect them, the locations of sensitive archaeological and burial sites were not disclosed in the Draft SEIS and are not disclosed in the Final SEIS.

FHWA and DOT&PF, along with the State Historic Preservation Officer (SHPO), had meetings on February 25, 2016 with Sealaska Corporation, Sealaska Heritage Institute, Douglas Indian Association, and Goldbelt Corporation to address the concerns expressed in comments on the Draft SEIS. Upon conclusion of these meetings, no previously unidentified sites of cultural or historic importance were identified. FHWA's determination of no adverse effect to historic properties remains valid.

As stated in Section 4.8.3, 5.10, and 5.12.1 of the SEIS, if a previously unknown cultural resource or burial site/human remains were discovered during construction, work in the vicinity of the discovery would halt until the discovery was evaluated and appropriate consultation with Tribes and other consulting parties was conducted per Section 106 of the National Historic Preservation Act. If the discovery included human remains or associated funerary objects, it would also be subject to the provisions of the Native American Graves Protection and Repatriation Act (NAGPRA), and tribal consultation would be conducted per NAGPRA.

In Sections 3.1.3 and 4.3.4, information has been added to indicate that sensitive sites are not disclosed but were taken into account, and to indicate the cultural importance of the area to Alaska Native people and organizations.

Specific Comments

Page 3-5, fourth paragraph: The document states that the Roadless Rule "...applies generally to the National Forest System..." and that "...it is the USFS's position that the Roadless Rule remains in effect on the Tongass National Forest because the U.S. Court of Appeals for the Ninth Circuit's order...." In reality, the Roadless Rule is a regulation that applies to the National Forest System and to the Tongass National Forest. The Forest Service is not "generally selecting to implement," but is implementing the Roadless Rule because it is regulation. The word "generally" should be deleted. Until the courts have made a final decision, the Roadless Rule is in effect on the Tongass. After the words "At the present time", delete the words "it is the Forest Service's position" and continue with the rest of the sentence.

RESPONSE: A 9th Circuit Court of Appeals decision in July 2015 confirmed that the Roadless Rule applies to Tongass National Forest. The Final SEIS reflects this decision, and the text in this section has been revised accordingly.

Page 3-5, fifth full paragraph: delete "typically." The same paragraph states that "IRAs on federal lands are a resource potentially available for future designation as wilderness under the Wilderness Act of 1964." While this is true, it's not the sole reason for roadless area designation. The Federal Register notice for the 2001 Roadless Rule identifies other roadless area values and characteristics (page 3245). This same comment applies to other locations in the SDEIS.

RESPONSE: The text of this paragraph has been updated in the Final SEIS according to this comment to reflect Roadless Area characteristics and values, apart from potential for Wilderness designation. This information is also presented in in Appendix DD of the Draft and Final SEIS.

Page 3-6, second full paragraph in middle of page: The sentence starting with "Because" should be changed to read: "It is the State of Alaska's position that the JAI Project easement is provided by statute and an analysis of other reasonable and prudent alternatives need not be conducted prior to the USFS issuance of the 4407 easement."

RESPONSE: Per your comment, the sentence has been modified to reflect that, because the JAI Project

easement was granted by statute, the State of Alaska believes an analysis of other 'reasonable and prudent' alternatives need not be conducted prior to USFS issuance of the 4407 easement.

Page 3-63, first paragraph below bullets: "Where the Non-Development LUDs do not fulfill size, spacing, and composition criteria of Old-Growth Habitat reserves, it would be necessary to add or modify old-growth reserves to meet the criteria." This paragraph should also include a statement that a Forest Plan amendment would be required to add or modify old-growth reserves.

RESPONSE: Per your comment, text has been added to the end of the paragraph to reflect that TLRMP documents indicate an amendment to the TLRMP would be required to add or modify old-growth reserves.

Page 4-3, first paragraph: The sentence starting with "If" should be changed to read: "If it becomes necessary...the Federal Highway Administration (FHWA) could seek to secure a transportation easement..." This same comment applies to other locations in the SDEIS.

RESPONSE: Per your comment, the sentence beginning with "if" has been modified to read: "If it became necessary to construct outside the Section 4407 easement..., the Federal Highway Administration (FHWA) would seek to secure..."

Page 4-3, Roadless Areas as a Resource: see comment for page 3-5. The Tongass is not exempt from the Roadless Rule; the agency is currently in litigation, but at the present time the Roadless Rule remains in effect on the Tongass.

RESPONSE: Per your comment, the Roadless paragraph has been modified to accurately reflect the current status of the Roadless Rule and the Tongass National Forest, based on the July 2015 9th Circuit Court of Appeals decision.

Page 4-3, Roadless Areas as a Resource: the SDEIS notes the nine roadless area characteristics and states that *most* of the characteristics are addressed elsewhere in the SDEIS. The cross-references mentioned should be identified here so the reader can easily find them elsewhere in the document. In addition, the SDEIS needs to include a discussion of those resources not addressed in other resource effects sections.

RESPONSE: Section 4.4 of Appendix DD, *Land Use Technical Report*, includes tables with cross references and needed discussion of topics for which there is not analysis elsewhere in the SEIS. Cross reference to specific sections in Appendix DD have been included in the "Roadless as a Resource" subsection of 4.1.1. A sentence also has been added to clarify that, while most of the characteristics are addressed within the SEIS document itself, there is additional information in Appendix DD.

Page 4-3, Roadless Areas as a Resource: Delete "The State of Alaska believes an analysis under the Roadless Rule (of whether other reasonable and prudent alternatives exist that do not use Inventoried Roadless Areas) is not required for this project because Congress authorized the granting of the SAFETEA-LU 4407 transportation easements mentioned in the "note" above to the State of Alaska." In our previous comments dated 8/1/14, the Forest Service specifically requested that the analysis should not go into detail regarding the type of easement to be granted and only focus on the environmental effects. Regardless of the type of easement, the Chief of the Forest Service would still need to make a determination that the easement can be granted to authorize the ROW within a roadless area.

RESPONSE: Per your comment, the Final SEIS has deleted the language as requested in Section 4.1.1. Similar language is retained in the Affected Environment section on Roadless areas (Section 3.1.1.1 of the Final SEIS), because FHWA believes it is important to disclose the options for securing an easement.

Page 4-34, Land Use: change "the" to "a" directly in front of the wording about the 4407 easement.

RESPONSE: The memorandum in question, addressing easements in Section 4407 of SAFETEA-LU, applies to all 4407 easements and the easement-granting process. Per your comment, the language in the Final SEIS has been modified to read as follows: "The 300-foot ROW width on USFS lands is based upon the width specified in the Memorandum of Understanding for Section 4407 easements...." Information on 4407 easements also has been added to Section 3.1.1.3.

Page 4-35, Consistency with Land Use and Management Plans: Change the wording to "If Alternative 2b were the selected alternative, the Forest Service would apply the TUS prescription upon initiation of construction and during system operation (TLRMP, page 3-128)."

RESPONSE: Because the Forest Plan revision in December 2016 eliminated the TUS LUD, it appears this comment no longer applies. The text has been modified throughout, including at this location, to reflect the Transportation Systems Corridors (TSC) concept adopted in the 2016 revised TLRMP. In Sections 4.3.1.2 and 4.4.1.2, a reference to the TLRMP revision Final EIS has been included.

Page 4-35, Section 4.3.1.2: "The USFS, in consultation with ADF&G and USFWS, would adjust the boundaries of the affected Old-Growth Habitat LUDs in accordance with old-growth reserve (OGR) standards in the TLRMP (see OGR discussion in Section 4.3.14)." This would require a Forest Plan amendment and a separate NEPA document signed by the Forest Supervisor. This requirement should be added to the document.

RESPONSE: The cross-referenced Section 4.3.14 has been rewritten to reflect the interagency team recommendations regarding adjustment of OGR boundaries and includes discussion of the need for a USFS NEPA decision and Forest Plan amendment. Such a statement has also been added in 4.3.1.2.

Page 4-202, Section 4.8, lines 3-5: The text mentions temporary facilities "such as borrow sources...." In actuality, the conversion of forest land to a borrow source is a permanent action. The following sentence goes on to say that the "specific location and sizes of these temporary facilities would be determined by the construction contractors." It should be recognized that the Tongass Forest Plan requires an interdisciplinary team process for the planning of quarry and borrow sites (page 4-84).

RESPONSE: Per your comment, the Final SEIS at the beginning of 4.8 clarifies that certain areas, such as staging and storage areas, truly would be temporary use areas used during the construction process. Any such area needed outside the highway right-of-way on USFS land would be secured under special use permit and ultimately restored and returned to USFS management. Borrow sites would be permanent and would be located within the highway right-of-way unless there were no other reasonable alternative. In that case, a USFS Interdisciplinary Team process would be needed. Per your comment, the Final SEIS also notes that material sites and disposal sites would be identified as part of the final design process.

Page 4-121, Section 4.4.9.3: "Alternative 3 would have summer ADT volumes of approximately 1,060 in 2020 and 1,055 in 2050. During winter, ADT would be less than 500 vehicles per day." These numbers do not match those on page 4-123.

RESPONSE: The traffic numbers throughout the EIS, including both Section 4.4.9.3 and Section 4.4.10.2, have been updated and should be consistent.

Page 4-223, second full paragraph: we did not understand this paragraph, and the forest plan reference on page D-17 is to a section on lakes and ponds.

RESPONSE: The only reference in Chapter 4 to p. D-17 was on p. 4-233, not p. 4-223, and was in the first full paragraph on that page, not the second, so it is possible we have not understood the comment as intended. The reference to p. D-17 should have been to Appendix D of the January 2008 Final EIS for the 2008 Forest Plan Amendment, which is about old-growth conservation strategy. In any case, the Forest Plan was revised again in 2016, and this reference has been eliminated in the JAI Final EIS. We have reviewed this paragraph and removed a sentence that may have caused confusion and have made changes to indicate the alternative would contribute to cumulative effects.

Page 5-2, Section 5.5, Intertidal and Subtidal Areas section: This section should include the mitigation change for herring spawning dates discussed on page 4-177.

RESPONSE: Per your comment, the commitment discussed on page 4-177 of the Draft SEIS (Section 4.6.13) has been added as a separate numbered item under Section 5.5 Intertidal and Subtidal Areas in the Final EIS to indicate that the ferry would not begin summer operations in Berner's Bay until May 15 (moved from May 1 to help protect Lynn Canal herring stock).

Page 5-3, Section 5.6: There should be a timing window identified for putting culverts in anadromous fish streams, and note that a Title 16 Permit from ADF&G is required.

RESPONSE: Commitment #1 in Section 5.6 indicates that all anadromous fish streams would be bridged, so no culverts would be required on such streams. A timing window is appropriate for bridge work in anadromous fish streams, and one is provided in Commitment #3. Section 5 lists mitigation commitments; the Permits and Approvals subsections of Chapter 4 (e.g., 4.3.18) lists the Title 16 permit. Commitment #3 indicates that in-water work would be in accordance with the permit.

Subject: Comments on the Draft Supplemental Environmental Impact Statement (DSEIS)
Department of Transportation Federal Highway Administration (FHWA), Juneau Access
Improvements Project, Alaska

Dear Ms. Holman:

The U.S. Department of the Interior has no comments to offer on the subject document at this time.

Thank you for the opportunity to review this DSEIS.

Sincerely,

Philip Johnson
Regional Environmental Officer - Alaska

Re: Juneau Access Improvements Project
STP-000S(131)/71100
AKR-2014-9360

Dear Ms. Garcia-Aline,

The National Marine Fisheries Service (NMFS) has reviewed the Federal Highway Administration's (FHWA) September 2014 Draft Supplemental Environmental Impact Statement (EIS) for the Juneau Access Improvements Project (Project). Our comments and recommendations are outlined below.

Project Background

The stated purpose of the Project is to improve surface transportation to and from Juneau in the Lynn Canal corridor. The Project has been the subject of ongoing multi-agency consultation since the initial Draft EIS in 1997. Most recently, the Alaska Department of Transportation and Public Facilities (ADOT) initiated preparation of a new Draft Supplemental EIS that evaluates a new alternative, Alternative 1B, for enhanced transportation service using existing Alaska Marine Highway Service (AMHS) assets from Juneau to Haines and Skagway. The Draft Supplemental EIS also reassesses alternatives presented in the 2006 Final EIS and updates other information since the 2006 Record of Decision.

In March 2012, NMFS declined an invitation to act as a cooperating agency for preparation of the new Draft Supplemental EIS and noted the need for Magnuson-Stevens Fishery Conservation and Management Act (MSA) and Endangered Species Act (ESA) consultations in light of required federal permits for the Project. In addition, NMFS restated our view that, relative to Alternative 2B, Alternative 3 was the environmentally preferred alternative for resources under NMFS's jurisdiction. Alternative 3 included a highway along the western shore of Lynn Canal from William Henry Bay to Haines with ferry terminals at Sawmill Cove and William Henry Bay and a bridge over the Chilkat Inlet.

Alternatives Analyses

The 2014 Draft Supplemental EIS considers alternatives and identifies consequences to living marine resources under NMFS jurisdiction. New information on aquatic invasive species is available since the 2006 Final EIS was prepared. Riparian invasive plants such as reed

canarygrass and knotweed are spreading in Southeast Alaska and may impact anadromous stream corridors with dense monoculture stands that alter sediment stability, shading, and nutrient cycling. Currently, Juneau contains major infestations of reed canarygrass and Japanese knotweed. Reed canarygrass occurs at the Kensington Mine site, near Juneau, Alaska (personal observation in July 2014, L.Shaw, Fisheries Biologist, NMFS, Alaska Region).

Although the Draft Supplemental EIS responds to a comment concerning invasive plants by describing measures to minimize their spread, the general public transportation vector is not considered. Vehicles traveling the East Lynn Canal Highway may spread these plants along the road corridor and potentially into anadromous streams and coastal areas that are currently not infested. Eradication or control of these invasive plants, once established, can be expensive and difficult. Recognizing this, the Metlakatla Indian Community has established a vehicle wash down system for all vehicles entering Annette Island from the Alaska Marine Highway System (Winter 2012).

NMFS recommends that all alternatives in the Final Supplemental EIS examine the potential for aquatic invasive species to spread as a result of project activities and identify management measures to prevent the spread of invasive species.

An EFH assessment for the proposed project was completed in 2004, with an addendum completed in 2006. The latest update to the EFH assessment was completed in May 2014. Specific to EFH, NMFS's comments evaluate only those alternatives that are new or have been modified; i.e. Alternatives 1B, 2B, and 3.

Also provided below is an assessment of potential impacts to marine mammals and their habitat from each of the eight alternatives in the 2014 Draft Supplemental EIS. Marine mammals under NMFS's authority in the Lynn Canal area include two species listed as endangered under the ESA (humpback whales and the western Distinct Population Segment of Steller sea lions), and six additional species protected by the Marine Mammal Protection Act (Dall's and harbor porpoise, harbor seals, the eastern Distinct Population Segment of Steller sea lions, killer whales, and minke whales).

Alternative 1-No Action

Alternative 1 includes a continuation of mainline ferry service in Lynn Canal and incorporates two Alaska Class Ferry (ACF) day boats already programmed for construction by the AMHS. No new roads or terminals would be built. Improvements include the two day boats (one would sail between Auke Bay and Haines, and the other would sail between Haines and Skagway), improvements to the Haines and Auke Bay Ferry Terminal staging areas, and expansion of the Haines Ferry Terminal to include a new double-end berth for the day boats.

Marine vessel collisions with marine mammals have the potential to cause injury or mortality (Laist 2001), however documented interactions between marine mammals and AMHS vessels are low in northern Lynn Canal (NMFS Alaska Region Stranding Database 2014).

Alternative 1B- Enhanced Service with Existing AMHS Assets from Juneau to Haines and Skagway

Alternative 1B would continue mainline ferry service in Lynn Canal with no new roads or ferry terminals to be built. Improvements would include two new ACF day boats, improved vehicle and passenger staging areas at the Auke Bay and Haines Ferry Terminals, and expansion of the Haines Ferry Terminal to include a new double-end berth for ACF day boats.

The latest update to the EFH assessment (May 2014) notes that an increase in the number of ferry vessels operated in Lynn Canal could generate more wave and surge effects on shorelines. This may cause an increase in shoreline erosion and turbidity, adversely affecting aquatic habitat, such as eelgrass. The document states that these impacts would be limited to existing ferry terminals in limited areas with shallow shorelines and near-shore vessel operations

Eelgrass provides EFH for the feeding and growth of juvenile salmon, rockfishes, Pacific cod, and flatfishes (Holsman et al. 2006, Laurel et al. 2007, Murphy et al. 2000, Johnson et al. 2003). A recent NMFS study by Harris, Neff, and Johnson (2012) compared the undeveloped eelgrass bed at Bridget Cove to eelgrass beds adjacent to coastal development at the Bay Creek estuary (adjacent to Statter Harbor) and Auk Nu Cove (adjacent to the Auke Bay ferry terminal and a private seafood processing facility). The study documents significant declines in percentage of eelgrass cover (shoot density and areal extent), changes in faunal assemblages, and decreases in fish catch-per-unit effort at Bay Creek and Auk Nu Cove.

Additional degradation of the eelgrass bed in Auk Nu Cove may stem from erosion and turbidity impacts. If chosen, additional ferry operations could further affect the area and impede the recovery of the adjacent eelgrass bed. The Final Supplemental EIS should consider incorporating elements into the design of the Auke Bay Ferry terminal to dissipate the additional wave energy from vessels and minimize continued degradation of the adjacent Auk Nu Cove eelgrass bed.

As noted in the 2004 Wildlife Technical Report (Appendix Q), marine vessel collisions with marine mammals can occur. To date, documented interactions are low between AMHS ferries and marine mammals in northern Lynn Canal. Alternative 1B is not expected to have any additional habitat impacts to marine mammals because no new roads or ferry terminals would be required.

Alternative 2B- East Lynn Canal Highway to Katzehin, Shuttles to Haines and Skagway

Alternative 2B would construct the East Lynn Canal Highway from a new ferry terminal at Echo Cove to a new ferry terminal two miles north of the Katzehin River, with ferry service connecting to Haines and Skagway. This alternative includes 47.9 miles of new highway, multiple new bridge crossings, blasting of new tunnels, and ongoing avalanche control operations.

This latest update to the EFH assessment concludes that despite the changes proposed in Alternative 2B, the overall acreage of impacts is approximately the same. However, impacts

associated with the ferry terminal were reduced and impacts associated with the roadway were increased. These impacts include filling 32 acres and dredging 4.4 acres of intertidal and subtidal marine areas for the Katzehin ferry terminal.

Alternative 2B would build bridges across ten streams and drainages that support populations of anadromous fish. Additional fill on the south bank of the Katzehin River is to provide scour protection at the bridge abutment will impact 0.55 acres. Further, Alternative 2B would result in the loss of 61 acres of wetlands, including 53 acres of palustrine forested wetlands between Slate Creek and Sherman Point north of Berners Bay, the largest area of wetland loss.

Short-term acute impacts to marine mammals from Alternative 2B include acoustic disturbance from helicopter use, marine vessel use, blasting, and construction noise near two Steller sea lion haulouts along the East Lynn Canal coastline (Gran Point and Met Point haulouts). Video monitoring of these two sites by FHWA/ADOT shows that these haulouts are used year-round by Steller sea lions from both eastern and western Distinct Population Segments. Gran Point is designated as Critical Habitat for Steller sea lions under the ESA. Critical Habitat was designated as a buffer against disturbance, noise, harassment, and illegal shooting.

During the construction period, pile driving at the multiple bridge construction sites will exceed acoustic thresholds for harm and harassment of marine mammals. Potential long-term impacts to marine mammals from Alternative 2B include harassment by helicopters or other equipment involved in avalanche control activities and maintenance of the road. The proposed routing of the road in Alternative 2B is near the two Steller sea lion haulouts and may increase human access to those sites, resulting in chronic harassment events. NMFS anticipates there may be negative impacts to Steller sea lions in response to the increased human activity in such close proximity to these important haulouts.

As noted in the 2004 Wildlife Technical Report (Appendix Q), the impacts to marine mammals from the stressors described above are expected to be greater for Alternative 2B than for any of the ferry improvement alternatives. This is primarily due to the impacts to marine mammals and their habitat from land-based activities.

Alternative 3-West Lynn Canal Highway

Alternative 3 would construct the West Lynn Canal Highway from a new ferry terminal at William Henry Bay on the west side of Lynn Canal to Haines with a new bridge across the Chilkat River/Inlet. This alternative includes 38.9 miles of new highway and a second new ferry terminal at Sawmill Cove in Berner's Bay. Two ACF day boats would operate between the new ferry terminals in Berner's Bay and William Henry Bay, and a new conventional monohull ferry would be constructed to operate between Haines and Skagway. The Skagway Ferry Terminal would be modified to include a new end berth to accommodate the Haines-Skagway shuttle ferry.

Alternative 3 would result in the loss of 26 acres of wetlands and 12 acres of intertidal and subtidal habitat, primarily from construction of ferry terminals at Sawmill Cove and William Henry Bay. All anadromous fish streams would be crossed with bridges.

Similar to Alternative 2B, short-term acute impacts to marine mammals from Alternative 3 include acoustic disturbance from helicopter use, marine vessel use, pile driving, and construction noise near the coast or in marine waters. These acoustic stressors will likely have more of an impact during the spring months when large aggregations of humpback whales and Steller sea lions occur in Berner's Bay in association with schooling/spawning forage fish (i.e., eulachon and herring). In addition, as noted in the 2004 Wildlife Technical Report (Appendix Q), the long term operation of marine shuttles through Berner's Bay will increase disturbance to marine mammals, particularly during the spring months.

The road construction component of Alternative 3 does not pass near known consistent Steller sea lion haulouts and would not be expected to alter designated Critical Habitat for this species. The construction of the two new ferry terminals may impact habitat used by marine mammal prey or potential haulout sites for harbor seals.

Alternatives 4A through 4D-Fast Vehicle Ferry Service vs. Conventional Monohull Ferry Service from Either Auke Bay or Berner's Bay

All four of these alternatives would include continued mainline ferry service with a minimum of two mainline ferry trips per week during the summer and one per week in the winter. The Haines-Skagway service would be provided by a new conventional monohull ferry. All four of these alternatives would require construction of a new double-end berth at Auke Bay. These four alternatives would provide faster and/or more frequent ferry service in Lynn Canal with greater capacity than Alternative 1.

Alternative 4A would construct two new fast vehicle ferries to provide daily summer service between Auke Bay and Haines and between Auke Bay and Skagway. Alternative 4B would widen and extend Glacier Highway from Echo Cove to Sawmill Cove in Berner's Bay and construct a new ferry terminal with two end berths to accommodate two new fast vehicle ferries that would be constructed. The two new fast ferries would provide service between Sawmill Cove and Haines/Skagway during the summer and between Auke Bay and Haines/Skagway during the winter. The ACF day boats programmed under Alternative 1 would not be used under these two alternatives.

Alternative 4B includes additional potential impacts from the construction of a new ferry terminal in Berner's Bay, which includes effects to marine mammal prey habitat.

Alternative 4C would use the two ACF day boats to operate between Auke Bay and Haines/Skagway and Alternative 4D would use the two ACF day boats to operate between Sawmill Cove and Haines, and Sawmill Cove and Skagway. As in Alternative 4B, Alternative 4D would widen and extend Glacier Highway from Echo Cove to Sawmill Cove in Berner's Bay, and construct a new ferry terminal with a double-end berth to accommodate both day boats at once.

Alternative 4D would result in day boats operating in Berner's Bay year-round, including during the spring months when large aggregations of humpback whales and Steller sea lions are present in association with schooling/spawning forage fish. Acoustic disturbance in Berner's Bay is a concern for marine mammals, particularly during the spring months.

Alternative Analyses—Conclusion

It is not clear from the Draft Supplemental EIS or referenced documents that the FHWA conducted an analysis to determine an environmentally preferred alternative. From NMFS's perspective, the environmentally preferred alternative is Alternative 1-No Action, followed by 1B. With appropriate mitigation measures to protect eelgrass beds at Auk Nu Cove, these alternatives would have the least impact because they require no additional fill, no dredging of wetlands or marine areas, and no new construction of roads and ferry terminals.

Impacts to marine mammals are expected to be less with the alternatives that rely exclusively on ferry transportation than those that rely on road construction. Additionally, Berner's Bay is a particularly sensitive area with humpback whales, Steller sea lions, and other marine mammals present year-round and in particularly high densities during the spring months. Therefore, alternatives proposing road construction and activities in and around haulouts and Berner's Bay are of greater concern for NMFS. For these reasons, the environmentally preferred alternative regarding marine mammals and their habitat is Alternative 1-No Action, followed by 1B, 4A, or 4C. Next would be 4B and 4D.

Construction of roads along the coastline of Lynn Canal would have greater short-term and long-term impacts to marine mammals and their habitat due to permanent construction and human activity near haulouts and high use areas than the alternatives primarily relying on ferry transportation. Of the two road construction alternatives, Alternative 3 would be preferable to Alternative 2B due to the expected impacts to the two Steller sea lion haulouts under the latter alternative. As noted in the 2004 Wildlife Technical Report (Appendix Q), the impacts to marine mammals from road construction-related stressors are expected to be greater for Alternative 2B than for any of the ferry improvement alternatives.

EFH Conservation Recommendations

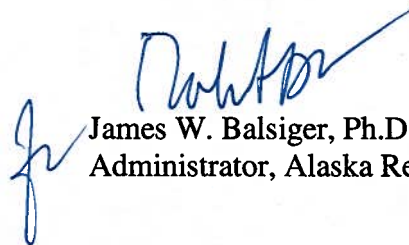

Section 305(b) of the MSA requires federal agencies to consult with NMFS on all actions that may adversely affect Essential Fish Habitat (EFH). NMFS is required to make conservation recommendations, which may include measures to avoid, minimize, mitigate or otherwise offset adverse effects. Therefore, in accordance with Section 305(b)(4)(A) of the MSA, NMFS offers the following EFH Conservation Recommendation:

- The Yankee Cove artificial reef site was previously completed as mitigation for adverse impacts to living marine resources, including EFH, as a result of the proposed project. NMFS credits the Project for this work. However, NMFS recommends that the Final Supplemental EIS re-evaluate the impacts of the preferred alternative to determine if the level of mitigation already completed is commensurate with and compensates for effects the final alternative may have on living marine resources, including EFH. Additional mitigation may be needed to address final project impacts. NMFS remains willing to discuss mitigation with FWHA.

Under section 305(b)(4) of the MSA, FHWA is required to respond to NMFS's EFH recommendations in writing within 30 days. If FHWA will not make a decision within 30 days of receiving NMFS's EFH Conservation Recommendation, FHWA should provide NMFS with a letter within 30 days to that effect and indicate when a full response will be provided.

Should you have any questions regarding EFH and our recommendation please contact Linda Shaw at 907-586-7510 or linda.shaw@noaa.gov. If you have any questions regarding the marine mammal assessment provided in this letter, please contact Sadie Wright at 907-586-7630 or sadie.wright@noaa.gov.

Sincerely,

James W. Balsiger, Ph.D.

Mr. James W. Balsiger, Ph.D
Administrator, Alaska Region
National Marine Fisheries Service
P.O. Box 21668
Juneau, AK 99802-1668

Dear Mr. Balsiger:

The Federal Highway Administration (FHWA) and Alaska Department of Transportation and Public Facilities (DOT&PF) thank you for your comments on the September 2014 Juneau Access Improvements (JAI) Project Draft Supplemental Environmental Impact Statement (SEIS). We are in the process of reviewing and responding to your comments on the Draft SEIS. This letter has been prepared as a response to the NMFS's EFH conservation recommendation contained in the comments pursuant to Section 305(b)(4) of the Magnuson-Stevens Fishery Conservation and Management Act (MSA).

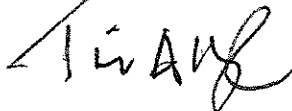

In your letter, dated November 3, 2014, you present the following EFH Conservation Recommendation:

The Yankee Cove artificial reef site was previously completed as mitigation for adverse impacts to living marine resources, including EFH, as a result of the proposed project. NMFS credits the Project for this work. However, NMFS recommends that the Final Supplemental EIS re-evaluate the impacts of the preferred alternative to determine if the level of mitigation already completed is commensurate with and compensates for effects the final alternative may have on living marine resources, including EHF. Additional mitigation may be needed to address final project impacts. NMFS remains willing to discuss mitigation with FHWA.

On December 15, 2016, Governor Walker identified Alternative 1, No-Action as the State of Alaska's new preferred alternative for the JAI Project. As no improvements are proposed under this alternative, no impacts to EFH would occur and therefore no further mitigation is proposed as a part of this project.

Thank you again for your comments on the Draft SEIS and the EFH Conservation Recommendation. We assume this letter fulfills our obligation under Section 305(b)(4) of the MSA. If you have any questions, please feel free to contact me at (907) 586-7430 or at Tim.Haugh@dot.gov.

Sincerely,

Dear Mr. Balsiger:

The Federal Highway Administration as the lead federal agency for Section 7 consultation of the Endangered Species Act on behalf of the U.S. Army Corps of Engineers and the U.S. Forest Service, both cooperating agencies for the Juneau Access Improvement (JAI) Project Supplemental Environmental Impact Statement (SEIS), is withdrawing the Biological Assessment and request for formal consultation with the National Marine Fisheries Service submitted January 29, 2014. As a result of Governor Walker's decision to identify Alternative 1, No-Action as the new State of Alaska's preferred alternative, further Section 7 consultation is not necessary.

I appreciate your agency's continued involvement and assistance in preparation of the JAI Final SEIS. Please feel free to contact me at (907) 586-7430 or email at tim.haugh@dot.gov with any questions.

Sincerely,

Tim A. Haugh

Dear Balsiger:

Thank you for your letter, dated November 3, 2014, with your agency's comments on the Juneau Access Improvements (JAI) Project Draft Supplemental Environmental Impact Statement (SEIS). We appreciate the participation of the National Marine Fisheries Service in the JAI Project.

We have reviewed your letter and have made appropriate revisions to the Final SEIS. Our attached responses have been embedded in a reprint of your letter.

We anticipate releasing a combined Final SEIS/Record of Decision very soon. FHWA has identified Alternative 1 – No Action as the Preferred Alternative in the Final SEIS. Governor Walker announced on December 15, 2017, that the “No Build Alternative” is the State's Preferred Alternative. Please see Section 2.5 of the Final SEIS for further discussion.

Please do not hesitate to contact me at (907) 586-7430 or Greg Lockwood, the DOT&PF Project Manager, at (907) 465-1828 if you have any additional questions or concerns.

Sincerely,

Tim A. Haugh
Environmental Program Manager

Enclosures: Responses to National Marine Fisheries Service Comments on the JAI Project Draft SEIS (November 3, 2014)

Re: Juneau Access Improvements Project
STP-OOOS(131)/71100
AJCR-2014-9360

Dear Ms. Garcia-Aline,

The National Marine Fisheries Service (NMFS) has reviewed the Federal Highway Administration's (FHWA) September 2014 Draft Supplemental Environmental Impact Statement (EIS) for the Juneau Access Improvements Project (Project). Our comments and recommendations are outlined below.

Project Background

The stated purpose of the Project is to improve surface transportation to and from Juneau in the Lynn Canal corridor. The Project has been the subject of ongoing multi-agency consultation since the initial Draft EIS in 1997. Most recently, the Alaska Department of Transportation and Public Facilities (ADOT) initiated preparation of a new Draft Supplemental EIS that evaluates a new alternative, Alternative 1B, for enhanced transportation service using existing Alaska Marine Highway Service (AMHS) assets from Juneau to Haines and Skagway. The Draft Supplemental EIS also reassesses alternatives presented in the 2006 Final EIS and updates other information since the 2006 Record of Decision.

In March 2012, NMFS declined an invitation to act as a cooperating agency for preparation of the new Draft Supplemental EIS and noted the need for Magnuson-Stevens Fishery Conservation and Management Act (MSA) and Endangered Species Act (ESA) consultations in light of required federal permits for the Project. In addition, NMFS restated our view that, relative to Alternative 2B, Alternative 3 was the environmentally preferred alternative for resources under NMFS's jurisdiction. Alternative 3 included a highway along the western shore of Lynn Canal from William Henry Bay to Haines with ferry terminals at Sawmill Cove and William Henry Bay and a bridge over the Chilkat Inlet.

Alternatives Analyses

The 2014 Draft Supplemental EIS considers alternatives and identifies consequences to living marine resources under NMFS jurisdiction. New information on aquatic invasive species is available since the 2006 Final EIS was prepared. Riparian invasive plants such as reed

canarygrass and knotweed are spreading in Southeast Alaska and may impact anadromous stream corridors with dense monoculture stands that alter sediment stability, shading, and nutrient cycling. Currently, Juneau contains major infestations of reed canarygrass and Japanese knotweed. Reed canarygrass occurs at the Kensington Mine site, near Juneau, Alaska (personal observation in July 2014, L. Shaw, Fisheries Biologist, NMFS, Alaska Region).

RESPONSE: The Draft Supplemental Environmental Impact Statement (SEIS) addressed invasive plant species in Section 3.3.3, and the Alaska Department of Transportation and Public Facilities' (DOT&PF's) commitment to mitigating, reducing, or eliminating vectors for invasive species to colonize areas affected by project activities is included in Section 5.4. Per your comment, the National Marine Fisheries Service's (NMFS's) personal observation of infestations of reed canarygrass and Japanese knotweed has been incorporated into Section 3.3.3 of the Final SEIS.

Although the Draft Supplemental EIS responds to a comment concerning invasive plants by describing measures to minimize their spread, the general public transportation vector is not considered. Vehicles traveling the East Lynn Canal Highway may spread these plants along the road corridor and potentially into anadromous streams and coastal areas that are currently not infested. Eradication or control of these invasive plants, once established, can be expensive and difficult. Recognizing this, the Metlakatla Indian Community has established a vehicle wash down system for all vehicles entering Annette Island from the Alaska Marine Highway System (Winter 2012).

NMFS recommends that all alternatives in the Final Supplemental EIS examine the potential for aquatic invasive species to spread as a result of project activities and identify management measures to prevent the spread of invasive species.

RESPONSE: The spread of invasive species during construction is discussed in Section 5.4 of the Draft SEIS. Once a project is completed, the road components become part of the Statewide road system. DOT&PF, in cooperation with the University of Alaska Fairbanks Cooperative Extension Service, has identified practices to prevent the spread of invasive species in *Best Management Practices – Controlling the Spread of Invasive Plants During Road Maintenance* (<http://aknhp.uaa.alaska.edu/big-files/AKEPIC/Publications/2014/Graziano%20et%20al.%202014%20BMPs.pdf>, UAF 2014). These best management practices would be used by DOT&PF during routine maintenance activities along the road system, concentrating on high-priority invasive plant species such as reed canarygrass and knotweed.

An EFH assessment for the proposed project was completed in 2004, with an addendum completed in 2006. The latest update to the EFH assessment was completed in May 2014. Specific to EFH, NMFS's comments evaluate only those alternatives that are new or have been modified; i.e. Alternatives 1B, 2B, and 3.

Also provided below is an assessment of potential impacts to marine mammals and their habitat from each of the eight alternatives in the 2014 Draft Supplemental EIS. Marine mammals under NMFS's authority in the Lynn Canal area include two species listed as endangered under the ESA (humpback whales and the western Distinct Population Segment of Steller sea lions), and six additional species protected by the Marine Mammal Protection Act (Dall's and harbor porpoise, harbor seals, the eastern Distinct Population Segment of Steller sea lions, killer whales,

and minke whales).

Alternative 1-No Action

Alternative 1 includes a continuation of mainline ferry service in Lynn Canal and incorporates two Alaska Class Ferry (ACF) day boats already programmed for construction by the AMHS. No new roads or terminals would be built. Improvements include the two day boats (one would sail between Auke Bay and Haines, and the other would sail between Haines and Skagway), improvements to the Haines and Auke Bay Ferry Terminal staging areas, and expansion of the Haines Ferry Terminal to include a new double-end berth for the day boats.

Marine vessel collisions with marine mammals have the potential to cause injury or mortality (Laist 2001), however documented interactions between marine mammals and AMHS vessels are low in northern Lynn Canal (NMFS Alaska Region Stranding Database 2014).

RESPONSE: Per your comment, information from the NMFS Alaska Region Stranding Database is incorporated into the Final SEIS in Section 4.2B.15.1.

Alternative 1B- Enhanced Service with Existing AMHS Assets from Juneau to Haines and Skagway

Alternative 1B would continue mainline ferry service in Lynn Canal with no new roads or ferry terminals to be built. Improvements would include two new ACF day boats, improved vehicle and passenger staging areas at the Auke Bay and Haines Ferry Terminals, and expansion of the Haines Ferry Terminal to include a new double-end berth for ACF day boats.

The latest update to the EFH assessment (May 2014) notes that an increase in the number of ferry vessels operated in Lynn Canal could generate more wave and surge effects on shorelines. This may cause an increase in shoreline erosion and turbidity, adversely affecting aquatic habitat, such as eelgrass. The document states that these impacts would be limited to existing ferry terminals in limited areas with shallow shorelines and near-shore vessel operations

Eelgrass provides EFH for the feeding and growth of juvenile salmon, rockfishes, Pacific cod, and flatfishes (Holsman et al. 2006, Laurel et al. 2007, Murphy et al. 2000, Johnson et al. 2003). A recent NMFS study by Harris, Neff, and Johnson (2012) compared the undeveloped eelgrass bed at Bridget Cove to eelgrass beds adjacent to coastal development at the Bay Creek estuary (adjacent to Statter Harbor) and Auk Nu Cove (adjacent to the Auke Bay ferry terminal and a private seafood processing facility). The study documents significant declines in percentage of eelgrass cover (shoot density and areal extent), changes in faunal assemblages, and decreases in fish catch-per-unit effort at Bay Creek and Auk Nu Cove.

RESPONSE: The improvements cited above as part of Alternative 1B (i.e., two new Day Boat Alaska Class Ferries [ACFs], improved vehicle and passenger staging areas at the Auke Bay and Haines Ferry Terminals, and expansion of the Haines Ferry Terminal to include a new double-end berth for Day Boat ACFs) are independent, separate projects that were already programmed and not part of Alternative 1B. Since Alternative 1B would not have included shoreline development at the ferry terminals, it would not have directly affected adjacent eelgrass beds. Per your comment, Section 4.2B.13 of the Final SEIS describes wakes from

ferries and potential effects to shallow nearshore areas. The studies by NMFS (Harris, Neff, and Johnson, 2012; Holsman et al., 2006; Laurel et al., 2007; Murphy et al., 2000; and Johnson et al., 2003) are incorporated into the analysis.

Additional degradation of the eelgrass bed in Auk Nu Cove may stem from erosion and turbidity impacts. If chosen, additional ferry operations could further affect the area and impede the recovery of the adjacent eelgrass bed. The Final Supplemental EIS should consider incorporating elements into the design of the Auke Bay Ferry terminal to dissipate the additional wave energy from vessels and minimize continued degradation of the adjacent Auk Nu Cove eelgrass bed.

RESPONSE: Alternative 1B would not have included modifications to the existing ferry terminal. Per your comment, Section 4.2B.13 of the Final SEIS acknowledges the increased turbidity and propeller wash effects on eelgrass. Eel grass beds in the terminal area of Auke Bay are already disturbed, and additional wave energy at the Auke Bay Ferry Terminal from ferry operations would not have been anticipated to substantially degrade the eelgrass bed adjacent to Auk Nu Cove beyond its current condition. The Federal Highway Administration (FHWA) has determined that Alternative 1B would not have a substantial adverse effect on eelgrass beds or other Essential Fish Habitat (EFH).

As noted in the 2004 Wildlife Technical Report (Appendix Q), marine vessel collisions with marine mammals can occur. To date, documented interactions are low between AMHS ferries and marine mammals in northern Lynn Canal. Alternative 1B is not expected to have any additional habitat impacts to marine mammals because no new roads or ferry terminals would be required.

Alternative 2B- East Lynn Canal Highway to Katzehin, Shuttles to Haines and Skagway

Alternative 2B would construct the East Lynn Canal Highway from a new ferry terminal at Echo Cove to a new ferry terminal two miles north of the Katzehin River, with ferry service connecting to Haines and Skagway. This alternative includes 47.9 miles of new highway, multiple new bridge crossings, blasting of new tunnels, and ongoing avalanche control operations.

This latest update to the EFH assessment concludes that despite the changes proposed in Alternative 2B, the overall acreage of impacts is approximately the same. However, impacts associated with the ferry terminal were reduced and impacts associated with the roadway were increased. These impacts include filling 32 acres and dredging 4.4 acres of intertidal and subtidal marine areas for the Katzehin ferry terminal.

Alternative 2B would build bridges across ten streams and drainages that support populations of anadromous fish. Additional fill on the south bank of the Katzehin River is to provide scour protection at the bridge abutment will impact 0.55 acres. Further, Alternative 2B would result in the loss of 61 acres of wetlands, including 53 acres of palustrine forested wetlands between Slate Creek and Sherman Point north of Berners Bay, the largest area of wetland loss.

Short-term acute impacts to marine mammals from Alternative 2B include acoustic disturbance from helicopter use, marine vessel use, blasting, and construction noise near two Steller sea lion haulouts along the East Lynn Canal coastline (Gran Point and Met Point haulouts). Video

monitoring of these two sites by FHWA/ADOT shows that these haulouts are used year-round by Steller sea lions from both eastern and western Distinct Population Segments. Gran Point is designated as Critical Habitat for Steller sea lions under the ESA. Critical Habitat was designated as a buffer against disturbance, noise, harassment, and illegal shooting.

RESPONSE: Video monitoring was conducted by FHWA/DOT&PF at the Gran Point haulout only. No video monitoring occurred at Met Point as stated in the above paragraph.

During the construction period, pile driving at the multiple bridge construction sites will exceed acoustic thresholds for harm and harassment of marine mammals. Potential long-term impacts to marine mammals from Alternative 2B include harassment by helicopters or other equipment involved in avalanche control activities and maintenance of the road. The proposed routing of the road in Alternative 2B is near the two Steller sea lion haulouts and may increase human access to those sites, resulting in chronic harassment events. NMFS anticipates there may be negative impacts to Steller sea lions in response to the increased human activity in such close proximity to these important haulouts.

As noted in the 2004 Wildlife Technical Report (Appendix Q), the impacts to marine mammals from the stressors described above are expected to be greater for Alternative 2B than for any of the ferry improvement alternatives. This is primarily due to the impacts to marine mammals and their habitat from land-based activities.

RESPONSE: Per your comment, Sections 4.3.13, 4.3.15.1, and 4.3.17 of the Final SEIS describe the potential effects of Alternative 2B on EFH and marine mammals as noted.

Alternative 3-West Lynn Canal Highway

Alternative 3 would construct the West Lynn Canal Highway from a new ferry terminal at William Henry Bay on the west side of Lynn Canal to Haines with a new bridge across the Chilkat River/Inlet. This alternative includes 38.9 miles of new highway and a second new ferry terminal at Sawmill Cove in Berner's Bay. Two ACF day boats would operate between the new ferry terminals in Berner's Bay and William Henry Bay, and a new conventional monohull ferry would be constructed to operate between Haines and Skagway. The Skagway Ferry Terminal would be modified to include a new end berth to accommodate the Haines-Skagway shuttle ferry.

Alternative 3 would result in the loss of 26 acres of wetlands and 12 acres of intertidal and subtidal habitat, primarily from construction of ferry terminals at Sawmill Cove and William Henry Bay. All anadromous fish streams would be crossed with bridges. Similar to Alternative 2B, short-term acute impacts to marine mammals from Alternative 3 include acoustic disturbance from helicopter use, marine vessel use, pile driving, and construction noise near the coast or in marine waters. These acoustic stressors will likely have more of an impact during the spring months when large aggregations of humpback whales and Steller sea lions occur in Berner's Bay in association with schooling/spawning forage fish (i.e., eulachon and herring). In addition, as noted in the 2004 Wildlife Technical Report (Appendix Q), the long term operation of marine shuttles through Berner's Bay will increase disturbance to marine mammals, particularly during the spring months.

The road construction component of Alternative 3 does not pass near known consistent Steller sea lion haulouts and would not be expected to alter designated Critical Habitat for this species. The construction of the two new ferry terminals may impact habitat used by marine mammal prey or potential haulout sites for harbor seals.

RESPONSE: Impacts to humpback whales and Steller sea lions from Alternative 3, including acoustic disturbances in Berners Bay, were addressed in Sections 4.4.17 and 4.8.12 of the Draft SEIS. Acoustic disturbances from construction and vessel operation may have caused Steller sea lions and humpback whales to avoid the area near the disturbance, but avoidance would have been expected to be temporary. As stated in Sections 4.4.15.1 and 4.8.12, haulouts for marine mammals would have been unlikely to be affected by construction or operation in Berners Bay. The amount of available forage in Berners Bay and temporary avoidance would have not been expected to adversely affect marine mammals or their prey species.

Alternatives 4A through 4D-Fast Vehicle Ferry Service vs. Conventional Monohull Ferry Service from Either Auke Bay or Berner's Bay

All four of these alternatives would include continued mainline ferry service with a minimum of two mainline ferry trips per week during the summer and one per week in the winter. The Haines-Skagway service would be provided by a new conventional monohull ferry. All four of these alternatives would require construction of a new double-end berth at Auke Bay. These four alternatives would provide faster and/or more frequent ferry service in Lynn Canal with greater capacity than Alternative 1.

Alternative 4A would construct two new fast vehicle ferries to provide daily summer service between Auke Bay and Haines and between Auke Bay and Skagway. Alternative 4B would widen and extend Glacier Highway from Echo Cove to Sawmill Cove in Berner's Bay and construct a new ferry terminal with two end berths to accommodate two new fast vehicle ferries that would be constructed. The two new fast ferries would provide service between Sawmill Cove and Haines/Skagway during the summer and between Auke Bay and Haines/Skagway during the winter. The ACF day boats programmed under Alternative 1 would not be used under these two alternatives.

Alternative 4B includes additional potential impacts from the construction of a new ferry terminal in Berner's Bay, which includes effects to marine mammal prey habitat.

Alternative 4C would use the two ACF day boats to operate between Auke Bay and Haines/Skagway and Alternative 4D would use the two ACF day boats to operate between Sawmill Cove and Haines, and Sawmill Cove and Skagway. As in Alternative 4B, Alternative 4D would widen and extend Glacier Highway from Echo Cove to Sawmill Cove in Berner's Bay, and construct a new ferry terminal with a double-end berth to accommodate both day boats at once.

Alternative 4D would result in day boats operating in Berner's Bay year-round, including during the spring months when large aggregations of humpback whales and Steller sea lions are present in association with schooling/spawning forage fish. Acoustic disturbance in Berner's Bay is a concern for marine mammals, particularly during the spring months.

RESPONSE: Impacts to humpback whales and Steller sea lions from Alternative 4D, including acoustic disturbances in Berners Bay, are addressed in Section 4.6.17 of the Draft SEIS. Underwater acoustic disturbances from vessel operation may have caused Steller sea lions and humpback whales to avoid the area near the vessel, but avoidance would have been expected to be temporary. The amount of available forage and temporary avoidance would not have been expected to adversely affect Steller sea lions or humpback whales.

Note that Alternative 4D would not have included year round Day Boat ACF use in Berners Bay. The Day Boat ACFs would have operated in Berners Bay during summer months only.

Alternative Analyses—Conclusion

It is not clear from the Draft Supplemental EIS or referenced documents that the FHWA conducted an analysis to determine an environmentally preferred alternative. From NMFS's perspective, the environmentally preferred alternative is Alternative 1-No Action, followed by 1B. With appropriate mitigation measures to protect eelgrass beds at Auk Nu Cove, these alternatives would have the least impact because they require no additional fill, no dredging of wetlands or marine areas, and no new construction of roads and ferry terminals.

Impacts to marine mammals are expected to be less with the alternatives that rely exclusively on ferry transportation than those that rely on road construction. Additionally, Berner's Bay is a particularly sensitive area with humpback whales, Steller sea lions, and other marine mammals present year-round and in particularly high densities during the spring months. Therefore, alternatives proposing road construction and activities in and around haulouts and Berner's Bay are of greater concern for NMFS. For these reasons, the environmentally preferred alternative regarding marine mammals and their habitat is Alternative 1-No Action, followed by 1B, 4A, or 4C. Next would be 4B and 4D.

Construction of roads along the coastline of Lynn Canal would have greater short-term and long-term impacts to marine mammals and their habitat due to permanent construction and human activity near haulouts and high use areas than the alternatives primarily relying on ferry transportation. Of the two road construction alternatives, Alternative 3 would be preferable to Alternative 2B due to the expected impacts to the two Steller sea lion haulouts under the latter alternative. As noted in the 2004 Wildlife Technical Report (Appendix Q), the impacts to marine mammals from road construction-related stressors are expected to be greater for Alternative 2B than for any of the ferry improvement alternatives.

RESPONSE: A Draft EIS for agency/public review does not typically identify the environmentally preferred alternative. Per 40 Code of Federal Regulations (CFR) 1505.2(b) and FHWA Technical Advisory 6640.8A Section VIII (Record of Decision [ROD]), the ROD includes the environmentally preferred alternative. The JAI Project ROD identifies Alternative 4C as the environmentally preferred alternative due, in part, to it having a lower potential for impacts to marine mammals (see Section III.G of the ROD). Alternative 1 – No Action is the selected alternative (see Section I of the ROD and Section 2.5 of the Final SEIS).

EFH Conservation Recommendations

Section 305(b) of the MSA requires federal agencies to consult with NMFS on all actions that

may adversely affect Essential Fish Habitat (EFH). NMFS is required to make conservation recommendations, which may include measures to avoid, minimize, mitigate or otherwise offset adverse effects. Therefore, in accordance with Section 305(b)(4)(A) of the MSA, NMFS offers the following EFH Conservation Recommendation:

- The Yankee Cove artificial reef site was previously completed as mitigation for adverse impacts to living marine resources, including EFH, as a result of the proposed project. NMFS credits the Project for this work. However, NMFS recommends that the Final Supplemental EIS re-evaluate the impacts of the preferred alternative to determine if the level of mitigation already completed is commensurate with and compensates for effects the final alternative may have on living marine resources, including EFH. Additional mitigation may be needed to address final project impacts. NMFS remains willing to discuss mitigation with FWHA.

RESPONSE: In the 2006 Final Environmental Impact Statement (FEIS), DOT&PF committed to \$780,000 in-lieu fee compensation to offset unavoidable adverse impacts to intertidal and subtidal marine waters (EFH). In 2008, DOT&PF provided \$324,000 to construct the Yankee Cove project, which established two artificial reefs to enhance habitat important to spawning and rearing fish, including Pacific herring and marine invertebrates. FHWA determined the balance remaining (\$456,000), in addition to the in-water work timing window to avoid sensitive life stages of fish (March 15 through June 15) and other measures described in Chapter 5 of the Draft SEIS, would provide adequate mitigation for Alternative 2B impacts to marine resources. Alternative 1 – No Action (preferred alternative) would not result in impacts above the existing condition; therefore, no mitigation is required or proposed under the Alternative 1 – No Action.

Under section 305(b)(4) of the MSA, FHWA is required to respond to NMFS's EFH recommendations in writing within 30 days. If FHWA will not make a decision within 30 days of receiving NMFS's EFH Conservation Recommendation, FHWA should provide NMFS with a letter within 30 days to that effect and indicate when a full response will be provided.

Should you have any questions regarding EFH and our recommendation please contact Linda Shaw at 907-586-7510 or linda.shaw@noaa.gov. If you have any questions regarding the marine mammal assessment provided in this letter, please contact Sadie Wright at 907-586-7630 or sadie.wright@noaa.gov.

Sincerely,

James W. Balsiger, Ph.D.

6860 Glacier Highway
Juneau, AK 99802-1648

Dear Ms. Holman:

Staff of the U.S. Fish and Wildlife Service has reviewed the Draft Supplemental Environmental Impact Statement (SEIS) for the Juneau Access Improvements Project. The SEIS evaluates seven action alternatives to improve surface transportation between Juneau and the head of Lynn Canal, plus a no action alternative. Action alternatives include new highways along either the east or west side of Lynn Canal, or enhanced ferry service using new or existing ferry facilities and various ferry types.

The SEIS identifies the East Lynn Canal Highway to Katzeihin, with shuttle ferries to Haines and Skagway (Alternative 2B) as the preferred alternative. Recent reports by the Alaska Department of Fish and Game document use of the East Lynn Canal project area by a variety of wildlife species, including mountain goats, brown bears, moose, and wolverines. The SEIS concludes that impacts to wildlife from construction and operation of a West Lynn Canal Highway (Alternative 3) would be similar but smaller. Studies of wildlife use of the West Lynn Canal route have not been conducted, so the validity of this conclusion cannot be verified. We recommend that wildlife use along the West route be better evaluated, using methods similar to those used for the East Lynn Canal route to allow better comparison of the road alternatives.

Surveys for bald eagle nests on both sides of Lynn Canal have shown that the East route could disturb approximately twice as many eagle nests as the west route, suggesting that the west route would have lower impacts. The Fish and Wildlife Service will continue to coordinate with you and the Alaska Department of Transportation and Public Facilities to conduct surveys and evaluate measures to avoid and minimize impacts to eagles, to the extent practicable, and to permit impacts that cannot be avoided.

Ferry enhancement alternatives would use either the existing ferry terminal at Auke Bay (Alternatives 4A and 4C) or a new terminal at Sawmill Cove in Berner's Bay. Sawmill Cove is currently undeveloped, and provides a variety of wildlife habitats and outdoor recreational opportunities. A large beach meadow, hidden from the salt water by a beach berm, offers excellent security for bears, moose, deer, and other species. The area is popular with campers, kayakers, hunters, and fishermen. These values would be impacted or lost by construction of a ferry terminal in Sawmill Cove.

We recommend that the Federal Highway Administration more fully evaluate the feasibility of operating a ferry terminal at nearby Cascade Point, which already has road access and a permitted marine access

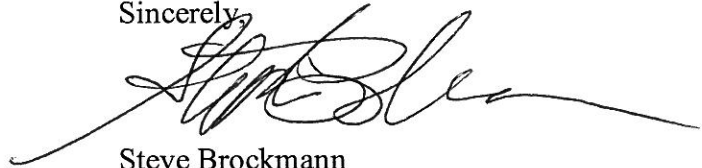

Ms. Deborah Holman

2

facility (breakwater and barge ramp), or other sites along the Juneau road system that could be used. We believe that additional construction at this site would have much lower environmental impacts than construction at Sawmill Cove.

Thank you for this opportunity to provide our comments on this project. If you have any questions, please contact me at (907) 780-1181 or by email at steve_brockmann@fws.gov.

Sincerely,

Dear Mr. Brockmann:

Thank you for your letter, dated November 24, 2014, with your agency's comments on the Juneau Access Improvements (JAI) Project Draft Supplemental Environmental Impact Statement (SEIS). We appreciate the participation of the U.S. Fish and Wildlife Service in the JAI Project.

We have reviewed your letter and have made appropriate revisions to the Final SEIS. Our attached responses have been embedded in a reprint of your letter.

We anticipate releasing a combined Final SEIS/Record of Decision very soon. FHWA has identified Alternative 1 – No Action as the Preferred Alternative in the Final SEIS. Governor Walker announced on December 15, 2017, that the “No Build Alternative” is the State's Preferred Alternative. Please see Section 2.5 of the Final SEIS for further discussion.

Please do not hesitate to contact me at (907) 586-7430 or Greg Lockwood, the DOT&PF Project Manager, at (907) 465-1828 if you have any additional questions or concerns.

Sincerely,

Tim A. Haugh
Environmental Program Manager

Public Facilities 6860 Glacier Highway
Juneau, AK 99802-1648

Dear Ms. Holman:

Staff of the U.S. Fish and Wildlife Service has reviewed the Draft Supplemental Environmental Impact Statement (SEIS) for the Juneau Access Improvements Project. The SEIS evaluates seven action alternatives to improve surface transportation between Juneau and the head of Lynn Canal, plus a no action alternative. Action alternatives include new highways along either the east or west side of Lynn Canal, or enhanced ferry service using new or existing ferry facilities and various ferry types.

The SEIS identifies the East Lynn Canal Highway to Katzehin, with shuttle ferries to Haines and Skagway (Alternative 2B) as the preferred alternative. Recent reports by the Alaska Department of Fish and Game document use of the East Lynn Canal project area by a variety of wildlife species, including mountain goats, brown bears, moose, and wolverines. The SEIS concludes that impacts to wildlife from construction and operation of a West Lynn Canal Highway (Alternative 3) would be similar but smaller. Studies of wildlife use of the West Lynn Canal route have not been conducted, so the validity of this conclusion cannot be verified. We recommend that wildlife use along the West route be better evaluated, using methods similar to those used for the East Lynn Canal route to allow better comparison of the road alternatives.

RESPONSE: The Alaska Department of Fish and Game (ADF&G) studies in the East Lynn Canal project area were not conducted to provide information to support an evaluation of potential effects of Alternative 2B in the Supplemental Environmental Impact Statement (SEIS). Rather, they were conducted as mitigation required in the Federal Highway Administration (FHWA) 2006 Record of Decision for the Juneau Access Improvements (JAI) Project to assist ADF&G manage those populations. Extrapolation of regional data to areas in proximity and with similar topography and habitat types is appropriate for an alternatives analysis under the National Environmental Policy Act (NEPA) and is commensurate with other NEPA evaluations.

Surveys for bald eagle nests on both sides of Lynn Canal have shown that the East route could disturb approximately twice as many eagle nests as the west route, suggesting that the west route would have lower impacts. The Fish and Wildlife Service will continue to coordinate with you and the Alaska Department of Transportation and Public Facilities to conduct surveys and evaluate measures to avoid and minimize impacts to eagles, to the extent practicable, and to permit impacts that cannot be avoided.

RESPONSE: FHWA and the Alaska Department of Transportation and Public Facilities (DOT&PF) appreciate the extensive coordination with Fish and Wildlife Service on this project.

Ferry enhancement alternatives would use either the existing ferry terminal at Auke Bay (Alternatives 4A and 4C) or a new terminal at Sawmill Cove in Berner's Bay. Sawmill Cove is currently undeveloped, and provides a variety of wildlife habitats and outdoor recreational opportunities. A large beach meadow, hidden from the salt water by a beach berm, offers excellent security for bears, moose, deer, and other species.

RESPONSE: Impacts to wildlife from construction and operation of Alternatives 4B and 4D, including the Sawmill Cove Ferry Terminal, are addressed in Section 4.6.15 of the Final SEIS and Section 4.6.4 of the *2014 Update to Appendix Q – Wildlife Technical Report*.

The impact analysis specifically addresses these habitats, noting in Section 4.6.15 of the Final SEIS, “The beach fringe between Echo Cove and Sawmill Cove provides high-value habitat for many terrestrial mammals, including bears, martens, river otters, and wolves.” Section 4.6.15 goes on to explain how the highway alignment for Alternatives 4B and 4D would have:

- Divided the home range of some bears that winter at higher elevations and move down to the coast during summer to forage, particularly for black bears that feed on salmon at Sawmill Creek.
- Likely caused seasonal disturbance and displacement of brown bears using beaches near Sawmill Cove and Point St. Mary during ferry operations.
- Provided more access for people to beaches in the Sawmill Cove vicinity, potentially inhibiting the use of this area by wolves.
- Not fragmented the ranges of martens and river otters, as these species have small home ranges and readily cross roads.
- Affected the winter habitat of goats in the area from Echo Cove to Sawmill Cove.

The area is popular with campers, kayakers, hunters, and fishermen. These values would be impacted or lost by construction of a ferry terminal in Sawmill Cove.

RESPONSE: Increasing access to this area with a road and ferry terminal would have increased recreational opportunities, but changed the quality. Sections 4.4.1.3 and 4.6.1.3 of the Final SEIS address the potential impacts of the Sawmill Cove Ferry Terminal (Alternatives 3, 4B, and 4D) on land and resource uses. The change in quality is described in Section 4.6.1.3 as follows:

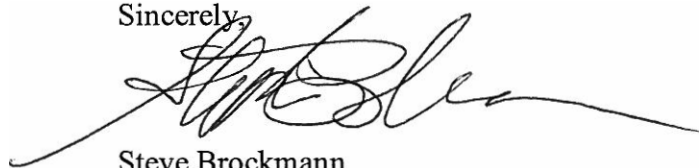

“A highway to Sawmill Cove would make it more accessible for people looking for a rustic but not pristine outdoor experience. It could also provide opportunities for outfitters to make more recreational trips available to the public in the region. Opening up the recreation opportunities of the coastline along the east side of Lynn Canal to Berners Bay would be perceived as a negative impact by those who enjoy the existing remote nature of the region, including some outfitters who currently provide wilderness trips there... Increases in hunting and fishing would be expected along the extension of the highway from Cascade Point to Sawmill Cove. As in other readily accessible regions of the state, the ADF&G would monitor the resources along Lynn Canal and adjust fish and game regulations, as necessary, to protect those resources from over utilization.”

We recommend that the Federal Highway Administration more fully evaluate the feasibility of operating a ferry terminal at nearby Cascade Point, which already has road access and a permitted marine access facility (breakwater and barge ramp), or other sites along the Juneau road system that could be used. We believe that additional construction at this site would have much lower environmental impacts than construction at Sawmill Cove.

RESPONSE: Sites along the road system south of Berners Bay were dismissed during alternative screening due to basin characteristics and exposure to the weather. Had the Final SEIS preferred alternative included a ferry terminal in Berners Bay, DOT&PF would have investigated the suitability and availability of siting the ferry terminal at Cascade Point (see Section 4.9.2.10).

Thank you for this opportunity to provide our comments on this project. If you have any questions, please contact me at (907) 780-1181 or by email at steve_brockmann@fws.gov.

MEMORANDUM

State of Alaska

Department of Fish and Game
Division of Habitat

TO: Gary Hogins
Special Projects Manager
Department of Transportation and
Public Facilities Southeast Region

DATE: November 25, 2014

FILE NO: 000S(131)/71100

SUBJECT: Juneau Access DSEIS
ADF&G Comments

FROM: Jackie Timothy 
Southeast Regional Supervisor

PHONE NO: (907) 465-4275

The Alaska Department of Fish and Game (ADF&G) reviewed the Alaska Department of Transportation and Public Facilities (ADOT&PF) Draft Supplemental Environmental Impact Statement (DSEIS) for the Juneau Access Improvement Project. The project addresses surface transportation to and from Juneau within Lynn Canal.

We limited our review to highway build alternatives that would impact fish and wildlife resources and habitats for which we have statutory management responsibilities. This includes preferred Alternative 2B East Lynn Canal, Alternative 3 West Lynn Canal, Alternative 4B Berners Bay fast ferry, and Alternative 4D Berners Bay conventional monohull.

In the 2006 Record of Decision for the Juneau Access Improvements Project, DOT&PF agreed to fund ADF&G wolverine, brown bear, and moose population studies for three years, and mountain goat population studies for four years. When the project was enjoined in federal court, the wildlife studies changed to include species range. ADF&G provided scoping comments on March 5, 2012 requesting the DSEIS include data from ADOT&PF funded studies of wolverine (Lewis et al. 2012), brown bear (Flynn et al. 2012), moose (White et al. 2012a), and mountain goat (White et al. 2012b). DSEIS Appendix Z includes a 2014 update to the 2005 Addendum to Appendix Q Wildlife Technical Report and 2004 Wildlife Technical Report included in Appendix W of the 2006 Final EIS. ADOT&PF states this information remains valid and includes

- Wolverine home range concluding no alternative is likely to have an impact on wolverines or their populations in southeast Alaska.
- Brown bear population estimates and density, home range and habitat use, concluding wildlife underpasses and best management practices during construction and operation will reduce disturbance, displacement, bear/human interactions, and collisions.

- Moose population estimates, distribution, and predicted habitat use, concluding wildlife underpasses and re-vegetation with non-palatable species will discourage browsing and reduce collisions.
- Mountain goat population estimates, distribution and predicted habitat use, concluding alternative 2B would intersect winter habitat in east Lynn Canal north of Comet to the Katzehin River and proposing, among others, spotting and hazing mountain goats from the area prior to routine avalanche control.

ADOT&PF estimates the terrestrial habitat loss from the highway build alternatives is one percent or less of the habitat available in the project study area, with the impacts to fish and wildlife resources from Alternative 2B greater than Alternative 3, and the impacts from Alternative 3 greater than Alternatives 4B and 4D. ADOT&PF concludes the wolverine, brown bear and moose habitat selection and use patterns would be similar on the west side of Lynn Canal in Alternative 3, with mountain goat habitat unlikely to be impacted. Alternatives 2B and 3 will increase public access to fish and wildlife resources in Lynn Canal, and ADOT&PF expects ADF&G will use the management tools available to manage increased harvest pressure.

ADF&G discovered inaccuracies in the DSEIS and occasional misapplication of information from the wildlife studies. ADOT&PF could improve the SEIS by incorporating the following information –

Page 3-69, paragraph 5: Moose use of the Katzehin flats should be addressed within this section and the map predicting relative probability of use during the summer should be included in the figures (White et al. 2012a).

Page 3-70, paragraph 2: Mountain goat wintering areas occur on the bluffs between Johnson Creek and Berners River and on the ridge east of Echo Cove. Some areas are not used by mountain goats due to lack of escape terrain. Please remove suitable forage from the penultimate sentence in the first shaded paragraph.

Page 3-75, paragraph 2: Figure 3-19 identifies locations within the study area that are frequented by humpback whales and Steller sea lions.

Figure 3-21: New maps are available for mountain goat (White et al. 2012b) and brown bear habitat (Flynn et al. 2012).

Figure 3-22: New maps are available for moose habitat (White et al. 2012a).

Page 4-84, paragraph 1: Though we have completed wildlife studies since ADOT&PF wrote section 4.3.15.3, the extent to which mountain goats may be disturbed by highway intersection of fragmented important winter range is unknown. Since mountain goats are sensitive to human disturbance and can experience nutritional deprivation during late winter, factors that result in increased energetic costs or restriction of suitable foraging areas have the potential to negatively impact local populations. It is unclear if the data from our recent studies will accurately represent important wintering areas if road construction results in changes in the way mountain goats use wintering areas.

Page 4-86, paragraph 1: Correct to reflect that moose in the Berners Bay area is managed under a drawing hunt and limited to 1 to 5 permits a year. The area along western Lynn Canal is managed as a registration hunt. The Katzehin River is managed as a Tier II limited entry subsistence hunt.

Page 4-91, bullet 10: ADOT&PF requests Title 16 fish habitat permits replace the Title 41 fish habitat permits previously issued for stream crossing structures. Sections 4.4.18 and 4.6.18 should be updated to acknowledge ADF&G fish habitat permits are issued under Title 16.

Page 4-135, paragraph 2: The Glacier Highway extension of Alternative 3 is adjacent to mountain goat wintering habitat in the vicinity of Echo Cove (White et al. 2012b). We request ADOT&PF not apply the White et al. (2012b) analyses to the West Lynn Canal Highway alternative.

Page 4-135, paragraph 3: The White et al. (2012b) studies show 25.3 km of the highway would intersect moderate to high use mountain goat wintering areas. Please update this paragraph.

Page 4-135, paragraph 4: ADF&G does not have data that supports the ADOT&PF claim that moose-vehicle collisions would be lower on the east side of Lynn Canal.

Page 4-215, paragraph 3: Studies in the Yakutat forelands indicate moose can be displaced by human activity associated with all-terrain vehicle use along trails. While moose can be seen along roads and in the vicinity of human activity, that does not mean moose do not avoid human activity.

Page 4-234, paragraph 4: Monitoring assesses, rather than mitigates, impacts.

Page 4-238, paragraph 3: There are no quantitative or qualitative analyses to support ADOT&PF's claim that there will be no Lynn Canal region mountain goat population-level effects from increased hunting pressure, habitat loss, and habitat fragmentation because ADF&G¹ would be monitoring the population and managing hunting accordingly.

Page 5-1, section 5.1, number 3: Reconcile "and to the extent certified seeds are available" with section 5.4 number 1: "Only certified seed mixtures would be used...".

Page 5-2, section 5.4, number 3: Reconcile "Construction equipment would be pressure washed..." with Terrestrial Habitat in 2014 Update to Appendix Q – Wildlife Technical Report section 5.4 number 2: "Construction equipment will be steam cleaned prior to use...".

Page 5-3, section 5.5, number 3: Please provide literature used to develop this recommendation and discuss the issue with your regional hydrologists and engineers.

Page 5-3, section 5.3, number 3: In-water work at anadromous and resident fish streams should be timed in accordance with the fish habitat permits.

¹ Insinuated.

Page 5-4, section 5.9, number 1: Camps necessary during construction of the project will be operated in accordance with the Division of Environmental Health Food Safety & Sanitation Program that addresses drinking water, food safety, solid waste and wastewater. See temporary camp practices consolidated application and worksheet at http://dec.alaska.gov/eh/fss/forms/food/Temp_Camp_Application%20Worksheet.pdf.

Page 5-4, section 5.9, number 3: Proofing.

Page 5-4, section 5.9, number 5: Change USFWS to ADF&G.

Page 5-4, section 5.9, number 6: Appropriately placed wildlife signs will help mitigate potential wildlife collisions.

Pages 5-4 and 5-5, section 5.9, numbers 9 and 11: ADOT&PF is committing to hazing wildlife prior to avalanche control or blasting. ADF&G recommends hazing mountain goats from helicopters as a last resort. ADOT&PF will be required to obtain a public safety permit from the ADF&G Division of Wildlife Conservation² prior to wildlife hazing.

Page 5-5, section 5.9, number 10: This commitment should be expanded to include strategically placed wildlife fences.

Page 5-5, section 5.9, numbers 12 and 13: Please commit to consulting with ADF&G Division of Wildlife Conservation staff during wildlife training program development.

Page 5-5, section 5.9: Please commit to limiting work in mountain goat over-wintering areas January through April.

Page 5-10, section 5.12.2: The long term effectiveness monitoring study of wildlife underpasses for brown bears should include effectiveness monitoring for moose in Berners Bay and the Katzehin River. These studies should also document mountain goat use of the underpasses. Mountain goat and moose pre and post-construction monitoring would determine the extent to which road intersection of winter range fragments and alters use of wintering habitat.

In addition to the inaccuracies we identified in the DSEIS, ADF&G discovered information in the *Appendix Z 2014 update to Appendix Q Wildlife Technical Report*³ that is invalidated by the studies we completed in 2012. ADOT&PF could improve the Wildlife Technical Report by incorporating the following information –

3.3 Species Accounts

*3.3.2.1 Brown Bear *Ursus arctos**

- Page 11, paragraph 2: Figures B1, B2, and B3 in Appendix B.
- Page 12, paragraph 1: Figures B3, B4, and B5 in Appendix B.

² ADOT&PF can request a permit application by sending an email to dfg.dwc.permits@alaska.gov.

³ Which is an update to the 2005 Addendum to Appendix Q Wildlife Technical Report and 2004 Wildlife Technical Report included in Appendix W of the 2006 Final EIS.

- Page 12, paragraph 3: Year range 1998 to 2009 (Bethune 2011).
- Page 12, paragraph 3: Unit 1D average harvest 14 bears per year (Bethune 2011).
- Page 12, paragraph 3: Four brown bear were reported as defense of life or property in all of GMU 1 during July 1, 2006 to June 30, 2010 (Bethune 2011).

3.3.2.2 Marten *Martes americana*

- Page 12: Figure 2 is a wetlands classification map for Berners Bay.

3.3.2.3 Moose *Alces alces*

- Page 13, paragraph 1: Figures C1 and C2 in Appendix C.
- Page 13, paragraph 3: Figures C3 and C4 in Appendix C.
- Page 13, paragraph 3: There were 14 surveys conducted during the winter between 2006 and 2011. The figure referenced is a model that predicts where moose can be found through the winter.
- Page 13, paragraph 4: Figures C5 and C6 in Appendix C.
- Page 13, paragraph 5: Cite White et al. (2012a).

3.3.2.4 Mountain Goat *Oreamnos americanus*

- Page 14, paragraph 2: Sinclair Mt. population has not rebounded from 2006 levels.
- Page 14, paragraph 5: The GMU 1C harvest between 2001 and 2010 ranged from 30 to 60 goats per year (Scott 2012). The GMU 1D harvest between 2001 and 2010 ranged from 22 to 43 goats per year (Sell 2012).

3.3.2.5 Wolverine *Gulo gulo*

- Page 15, paragraph 1: Correct home ranges for male and female to show the medians; 521 km² and 71 km², respectively (Lewis et al. 2012).
- Page 15, paragraph 4: Average harvest in Unit 1C between 1997 and 2008 is 5 wolverines. Average harvest in combined Unit 1C and Unit 1D is 9 wolverines (Scott 2010, Crupi 2010). In Unit 1C, most wolverines are harvested in Berners Bay or on the west side of Lynn Canal (Scott 2010), so wolverine presence in the construction area is underrepresented.

4.2.2 Mammals

4.2.2.1 Wolverine

- Page 18: Alternative 1B would require no construction, and would result in no construction-related impact to brown bear, moose, marten, mountain goat and wolverine.

4.3 Alternative 2B – East Lynn Canal Highway to Katzeihin, Shuttles to Haines and Skagway

4.3.4.1 Brown Bear

- Page 21, paragraph 2: Describe the measures that will be used to minimize bears shot and killed in defense of life or property during construction or reference section where these measures are described.

4.3.4.2 Moose

- Page 22, penultimate sentence of last paragraph: Include lower Lace and Gilkey Rivers.

4.4 *Alternative 3 – West Lynn Canal Highway*

4.4.4.1 Brown Bears

- Page 28, paragraph 4: Bear use of habitats between Echo Cove and Sawmill Creek and proposed road corridor crossings are underestimated. This area is included in the home range of 2 collared females and 8 collared males (Flynn et al. 2012).

4.4.4.2 Moose

- Page 29, paragraph 4: Cows from Berners Bay also move into Yankee Basin along the beach fringe and road in the spring to calf.

4.4.4.3 Mountain Goat

- Page 29, paragraph 1: William Henry Bay.
- Page 30, paragraph 2: If close to wintering habitat, groups of goats could potentially be down on the highway during the winter months.

4.6 *Alternatives 4B and 4D – FVF/Conventional Monohull Service from Berners Bay*

4.6.4.1 Brown Bear

- Pages 35 and 36: Bear use of habitats between Echo Cove and Sawmill Creek and proposed road corridor crossings are underestimated on Page 28, paragraph 4 (Flynn et al. 2012). This area is included in the home range of 2 collared females and 8 collared males and their use of this habitat should be documented in this section.

5 *Mitigation Measures*

5.5 Terrestrial Mammals

- Page 39, number 1: Please work with Division of Wildlife Conservation staff to write best management practices to prevent wildlife habituation.
- Page 39, number 3: ADF&G recommends extending the bridges 50 m on either side rather than 50 ft. We will work with ADOT&PF during fish habitat permitting to address this recommendation.
- Page 39, number 4: ADF&G will work ADOT&PF during fish habitat permitting to ensure the Lace River bridge is aligned with the high use brown bear crossing area identified in Flynn et al. (2012).
- Page 39, number 5: Change USFWS to ADF&G.
- Page 39, number 6: ADF&G recommends the proposed long term wildlife underpass effectiveness monitoring study for brown bears include effectiveness monitoring for moose in Berners Bay and the Katzehin. These studies should also document mountain goat use of the underpasses. Mountain goat and moose pre and post-construction monitoring would determine the extent to which road intersection of winter range fragments and alters use of wintering habitat.

Staff from the Division of Wildlife Conservation are available to help ADOT&PF update the Wildlife Technical Report with the best available information.

In our March 5, 2012 scoping comments, we recommended ADOT&PF include Berners Bay herring spawn maps in the DSEIS. While ADOT&PF has described herring spawn areas in the narrative, Chapter 3 figures could also include ADF&G's Commercial Fisheries Division GIS shapefiles. The Chapter 3 narrative would be improved by including that the herring sac-roe fisheries provided for in regulation could resume if the Lynn Canal population recovered. Chapter 3 could also be updated with the NOAA April 2, 2014 final report concluding the endangered species listing of the Southeast Alaska Distinct Population Segment of Pacific herring is not currently warranted.

Public access provided under alternatives 2B, 3, 4B and 4D will improve the public's ability to harvest eulachon and herring spawn. While increased public access to these resources is noted in Chapter 4 of the DSEIS, the document could be improved by acknowledging in Chapter 2 the increase in management responsibilities for commercial fishery managers. Herring spawn habitat would be lost in Alternatives 3, 4B and 4D, so a commitment to replace the habitat in ferry terminal design would be appropriate. In Chapter 5, the commitment to time in-water work can specify Sawmill Creek ferry terminal in-water work will not occur between April 15 and May 31. Please also update the DSEIS index to include references to herring in Chapters 3, 4 and 5.

ADOT&PF documents 26 anadromous water bodies among the 90 or so streams within the proposed project area. The ADF&G anadromous waters catalog incorrectly lists the stream course, upper extent, and species composition of many of the fish-bearing water bodies in the project area. Most inaccuracies are a result of antiquated mapping practices that are resolved by tracking the stream course on foot using a global positioning system from the stream mouth to an anadromous fish passage barrier, sampling for salmonids using minnow traps, hand nets, or a backpack electrofisher, and digitizing the water body using ArcGIS mapping software. Sawmill Creek is an example of a stream documented as anadromous far above a barrier, Independence Creek is an example of unconfirmed species composition, and Glacier Creek is an example of a stream listed as anadromous but not found in the 2014 anadromous waters catalog. Habitat Division staff will begin correcting the anadromous waters catalog next spring and we will provide the corrected information to ADOT&PF as it becomes available.

The following recommendation, while outside ADF&G authorities, would improve the SEIS:

The information in the SEIS would be better understood if it was consolidated and reorganized. For instance, to review information about anadromous water bodies within the project area, the compact disc the Federal Highway Administration sent to me on September 15, 2014 contains Adobe Acrobat file JAIP 07 - Chapter 3 Affected Environment. Chapter 3 describes freshwater habitat in Lynn Canal and directs the reader to the Anadromous and Resident Fish Streams Technical Report (Appendix P) and the 2014 Update to Appendix P – Anadromous and Resident Fish Streams Technical Report (Appendix Z Update to P) for additional information on stream habitat in the project area. Appendix Z is not easily located as files are shown on the compact disc as Appendices Volumes 1 through 6, and the reader must review Volumes 1 through 5 before locating Appendix Z, which contains Appendix P and the Update to Appendix P.

Appendix P contains an errata sheet and the 2014 update to Appendix P contains an errata sheet triple the size of the Appendix P errata sheet.

Or, for example, to review anticipated impacts from a terminal in William Henry Bay, which is *south* of the Endicott River in the West Lynn Canal, Alternative 3, JAIP 07 - Chapter 3 Affected Environment, points to the Appendix Z update to N, 2014 Update to Appendix N – Essential Fish Habitat Assessment, Attachment A 2005 Addendum to Appendix N – Essential Fish Habitat Assessment, Appendix W – Technical Report Addenda January 2006, W-220, 3.1.3.2, Cumulative Effects, which says Alternative 3 would be on the shoreline approximately two miles *north* of the Endicott River.

Though I provide two specific examples here, I encountered equivalent DSEIS disorganization for every topic of ADF&G interest – for instance, see paragraph three of this memo. The Council on Environmental Quality requires clear and concise National Environmental Policy Act documents because the public has a role in the process and because the documents need to be useful to decision-makers. The public and decision-makers would benefit if the final SEIS was clear and concise.

Thank you for the opportunity to review and comment.

P.O. Box 115526
Juneau, Alaska 99811

Dear Ms. Timothy:

Thank you for your letter, dated November 25, 2014, with your agency's comments on the Juneau Access Improvements (JAI) Project Draft Supplemental Environmental Impact Statement (SEIS). We appreciate the participation of the Alaska Department of Fish and Game in the JAI Project.

We have reviewed your letter and have made appropriate revisions to the Final SEIS. Our attached responses have been embedded in a reprint of your letter.

We anticipate releasing a combined Final SEIS/Record of Decision very soon. FHWA has identified Alternative 1 – No Action as the Preferred Alternative in the Final SEIS. Governor Walker announced on December 15, 2017, that the "No Build Alternative" is the State's Preferred Alternative. Please see Section 2.5 of the Final SEIS for further discussion.

Please do not hesitate to contact me at (907) 465-1828 if you have any additional questions or concerns.

Sincerely,

A handwritten signature in blue ink that reads "Greg Lockwood".

MEMORANDUM

State of Alaska

Department of Fish and Game
Division of Habitat

TO: Gary Hogins
Special Projects Manager
Department of Transportation and
Public Facilities Southeast Region

DATE: November 25, 2014
FILE NO: 000S(131)/71100
SUBJECT: Juneau Access DSEIS
ADF&G Comments

FROM: Jackie Timothy 
Southeast Regional Supervisor

PHONE NO: (907) 465-4275

The Alaska Department of Fish and Game (ADF&G) reviewed the Alaska Department of Transportation and Public Facilities (ADOT&PF) Draft Supplemental Environmental Impact Statement (DSEIS) for the Juneau Access Improvement Project. The project addresses surface transportation to and from Juneau within Lynn Canal.

We limited our review to highway build alternatives that would impact fish and wildlife resources and habitats for which we have statutory management responsibilities. This includes preferred Alternative 2B East Lynn Canal, Alternative 3 West Lynn Canal, Alternative 4B Berners Bay fast ferry, and Alternative 4D Berners Bay conventional monohull.

In the 2006 Record of Decision for the Juneau Access Improvements Project, DOT&PF agreed to fund ADF&G wolverine, brown bear, and moose population studies for three years, and mountain goat population studies for four years. When the project was enjoined in federal court, the wildlife studies changed to include species range. ADF&G provided scoping comments on March 5, 2012 requesting the DSEIS include data from ADOT&PF funded studies of wolverine (Lewis et al. 2012), brown bear (Flynn et al. 2012), moose (White et al. 2012a), and mountain goat (White et al. 2012b). DSEIS Appendix Z includes a 2014 update to the 2005 Addendum to Appendix Q Wildlife Technical Report and 2004 Wildlife Technical Report included in Appendix W of the 2006 Final EIS. ADOT&PF states this information remains valid and includes

- Wolverine home range concluding no alternative is likely to have an impact on wolverines or their populations in southeast Alaska.
- Brown bear population estimates and density, home range and habitat use, concluding wildlife underpasses and best management practices during construction and operation will reduce disturbance, displacement,

- bear/human interactions, and collisions
- Moose population estimates, distribution, and predicted habitat use, concluding wildlife underpasses and re-vegetation with non-palatable species will discourage browsing and reduce collisions.
- Mountain goat population estimates, distribution and predicted habitat use, concluding alternative 2B would intersect winter habitat in east Lynn Canal north of Comet to the Katzehin River and proposing, among others, spotting and hazing mountain goats from the area prior to routine avalanche control.

ADOT&PF estimates the terrestrial habitat loss from the highway build alternatives is one percent or less of the habitat available in the project study area, with the impacts to fish and wildlife resources from Alternative 2B greater than Alternative 3, and the impacts from Alternative 3 greater than Alternatives 4B and 4D. ADOT&PF concludes the wolverine, brown bear and moose habitat selection and use patterns would be similar on the west side of Lynn Canal in Alternative 3, with mountain goat habitat unlikely to be impacted. Alternatives 2B and 3 will increase public access to fish and wildlife resources in Lynn Canal, and ADOT&PF expects ADF&G will use the management tools available to manage increased harvest pressure.

ADF&G discovered inaccuracies in the DSEIS and occasional misapplication of information from the wildlife studies. ADOT&PF could improve the SEIS by incorporating the following information –

Page 3-69, paragraph 5: Moose use of the Katzehin flats should be addressed within this section and the map predicting relative probability of use during the summer should be included in the figures (White et al. 2012a).

RESPONSE: Section 3.3.2.3.2 of Appendix Z *2017 Update to Appendix Q – Wildlife Technical Report* provides additional detail regarding moose use of the Katzehin flats. Small populations of moose occur in Berners Bay and the lower Katzehin River areas. Based on nine aerial surveys between 2005 and 2011, the Katzehin River population was estimated between 30 and 40 moose, with distribution concentrated along the river corridor and delta areas near Alternative 2B (Figures C5 and C6 in Appendix C of the report). Figure C5 illustrates the relative probability of use during the summer.

Page 3-70, paragraph 2: Mountain goat wintering areas occur on the bluffs between Johnson Creek and Berners River and on the ridge east of Echo Cove. Some areas are not used by mountain goats due to lack of escape terrain. Please remove suitable forage from the penultimate sentence in the first shaded paragraph.

RESPONSE: The referenced statement allows for the existence of suitable wintering areas in the Berners Bay, Katzehin beach, and Slate Cove to Comet coastal areas. Per your comment, suitable forage has been removed from the cited sentence in the Final Supplemental Environmental Impact Statement (SEIS).

Page 3-75, paragraph 2: Figure 3-19 identifies locations within the study area that are frequented by humpback whales and Steller sea lions.

RESPONSE: Per your comment, the Final SEIS has been revised to cite the correct figure (Figure 3-20).

Figure 3-21: New maps are available for mountain goat (White et al. 2012b) and brown bear habitat (Flynn et al. 2012).

RESPONSE: The Draft SEIS Figure 3-21 illustrated that mountain goat and brown bear habitat is present in the project area. The Final SEIS contains the current information, either publically available or provided by the Alaska Department of Fish and Game (ADF&G).

Figure 3-22: New maps are available for moose habitat (White et al. 2012a).

RESPONSE: Draft SEIS Figure 3-22 illustrated that moose habitat is present in the project area. The Final SEIS contains the current information, either publically available or provided by ADF&G.

Page 4-84, paragraph 1: Though we have completed wildlife studies since ADOT&PF wrote section 4.3.15.3, the extent to which mountain goats may be disturbed by highway intersection of fragmented important winter range is unknown. Since mountain goats are sensitive to human disturbance and can experience nutritional deprivation during late winter, factors that result in increased energetic costs or restriction of suitable foraging areas have the potential to negatively impact local populations. It is unclear if the data from our recent studies will accurately represent important wintering areas if road construction results in changes in the way mountain goats use wintering areas

RESPONSE: The Final SEIS includes best available information from ADF&G regarding winter habitat areas. Appendix Z *2017 Update to Appendix Q – Wildlife Technical Report*, Section 4.3.4.4, recognizes uncertainty associated with habitat fragmentation due to construction activities. Per your comment, Section 4.3.15.3 of the Final SEIS has been revised to discuss impacts on the mountain goat winter range due to habitat fragmentation from construction.

Page 4-86, paragraph 1: Correct to reflect that moose in the Berners Bay area is managed under a drawing hunt and limited to 1 to 5 permits a year. The area along western Lynn Canal is managed as a registration hunt. The Katzechin River is managed as a Tier II limited entry subsistence hunt.

RESPONSE: Per your comment, the Final SEIS has been revised to state that the Berners Bay area is managed under a limited drawing hunt of one to five permits per year.

Page 4-91, bullet 10: ADOT&PF requests Title 16 fish habitat permits replace the Title 41 fish habitat permits previously issued for stream crossing structures. Sections 4.4.18 and 4.6.18 should be updated to acknowledge ADF&G fish habitat permits are issued under Title

16.

RESPONSE: Per your comment, Sections 4.4.18 and 4.6.18 of the Final SEIS have been revised to state that fish habitat permits are issued under Title 16.

Page 4-135, paragraph 2: The Glacier Highway extension of Alternative 3 is adjacent to mountain goat wintering habitat in the vicinity of Echo Cove (White et al. 2012b). We request ADOT&PF not apply the White et al. (2012b) analyses to the West Lynn Canal Highway alternative.

RESPONSE: Extrapolation of regional data to areas in proximity and with similar topography and habitat types is appropriate for an alternatives analysis under the National Environmental Policy Act (NEPA) and is commensurate with other NEPA evaluations. Additionally, Section 4.4.4.3 of the *2017 Update to Appendix Q – Wildlife Technical Report* uses several broad conclusions from White et al. (2012b) about general habitat use by mountain goats to develop a good-faith analysis of potential effects from the construction, operation, and maintenance of Alternative 3 on the west side of Lynn Canal. To not apply these conclusions would limit a reasonable analysis of these effects due to the lack of region-specific information. However, we have noted the concern with the use of the White et al. (2012b) for the West Lynn Canal Highway alternative in the *Wildlife Technical Report*.

Page 4-135, paragraph 3: The White et al. (2012b) studies show 25.3 km of the highway would intersect moderate to high use mountain goat wintering areas. Please update this paragraph.

RESPONSE: Per your comment, Section 4.4.15 of the Final SEIS has been revised to state that the alternative could create the potential for vehicle collisions with mountain goats in moderate-high winter use areas.

Page 4-135, paragraph 4: ADF&G does not have data that supports the ADOT&PF claim that moose-vehicle collisions would be lower on the east side of Lynn Canal.

RESPONSE: Text stating that the moose population along the west side of Lynn Canal is more widespread and substantially larger than along the east side resulting in less moose-vehicle collisions is deleted from Section 4.4.15.3 of the Final SEIS.

Page 4-215, paragraph 3: Studies in the Yakutat forelands indicate moose can be displaced by human activity associated with all-terrain vehicle use along trails. While moose can be seen along roads and in the vicinity of human activity, that does not mean moose do not avoid human activity.

RESPONSE: Section 4.8.12.3 of the Draft and Final SEIS states that noise from construction and human disturbances may cause moose to avoid feeding areas in or near the project area during daytime hours when human disturbance is greatest. However, moose are known to adapt to human disturbances and construction noise, reducing the likelihood that moose would be adversely displaced or disturbed by construction noise and human presence during construction. These statements are consistent with ADF&G's comment.

Page 4-234, paragraph 4: Monitoring assesses, rather than mitigates, impacts.

RESPONSE: Monitoring, in this case, allows managers to make more appropriate decisions to avoid or lessen impacts to goat populations. Therefore, monitoring efforts would have contributed to mitigating effects.

Page 4-238, paragraph 3: There are no quantitative or qualitative analyses to support ADOT&PF's claim that there will be no Lynn Canal region mountain goat population-level effects from increased hunting pressure, habitat loss, and habitat fragmentation because ADF&G¹ would be monitoring the population and managing hunting accordingly.

RESPONSE: The analysis in the Final SEIS finds that while there is potential for limited impacts, each would not likely have a population-level effect. The conclusion in Section 4.9.3.2 of the Final SEIS is based on this analysis and the knowledge that ADF&G would also be monitoring and managing mountain goat populations.

Page 5-1, section 5.1, number 3: Reconcile "and to the extent certified seeds are available" with section 5.4 number 1: "Only certified seed mixtures would be used..."

RESPONSE: The text in Section 5.4, Number 1 of the Final SEIS has been revised to delete the phrase "and to the extent certified seed mixes are available."

Page 5-2, section 5.4, number 3: Reconcile "Construction equipment would be pressure washed..." with Terrestrial Habitat in 2014 Update to Appendix Q – Wildlife Technical Report section 5.4 number 2: "Construction equipment will be steam cleaned prior to use..."

RESPONSE: Per your comment, Appendix Z *2017 Update to Appendix Q – Wildlife Technical Report* has been revised to be consistent with Section 5.4, Number 3 of the Final SEIS and states that "Construction equipment would be pressure washed..."

Page 5-3, section 5.5, number 3: Please provide literature used to develop this recommendation and discuss the issue with your regional hydrologists and engineers.

RESPONSE: Section 5.5, Number 3 is a design commitment to allow for fish passage at the ferry terminals that is based on National Marine Fisheries Service's (NMFS) recommendation. DOT&PF did not require or request supporting literature when agreeing to the commitment. Please contact NMFS for supporting literature.

Page 5-3, section 5.3, number 3: In-water work at anadromous and resident fish streams should be timed in accordance with the fish habitat permits.

RESPONSE: Per your comment, Section 5.5, Number 2 of the Final SEIS has been revised to state that in-water work timing would be in accordance with fish habitat permits.

¹ Insinuated.

Page 5-4, section 5.9, number 1: Camps necessary during construction of the project will be operated in accordance with the Division of Environmental Health Food Safety & Sanitation Program that addresses drinking water, food safety, solid waste and wastewater. See temporary camp practices consolidated application and worksheet at [http://dec.alaska.gov/eh/fss/forms/food/Temp_Camp_Application%20 Worksheet.pdf](http://dec.alaska.gov/eh/fss/forms/food/Temp_Camp_Application%20Worksheet.pdf).

RESPONSE: Section 5.9, Number 1 of the Final SEIS concerns handling food to reduce or eliminate wildlife attractants. Per your comment, if an action alternative had been selected, DOT&PF would have consulted with ADF&G.

Page 5-4, section 5.9, number 3: Proofing.

RESPONSE: Per your comment, Section 5.9, Number 3 of the Final SEIS has been corrected for typographical errors.

Page 5-4, section 5.9, number 5: Change USFWS to ADF&G.

RESPONSE: Per your comment, Section 5.9, Number 5 of the Final SEIS has been revised to reference consultation with ADF&G, not U.S. Fish and Wildlife Service (USFWS).

Page 5-4, section 5.9, number 6: Appropriately placed wildlife signs will help mitigate potential wildlife collisions.

RESPONSE: Per your comment, Section 5.9, Number 6 of the Final SEIS has been revised to state, "Roadway signs indicating wildlife presence would be placed in areas of high brown bear, moose, and mountain goat use to reduce potential vehicle collisions with wildlife."

Pages 5-4 and 5-5, section 5.9, numbers 9 and 11: ADOT&PF is committing to hazing wildlife prior to avalanche control or blasting. ADF&G recommends hazing mountain goats from helicopters as a last resort. ADOT&PF will be required to obtain a public safety permit from the ADF&G Division of Wildlife Conservation² prior to wildlife hazing.

RESPONSE: DOT&PF dropped the commitment to haze goats prior to avalanche control. DOT&PF would not use helicopters for hazing goats prior to construction rock blasting.

Page 5-5, section 5.9, number 10: This commitment should be expanded to include strategically placed wildlife fences.

RESPONSE: If Alternative 2B had been selected, location of potential fencing would have been developed as appropriate during final design. Because it was not selected, it is not included as a commitment in the Final SEIS.

Page 5-5, section 5.9, numbers 12 and 13: Please commit to consulting with ADF&G Division of Wildlife Conservation staff during wildlife training program development.

² ADOT&PF can request a permit application by sending an email to dfg.dwc.permits@alaska.gov.

RESPONSE: Per your comment, Section 5.9, Number 12 of the Final SEIS has been updated to reflect that DOT&PF would work with ADF&G during development of wildlife training programs for project construction.

Page 5-5, section 5.9: Please commit to limiting work in mountain goat over-wintering areas January through April.

RESPONSE: Limiting work in mountain goat over-wintering areas is not included as a commitment in the Final SEIS. Construction, as well as operations and maintenance work (e.g. avalanche control), would likely need to occur during this timeframe depending on seasonal conditions and schedule requirements.

Page 5-10, section 5.12.2: The long term effectiveness monitoring study of wildlife underpasses for brown bears should include effectiveness monitoring for moose in Berners Bay and the Katzehin River. These studies should also document mountain goat use of the underpasses.

Mountain goat and moose pre and post-construction monitoring would determine the extent to which road intersection of winter range fragments and alters use of wintering habitat.

RESPONSE: Specific commitments and mitigation measures for the JAI Project build alternatives are described by resource area in Sections 5.1 through 5.11 of the Final SEIS. As explained in Sections 5.1 through 5.11, most of these commitments and mitigation measures apply to any of the build alternatives; some apply only to road alternatives or certain ferry alternatives. However, because Alternative 1 – No Action has been identified as the preferred alternative, no mitigation is required or proposed; therefore, Section 5.12 has been deleted.

In addition to the inaccuracies we identified in the DSEIS, ADF&G discovered information in the *Appendix Z 2014 update to Appendix Q Wildlife Technical Report*³³ that is invalidated by the studies we completed in 2012. ADOT&PF could improve the Wildlife Technical Report by incorporating the following information –

3.3 Species Accounts

3.3.2.1 Brown Bear *Ursus arctos*

- Page 11, paragraph 2: Figures B1, B2, and B3 in Appendix B.
- Page 12, paragraph 1: Figures B3, B4, and B5 in Appendix B.
- Page 12, paragraph 3: Year range 1998 to 2009 (Bethune 2011).
- Page 12, paragraph 3: Unit 1D average harvest 14 bears per year (Bethune 2011).
- Page 12, paragraph 3: Four brown bear were reported as defense of life or property in all of GMU 1 during July 1, 2006 to June 30, 2010 (Bethune 2011).

RESPONSE: Per your comment, Appendix Z 2017 Update to Appendix Q – Wildlife Technical

³³ Which is an update to the 2005 Addendum to Appendix Q Wildlife Technical Report and 2004 Wildlife Technical Report included in Appendix W of the 2006 Final EIS

Report includes this information.

3.3.2.2 Marten *Martes americana*

- Page 12: Figure 2 is a wetlands classification map for Berners Bay.

RESPONSE: Per your comment, Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report, Section 3.3.2.2, states, “In the project study area, marten primarily occur in high-volume old-growth forest habitat (Figure 8 of Appendix A – 2005 Addendum to Appendix Q, Wildlife Technical Report).”

3.3.2.3 Moose *Alces alces*

- Page 13, paragraph 1: Figures C1 and C2 in Appendix C.
- Page 13, paragraph 3: Figures C3 and C4 in Appendix C.
- Page 13, paragraph 3: There were 14 surveys conducted during the winter between 2006 and 2011. The figure referenced is a model that predicts where moose can be found through the winter.
- Page 13, paragraph 4: Figures C5 and C6 in Appendix C.
- Page 13, paragraph 5: Cite White et al. (2012a).

RESPONSE: Per your comment, Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report includes figure references.

3.3.2.4 Mountain Goat *Oreamnos americanus*

- Page 14, paragraph 2: Sinclair Mt. population has not rebounded from 2006 levels.
- Page 14, paragraph 5: The GMU 1C harvest between 2001 and 2010 ranged from 30 to 60 goats per year (Scott 2012). The GMU 1D harvest between 2001 and 2010 ranged from 22 to 43 goats per year (Sell 2012).

RESPONSE: Per your comment, Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report includes this information.

3.3.2.5 Wolverine *Gulo gulo*

- Page 15, paragraph 1: Correct home ranges for male and female to show the medians; 521 km² and 71 km², respectively (Lewis et al. 2012).
- Page 15, paragraph 4: Average harvest in Unit 1C between 1997 and 2008 is 5 wolverines. Average harvest in combined Unit 1C and Unit 1D is 9 wolverines (Scott 2010, Crupi 2010). In Unit 1C, most wolverines are harvested in Berners Bay or on the west side of Lynn Canal (Scott 2010), so wolverine presence in the construction area is underrepresented.

RESPONSE: Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report, Section 3.3.2.5, appropriately shows the disparity in home range size between male and female wolverine.

Per your comment, Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report, Section 3.3.2.5, includes the information provided per your comment in the second bullet;

however, the text makes it clear that a large portion of the harvest occurs in Berners Bay.

4.2.2 Mammals

4.2.2.1 Wolverine

- Page 18: Alternative 1B would require no construction, and would result in no construction-related impact to brown bear, moose, marten, mountain goat and wolverine.

RESPONSE: Per your comment, Appendix Z *2017 Update to Appendix Q – Wildlife Technical Report*, Section 4.1.2, includes sections for brown bear, moose, marten, and mountain goat for impacts related to Alternative 1B. Wolverine were evaluated in the Draft SEIS Appendix Z *2014 Update to Appendix Q – Wildlife Technical Report*.

4.3 Alternative 2B – East Lynn Canal Highway to Katzehin, Shuttles to Haines and Skagway

4.3.4.1 Brown Bear

- Page 21, paragraph 2: Describe the measures that will be used to minimize bears shot and killed in defense of life or property during construction or reference section where these measures are described.

RESPONSE: Section 5.9, Numbers 11 through 13 of the Final SEIS contain the following mitigation measures for minimizing human-bear interactions:

“11. All construction personnel on site would be required to attend wildlife awareness training and orientation.

12. DOT&PF would work with ADF&G to develop a wildlife interaction plan prior to the start of construction for use by all personnel on site during construction to protect both people and wildlife. The plan would include topics such as safety measures for on-site personnel, (e.g., use of bear guards and bear spray); proposed storage and disposal of construction materials and trash; wildlife orientation training for on-site personnel; description of the handling of people/wildlife interactions, including contingencies in the event wildlife does not leave the site (e.g., hazing by trained staff); description of the layout of temporary buildings and work areas to minimize interactions between humans and bears/moose (e.g., use of electric fencing); and requirement to document and communicate the sighting of bears/moose on site or in the immediate area to all shift employees.

13. During construction, all garbage would be properly disposed of in closed bear-proof containers to avoid attracting bears.”

4.3.4.2 Moose

- Page 22, penultimate sentence of last paragraph: Include lower Lace and Gilkey Rivers.

RESPONSE: Per your comment, Appendix Z *2017 Update to Appendix Q – Wildlife Technical Report*, Section 4.3.4.2, includes the Lace and Gilkey River valleys in the referenced paragraph.

4.4 Alternative 3 – West Lynn Canal Highway

4.4.4.1 Brown Bears

- Page 28, paragraph 4: Bear use of habitats between Echo Cove and Sawmill Creek and proposed road corridor crossings are underestimated. This area is included in the home range of 2 collared females and 8 collared males (Flynn et al. 2012).

RESPONSE: Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report, Section 4.4.4.1, states that brown bears have been documented using areas just north of Echo Cove to Sawmill Cove.

4.4.4.2 Moose

- Page 29, paragraph 4: Cows from Berners Bay also move into Yankee Basin along the beach fringe and road in the spring to calf.

RESPONSE: Per your comment, Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report, Section 4.4.4.2.2, states that the area is used by cows in the spring for calving.

4.4.4.3 Mountain Goat

- Page 29, paragraph 1: William Henry Bay.
- Page 30, paragraph 2: If close to wintering habitat, groups of goats could potentially be down on the highway during the winter months.

RESPONSE: Per your comment, Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report, Section 4.4.4.3, page 29, paragraph 1 revises “Henry Bay” to “William Henry Bay.”

Per your comment, Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report, Section 4.4.4.3, states that goats may be on the highway in winter and contrasts the potential with Alternative 2B.

4.6 Alternatives 4B and 4D – FVF/Conventional Monohull Service from Berners Bay

4.6.4.1 Brown Bear

- Pages 35 and 36: Bear use of habitats between Echo Cove and Sawmill Creek and proposed road corridor crossings are underestimated on Page 28, paragraph 4 (Flynn et al. 2012). This area is included in the home range of 2 collared females and 8 collared males and their use of this habitat should be documented in this section.

RESPONSE: Per your comment, Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report, Section 4.6.4.1, states the number of brown bears using the habitats between Echo Cove and Sawmill Creek.

5 Mitigation Measures

5.5 Terrestrial Mammals

- Page 39, number 1: Please work with Division of Wildlife Conservation staff to write best management practices to prevent wildlife habituation.

RESPONSE: Per your comment, Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report, Section 5.5, Number 1 states that DOT&PF would consult with ADF&G on best management practices to prevent wildlife habituation.

- Page 39, number 3: ADF&G recommends extending the bridges 50 m on either side rather than 50 ft. We will work with ADOT&PF during fish habitat permitting to address this recommendation.

RESPONSE: Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report, Section 5.5, Number 3 was developed during extensive coordination and through consensus with resource agencies as part of the 2006 Record of Decision (ROD). No additional modifications to the bridges would have been included had the alternative been selected.

- Page 39, number 4: ADF&G will work ADOT&PF during fish habitat permitting to ensure the Lace River bridge is aligned with the high use brown bear crossing area identified in Flynn et al. (2012).

RESPONSE: Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report, Section 5.5, Numbers 2 and 3 were developed in conjunction with resource agencies as part of the 2006 ROD. No additional modifications to the Lace River Bridge alignment would have been proposed. DOT&PF believes the siting of two wildlife undercrossings at high use crossing areas in combination with the bridge superstructure extensions would have provided sufficient bear crossings.

- Page 39, number 5: Change USFWS to ADF&G.

RESPONSE: Per your comment, Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report, Section 5.5, Number 4 references consultation with ADF&G.

- Page 39, number 6: ADF&G recommends the proposed long term wildlife underpass effectiveness monitoring study for brown bears include effectiveness monitoring for moose in Berners Bay and the Katzehin. These studies should also document mountain goat use of the underpasses. Mountain goat and moose pre and post-construction monitoring would determine the extent to which road intersection of winter range fragments and alters use of wintering habitat.

RESPONSE: Per your comment, Appendix Z 2017 Update to Appendix Q – Wildlife Technical Report, Section 5.5, states that brown bear effectiveness monitoring would include anecdotal information on moose and mountain goat use.

Staff from the Division of Wildlife Conservation are available to help ADOT&PF update the Wildlife Technical Report with the best available information.

In our March 5, 2012 scoping comments, we recommended ADOT&PF include Berners Bay herring spawn maps in the DSEIS. While ADOT&PF has described herring spawn areas in the narrative, Chapter 3 figures could also include ADF&G's Commercial Fisheries Division GIS shapefiles. The Chapter 3 narrative would be improved by including that the herring sac-roe fisheries provided for in regulation could resume if the Lynn Canal population recovered. Chapter 3 could also be updated with the NOAA April 2, 2014 final report concluding the endangered species listing of the Southeast Alaska Distinct Population Segment of Pacific herring is not currently warranted.

RESPONSE: Per your comment, Section 3.3.7 of the Final SEIS addresses the Pacific herring petition to list under the Endangered Species Act and the NMFS' conclusion that the listing was not currently warranted. Herring spawning map data provided by ADF&G are incorporated into Chapter 3 of the Final SEIS (see Figure 3-19).

Public access provided under alternatives 2B, 3, 4B and 4D will improve the public's ability to harvest eulachon and herring spawn. While increased public access to these resources is noted in Chapter 4 of the DSEIS, the document could be improved by acknowledging in Chapter 2 the increase in management responsibilities for commercial fishery managers. Herring spawn habitat would be lost in Alternatives 3, 4B and 4D, so a commitment to replace the habitat in ferry terminal design would be appropriate. In Chapter 5, the commitment to time in-water work can specify Sawmill Creek ferry terminal in-water work will not occur between April 15 and May 31. Please also update the DSEIS index to include references to herring in Chapters 3, 4 and 5.

RESPONSE: Per your comment, the Final SEIS includes an index reference to herring.

As stated in Section 5.5 of the Final SEIS, in-water work for fill placement, dredging, or pile driving would have been timed to avoid impacts to spawning and migrating fish species in accordance with the Title 16 fish habitat permits.

Chapter 2 is for alternative description only.

ADOT&PF documents 26 anadromous water bodies among the 90 or so streams within the proposed project area. The ADF&G anadromous waters catalog incorrectly lists the stream course, upper extent, and species composition of many of the fish-bearing water bodies in the project area. Most inaccuracies are a result of antiquated mapping practices that are resolved by tracking the stream course on foot using a global positioning system from the stream mouth to an anadromous fish passage barrier, sampling for salmonids using minnow traps, hand nets, or a backpack electrofisher, and digitizing the water body using ArcGIS mapping software. Sawmill Creek is an example of a stream documented as anadromous far above a barrier, Independence Creek is an example of unconfirmed species composition, and Glacier Creek is an example of a stream listed as anadromous but not found in the 2014 anadromous waters catalog. Habitat Division staff will begin correcting the anadromous waters catalog next spring and we will provide the corrected information to ADOT&PF as it becomes available.

RESPONSE: The description of anadromous waters in the Final SEIS is based on ADF&G updates to the catalog available online as of September 2017.

The following recommendation, while outside ADF&G authorities, would improve the SEIS:

The information in the SEIS would be better understood if it was consolidated and reorganized. For instance, to review information about anadromous water bodies within the project area, the compact disc the Federal Highway Administration sent to me on September 15, 2014 contains Adobe Acrobat file JAIP 07 - Chapter 3 Affected Environment. Chapter 3 describes freshwater habitat in Lynn Canal and directs the reader to the Anadromous and Resident Fish Streams Technical Report (Appendix P) and the 2014 Update to Appendix P – Anadromous and Resident Fish Streams Technical Report (Appendix Z Update to P) for additional information on stream habitat in the project area. Appendix Z is not easily located as files are shown on the compact disc as Appendices Volumes 1 through 6, and the reader must review Volumes 1 through 5 before locating Appendix Z, which contains Appendix P and the Update to Appendix P.

RESPONSE: The Final SEIS conforms to standard practices for the organization of FHWA NEPA documents.

Appendix P contains an errata sheet and the 2014 update to Appendix P contains an errata sheet triple the size of the Appendix P errata sheet.

RESPONSE: The Final SEIS conforms to standard practices for the organization of FHWA NEPA documents.

Or, for example, to review anticipated impacts from a terminal in William Henry Bay, which is *south* of the Endicott River in the West Lynn Canal, Alternative 3, JAIP 07 - Chapter 3 Affected Environment, points to the Appendix Z update to N, 2014 Update to Appendix N – Essential Fish Habitat Assessment, Attachment A 2005 Addendum to Appendix N – Essential Fish Habitat Assessment, Appendix W – Technical Report Addenda January 2006, W-220, 3.1.3.2, Cumulative Effects, which says Alternative 3 would be on the shoreline approximately two miles *north* of the Endicott River.

RESPONSE: Per your comment, Appendix Z *2017 Update to Appendix N – Essential Fish Habitat Assessment*, Attachment A, Section 3.1.3.2, states that the terminal location is south of the Endicott River.

Though I provide two specific examples here, I encountered equivalent DSEIS disorganization for every topic of ADF&G interest – for instance, see paragraph three of this memo. The Council on Environmental Quality requires clear and concise National Environmental Policy Act documents because the public has a role in the process and because the documents need to be useful to decision-makers. The public and decision-makers would benefit if the final SEIS was clear and concise.

RESPONSE: The Final SEIS conforms to standard practices for the organization of FHWA

NEPA documents.

Thank you for the opportunity to review and comment.

Juneau Access Improvements Project
Attn: Deborah Holman
DOT&PF Southeast Region
P.O. Box 112506
Juneau, AK 99811-2506

Re: Response to the Supplemental Environmental Impact Statement

Dear Ms. Holman:

Thank you for the opportunity to comment on the Supplemental Environmental Impact Statement concerning Juneau Access.

On June 26, 2006, the Department of Natural Resources, Division of Mining Land and Water for the Southeast Region ("DMLW") issued a Final Finding and Decision ("Final Decision") regarding the Juneau Access Project (See ADL 107463).

This Final Decision granted a public easement on State of Alaska tide and submerged land and shore land to the Alaska Department of Transportation and Public Facilities ("DOT&PF") for the construction and use of a road extending Glacier Highway from Echo Cove north around Berners Bay and along the eastern shore of Lynn Canal to a location approximately one mile north of Independence Creek. The easement granted was for approximately 43.3 acres with the final acreage to be determined by an as-built survey when construction of the improvements is completed.

The portion of the Juneau Access Project extending from one mile north of Independence Creek to the Katzehin River, including a ferry terminal at the Katzehin Delta, are not included in the previously published Final Decision. As of this date, DMLW has not received an Application for consideration of State land use authorizations for the northern portion of the project. Specifically, these land areas are identified in the Northern Southeast Area Plan ("NSEAP") and set forth in Figures 1 and 2 as H20, H40, H41 and HT-07. (See below).

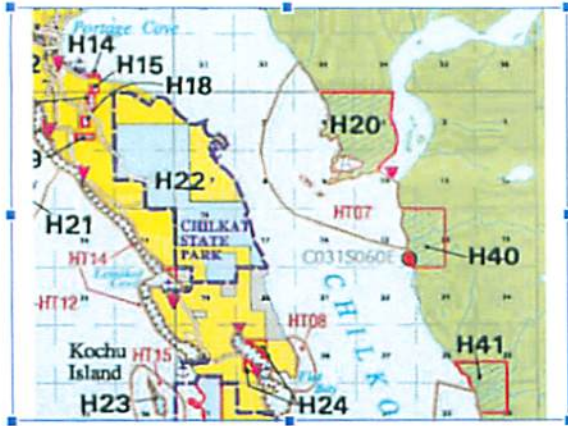

Fig. 1 NSEAP Management Unit H20

Fig.2 DMLW Mapper USGS view H20

Further, some of these lands are subject to a Municipal Entitlement determination by DMLW that is now in progress. (See ADL 108105.) This process has been in progress for several years but has been delayed while surveys of the affected areas are completed.

Here, DMLW's role is to provide the necessary State land use authorization for entry onto State land for the construction of the Juneau Access highway. DMLW has not received an Application to commence an adjudicatory process to determine if these lands are appropriate for such use with respect to these properties.

Alaska Statutes require an adjudicatory process for uses of State land. Until an adjudicatory process is completed, it is premature for DMLW to comment on probable outcomes concerning the approval of land uses for which no Application has been received. Therefore, once an Application is received by DMLW, the adjudicatory process can begin.

Respectfully submitted,

Robert H. Edwardson
Regional Land Manager

P.O. Box 111020
Juneau, Alaska 99811

Dear Mr. Cole:

Thank you for your letter, dated November 25, 2014, with your agency's comments on the Juneau Access Improvements (JAI) Project Draft Supplemental Environmental Impact Statement (SEIS). We appreciate the participation of the Alaska Department of Natural Resources in the JAI Project.

We have reviewed your letter and have made appropriate revisions to the Final SEIS. Our attached responses have been embedded in a reprint of your letter.

We anticipate releasing a combined Final SEIS/Record of Decision very soon. FHWA has identified Alternative 1 – No Action as the Preferred Alternative in the Final SEIS. Governor Walker announced on December 15, 2017, that the "No Build Alternative" is the State's Preferred Alternative. Please see Section 2.5 of the Final SEIS for further discussion. No application for consideration of State land use authorizations will be submitted at this time.

However, lands within the Lynn Canal corridor remain critical for potential future transportation projects, as the Department's mission to provide statewide connectivity for commerce, defense, recreation, and community development remain. A shape file of the project area is provided on CD and enclosed for inclusion to your database so it is viewable on Geographic Information System layers, such as Alaska Mapper. It provides alignments for both the Lynn Canal east and west side roads. We request that when applications concerning these lands are considered, DNR coordinate with DOT&PF per AS 38.05.945(b)(2)(D)(iii) prior to taking any action, and that DNR note these corridors in their area plans. DOT&PF thanks DNR for continued cooperation to ensure lands for highway corridors are retained in public ownership.

Please do not hesitate to contact me at (907) 465-1828 if you have any additional questions or concerns.

Sincerely,

Juneau Access Improvements Project Attn: Deborah Holman
DOT&PF Southeast Region
P.O. Box 112506
Juneau, AK 99811-2506

Re: Response to the Supplemental Environmental Impact Statement

Dear Ms. Holman:

Thank you for the opportunity to comment on the Supplemental Environmental Impact Statement concerning Juneau Access.

On June 26, 2006, the Department of Natural Resources, Division of Mining Land and Water for the Southeast Region ("DMLW") issued a Final Finding and Decision ("Final Decision") regarding the Juneau Access Project (See ADL 107463).

This Final Decision granted a public easement on State of Alaska tide and submerged land and shore land to the Alaska Department of Transportation and Public Facilities ("DOT&PF") for the construction and use of a road extending Glacier Highway from Echo Cove north around Berners Bay and along the eastern shore of Lynn Canal to a location approximately one mile north of Independence Creek. The easement granted was for approximately 43.3 acres with the final acreage to be determined by an as-built survey when construction of the improvements is completed.

The portion of the Juneau Access Project extending from one mile north of Independence Creek to the Katzeihin River, including a ferry terminal at the Katzeihin Delta, are not included in the previously published Final Decision. As of this date, DMLW has not received an Application for consideration of State land use authorizations for the northern portion of the project. Specifically, these land areas are identified in the Northern Southeast Area Plan ("NSEAP") and set forth in Figures 1 and 2 as H20, H40, H41 and HT-07. (See below).

RESPONSE: The Final SEIS identifies the Alternative 1 – No Action as the preferred alternative. No application for consideration of State land use authorizations will be submitted for the Juneau Access Improvements (JAI) Project at this time.

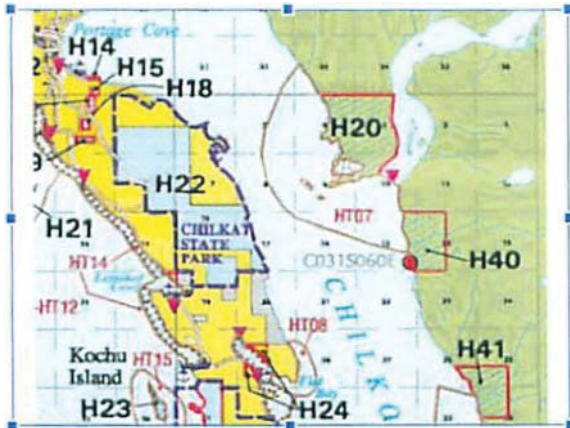

Fig. 1 NSEAP Management Unit H20

Fig.2 DMLW Mapper USGS view H20

Further, some of these lands are subject to a Municipal Entitlement determination by DMLW that is now in progress. (See ADL 108105.) This process has been in progress for several years but has been delayed while surveys of the affected areas are completed.

RESPONSE: DOT&PF's Southeast Alaska Transportation Plan (SATP), a long-term transportation plan, identified a need to improve surface transportation in the Lynn Canal Corridor via a road. DOT&PF has been in the process of updating its SATP for several years and released a Draft SATP in June 2014. The 2014 Draft SATP recommended a highway from Juneau to Katzeihin with ferry service between Katzeihin and Haines and Skagway (i.e., Alternative 2B, the preferred alternative in the 2014 Draft SEIS). The SATP is now in the process of being updated to change the planned improvement to be Alternative 1 – No Action, consistent with the preferred alternative for this Final EIS.

Planning for and maintaining a transportation corridor is consistent with DOT&PF's statute mission. Under AS 19.05.125, Purpose, it is one of DOT&PF's missions to establish and maintain a network of highway connectivity linking together cities and communities throughout the State for national and State defense; promotion of commerce and industry; resource extraction and utilization; and improvement of the economic and general welfare of the people of Alaska.

Congress recognizes the significance of community transportation corridors in Southeast Alaska. Transportation and utility rights-of-way and easements within the Tongass National Forest along the east and west sides of Lynn Canal were granted to the State of Alaska by Congress in SAFETEA-LU's Section 4407 as amended by the FAST Act.

Given DOT&PF's long-term planning goals, the public interest in retaining State ownership of the land outweighs the municipality's interest in obtaining the land, (AS 29.65.050 (c) Fulfillment of Land Entitlements). It is DOT&PF's policy to retain fee-simple interest in transportation lands whenever possible. Divesting of lands with potential for future projects causes extensive project delays and raises the State's acquisition and relocation liabilities as the lands are developed outside of State ownership.

Here, DMLW's role is to provide the necessary State land use authorization for entry onto State land for the construction of the Juneau Access highway. DMLW has not received an Application to commence an adjudicatory process to determine if these lands are appropriate for such use with respect to these properties.

Alaska Statutes require an adjudicatory process for uses of State land. Until an adjudicatory process is completed, it is premature for DMLW to comment on probable outcomes concerning the approval of land uses for which no Application has been received. Therefore, once an Application is received by DMLW, the adjudicatory process can begin.

RESPONSE: As stated earlier, the Final SEIS now identifies Alternative 1 – No Action as the preferred alternative. Therefore, no application will be submitted for the JAI Project at this time.

Respectfully submitted,

Robert H. Edwardson
Regional Land Manager
South East Region

Juneau Access Improvement Project
ATTN: Deborah Holman
DOT&PF Southeast Region
P.O. Box 112506
Juneau, AK 99811-2506
juneauaccess@alaska.gov

The position of the Borough has not changed regarding Alternative 2B, the state's preferred alternative. The Borough continues to oppose an East Lynn Canal road and continues to support improved marine access. (Resolutions attached.) This is in keeping with a 2003 McDowell survey that 67% of Haines residents preferred better ferry service than a road to Juneau (See Appendix EE at page 214).

Our concerns are primarily about:

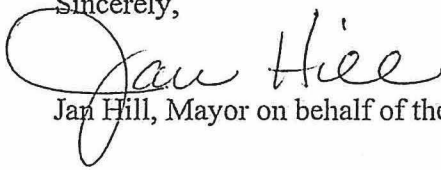

- Safety – Road would run underneath 41 active avalanche paths and 99 rock, debris, and landslides. Accidents and fatalities will occur, as will unpredictable travel delays.
- Reliability - AMHS is not weather-dependent, offering reliable access to Juneau year round. If Alternative 2B is built, both road and air access will be weather-dependent. 19% of trips to Juneau are medical or business related, and 18% of Juneau trips are for jet service. Reliability is key.
- Emergency Services – 20 miles of road will be in the Haines Borough, spreading our emergency service providers thin.
- Economy – Alternative 2B will likely provide a net economic loss for Haines with expected retail leakage to Juneau and resulting decreased sales tax revenues.
- Foot Passengers – Additional costs and inconvenience to this large segment of the traveling public is an on-going concern.
- Regional School Activities and Competitions – Student travel is frequent and is almost always as AMHS walk-on. If built, Alternative 2B will force the District to either drive students to Juneau, or fly. Either option would be far more expensive

for our District – perhaps cost-prohibitive - and we would have safety concerns for our students.

- Funding Priorities – Existing infrastructure should be maintained including replacing aging AMHS vessels. With declining federal highway funding and declining state funds, Alternative 2B is too expensive to build and maintain. Local transportation priorities could be postponed or cancelled due to huge capital and maintenance costs for 2B.

Thank you for the opportunity to comment.

Sincerely,

A handwritten signature in cursive script that reads "Jan Hill". The signature is written in black ink and is positioned above the typed name.

Jan Hill, Mayor on behalf of the Haines Borough Assembly

HB Resolution 11-11-316

HB Resolution 07-11-116

HB Resolution 04-08-046

HB Resolution 418

Resolution, Haines Chamber of Commerce

A RESOLUTION OF THE HAINES BOROUGH ASSEMBLY REAFFIRMING ITS SUPPORT OF RESOLUTIONS 04-04-042 AND 07-11-116, AND ITS CONTINUED PREFERENCE FOR IMPROVED FERRY SERVICE RATHER THAN AN EAST LYNN CANAL HIGHWAY.

WHEREAS, the Alaska Department of Transportation and Public Facilities has requested public input on the Southeast Alaska Transportation Plan *2011 Update Scoping Report*; and

WHEREAS, the *2011 Update Scoping Report* includes an alternative that would build an East Lynn Canal Highway; and

WHEREAS, through Resolutions 04-04-042 and 07-11-116 the Haines Borough has expressed and reaffirmed its preference for improved Alaska Marine Highway service in the Lynn Canal and opposed development of an East Lynn Canal Highway; and

WHEREAS, Appendix C of the Juneau Access Draft Environmental Impact Statement states a majority of residents surveyed in Juneau, Haines and Skagway prefer improved ferry service rather than road access to Juneau; and

WHEREAS, the Record of Decision of the Juneau Access Final Environmental Impact Statement determined an East Lynn Canal Highway would be twice as expensive to operate and maintain as existing ferry service; and

WHEREAS, the Golder Associates Geotechnical Investigation found 112 geological hazards that, in addition to 36 active avalanche paths, would endanger public safety and close an East Lynn Canal Highway frequently, thereby decreasing Juneau access; and

WHEREAS, the Juneau Access Final Environmental Impact Statement determined there would likely be 600 non-fatal and 8 fatal accidents over a 40 year period on an East Lynn Canal Highway; and

WHEREAS, the Alaska Marine Highway has an excellent safety record; and

WHEREAS, the Marine Transportation Advisory Board advocates investments in new ferries,

NOW, THEREFORE, BE IT RESOLVED that the Haines Borough Assembly:

Section 1: Reaffirms its support of Resolutions 04-04-042 and 07-11-116 and its continued preference for improved ferry service rather than an East Lynn Canal Highway;

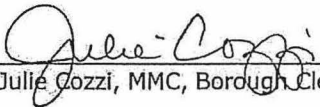

Section 2: Recommends that the state focus planning and funding strategies for transportation improvements in Southeast Alaska on enhancing marine transportation options recommended by the Marine Transportation Advisory Board with special emphasis on the deployment of Alaska Class ferries and that consideration of a Berner's Bay ferry terminal include an inherent public transportation component to support walk-on ferry passengers;

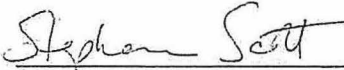

HAINES BOROUGH
Resolution No. 11-11-316
Page 2

Section 3: Shall submit copies of this resolution to Andy Hughes, Planning Chief for the Southeast Alaska Transportation Plan, Governor Sean Parnell, Senator Albert Kookesh, and Representative Bill Thomas.

ADOPTED BY A DULY CONSTITUTED QUORUM OF THE HAINES BOROUGH ASSEMBLY THIS 15th DAY OF NOVEMBER 2011.

ATTEST:

Stephanie Scott, Mayor

HAINES BOROUGH
RESOLUTION 07-11-116

Adopted

A RESOLUTION OF THE HAINES BOROUGH ASSEMBLY REAFFIRMING ITS SUPPORT OF RESOLUTION 04-04-042 AND ITS PREFERENCE FOR IMPROVED FERRY SERVICE RATHER THAN AN EAST LYNN CANAL HIGHWAY.

Whereas, on October 29, 2007 Governor Sarah Palin's office issued a statement urging people to contact their legislators to support an East Lynn Canal Highway; and,

Whereas, the Haines Borough has repeatedly expressed its preference for improved Alaska Marine Highway service in the upper Lynn Canal and opposed the development of an East Lynn Canal Highway; and,

Whereas, the Haines Borough Assembly adopted resolution 04-04-042 on April 7, 2004, which states:

"WHEREAS, the Alaska Marine Highway System was created as a public transportation network, serving all Alaskans, supported in part by public funds; and,

WHEREAS, the Alaska Marine Highway System serves as Southeast Alaska's road system, effectively providing ferry service to connect the remote communities of Southeast Alaska and promote economic development within the region for over forty years; and,

WHEREAS, the construction of new roads would offer minimal enhancements to SE Alaska's transportation system due to the geographic challenges unique to this region; and,

WHEREAS, Alaska Marine Highway System is currently in need of investments to ensure continued and improved ferry service in the future; and

WHEREAS, the Haines economy is largely dependent upon being a transportation link between Southeast and interior Alaska, the Yukon, and Lower 48; and,

WHEREAS, a majority of Haines residents and businesses support improved marine access over a Juneau Road;

THEREFORE BE IT RESOLVED that the Haines Borough Assembly requests that state and federal governments focus planning and funding strategies for transportation improvements in Southeast Alaska on enhancing marine transportation within the region."; and,

Whereas, the estimated funds needed for the proposed East Lynn Canal Highway have recently been increased to \$350 million, and this amount would significantly address the many needs of the Marine Highway System,

NOW, THEREFORE, BE IT RESOLVED by the Haines Borough Assembly:

Section 1: That the Haines Borough Assembly reaffirms its support of Resolution 04-04-042 and preference for improved ferry service rather than an East Lynn Canal Highway;

Section 2: That the Haines Borough Assembly requests the Governor establish a segregated fund for the purpose of replacing the aging fleet and construction of needed ferry terminal modifications;

Section 3: That the Haines Borough pledges its full support and cooperation to develop the Haines Ferry Terminal into a regional hub that will support daily service to the ports of Juneau and Skagway; and

Section 4: That copies of this resolution will be sent to Senator Albert Kookesh, Representative Bill Thomas, and Governor Sarah Palin.

ADOPTED by a duly constituted quorum of the Haines Borough Assembly on the 20th day of November, 2007.

RESOLUTION 04-08-046

A RESOLUTION OF THE HAINES BOROUGH, EXPRESSING APPRECIATION FOR THE ALASKA MARINE HIGHWAY'S PROPOSED 2004/2005 FALL/WINTER/SPRING FERRY AND ADVOCATING FOR THE ESTABLISHMENT OF A HAINES-BASED SHUTTLE FERRY TO OPERATE BETWEEN HAINES AND SKAGWAY, BEGINNING IN THE SUMMER OF 2005.

WHEREAS, the Haines Borough is a coastal community that depends on the Alaska Marine Highway as a critical means of moving people, vehicles, and goods; and,

WHEREAS, the Alaska Marine Highway System has proposed a Fall/Winter/Spring schedule of service that is very favorable to the community of Haines; and,

WHEREAS, the Haines Borough Assembly recognizes and appreciates this level of service; and,

WHEREAS, the regional economy depends upon consistent and regular transportation service between Haines and Skagway; and

WHEREAS, the Department of Transportation's various plans for future transportation in the Upper Lynn Canal call for the deployment of a shuttle ferry between Haines and Skagway;

THEREFORE BE IT RESOLVED that the Haines Borough Assembly expresses appreciation for the Alaska Marine Highway's proposed 2004/2005 Fall/Winter/Spring ferry and advocates for the establishment of a Haines-based shuttle ferry to operate between Haines and Skagway beginning in the summer of 2005.

Adopted by a duly constituted quorum of the Haines Borough Assembly on this 4th day of August, 2004.

Haines Chamber of Commerce

A resolution of the Haines Chamber of Commerce opposing construction of road options of the Juneau Access Project and supporting improved Ferry Service.

WHEREAS, the Department of Transportation and Public Facilities is currently taking public comment on proposed access improvements to Juneau; and

WHEREAS, the Juneau Access Project has identified the East Lynn Canal road as the preferred alternative; and

WHEREAS, the East Lynn Canal Road will cross designated wilderness lands (LUD-2) and will negatively impact wildlife habitat for bald eagles, sea lions and salmon; and

WHEREAS, the East Lynn Canal Road could negatively impact the Lynn Canal Commercial fishery due to construction and an increase in sports fishing activity as a result of improved access to the Lynn Canal; and

WHEREAS, the East Lynn Canal Road will traverse fifty-eight avalanche chutes and will have the highest avalanche hazard rating of any highway in North America, with the resulting increase in project and maintenance costs due to avalanche mitigation and clearing; and

WHEREAS, avalanches will result in the loss of any surface access due to road closures, will result in high maintenance costs and will create the potential for the loss of life to maintenance workers and users of the road; and

WHEREAS, increased maintenance costs due to the East Lynn Canal Road will further impact maintenance of existing State transportation facilities such as highways, airports, terminals and marine vessels, which are presently maintained at sub-standard levels; and

WHEREAS, according to Appendix C of the Juneau Access Draft Environmental Impact Statement a majority of residents surveyed in Juneau, Haines and Skagway prefer improved ferry service rather than road access to Juneau.

NOW THEREFORE BE IT RESOLVED, that the Haines Chamber of Commerce opposes construction of the East Lynn Canal Road and other road options as currently proposed by the State of Alaska Department of Transportation and Public Facilities and favors improved ferry service to the communities of Haines, Skagway and Juneau.

Haines Borough
P.O. Box 1209
Haines, Alaska 99827

Dear Ms. Hill:

Thank you for your letter, dated October 28, 2014, with comments on the Juneau Access Improvements (JAI) Project Draft Supplemental Environmental Impact Statement (SEIS). We appreciate the participation of the Haines Borough in the JAI Project.

We have reviewed your letter and have made appropriate revisions to the Final SEIS. Our attached responses have been embedded in a reprint of your letter.

We anticipate releasing a combined Final SEIS/Record of Decision very soon. FHWA has identified Alternative 1 – No Action as the Preferred Alternative in the Final SEIS. Governor Walker announced on December 15, 2017, that the “No Build Alternative” is the State’s Preferred Alternative. Please see Section 2.5 of the Final SEIS for further discussion.

Please do not hesitate to contact me at (907) 465-1828 if you have any additional questions or concerns.

Sincerely,

A handwritten signature in blue ink that reads "Greg Lockwood".

juneauaccess@alaska.gov

The position of the Borough has not changed regarding Alternative 2B, the state's preferred alternative. The Borough continues to oppose an East Lynn Canal road and continues to support improved marine access. (Resolutions attached.) This is in keeping with a 2003 McDowell survey that 67% of Haines residents preferred better ferry service than a road to Juneau (See Appendix EE at page 214).

Our concerns are primarily about:

- Safety - Road would run underneath 41 active avalanche paths and 99 rock, debris, and landslides. Accidents and fatalities will occur, as will unpredictable travel delays.

RESPONSE: The Department of Transportation and Public Facilities (DOT&PF) and Federal Highway Administration (FHWA) identified Alternative 1 – No Action as the preferred alternative in the Final Supplemental Environmental Impact Statement (SEIS)/Record of Decision (ROD). DOT&PF and FHWA examined the reliability and risk associated with avalanches and weather using the best information available and appropriate analysis techniques, and included avalanche risk mitigation in the design (e.g., alignment location, elevated embankments, and avalanche sheds) and in DOT&PF's operating plan for Alternatives 2B and 3. Section 4.3.8.2 of the Draft SEIS disclosed the avalanche hazard for Alternative 2B and demonstrated how the alternative included hazard reduction methods to improve safety for the corridor. There have been no fatalities to the traveling public on any of the highways ranked with the same Avalanche Hazard Index as Alternative 2B since implementation of a

full avalanche control program.

The *2017 Update to Appendix D – Technical Alignment Report* in Appendix Z has been updated for the Final SEIS to include identification of the geotechnical hazards and proposed mitigation for each hazard based on preliminary design. Based on the current design, inadvertent road closures may have occurred over the lifetime of the Juneau Access Improvements (JAI) Project. It is expected that these closures would have required less than half a day to clean up. It is also expected that in the event of a full width road closure, single lane traffic would have been restored within 2 hours and two-lane traffic would have been restored within half a day. This is consistent with closures experienced on other Alaska highways with similar terrain.

- Reliability - AMHS is not weather-dependent, offering reliable access to Juneau year round. If Alternative 2B is built, both road and air access will be weather- dependent. 19% of trips to Juneau are medical or business related, and 18% of Juneau trips are for jet service. Reliability is key.

RESPONSE: For Alternative 2B, missed ferry sailings would likely have been the result of wind and wave conditions in the middle of Lynn Canal and not at the ferry terminal sites. From the current data, an assumption of 1 to 6 days per year could have been reasonably expected for days with vessel cancellations.

The upper magnitude wind speeds (1 minute average) in the middle of Lynn Canal in the Haines/Katzehin vicinity can vary 30 to 68 knots, causing mid canal wave conditions that could have potentially prevented ferry sailings. Based on the The Glostien Associates reports (available on the JAI Project website at www.juneauaccess.alaska.gov), these wind events could have been expected to occur 1 to 5 percent of the time, primarily from November through February. Assuming a period of 4 months or 120 days for the worst weather conditions, it can be assumed that 1 to 6 days per year may have been subjected to weather conditions that could have prevented a ferry crossing. The projected number of sailings that could have been missed depends on the number of sailings per day and if the inclement weather occurred during those sailing times.

Current data for the north and south wind directions suggests relatively low wave height (under two feet) near the Katzehin Ferry Terminal site regardless of the magnitude of the wind event. The Katzehin Ferry Terminal would have been somewhat exposed to the westerly direction. There is no current data presented for the westerly direction; however, the fetch distance would have been short and wave heights should have been relatively low.

While winds would have been strong, causing difficulty in berthing, the ferry mooring structures at the Katzehin and Haines Ferry Terminals would not likely have been significantly affected by wave and wind conditions from any direction. The ferry would have been able to safely weather storms at either port, assuming the moored vessel would have been properly safeguarded and monitored during extreme storm events.

The Draft SEIS acknowledged that adverse driving conditions would have occurred on the East Lynn Canal Highway in the winter, but anticipated that State maintenance crews would have kept the highway open under all but the most severe conditions. Such severe weather conditions could have called for road closures. DOT&PF and FHWA disclosed the impacts of potential road closures and mitigated those effects to the extent that travel delays and closures would have been minimized.

- Emergency Services - 20 miles of road will be in the Haines Borough, spreading our emergency service providers thin.

RESPONSE: Statewide, the Alaska State Troopers are responsible for general policing, patrols, and emergency response along rural roads, particularly outside of the areas associated with individual local governments. Alternative 2B would have fallen partially in the City and Borough of Juneau (CBJ; approximately 30 road miles north of Echo Cove to Eldred Rock) and partially in the Haines Borough (from Eldred Rock northward). Within the CBJ, the Juneau Police Department (JPD) would have been responsible for the primary response. The Alaska State Troopers based in Juneau would have provided the primary response for the segment of road north of the CBJ boundary. The Alternative 3 road on the west side of Lynn Canal would have fallen within the Haines Borough. Under Alternative 3, the primary response would have come from State Troopers based in Haines.

The SEIS indicates it is likely that emergency medical response would have come from these communities. In the Draft and Final SEIS, Section 3.1.4 and corresponding Socioeconomic Resources sections in Chapter 4 for each alternative provide basic information about services provided at each community and disclose the potential impacts to the service providers of having more road miles and more traffic within their areas of responsibility. See also Section 3.3 of Revised Appendix EE, *Socioeconomic Effects Technical Report*. Fire protection outside local fire service areas (i.e., along these road routes) would have come from the Alaska Division of Forestry and Tongass National Forest. Haines, Skagway, and Juneau all have search and rescue capabilities either through separate organizations, through their fire/rescue departments, or both. Overall, providers of public safety would have remained the same as today under all alternatives. The text of the Final SEIS has been reviewed and clarifications have been made to ensure the information above is clearly represented.

The agencies with the most resources available (State Troopers, JPD, and Capital City Fire and Rescue [CCFR]) say they are operating at minimal staffing levels given the extent of their current responsibilities and service areas. The SEIS and Revised Appendix EE disclose the potential that local agencies may have required further resources to continue to provide the same level of service.

- Economy - Alternative 2B will likely provide a net economic loss for Haines with expected retail leakage to Juneau and resulting decreased sales tax revenues.

RESPONSE: As stated in Section 4.3.5.3 of the Draft SEIS, sales tax revenue in Haines would have been expected to increase under Alternative 2B due to increased visitor spending of approximately \$6.9 million per year. Approximately \$1.3 million in new spending that would have occurred in Juneau with Alternative 2B would have been by Haines residents, reducing the net visitor spending in Haines to approximately \$5.6 million annually (see Table 4-17 in the Draft SEIS). This net increase in annual visitor spending in Haines would have generated as much as \$2.1 million in new payroll and about 60 additional jobs (increase of approximately 90 new residents).

Section 4.3.5.3 of the Draft SEIS also described how the increase in residents would have been expected to result in a demand for approximately 26 housing units (based on 3.4 persons per household). Improved access would have also been anticipated to enhance Haines's reputation as a retirement community, which would have also been expected to lead to additional demand for property in Haines. Land availability in Haines, and its drier climate, could have resulted in Juneau residents seeking seasonal or year-round housing in Haines. In addition, improved access between Haines and the Kensington Gold Mine could have resulted in a demand for housing in Haines by mine workers. Haines would have also received an increase in property tax revenues as a result of the potential increase in private property values.

- Foot Passengers - Additional costs and inconvenience to this large segment of the traveling public is an on-going concern.

RESPONSE: As explained in Section 1.4.1.1 of the SEIS, the State's primary responsibility is to provide transportation facilities for vehicles, not the transportation itself. Because of the nature of the Alaska Marine Highway System (AMHS), the vessels that move vehicles also accommodate walk-on passengers; however, this is a secondary function that is not provided on other highways in the State.

Walk-on passengers would have been accommodated on shuttle ferries. The road alternatives (2B and 3), however, represent a shift in the way transportation would have been provided in the corridor—away from a primarily public transportation mode that operates more like a public transit service, to a highway system where private vehicles would have provided most of the transportation (shorter, shuttle ferries would have provided links connecting the roadways). The SEIS acknowledges the impact to travelers wishing to not take a vehicle but also makes it clear that the State does not recognize a responsibility to provide public transportation. The cost of taking a vehicle would have been considerably cheaper under Alternative 2B than it would have been under Alternative 1 – No Action; therefore, there would have been less economic incentive to travel as a walk-on passenger. DOT&PF and FHWA recognize that this shift would have an effect on passengers who do not own vehicles (approximately 9 percent of the combined Juneau, Haines, and Skagway households). Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS described impacts to "Pedestrians and Bicyclists" for Alternatives 2B and 3, including walk-on passengers.

Additional information about walk-on passengers has been added to Sections 4.3.7.5 and 4.4.7.5 of the Final SEIS. Travelers without vehicles would have been forced to rent vehicles, take a commuter flight, or travel in private vehicles or with private entities to accommodate this demand. The out-of-pocket user cost of travel to/from Juneau for a passenger with a car under Alternatives 2B and 3 would have been lower than the cost for a walk-on passenger under Alternative 1 – No Action, and it would have been more convenient to have a car to travel between Juneau and Katzechin. While transportation services may have been developed by private entities to accommodate walk-on passengers, the cost, frequency, and convenience of a bus or van service would have depended on the size of the market.

Walk-on passengers who would have relied on bus service to/from the Katzechin Ferry Terminal (if it developed) would have had less flexibility and opportunity to travel compared to travelers who drove, as it would have been likely that bus service would not have been available for every ferry sailing (i.e., walk-on passengers would have needed to time their travels with the bus schedule). It is anticipated that walk-on passengers relying on getting rides with others in private vehicles would have had more flexibility and shorter travel times than those relying on the bus.

- Regional School Activities and Competitions – Student travel is frequent and is almost always as AMHS walk-on. If built, Alternative 2B will force the District to either drive students to Juneau, or fly. Either option would be far more expensive for our District - perhaps cost-prohibitive - and we would have safety concerns for our students.

RESPONSE: FHWA and DOT&PF acknowledge that student transportation between Lynn Canal communities may have changed as a result of Alternative 2B. Additional information regarding the impact of Alternative 2B to student transportation has been added to Section 4.3.5.2 of the Final SEIS, and to Section 4.4.5.2 where Alternative 3 would have had corresponding effects. The cost of transporting students from Haines or Skagway to Juneau would have depended on a variety of factors, including the number of students and the need to overnight away from home. The opportunity for

students to travel between the communities may have increased due to reduced costs and the increased ability to make the trip within the same day.

Any transportation project proposed by DOT&PF and FHWA must meet established engineering standards and practices for safety and reliability. Therefore, all JAI Project alternatives would have been developed to be safe and reliable in accordance with those standards.

- Funding Priorities - Existing infrastructure should be maintained including replacing aging AMHS vessels. With declining federal highway funding and declining state funds, Alternative 2B is too expensive to build and maintain. Local transportation priorities could be postponed or cancelled due to huge capital and maintenance costs for 2B.

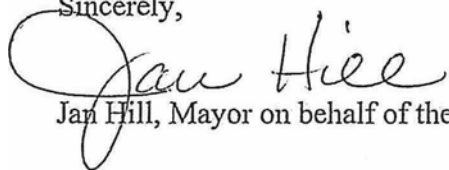

RESPONSE: Prioritizing the use of National Highway System transportation funds is the responsibility of the DOT&PF. That prioritization is done through the 4-year Statewide Transportation Improvement Program (STIP), which is published in draft form for public review and comment before approval. The STIP is modified each year to account for shifting priorities and project schedules around the State. The STIP is approved by the DOT&PF Commissioner and federal funding partners. The Legislature provides DOT&PF with authority to spend federal money and allocates funding for the State's match through the capital budget. FHWA funds are not available to be spent on routine maintenance on existing highways. AMHS receives Ferry Boat formula funds and is eligible for other types of FHWA funding as well. It is not possible to indicate specifically which other State transportation projects may have been postponed or cancelled if STIP funds would have been allocated for the construction of the JAI Project.

On December 4, 2015 the FAST Act, a 5-year transportation bill that provides stability in federal funding over the life of the bill, was signed into law. This bill includes slight increases in funding to Alaska.

DOT&PF and FHWA have identified Alternative 1 – No Action as the preferred alternative in the Final SEIS/ROD, and programmed funding will be allocated to other projects. DOT&PF's 2016–2019 STIP (Amendment 3, June 28, 2017) does not include funding for any JAI Project build alternatives.

Thank you for the opportunity to comment.

Sincerely,

Jan Hill, Mayor on behalf of the Haines Borough Assembly

HB Resolution 07-11-116

HB Resolution 04-08-046

HB Resolution 418

Resolution, Haines Chamber of Commerce

A RESOLUTION OF THE HAINES BOROUGH ASSEMBLY REAFFIRMING ITS SUPPORT OF RESOLUTIONS 04-04-042 AND 07-11-116, AND ITS CONTINUED PREFERENCE FOR IMPROVED FERRY SERVICE RATHER THAN AN EAST LYNN CANAL HIGHWAY.

WHEREAS, the Alaska Department of Transportation and Public Facilities has requested public input on the Southeast Alaska Transportation Plan *2011 Update Scoping Report*; and

WHEREAS, the *2011 Update Scoping Report* includes an alternative that would build an East Lynn Canal Highway; and

WHEREAS, through Resolutions 04-04-042 and 07-11-116 the Haines Borough has expressed and reaffirmed its preference for improved Alaska Marine Highway service in the Lynn Canal and opposed development of an East Lynn Canal Highway; and

WHEREAS, Appendix C of the Juneau Access Draft Environmental Impact Statement states a majority of residents surveyed in Juneau, Haines and Skagway prefer improved ferry service rather than road access to Juneau; and

WHEREAS, the Record of Decision of the Juneau Access Final Environmental Impact Statement determined an East Lynn Canal Highway would be twice as expensive to operate and maintain as existing ferry service; and

WHEREAS, the Golder Associates Geotechnical Investigation found 112 geological hazards that, in addition to 36 active avalanche paths, would endanger public safety and close an East Lynn Canal Highway frequently, thereby decreasing Juneau access; and

WHEREAS, the Juneau Access Final Environmental Impact Statement determined there would likely be 600 non-fatal and 8 fatal accidents over a 40 year period on an East Lynn Canal Highway; and

WHEREAS, the Alaska Marine Highway has an excellent safety record; and

WHEREAS, the Marine Transportation Advisory Board advocates investments in new ferries,

NOW, THEREFORE, BE IT RESOLVED that the Haines Borough Assembly:

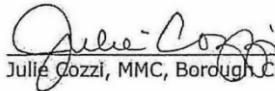

- Section 1: Reaffirms its support of Resolutions 04-04-042 and 07-11-116 and its continued preference for improved ferry service rather than an East Lynn Canal Highway;
- Section 2: Recommends that the state focus planning and funding strategies for transportation improvements in Southeast Alaska on enhancing marine transportation options recommended by the Marine Transportation Advisory Board with special emphasis on the deployment of Alaska Class ferries and that consideration of a Berner's Bay ferry terminal include an inherent public transportation component to support walk-on ferry passengers;

WHEREAS, the East Lynn Canal Road could negatively impact the Lynn Canal Commercial fishery due to construction and an increase in sports fishing activity as a result of improved access to the Lynn Canal; and

WHEREAS, the East Lynn Canal Road will traverse fifty-eight avalanche chutes and will have the highest avalanche hazard rating of any highway in North America, with the resulting increase in project and maintenance costs due to avalanche mitigation and clearing; and

WHEREAS, avalanches will result in the loss of any surface access due to road closures, will result in high maintenance costs and will create the potential for the loss of life to maintenance workers and users of the road; and

WHEREAS, increased maintenance costs due to the East Lynn Canal Road will further impact maintenance of existing State transportation facilities such as highways, airports, terminals and marine vessels, which are presently maintained at sub-standard levels; and

WHEREAS, according to Appendix C of the Juneau Access Draft Environmental Impact Statement a majority of residents surveyed in Juneau, Haines and Skagway prefer improved ferry service rather than road access to Juneau.

NOW THEREFORE BE IT RESOLVED, that the Haines Chamber of Commerce opposes construction of the East Lynn Canal Road and other road options as currently proposed by the State of Alaska Department of Transportation and Public Facilities and favors improved ferry service to the communities of Haines, Skagway and Juneau.

WWW.SKAGWAY.ORG

Thank you for the opportunity to comment on the Draft Supplemental Environmental Impact Statement (DSEIS) on the Juneau Access Improvements Project. This project has the potential to profoundly affect the future of Lynn Canal communities. The following comments cover a range of alternatives and address a variety of issues related to those alternatives. They are intended to provide direction to the Alaska Department of Transportation and Public Facilities (AKDOT) in developing more meaningful analysis of issues which will have direct impacts on the community of Skagway. We are including for the record the North Lynn Canal Ferry Service Analysis prepared for the Municipality of Skagway in June 2014 by McDowell Group. This report documents the high volume of traffic that historically has been generated between the communities of Skagway, Haines and Juneau. The report also discusses fare inequities in the AMHS system which highlights the need for a consistent AMHS fare structure methodology.

Economic Impacts

The plan is named Juneau Access Improvements Project (JAIP) and in this sense it is Juneau-centric in its conception and its execution. The emphasis is on improving access from Juneau to Haines and Juneau to Skagway. There is very little written in the document about the vital transportation link that exists between Haines and Skagway. Historically, this connection between the two communities has carried a disproportionately large amount of traffic compared to other segments of the Marine Highway around the state.

- 1. The highly popular Golden Circle Tour is a mainstay of summer tourism for Skagway, Haines, Haines Junction and Whitehorse.** These communities have promoted this tour successfully for two decades. It has been the policy of our Municipality to support and encourage visitation by the independent traveler as a counter balance to total reliance on cruise ship traffic. Traditionally the independent traveler spends more money per capita than other visitors. Any proposal that would disconnect or bottleneck this important economic connection could harm this important market.
- 2. Insufficient capacity of the small Skagway/Haines shuttle ferry.** Under Alternatives 2B, 4A, 4B, 4C and 4D the Skagway-Haines link would be serviced by a small shuttle ferry modeled after the *Lituya*. The *Lituya* features an open car deck design and is the smallest vessel in the Alaska Marine Highway System. It serves the 16.5 nautical-mile distance between Metlakatla and Ketchikan, a route which historically has carried less volume of passengers and vehicles than the Skagway/Haines route. The design for the small shuttle ferry planned for the Skagway/Haines route calls for a carrying capacity of 18 Alaska standard vehicles (ASV). However, rule of thumb on the Marine Highway states that the average RV requires twice the deck space as a car or pickup truck. Therefore, if the shuttle

were loaded with only RVs, the maximum the shuttle could carry would be nine RVs on any given trip between Haines and Skagway. The shuttle is scheduled to sail twice a day thereby creating opportunity for 36 ASVs or 18 RVs to move from Skagway to Haines each day. Size, weight and capacity restrictions could impact independent bus traffic moving between communities.

Based on historic patterns of traffic between our communities, the Municipality questions the ability of this shuttle to provide adequate capacity. The reasoning for designing a vessel with such limited capacity is not explained in the EIS. We note that in association with Alternative 3 (West Side Road) larger shuttle designs have been considered. We further note that under Alternative 2B, the small shuttle is taken out of service in winter and there is no direct connection between Skagway and Haines.

- 3. Traffic forecasts for the Haines/Skagway link are conspicuously absent.** The DSEIS offers expansive analysis on traffic forecasts for the Juneau/Haines and Juneau/Skagway segments. However it treats the Haines/Skagway link as totally separate from Juneau Access and offers no analysis of traffic demand between the communities. It merely states that the demand between Haines and Skagway will be 53 ASV per day but the document is silent on how this number is arrived at. We believe that capacity engineered to this demand number would be insufficient to handle future growth and peaks in current demand such as week-end, special events and holidays.
- 4. Additional costs and inconvenience to foot passengers.** traveling between communities without a vehicle has been an ongoing concern for the Municipality. Many of our residents, particularly seniors and school children, travel to Juneau without a vehicle. The Alaska Marine Highway System Marketing and Pricing Study conducted by the McDowell Group in 2000 estimated the number of foot passengers to be 45% of the total passengers. The potential costs to these passengers go unreported in the document. Conservative estimates of the costs for a person traveling without a vehicle between Katzehin and Auke Bay range from \$50 (van/bus) to \$180 (taxi). The draft EIS should provide more detail than merely stating it is “assumed a commercial system will be created.” The additional costs to these users, whether bus or a taxi should be factored into the User Cost/Benefit Analysis. Or, the cost to the state should be reported if the state assumes the responsibility for transferring travelers between Auke Bay and Katzehin. Either way, the costs of transport between Katzehin and Auke Bay for travelers without a vehicle are real and should be identified.
- 5. North Lynn Canal Ticket Prices.** In letters to the Federal Highway Administration (FHWA), the Municipality has raised the issue of the unusually high cost of travel in Lynn Canal. Per-mile passenger and vehicle fares for the 13-mile Haines-Skagway route remain the highest in the Southeast System.

It is difficult to determine from the DSEIS the actual cost of a ticket from Skagway to Haines. Prices vary depending on which alternative is being considered, which source

document you are reading and/or which vessel you are sailing on. For example, the 2012 HDR Ferry Fares Memo referenced in Appendix A of the Traffic Forecast Report indicates that for all alternatives other than Alternative 3, a ticket from Skagway to Haines will cost \$22.00/vehicle and \$7.50/passenger on the small shuttle. However, if you board a mainliner to travel to Haines it will cost you \$49.00/vehicle and \$31.00/passenger. Table A-22 of Appendix FF (User Benefit, Life Cycle Cost and Total Project Cost Report) presents a different pricing scenario.

To add to the confusion the Municipality has received correspondence from FHWA (August 20, 2014, letter from Division Director Garcia-Aline) which states “With regards to your specific concerns about the current fare for the Haines-Skagway ferry link, the Draft SEIS will provide the predicted fare for this link based on the current statewide fare structure, but it is my understanding that in all scenarios the fare would be reduced from the current price.” To further add to the confusion, we were told by Deputy Commissioner Reuben Yost at AKDOT’s public hearing in Skagway on October 23, 2014, that most likely the price for the Skagway/Haines link would not be reduced but the prices for other routes elsewhere in the region would be raised to be compatible with the prices that have been charged historically in Northern Lynn Canal.

The following table looks only at rates relevant to marine segments in the Preferred Alternative (2B) and shows how different the two pricing scenarios are:

Routes less than 20 miles	2014 DSEIS Pricing	2014 AMHS fare structure
Skagway/Haines 15 miles	\$22.00/vehicle 7.50 pax	\$49.00/vehicle \$31.00/pax
Skagway/Katzeihin 16 miles	\$24.00/vehicle 8.00/pax	\$52.00/vehicle \$33.00/pax

Assumptions: Using mileage provided in Table 1 of the HDR Ferry Fares memo referenced in Appendix A of the Traffic Forecast Report (2014 DSEIS.) **Yellow highlights indicate fares prorated for distance** (there is lack of consistency with regard to route distances throughout the source documents.)

Recalculating the price of a ticket from Skagway to Katzeihin to reflect the current AMHS fares makes a dramatic illustration of how drastically the price of ticket from Skagway to Katzeihin would change: for the proverbial family of four, the price balloons from \$52 to \$168.

In 2013, the AMHS contracted with Northern Economics to conduct a fare equalization study to develop a “fair and equitable tariff structure.” The Municipality has requested on numerous occasions that the results of the AMHS fare equalization study be included in the Juneau Access EIS. The fare adjustments that will be made as a result of the study will have a direct effect on the ticket prices for ferries operating in Lynn Canal. The AMHS Fare Study is an important tool for evaluating user costs and benefits and should be

included in the EIS. Without knowing what the fares will be for Skagway routes or the methodology behind them, it is impossible to determine which alternatives will most benefit the residents of our community.

Skagway Ferry Float

The floating dock associated with the Skagway Ferry Terminal is an example of critical transportation infrastructure that needs to be refurbished and/or replaced. Ownership and use of the float is shared between the Municipality of Skagway and the State of Alaska and serves an important economic function for the community as well as the Alaska Marine Highway System. Small cruise ships, large fishing vessels, yachts and tugboats utilize this dock on a regular basis. It also serves as an emergency dock for Alaska Marine Lines and Petro Marine. It is imperative that any design changes to that dock be coordinated with the Municipality to ensure that they are compatible with the Municipality's uses.

Safety

Safety is one of Skagway's top priorities. The following safety issues should be addressed in the EIS with regard to the preferred alternative:

1. How will Homeland Security be handled at the "unmanned" Katzeihin ferry terminal? What part of the responsibility for emergency services will fall to local municipalities?
2. The EIS contains many studies on avalanche hazards. From our experience icing and freezing rain may be a bigger concern in this coastal corridor. Please include studies of how coastal freeze/thaw weather phenomenon affect roads and document the measures that will be taken to protect the safety of travelers.
3. People who fish north of the Katzeihin River near the planned location of the terminal report high winds and large swells in this area. We have not found any reports or studies of sea conditions in this area. These should be included in the EIS.
4. Many lives have been lost on the Seward Highway, a road that shares similarities to the proposed Katzeihin road. Since 2006, planners and residents at numerous public meetings have been calling for a divided highway as the best and most effective engineering enhancement on the Seward Highway. The DSEIS should analyze the cost/benefits of making the road to Katzeihin a divided highway.

2nd slide from DOT&PF presentation: "Funding for the Engineering "E" Seward Highway Traffic Safety

Katzehin Terminal Logistics

Many residents have raised questions about the logistics of the unmanned Katzehin terminal. The DSEIS leaves many of those questions unanswered:

- Where will passengers purchase tickets?
- Who will be responsible for snow removal, lane assignments, propane inspections?
- Are the fast turnaround times realistic? Wait times for passengers seem overly optimistic. How will a "reservationless" system work?
- What amenities will be available for people arriving at the terminal such as bathrooms, electricity and shelter? Will there be telephone service?
- Who will check identification?

Parks and Recreation Areas

Section 6.2.1 Identifies parks and recreation areas within the project area. In Skagway, the plan identifies Mollie Walsh Park and Pullen Creek Shoreline Park as municipal parks within the project area. Registry Rock and Dewey Lakes Recreation Area should be added to this list.

Funding Priorities and Cost Overruns

The Municipality of Skagway is concerned that many transportation projects of local and regional importance will be postponed or cancelled if the State allocates its sparse transportation money to this project. The EIS should also consider the issue of cost overruns which historically have

been incurred on mega-projects. The Skagway Ferry Float and the Moore Bridge are two examples of critical local infrastructure that require immediate refurbishment or replacement.

The Municipality requests an opportunity to comment on the Final.

The DSEIS discusses many scenarios that could have a profound effect on the economic future of our community. However many of the supporting documents that are referenced are not included or are buried in the DSEIS and cannot be discovered and retrieved within the timeframe of the comment period. The DSEIS has taken more than two years to produce and requires deep analysis. Many municipalities rely on volunteer committees to develop comments and are handicapped by their own public notice and public meeting requirements. This significantly limits the amount of available time for research and public vetting of comments. We ask that you provide the Municipality the opportunity to comment on the Final SEIS prior to the record of decision.

September 6, 2013

David Miller, Administrator
Federal Highway Administration, Alaska Division
P.O. Box 21648
Juneau, AK 99802

Dear Mr. Miller,

On August 29th, the Alaska Department of Transportation and Public Facilities announced that in accordance with provisions in the new federal transportation act commonly referred to as MAP-21, the department would conduct a streamlined public process for the Juneau Access Improvements Project Supplemental Environmental Impact Statement (EIS).

As you are aware, the previous EIS for this project was deemed inadequate by the courts and for the past two years the department has been collecting data and conducting extensive analysis for a revised study. It is the concern of the Municipality of Skagway that an abbreviated public process may not provide us with adequate opportunity to fully analyze this data and evaluate potential impacts to our community.

For this reason, the Skagway Borough Assembly would like to take the opportunity earlier rather than later to apprise you of our concerns and make the following requests:

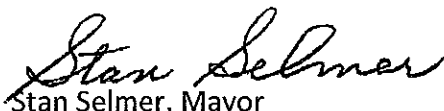

- We request that the comment period on the draft EIS be extended to no less than 60 working days in order to provide adequate time for evaluation of alternatives by local officials and residents. We also request that the draft EIS not be released over the holidays as this would be counterproductive to substantive review.
- The Municipality of Skagway is in the final stages of developing its own coastal zone management program. As such we request that we be included in the planning process as a cooperating agency.
- We are concerned that the Alaska Marine Highway System (AMHS) price structure as it currently exists in Lynn Canal has resulted in severely skewed ticket prices which bear no relationship to cost per mile. We have been told by Deputy Commissioner Reuben Yost

that the fare structure system-wide is currently under review and a formal study has been instituted. We request that the results of that study be included in the EIS and applied to all marine segments for all alternatives. *

- Additionally, we request that any analysis of cost per mile whether for marine or road links include adequate explanation of underlying assumptions and methodologies.
- The Marine Highway System serves an important mass transit function in our region. Over the past ten years, our community has consistently voiced concerns about the large percentage of marine highway passengers who travel without a vehicle. We request that the EIS devote significant analysis to determining how under the various alternatives foot passengers will be transported between communities and what the added costs will be for the state and the end users in each situation.

Thank you for your consideration.

Sincerely,

Stan Selmer, Mayor
Municipality of Skagway

Senator Mark Begich
Congressman Don Young
Governor Sean Parnell
Senator Dennis Egan
Representative Beth Kerttula

*Examples of excessive ticket prices in Lynn Canal can be found in the 2008 Study by Northern Economics, Inc available on the AMHS website. This study shows that the a passenger between Haines and Skagway pays \$2.38 per nautical mile while a passenger between Juneau and Sitka pays only 34 cents per mile, a 700% difference. The DOT&PF Juneau Access website under Alternative 1B calls for a 20% reduction in fares for Lynn Canal. However, even with that reduction, passengers in Lynn Canal still would be paying nearly six times as much as travelers between Sitka and Juneau.

Mr. Stan Selmer
Mayor
Municipality of Skagway
P.O. Box 415
Skagway, AK 99840

Dear Mr. Selmer:

Thank you for your September 6, 2013, letter expressing interest in the Juneau Access Improvements (JAI) project and for sharing your concerns regarding the development of the Supplemental Environmental Impact Statement (SEIS) for the project. I will address your comments in the order they were presented in your letter.

Regarding your request for an extension of the comment period for the Draft SEIS to a period of no less than 60 days, I will note that the Federal Highway Administration (FHWA) normally provides a 45 day comment period on Draft Environmental Impact Statements (EISs). This length of comment period is typically sufficient. The JAI SEIS will be a document with limited changes in text from the prior approved Final EIS, where most of the information is not new; we believe the review should prove less demanding than a typical Draft EIS. For reviewers' convenience, the Draft SEIS will have all new information highlighted. Also of note, because of the sequence required for providing notice of an EIS's availability in the Federal Register, the documents are normally available for a week or ten days before the actual comment period technically begins, thus the comment period is effectively longer than 45 days. At this time, we believe that due to the nature and format of this particular document, that a 45 day comment period will be adequate.

In reference to your request to be included as a Cooperating Agency (due to the Municipality's ongoing efforts in developing a coastal zone management program), Cooperating Agency status on an FHWA EIS is typically limited to federal and state agencies with a jurisdiction by law and/or special expertise. Nevertheless, the FHWA is interested in the Skagway Borough's concerns relative to the coastal management program and will carefully consider all comments submitted by the Skagway Borough. Detailed responses to those comments will be provided in the Final SEIS.

Your next request relates to an Alaska Marine Highway System (AMHS) study that has been proposed to analyze fares across the AMHS system.

You expressed concerns specifically about current fare structure in the Lynn Canal and its apparent inequities compared to other portions of the system. You requested that the results of the study be incorporated into the JAI SEIS. We have confirmed with the Department of Transportation and Public Facilities (DOT&PF) that this study has not begun, and as a system-wide proposal, it is entirely separate from the JAI project in timing and in scope. However, it is important to note that one of the key goals of the project is to reduce user costs for transportation within the Lynn Canal corridor, and that the SEIS will address the potential impacts that each of the reasonable alternatives would have on AHMS fares in the Lynn Canal.

Regarding your desire that any analysis of travel costs per mile include adequate explanation of underlying assumptions and methodologies, I can assure you that the assumptions and methodologies behind all of the cost analyses provided in the SEIS will be adequately explained.

Your final request was that the EIS provide an analysis on how the various alternatives would impact AMHS foot passengers, including transportation between communities and any added costs. The JAI Final EIS approved in 2006 provided an analysis of the potential impacts of each reasonable alternative on AMHS foot passengers and the FHWA will ensure that the Draft SEIS provides a detailed update to that analysis, including any potential added costs.

Again, thank you for your interest in the Juneau Access Improvements project.

Sincerely,

A handwritten signature in black ink, appearing to read "D. C. Miller". The signature is written in a cursive style with a large, looped initial "D".

March 25, 2014

David Miller, Administrator
Federal Highway Administration, Alaska Division
P.O. Box 21648
Juneau, AK 99802

Dear Mr. Miller,

In October of 2013, former Mayor Stan Selmer of Skagway wrote to you regarding a number of concerns of the Municipality related to the pending revised draft Environmental Impact Statement (EIS) on Juneau Access. In particular, Mayor Selmer addressed the issue of the skewed marine highway ticket price structure which currently exists in Lynn Canal and which bears no relationship to cost per mile. The community had been told by Deputy Commissioner Reuben Yost at a public meeting this past fall that the fare structure was currently under review and a formal study had been instituted. It was the Mayor's request that the results of that study be included in the EIS and applied to all marine segments for all alternatives.

In your response dated October 10, 2013, you stated that "We have confirmed with the Department of Transportation and Public Facilities (DOT&PF) that this study has not begun and as a system-wide proposal, it is entirely separate from the JAI project in timing and in scope."

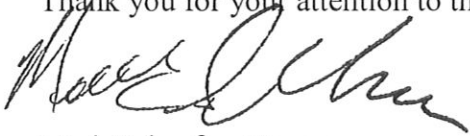

However, at the most recent MTAB meeting on March 11, Captain Falvey of the Alaska Marine Highway (AMHS) announced that in fact a "fare equalization study" was in progress and a draft would be released in April.

Riders on the Alaska Marine Highway System between Skagway and Haines pay the highest ticket prices per mile of any marine segment in the entire system. This fact makes the subject and scope of the AMHS fare study very relevant to all marine alternatives being proposed for Lynn Canal.

We believe that it would undermine the integrity of the new EIS if the DOT&PF were to exclude the results of the AMHS study and adopt arbitrary pricing for Lynn Canal which bears no relationship to AMHS costs of operation or to pricing for other parts of the state.

In as much as the revised EIS and the new AMHS fare study are both scheduled to be released in April, we would like to reiterate our request that the results of that study be included in the pending EIS and be applied to all marine segments for all alternatives.

Thank you for your attention to this matter.

A handwritten signature in black ink, appearing to read 'Mark Schaefer', written in a cursive style.

Sandra Garcia-Aline
Alaska Division Director
Federal Highway Administration
P.O. Box 21648
Juneau, AK 99802
sandra.garcia-aline@dot.gov

Dear Ms. Garcia-Aline,

On behalf of the Municipality of Skagway I would like to congratulate you on your appointment as Alaska Division Director for the Federal Highway Administration. We look forward to working with you on the many important transportation issues that will shape the future of our community and our region.

In particular, the Municipality is planning to comment on the draft Environmental Impact Statement (EIS) for the Juneau Access Project. Recently we learned that the release of the draft has been delayed until late in 2014. We would like to request that the public comment period be extended from 45 days to 60 days in order to allow us adequate time to conduct a thorough review of the document and draft comprehensive comments.

It is our understanding that Alaska Marine Highway System (AMHS) is currently conducting a system-wide fare equalization study to review the equitability of Marine Highway fares statewide. In the past, Skagway has raised concerns about the unusually high cost of travel in northern Lynn Canal. Per-mile passenger and vehicle fares for the 13-mile Haines-Skagway link remain the highest in the Southeast System and are about 50-percent above the next highest per-mile fare. For this reason we would request that the new AMHS fare study (also scheduled to be released later this year) be included in the pending EIS and the results of the study be applied to all marine segments for all alternatives.

Our previous correspondence on these topics is attached. Thank you for your consideration and again, congratulations on your appointment.

Sincerely,

Mark Schaefer, Mayor

RECEIVED

SEP 05 2014

**MUNICIPALITY
OF SKAGWAY**

Dear Mayor Schaefer:

Thank you for your July 28, 2014, letter welcoming me to my new position as the Alaska Division Administrator for the Federal Highway Administration (FHWA). I also appreciate your interest in the Juneau Access Improvements (JAI) project and expression of concern regarding the development of the Supplemental Environmental Impact Statement (SEIS) for the project.

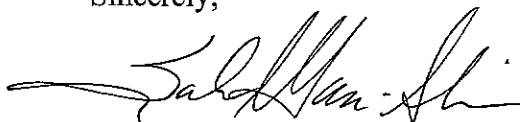

Regarding your request for an extension of the comment period for the Draft SEIS to a period of 60 days, FHWA normally provides a 45-day comment period on Draft Environmental Impact Statements (EISs). This length of comment period is typically sufficient. The JAI SEIS will be a document with limited changes in text from the prior approved Final EIS, where most of the information is not new; we believe the review should prove to be less demanding than a typical Draft EIS. For reviewers' convenience, the document will highlight all new information. Also, due to the sequence required for providing notice of an EIS's availability in the Federal Register, the documents are normally available for a week or ten days before the actual comment period technically begins, thus the comment period is effectively longer than 45 days. At this time, we believe that due to the nature and format of this particular document, a 45-day comment period will be adequate.

Your next request relates to an Alaska Marine Highway System (AMHS) statewide study that is underway to analyze fares across the entire AMHS system. You requested that the results of the study be incorporated into the JAI SEIS. We have confirmed with the Department of Transportation and Public Facilities (DOT&PF) that this study has begun, but is not expected to be released until February of next year. As a system-wide proposal, it is entirely separate from the JAI project in timing and in scope. While the study could potentially result in fare adjustments in Lynn Canal (and across the State), we understand that any changes would be effectively equal amongst the reasonable alternatives presented in the Draft SEIS. Thus, the results of the fare study will not change the comparative analysis.

However, it is important to note that one of the key goals of the project is to reduce user costs for transportation within the Lynn Canal corridor, and that the Draft SEIS will address the potential impacts that each of the reasonable alternatives would have on AMHS fares in the Lynn Canal. With regards to your specific concerns about the current fare for the Haines-Skagway ferry link, the Draft SEIS will provide the predicted fare for this link based on the current statewide fare structure, but it is my understanding that in all scenarios the fare would be reduced from the current price.

Again, thank you for your interest in the Juneau Access Improvements project.

Sincerely,

A handwritten signature in black ink, appearing to read "Sandra A. Garcia-Aline". The signature is fluid and cursive, with a long horizontal flourish extending to the left.

Sandra Garcia-Aline, Administrator
Alaska Division, Federal Highway Administration
P.O. Box 21648
Juneau, AK 99802-1648
sandra.garcia-aline@dot.gov

Dear Ms. Garcia-Aline,

Thank you for your response to our previous correspondence regarding the Alaska Marine Highway System (AMHS) analysis of fares across the AMHS system.

As you know the issue of fare inequality has been a long-standing concern of our community. In past correspondence, the Municipality has raised the issue of the unusually high cost of travel in Lynn Canal. Per-mile passenger and vehicle fares for the 13-mile Haines-Skagway link remain the highest in the Southeast System and are about 50% above the next highest per-mile fare. In discussing this with AMHS we have been assured that the fare equalization study is the first step in moving the System toward a more balanced fare structure with rates for some links being increased and rates for other links being lowered. By their own admission AMHS has no current logarithm or formula for setting fares. We are concerned that this imbalance is being perpetuated in the Juneau Access Environmental Impact Statement (EIS) with rates for the various marine links being established in an arbitrary manner.

Ticket prices on the ferry system will be significantly impacted by the fare adjustments which will result from the AMHS fare equalization study. This analysis is an invaluable tool for evaluating end user costs associated with the various alternatives and should be integrated into the EIS.

Without this tool, the Municipality and residents of our community cannot adequately evaluate the various alternatives presented in the Juneau Access EIS. We respectfully request that the AMHS study be made public and the comment period be extended to allow adequate time for evaluation of alternatives in light of the new information.

Thank you for your consideration.

Sincerely,

Mark Schaefer, Mayor

Introduction

The City of Skagway asked McDowell Group, Inc. to prepare a brief report regarding specific aspects of Lynn Canal ferry service, including the following:

- An analysis of AMHS day boat/Alaska Class Ferry capacity
- Analysis of Southeast Alaska AMHS per-mile fare costs
- Day boat/Alaska Class Ferry operating cost analysis
- Baseline historical Lynn Canal AMHS traffic data

This report supplements a report prepared in 2003 by McDowell Group for the City Skagway and Haines Borough. That report, *“Analysis of Traffic on Lynn Canal Ferry Routes,”* summarized several important themes regarding the role of Lynn Canal within AMHS operations:¹

“The communities of Haines and Skagway are strategically located on the Alaska Marine Highway, generating significant traffic volumes. Haines and Skagway are two of the highest-volume ports in terms of passenger, vehicle and freight traffic and in terms of revenue contributed to the overall system.”

“The combination of a high volume of passengers using local Lynn Canal service together with passengers from many distant ports making road connections through Haines and Skagway means the Lynn Canal market is an economic opportunity for the system that can help underwrite the essential service provided to lower volume communities.”

“Four of every ten Alaska Marine Highway revenue dollars are related to Lynn Canal travel or freight. That is, 40 percent of System revenue comes from passengers or freight that, at some point in their voyages, pass through Lynn Canal.”

This current study provides further data and analysis regarding the importance of optimized AMHS Lynn Canal service to the communities of Haines and Skagway as well as to the sustainability of the Alaska Marine Highway overall.

Key Findings

Key points noted in this analysis include the following:

- In 2013, approximately 1 in 5 north-bound Malaspina voyages (departing Juneau) had total car deck usage greater than the vehicle capacity of the day boat/ACF. Approximately 1 in 6 southbound voyages (arriving Juneau) had total car deck usage greater than day boat/ACF capacity.

¹ *“Analysis of Traffic on Lynn Canal Ferry Routes.”* Prepared by McDowell Group for the Haines Borough and City of Skagway, July 15, 2003.

- Per-mile passenger and vehicle fares for the 13 nautical-mile Haines-Skagway link remain highest in the Southeast system and are about 50 percent above the next highest per-mile.
- Deployment of the new AMHS day boat/ACF should result in an overall reduction in the cost of providing ferry service in Lynn Canal. Day boat/ACF costs are expected to average \$173 per-mile for Juneau-Haines service and \$336 per-mile for the Haines-Skagway service. In FY2012, all vessels serving Lynn Canal combined operated at an average per-mile cost of \$527. The Malaspina (providing 40 percent of all Lynn Canal service miles in FY2012) operated at a per-mile cost of \$649.
- Passenger traffic between Skagway and Haines in 2013 reached the highest level since 2003. The traffic low-point was in the 2006-2007 period; passenger traffic has increased by about 60 percent since then. Vehicle traffic is up about 50 percent over the same period. The number of voyages between Skagway and Haines increased from 339 in 2007 to 583 in 2013, a 70 percent increase.
- Passenger traffic between Skagway and Juneau was up 4.5 percent in 2013 from 2012 and up 9 percent from 2011. However, passenger traffic between the two ports remains well below the 2007 and 2008 peak.

Day Boat/Alaska Class Ferry Capacity Analysis

This analysis identifies the number of Malaspina Lynn Canal voyages in 2012 and 2013 that carried more vehicles than could have been accommodated by the day boat/ACF, with capacity of 53 Alaska standard vehicles (ASV). Based on data provided by AMHS, in 2013, 19 percent of northbound voyages (departing Juneau) and 16 percent of southbound voyages (arriving Juneau) had total car deck usage of more than 1,060 feet. This is less than in 2012, when 33 percent of northbound voyages and 28 percent of southbound voyages had total car deck usage of more than 1,060 feet.

This data suggests that operating two day boat/ACF voyages between Juneau and Haines (or other capacity enhancement measures) may be required to meet peak-period demand.

It is important to note in 2013, the Malaspina carried 61 percent of total summer northbound (departing Juneau) vehicle traffic in Lynn Canal and 54 percent of southbound (arriving Juneau) traffic. In 2012, the Malaspina carried 62 percent of summer northbound and 57 percent of southbound vehicle traffic.

Analysis of Southeast Per-Mile Fare Costs

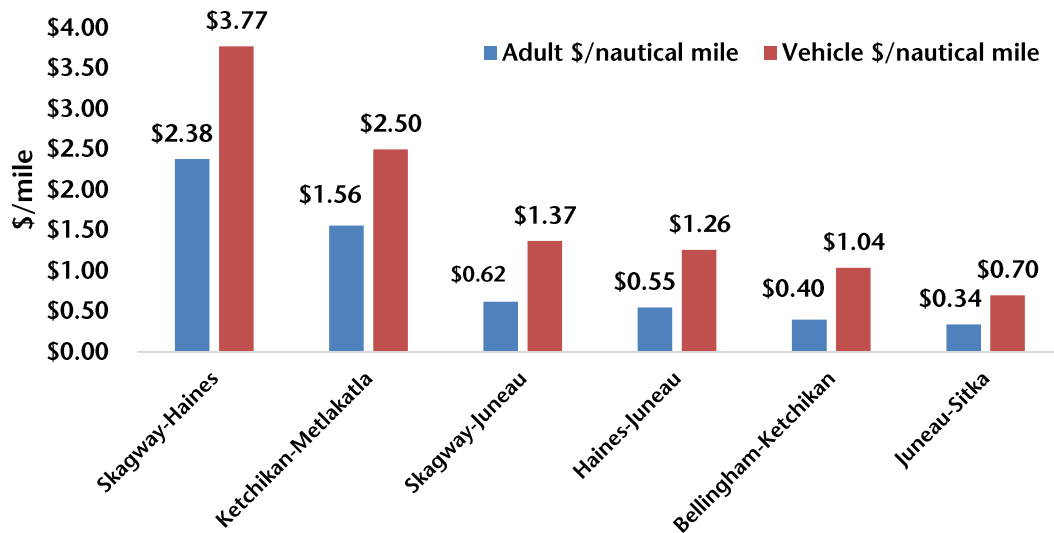

The following table provides per-mile passenger (adult) and vehicle (up to 19 feet) fares. Per-mile fares for the 13 nautical-mile Haines-Skagway link are highest in the Southeast system, both approximately 50 percent above the next highest per-mile fare, which is for the 16 nautical-mile Metlakatla-Ketchikan link.

Table 4. AMHS Per-Mile Fare Analysis

Link	Adult Fare (12 years+)	Vehicle up to 19 feet	Nautical miles	Adult \$/nautical mile	Vehicle \$/nautical mile
Haines-Skagway	\$31	\$49	13	\$2.38	\$3.77

**Figure 1. AMHS Per-Mile Fare Analysis, Selected AMHS Links
Adult Passenger Fare and Vehicle Fare up to 19 Feet**

It is interesting to note the variation in fares among links that are of generally similar distance. Juneau-Kake, at 114 nautical miles, has passenger and vehicle per-mile fares of \$0.58 and \$1.46, respectively. Hoonah-Sitka (118 nautical miles) and Juneau-Sitka (132 nautical miles) are approximately the same length, but are about half the cost on a per-mile basis.

Based on a 2008 report by Northern Economics, Skagway-Haines passenger fares are the highest in the statewide system and vehicle fares are the highest except Southcentral fares.²

Table 5. AMHS System-Wide and Regional Fare Ranges (One-Way), Per Nautical Mile

	Adult Passenger		Vehicle up to 19 feet*	
	Low	High	Low	High
System-wide	\$0.27	\$2.38	\$0.60	\$5.00
Southeast, Inside Passage	\$0.27	\$2.38	\$0.60	\$3.77
Southeast, Feeder	\$0.32	\$0.89	\$0.76	\$1.73
Cross Gulf	\$0.42	\$0.54	\$1.14	\$1.49
Southcentral	\$0.34	\$2.27	\$0.85	\$5.00
Southwest	\$0.37	\$1.94	\$0.98	\$3.18

*Does not include driver.

Day Boat/Alaska Class Ferry Operating Cost Analysis

The question of whether day boat/ACF service in Lynn Canal will result in lower overall corridor costs to the AMHS than current costs is a complex one, with no simple answer. The July 2013 Design Study Report provided estimates of day boat/ACF annual operating costs (see following table).

Table 6. Day Boat/ACF Annual Operating Costs (\$millions)

	Juneau-Haines	Haines-Skagway	Total
Manning	\$2.84	\$2.45	\$5.29
Fuel	\$2.25	\$1.15	\$3.40
Maintenance	\$0.67	\$0.67	\$1.34
Total	\$5.76	\$4.27	\$10.03

Source: Day Boat ACF Design Study Report, July 10, 2013.

These cost estimates are based on a service frequency of seven days per week for a 20-week summer period and four days per week for a 28-week winter period. The estimates also include a four-week overhaul. Cost estimates are based on the assumption that one day boat/ACF would make a single round trip each day Auke Bay-Haines-Auke Bay, while the other vessel would make two Haines-Skagway-Haines trips each service day.

Juneau Access alternatives include various options for using the day boat/ACF. In all of the “no-build” alternatives, mainliners would continue to serve northern Lynn Canal, in addition to day boat/ACF service.

As illustrated in the following tables, utilization of the day boat/ACF should result in an overall reduction in the cost of providing North Lynn Canal (NLC) ferry service. In FY2012, AMHS spent \$17.2 million providing service to NLC, excluding any shore-side costs. That included a total of 32,800 service miles, for all vessels combined, equating to an average per-mile cost of \$527. Per-mile costs ranged from a low of \$135 for the Fairweather to \$874 for the Columbia. The Malaspina (which provided 40 percent of all NLC service miles) had a per-mile cost of \$649, while the LeConte (33 percent of all NLC service miles) had a cost of \$395 per-mile.

Based on annual operating cost data provided in the Design Study Report, day boat/ACF costs should average \$173 per-mile for Juneau-Haines service and \$336 per-mile for the Haines-Skagway service. The Juneau-Haines estimate is based on 252 total round trips of 132.5 nautical miles, for a total of 33,390 nautical miles traveled (with total annual cost of \$5.76 million). The Haines-Skagway estimate is based on 504 total round trips of 25.2 nautical miles, for a total of 12,701 nautical miles traveled (with total annual cost of \$4.27 million).

Baseline Historical Lynn Canal Service and Traffic Data

The following tables provide a variety of historical data concerning AMHS ferry traffic and service in Lynn Canal. Table 10 provides a history of AMHS Lynn Canal fares. The data indicates the following:

- Haines-Skagway adult passenger fares in 2013 were about 80 percent above the 1999 level, while vehicle fares (for vehicles up to 19 feet) are up about 60 percent.
- Skagway-Juneau adult passenger fares in 2013 were about 65 percent above 1999; vehicle fares were up about 70 percent.

- Haines-Juneau adult passenger fare increased 54 percent since 1999. Vehicle fares were up 51 percent.
- Published Lynn Canal passenger and vehicle fares have been the current level since 2008.
- Based on the Anchorage Consumer Price Index (CPI), inflation in Alaska has totaled 43 percent since 1999.

Table 11 provides Lynn Canal AMHS traffic volume data for the 2000 to 2013 period. A brief analysis of the data reveals the following:

- In 2013 Haines-Skagway and Skagway-Haines passenger traffic reached the highest level since 2003. Since bottoming-out in the 2006-2007 period, passenger traffic between the two ports has increased by about 60 percent. Vehicle traffic is up about 50 percent over the same period. 2007 marked the low-point in ferry service frequency between Skagway and Haines, with only 180 Haines-Skagway trips and 159 Skagway-Haines trips.
- In 2013, 15,865 passengers and 6,742 vehicles made the trip between Skagway and Haines (bi-directional totals). In 2006, 10,014 passengers and 4,542 vehicles made the trip.
- Passenger traffic from Juneau-Skagway, though up about 5 percent in 2013 compared to 2012 (and 11 percent above 2011) remains below historical levels. In 2007 and 2008, passenger traffic from Juneau to Skagway averaged just under 14,200, about 1,300 more than the 2013 volume of 12,850 passengers.
- Skagway-Juneau passenger traffic was also up in 2013 from 2012 (up about 4 percent), but still well below 2007-2008. The 2013 total of 13,161 passengers was about 15 percent below the 2007-2008 average of about 15,510.
- The increase in Lynn Canal traffic between 2012 and 2013 is no doubt related to the increase in service frequency. There were 291 voyages from Haines to Skagway and 292 voyages from Skagway to Haines, both 7 percent above 2012.
- The number of Juneau-Haines and Haines-Juneau voyages was up 9 percent between 2012 and 2013.

Table 10. AMHS Lynn Canal Fares, 1999 to 2013

Year	Haines to Skagway Skagway to Haines		Haines to Juneau Juneau to Haines		Skagway to Juneau Juneau to Skagway

Memo

Federal Project No: STP-000S(131)
AKSAS Project No. 71100

To:	File	
From:	Laurie Cummings/Terri Morrell	Project: Juneau Access Improvements SEIS
CC:	Subject: Alternatives – Ferry Fares	
Date:	August 30, 2012	Job No:

Background

The fares for the alternatives being studied in the SEIS were established based on direction given from Reuben Yost on August 17 and 24, 2012:

- The No Action fare is to be consistent with current AHMS Rates.
- The fares for Alternatives 2B and 3 should be calculated by inflating the 2004 fares reported in the FEIS relative to 2012 fares.
- The fare for Alternatives 4A and 4C should match the No Action because they have the same origin/destination points.
- The fares for Alternatives 4B and 4D should be the same. The rates will be based on the Alternative 1A fares but prorated based on distance.
- As in the *Proposed Marine Segments Fare Structures (Fare)* report, vehicle fares are rounded to the nearest dollar; passenger fares are rounded to the nearest half dollar.

Yost found the Summer 2004 fare sheet from the published AMHS schedule, which was used as the basis for the fares published in the 2006 FEIS. The fares were as follows:

- Adult Passengers (12 years and over)
 - Auke Bay to Haines \$32.00
 - Auke Bay to Skagway \$42.00
- Children (2–11 years) are ½ the adult passenger fare with children under 2 traveling for free
- Vehicles (15 feet to 19 feet long)
 - Auke Bay to Haines \$68.00
 - Auke Bay to Skagway \$90.00

The AMHS Summer 2012 through April 2013 fares published on the AMHS website are as follows:

- Adult passengers (12 years and over)
 - Auke Bay to Haines \$37.00 (a 15.6 percent increase from the 2004 fare)
 - Auke Bay to Skagway \$50.00 (a 19.0 percent increase from the 2004 fare)
- Children under 6 travel free. Children 6–11 years approximately ½ adult fare
- Vehicles (15 feet to 19 feet long)
 - Auke Bay to Haines \$86.00 (a 26.5 percent increase from the 2004 fare)
 - Auke Bay to Skagway \$111.00 (a 23.3 percent increase from the 2004 fare)

Alternative 1A

This alternative is the No Action Alternative. For this SEIS, the 2012–2013 fares published by AMHS will be used. See Table 1 below.

Alternative 1B

Fares to be determined.

Alternative 2B

This alternative starts ferry service from Katzehin. For this SEIS, the 2004 fares published in the *Fare* report, which were \$12 for vehicles and \$4 for adult passengers going from Katzehin to Haines, were increased by the average of the AMHS fare increases from 2004 to 2012: 24.9 percent (average of 26.5 and 23.3 percent) and 17.3 percent (average of 15.6 and 19.0 percent) respectively. This resulted in 2012 values of \$14.98 for vehicles and \$4.69 for adult passengers, which were rounded to fares of \$15.00 and \$4.50 respectively. For trips from Katzehin to Skagway, 2004 fares of \$19.00 for vehicles and \$7.00 for adult passengers were increased by these same percentages. This resulted in 2012 values of \$23.73 and \$8.21 which were rounded to fares of \$24.00 and \$8.00 respectively. See Table 1 below.

Alternative 3

This alternative moves all traffic on shuttles between Sawmill Cove and William Henry Bay. The *Fare* report had published fares of \$16 for vehicles and \$6 for adult passengers. The average of the fare increases from 2004 to 2012 was 24.9 percent for vehicles and 17.3 percent for adult passengers. These percent increases were applied to fares reported in the 2006 FEIS and resulted in values of \$19.98 for vehicles and \$7.04 for adult passengers. These values were rounded to fares of \$20.00 and \$7.00 respectively.

This alternative relies on a shuttle to provide the connection between Haines and Skagway. The 2006 FEIS fares for the shuttle were \$18.00 for vehicles and \$6.50 for adult passengers. These fares were also increased by the above percentages. This resulted in 2012 values of \$22.48 and \$7.62, which were rounded to fares of \$22.00 and \$7.50 respectively. See Table 1 below.

Alternative 4A

This alternative has the same origins/destinations as the No Action Alternative. For purposes of this SEIS, the 2012–2013 fares published by AMHS will be used. See Table 1 below.

Alternative 4B

This alternative starts ferry service at Sawmill Cove with service to Haines (45 miles) and to Skagway (60 miles) (mileage taken from *Fare* report Table 1a). The mileage for Alternative 1A (78 miles from Auke Bay to Haines and 93 miles from Auke Bay to Skagway) was compared to the mileage from Sawmill Cove for each town. The 4B mileage to Haines is 57.7 percent of the 1A mileage. The 4B mileage to Skagway is 64.5 percent of the 1A mileage. These percentages were then applied to the 2012 fares for Alternative 1A for vehicles and passengers. For Sawmill Cove to Haines, this resulted in 2012 values of \$49.62 for vehicles and \$21.39 for adult passengers, which were rounded to fares of \$50.00 and \$21.50 respectively. For Sawmill Cove to Skagway, 2012 values were \$71.60 for vehicles and \$32.25 for adult passengers, which were rounded to fares of \$72.00 and \$32.00¹ respectively. See Table 1 below.

Alternative 4C

This alternative has the same origins/destinations as the No Action Alternative. For purposes of this SEIS, the 2012–2013 fares published by AMHS are used. See Table 1 below.

¹ The value of \$32.25 was rounded down to \$32.00 following the round-to-even rule.

Alternative 4D

This alternative starts ferry service at Sawmill Cove with service to Haines (45 miles) and to Skagway (60 miles) (mileage taken from *Fare* report Table 1a). The mileage for Alternative 1A (78 miles from Auke Bay to Haines and 93 miles from Auke Bay to Skagway) was compared to the mileage from Sawmill Cove for each town. The 4D mileage to Haines is 57.7 percent of the 1A mileage. The 4D mileage to Skagway is 64.5 percent of the 1A mileage. These percentages were then applied to the 2012 fares for Alternative 1A for vehicles and passengers. For Sawmill Cove to Haines, this resulted in 2012 values of \$49.62 for vehicles and \$21.39 for adult passengers, which were rounded to \$50 and \$21.50 respectively. For Sawmill Cove to Skagway, 2012 values were \$71.60 for vehicles and \$32.25 for adult passengers, which were rounded to fares of \$72.00 and \$32.00 respectively. See Table 1 below.

Haines/Skagway Shuttle for Alternatives other than 3

All of the build alternatives in the SEIS have a new shuttle to provide a link between Haines and Skagway. Except for Alternative 3, this shuttle is only to accommodate Haines/Skagway traffic independent of traffic to/from Juneau. Although this link is provided for different traffic volumes and purposes in different alternatives, the same fares are proposed. Therefore the Haines-Skagway fares for all build alternatives are calculated as explained above for Alternative 3. Alternatives 1A and 1B rely on existing vessels that travel the entire length of Lynn Canal to provide a Haines-Skagway link and therefore the Haines-Skagway fares for these alternatives are based on the current published AMHS fares.

Table 1: Summary of 2012 Proposed Lynn Canal Ferry Fares for Each Alternative

Alternative	From	To	Miles	2012 Vehicle Fare \$ (15 to 19 feet long)	2012 Adult Passenger Fare \$
1A	Auke Bay	Haines	78	86.00	37.00
	Auke Bay	Skagway	93	111	50.00

Monica Carlson
Municipality of Skagway
P.O. Box 415
Skagway, Alaska 99840

Dear Ms. Carlson:

Thank you for your letter, dated November 1, 2014, with your comments on the Juneau Access Improvements (JAI) Project Draft Supplemental Environmental Impact Statement (SEIS). We appreciate the participation of the Municipality of Skagway in the JAI Project.

We have reviewed your letter and have made appropriate revisions to the Final SEIS. Our attached responses have been embedded in a reprint of your letter.

We anticipate releasing a combined Final SEIS/Record of Decision very soon. FHWA has identified Alternative 1 – No Action as the Preferred Alternative in the Final SEIS. Governor Walker announced on December 15, 2017, that the “No Build Alternative” is the State’s Preferred Alternative. Please see Section 2.5 of the Final SEIS for further discussion.

Please do not hesitate to contact me at (907) 465-1828 if you have any additional questions or concerns.

Sincerely,

A handwritten signature in blue ink that reads "Greg Lockwood".

WWW.SKAGWAY.ORG

Thank you for the opportunity to comment on the Draft Supplemental Environmental Impact Statement (DSEIS) on the Juneau Access Improvements Project. This project has the potential to profoundly affect the future of Lynn Canal communities. The following comments cover a range of alternatives and address a variety of issues related to those alternatives. They are intended to provide direction to the Alaska Department of Transportation and Public Facilities (AKDOT) in developing more meaningful analysis of issues which will have direct impacts on the community of Skagway. We are including for the record the North Lynn Canal Ferry Service Analysis prepared for the Municipality of Skagway in June 2014 by McDowell Group. This report documents the high volume of traffic that historically has been generated between the communities of Skagway, Haines and Juneau. The report also discusses fare inequities in the AMHS system which highlights the need for a consistent AMHS fare structure methodology.

Economic Impacts

The plan is named Juneau Access Improvements Project (JAIP) and in this sense it is Juneau-centric in its conception and its execution. The emphasis is on improving access from Juneau to Haines and Juneau to Skagway. There is very little written in the document about the vital transportation link that exists between Haines and Skagway. Historically, this connection between the two communities has carried a disproportionately large amount of traffic compared to other segments of the Marine Highway around the state.

RESPONSE: DOT&PF and FHWA have identified the No Action Alternative as the preferred alternative in the Final Supplemental Environmental Impact Statement (SEIS). The purpose and need statement for the project is to improve surface transportation to and from Juneau in Lynn Canal. The Department of Transportation and Public Facilities (DOT&PF) and Federal Highway Administration (FHWA) have updated the data in Chapter 1 of the Draft SEIS since 2006 and have reconfirmed the project purpose and need. Because Juneau is a regional hub, with a substantial population and employment base, the demand for travel in and out of Juneau has been identified as driving the primary needs of the project. The purpose and need chapter documents legitimate transportation problems with the current system. The ferry connection between Haines and Skagway is affected by some of the alternatives, resulting in changes to vessels or schedules on that link. These changes are described in Chapter 2 and Chapter 4 of the SEIS. In general, alternatives evaluated in the SEIS replace or maintain the existing ferry link

between Haines and Skagway, continuing its operation in the same manner as it currently functions.

- 1. The highly popular Golden Circle Tour is a mainstay of summer tourism for Skagway, Haines, Haines Junction and Whitehorse.** These communities have promoted this tour successfully for two decades. It has been the policy of our Municipality to support and encourage visitation by the independent traveler as a counter balance to total reliance on cruise ship traffic. Traditionally the independent traveler spends more money per capita than other visitors. Any proposal that would disconnect or bottleneck this important economic connection could harm this important market.

RESPONSE: DOT&PF and FHWA did not anticipate that the project would have impacted people's ability to complete the "Golden Circle Tour." None of the alternatives would have disconnected or been a bottleneck for the ferry connection between Haines and Skagway. Under Alternative 2B, a new Haines-Skagway shuttle ferry would have made two round trips between the communities daily. This ferry design was sized to accommodate 18 vehicles, providing the ability to transport 72 vehicles per day. According to the traffic forecasted for this link, the summer average daily traffic (ADT) would have been 53, providing sufficient ferry capacity for people who want to travel between Haines and Skagway.

As discussed in the Draft and Final SEIS, all the build project alternatives were projected to increase independent tourist visits to Lynn Canal communities, with Alternatives 2B and 3 projected to result in the largest increase in independent tourist visits (see Sections 4.3.5 and 4.4.5 of the Final SEIS).

- 2. Insufficient capacity of the small Skagway/Haines shuttle ferry.** Under Alternatives 2B, 4A, 4B, 4C and 4D the Skagway-Haines link would be serviced by a small shuttle ferry modeled after the *Lituya*. The *Lituya* features an open car deck design and is the smallest vessel in the Alaska Marine Highway System. It serves the 16.5 nautical-mile distance between Metlakatla and Ketchikan, a route which historically has carried less volume of passengers and vehicles than the Skagway/Haines route. The design for the small shuttle ferry planned for the Skagway/Haines route calls for a carrying capacity of 18 Alaska standard vehicles (ASV). However, rule of thumb on the Marine Highway states that the average RV requires twice the deck space as a car or pickup truck. Therefore, if the shuttle were loaded with only RVs, the maximum the shuttle could carry would be nine RVs on any given trip between Haines and Skagway. The shuttle is scheduled to sail twice a day thereby creating opportunity for 36 ASVs or 18 RVs to move from Skagway to Haines each day. Size, weight and capacity restrictions could impact independent bus traffic moving between communities.

Based on historic patterns of traffic between our communities, the Municipality questions the ability of this shuttle to provide adequate capacity. The reasoning for designing a vessel with such limited capacity is not explained in the EIS. We note that in association with Alternative 3 (West Side Road) larger shuttle designs have been

considered. We further note that under Alternative 2B, the small shuttle is taken out of service in winter and there is no direct connection between Skagway and Haines.

RESPONSE: The sizing of the Haines-Skagway shuttle ferry is addressed in Chapter 4 and Attachment C of the Revised Appendix GG, *Marine Segments Technical Report*. As stated above, the design of the vessel serving the Haines-Skagway link was sized to meet the demand for travel on that link. The demand estimate for this link was prepared by the McDowell Group, the same firm that prepared the *North Lynn Canal Ferry Service Analysis* cited in the opening paragraph of this letter.

Under Alternatives 4A, 4B, 4C, and 4D, the mainliners would have continued to sail twice per week in summer and once per week in winter, providing additional capacity between Haines and Skagway. If there had been sufficient demand, the Alaska Marine Highway System (AMHS) could have increased the number of sailings between Haines and Skagway to provide additional capacity.

The Alternative 3 Haines-Skagway shuttle ferry was sized to account for Juneau-Skagway traffic in addition to the Haines-Skagway traffic only.

During winter, under Alternative 2B, only two of the three vessels would have operated at any one time due to 1) reduced traffic demand and 2) the need to perform annual maintenance. Each winter, each of the three vessels would have been serviced, one at a time, while the remaining two continued to operate. Even with two vessels operational in winter, there would have been multiple trips per day between Haines and Skagway under Alternative 2B, versus the few trips per week currently provided.

- 3. Traffic forecasts for the Haines/Skagway link are conspicuously absent.** The DSEIS offers expansive analysis on traffic forecasts for the Juneau/Haines and Juneau/Skagway segments. However it treats the Haines/Skagway link as totally separate from Juneau Access and offers no analysis of traffic demand between the communities. It merely states that the demand between Haines and Skagway will be 53 ASV per day but the document is silent on how this number is arrived at. We believe that capacity engineered to this demand number would be insufficient to handle future growth and peaks in current demand such as week-end, special events and holidays.

RESPONSE: The ferry connection between Haines and Skagway was not identified as a direct component of the alternatives for improving access to and from Juneau in Lynn Canal. The traffic forecast for the Haines-Skagway link is in the *Juneau Access Haines/Skagway Traffic Forecast*, dated November 2012 (prepared by The McDowell Group). This report was not appended to the Draft SEIS because the Haines-Skagway link is not directly part of the alternatives being evaluated. Based in part on your comment, the revised *Juneau Access Haines/Skagway Traffic Forecast*, dated December 2016, has been included as an attachment to Revised Appendix AA, *Traffic Forecast Report* in the Final SEIS. As stated above, the ferry vessel serving the Haines-Skagway link would have been sized to accommodate the forecast demand. If more demand had developed than forecasted between Haines and Skagway, the presence of a dedicated Haines-Skagway

shuttle would have allowed AMHS to increase the number of sailings between these communities to provide additional capacity.

- 4. Additional costs and inconvenience to foot passengers.** traveling between communities without a vehicle has been an ongoing concern for the Municipality. Many of our residents, particularly seniors and school children, travel to Juneau without a vehicle. The Alaska Marine Highway System Marketing and Pricing Study conducted by the McDowell Group in 2000 estimated the number of foot passengers to be 45% of the total passengers. The potential costs to these passengers go unreported in the document. Conservative estimates of the costs for a person traveling without a vehicle between Katzehin and Auke Bay range from \$50 (van/bus) to \$180 (taxi). The draft EIS should provide more detail than merely stating it is “assumed a commercial system will be created.” The additional costs to these users, whether bus or a taxi should be factored into the User Cost/Benefit Analysis. Or, the cost to the state should be reported if the state assumes the responsibility for transferring travelers between Auke Bay and Katzehin. Either way, the costs of transport between Katzehin and Auke Bay for travelers without a vehicle are real and should be identified.

RESPONSE: The Draft SEIS does describe the user costs for walk-on passengers. The road alternatives (2B and 3) represent a shift in the way transportation would have been provided in the corridor—away from a primarily public transportation mode that operated more like a public transit service, to a highway system where private vehicles provided most of the transportation (publicly-owned shuttle ferries would have provided shorter links connecting the roadways). DOT&PF and FHWA recognized that this shift would have affected walk-on passengers. Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS described impacts to “Pedestrians and Bicyclists” for Alternatives 2B and 3, including walk-on passengers. The information included estimates of how many walk-on passengers might have been affected and how they would have been affected, including the anticipated changes in fares. Walk-on passengers are currently able to ride on a subsidized ferry for a long portion of the trip, and under Alternative 2B or 3 they would have needed to drive, use commercial transportation, or ride with another driver, which would have increased their total out of pocket cost.

Sections 4.3.7.5 and 4.4.7.5 of the Draft and Final SEIS indicate that under Alternative 2B, the cost would have ultimately depended on the size of the market but would have likely been in the range of \$42 to \$60 one-way between Juneau and Haines or Skagway based on the projected shuttle fares and rates on similar existing bus services. This would have placed the cost in the same range as the current AMHS adult passenger fares for the Juneau-Skagway and Juneau-Haines ferry links. The out of pocket user cost of travel to/from Juneau for a passenger with a car under Alternatives 2B and 3 would have been lower than the cost for a walk-on passenger under Alternative 1 – No Action, and it would have been more convenient to have a car to travel between Juneau and Katzehin. The anticipated fares for those choosing to walk-on or those who could not afford a vehicle have been updated and disclosed in the Final SEIS.

Based on AMHS information, DOT&PF believes the current percentage of walk on passengers to be closer to 30 percent as the ratio of passengers versus vehicles has declined over the past 15

years. Under Alternative 2B, a substantial segment of current walk-on traffic would have been expected to convert to personal vehicle travel. Given the distances along the road to access the Katzehin, William Henry Bay, and Sawmill Cove Ferry Terminals, walk-on traffic would not have found it nearly as convenient to access the ferries. It was assumed that the percentage of walk-on passengers would not exceed Alternative 1 – No Action volumes, and would likely have been lower, given the inconvenience and the reduced cost for vehicle travel.

Additional information regarding the impact of Alternative 2B to student transportation has been added to Section 4.3.5.2 of the Final SEIS, and to Section 4.4.5.2 where Alternative 3 would have had corresponding effects. The cost of transporting students from Haines or Skagway to Juneau would have depended on a variety of factors, including the number of students and the need to overnight away from home. The opportunity for students to travel between the communities may have increased due to reduced costs and the increased ability to make the trip within the same day.

Appendix FF (*User Benefit, Life-cycle Cost, and Total Life Cost Analyses*) of the Draft SEIS described in detail all the traveler costs included in the economic analysis, including travel time, fuel, vehicle maintenance, accident costs, insurance, etc. It is important to recognize that the travel cost figures used in the *User Benefit Analysis* are averages intended to represent a broad range of individual cost scenarios, ranging from the individual sharing personal vehicle expenses with three or four other travelers to the solo traveler who might have to hire some form of ground transportation to make a trip between Haines and Juneau. It is not possible to know with any degree of certainty how many travelers would have fallen into these and other categories of travelers. Because it is not possible to credibly predict the number of travelers who might have been seeking commercial transportation services to and from ferry terminals under various Juneau Access Improvements (JAI) Project alternatives, it is not specifically possible to predict the cost of such services.

The Draft SEIS provided an example for purposes of illustrating user cost. It was not meant to illustrate every possible scenario of vehicle type, number of occupants, or walk-on users. DOT&PF and FHWA recognize that there would have been cost implications due to changes in travel patterns like those mentioned in the comments, including costs to individuals traveling to Juneau to access the airport using Alternatives 2B or 3, costs to those travelers who may have used the existing ferry like a bus rather than as a highway, and cost savings for travelers coming or going beyond Haines or Skagway who did not wish to spend the night in a hotel (due to border closure or ferry schedule). Based on this comment, additional information has been added to Sections 4.3.7.5 and 4.4.7.5 (Other Transportation Impacts, under the Pedestrians and Cyclists subheading), as well as parallel subsections under the other alternatives, of the Final SEIS.

- 5. North Lynn Canal Ticket Prices.** In letters to the Federal Highway Administration (FHWA), the Municipality has raised the issue of the unusually high cost of travel in Lynn Canal. Per-mile passenger and vehicle fares for the 13-mile Haines-Skagway route remain the highest in the Southeast System.

It is difficult to determine from the DSEIS the actual cost of a ticket from Skagway to

Haines. Prices vary depending on which alternative is being considered, which source document you are reading and/or which vessel you are sailing on. For example, the 2012 HDR Ferry Fares Memo referenced in Appendix A of the Traffic Forecast Report indicates that for all alternatives other than Alternative 3, a ticket from Skagway to Haines will cost \$22.00/vehicle and \$7.50/passenger on the small shuttle. However, if you board a mainliner to travel to Haines it will cost you \$49.00/vehicle and \$31.00/passenger. Table A-22 of Appendix FF (User Benefit, Life Cycle Cost and Total Project Cost Report) presents a different pricing scenario.

RESPONSE: The fares for the direct Haines-Skagway shuttle ferry were anticipated to be the same for each alternative, except that under Alternative 1B they would have been lowered by 20 percent (it is for this reason that Table A-22 in Appendix FF (*User Benefit, Life-cycle Cost, and Total Life Cost Analyses* of the Draft SEIS) reports different fares for Alternative 1B). As you report, the fares for the Haines-Skagway shuttle were anticipated to be \$22.00/vehicle and \$7.50/passenger in the Draft SEIS. In winter, under Alternative 2B, there would have been no direct shuttle service between Haines and Skagway. This would have required travel to occur via Katzehin using the two Alternative 2B shuttles, which would have increased the cost of that trip (as reported Table A-22 of Appendix FF of the Draft SEIS).

The HDR Fare Memo (attached to Revised Appendix AA, *Traffic Forecast Report*) does not indicate that the fares would have been different for Alternative 3. The memo indicates (as was explained above) that the Haines-Skagway shuttle would have accommodated traffic between Haines and Skagway. That travel demand would have been independent from the traffic associated with the build alternatives to and from Juneau. The exception to this is under Alternative 3, which would have relied on the Haines-Skagway shuttle as part of the proposed alternative.

The fares have been updated for the Final SEIS, and a revised Fare Memo is attached to Revised Appendix AA, *Traffic Forecast Report*.

To add to the confusion the Municipality has received correspondence from FHWA (August 20, 2014, letter from Division Director Garcia-Aline) which states “With regards to your specific concerns about the current fare for the Haines-Skagway ferry link, the Draft SEIS will provide the predicted fare for this link based on the current statewide fare structure, but it is my understanding that in all scenarios the fare would be reduced from the current price.” To further add to the confusion, we were told by Deputy Commissioner Reuben Yost at AKDOT’s public hearing in Skagway on October 23, 2014, that most likely the price for the Skagway/Haines link would not be reduced but the prices for other routes elsewhere in the region would be raised to be compatible with the prices that have been charged historically in Northern Lynn Canal.

RESPONSE: Transportation problems on the Haines-Skagway link (to the extent there are any) are independent from the problems to and from Juneau in Lynn Canal being addressed in this SEIS. Decisions made regarding pricing for that link are made outside of this SEIS. The communications with the FHWA and DOT&PF that you refer to appear to be related to the AMHS Tariff Analysis.

The fare study examined AMHS tariff rates and tariff rates for similar ferry systems, looking at changes in fares made since the previous rate study was completed in 2008. It also looked for anomalies on routes of similar length within the AMHS system. As a result of the 2015 Rate Study, AMHS implemented a variable leveling tariff increase on all routes.

The following table looks only at rates relevant to marine segments in the Preferred Alternative (2B) and shows how different the two pricing scenarios are:

Routes less than 20 miles	2014 DSEIS Pricing	2014 AMHS fare structure
Skagway/Haines 15 miles	\$22.00/vehicle 7.50 pax	\$49.00/vehicle \$31.00/pax
Skagway/Katzehin 16 miles	\$24.00/vehicle 8.00/pax	\$52.00/vehicle \$33.00/pax

Assumptions: Using mileage provided in Table 1 of the HDR Ferry Fares memo referenced in Appendix A of the Traffic Forecast Report (2014 DSEIS.) **Yellow highlights indicate fares prorated for distance** (there is lack of consistency with regard to route distances throughout the source documents.)

Recalculating the price of a ticket from Skagway to Katzehin to reflect the current AMHS fares makes a dramatic illustration of how drastically the price of ticket from Skagway to Katzehin would change: for the proverbial family of four, the price balloons from \$52 to \$168.

RESPONSE: For Alternatives 1 – No Action (preferred), 4A, and 4C, the fares were based on 2012-2013 AMHS rates included in the Draft SEIS. For new routes that were shortened versions of existing AMHS routes, the AMHS fares were prorated by distance traveled. Alternative 1B fares were a 20 percent reduction of the Alternative 1 – No Action fares. For new routes less than 20 miles long (Alternatives 2B and 3), ferry fares were based on a flat fee to board the vessel and a cost per mile for the transit for both passengers and vehicles. These fares were lower than the existing AMHS fares due to efficiencies generated from using ferries designed as Day Boats with drive through loading and unloading, no reservation system expense, and the projected higher traffic volumes generated by frequent regularly scheduled service. Fares were commensurate with similarly operated ferry systems in other locations.

A memo documenting how the fares were developed has been added as an appendix to Revised Appendix AA, *Traffic Forecast Report*, in the Final SEIS.

In 2013, the AMHS contracted with Northern Economics to conduct a fare equalization study to develop a “fair and equitable tariff structure.” The Municipality has requested on numerous occasions that the results of the AMHS fare equalization study be included in the Juneau Access EIS. The fare adjustments that will be made as a result of the study will have a direct effect on the ticket prices for ferries operating in Lynn Canal. The AMHS Fare Study is an important tool for evaluating user costs and benefits and should be included in the EIS. Without knowing what the fares will be

for Skagway routes or the methodology behind them, it is impossible to determine which alternatives will most benefit the residents of our community.

RESPONSE: The AMHS Tariff Analysis was completed in January 2015 and was made publicly available on the AMHS website. The fare study examined AMHS tariff rates and tariff rates for similar ferry systems, and looked at changes in fares made since the previous rate study was completed in 2008. It also looked for anomalies on routes of similar length within the AMHS. It considered the development and implementation of a change in tariff policy with the goal of creating a fair and equitable tariff structure. DOT&PF and FHWA have determined that the results of the study do not have an impact on the JAI Project.

Skagway Ferry Float

The floating dock associated with the Skagway Ferry Terminal is an example of critical transportation infrastructure that needs to be refurbished and/or replaced. Ownership and use of the float is shared between the Municipality of Skagway and the State of Alaska and serves an important economic function for the community as well as the Alaska Marine Highway System. Small cruise ships, large fishing vessels, yachts and tugboats utilize this dock on a regular basis. It also serves as an emergency dock for Alaska Marine Lines and Petro Marine. It is imperative that any design changes to that dock be coordinated with the Municipality to ensure that they are compatible with the Municipality's uses.

RESPONSE: FHWA has selected Alternative 1 – No Action as the preferred alternative for the JAI Project in the Final SEIS/Record of Decision (ROD). If a build alternative had been selected that required modifications to the Skagway Ferry Float, DOT&PF would have coordinated those changes to the ferry float with the Municipality of Skagway during the design phase of JAI Project development.

Safety

Safety is one of Skagway's top priorities. The following safety issues should be addressed in the EIS with regard to the preferred alternative:

1. How will Homeland Security be handled at the "unmanned" Katzeihin ferry terminal? What part of the responsibility for emergency services will fall to local municipalities?

RESPONSE: The operation of the proposed Katzeihin Ferry Terminal would not have required staffing. Homeland Security and the U.S. Coast Guard do not require a separate security plan for unmanned terminals. The security for unmanned terminals is covered by the individual vessel security plans that are approved by the U.S. Coast Guard. Receiving approval for vessel security plans for vessels servicing Haines, Skagway, and Katzeihin is not anticipated to be an issue. AMHS currently has several unmanned terminals in service.

Statewide, the Alaska State Troopers are responsible for general policing, patrols, and emergency

response along rural roads, particularly outside of the areas associated with individual local governments. Alternative 2B falls partially in the City and Borough of Juneau (CBJ; approximately 30 road miles north of Echo Cove to Eldred Rock) and partially in the Haines Borough (from Eldred Rock northward). Within the CBJ, the Juneau Police Department (JPD) would be responsible for the primary response. The Alaska State Troopers based in Juneau would have provided the primary response for the segment of road north of the CBJ boundary. The Alternative 3 road on the west side of Lynn Canal lies within the Haines Borough. Under Alternative 3, the primary response would have come from State Troopers based in Haines.

The SEIS indicates it is likely that emergency medical response would have come from these communities. In the Draft and Final SEIS, Section 3.1.4 and corresponding Socioeconomic Resources sections in Chapter 4 for each alternative provide basic information about services provided at each community and disclose the potential impacts to the service providers of having more road miles and more traffic within their areas of responsibility. See also Section 3.3 of Revised Appendix EE, *Socioeconomic Effects Technical Report*. Fire protection outside local fire service areas (i.e., along these road routes) would have been provided by the Alaska Division of Forestry and Tongass National Forest. Haines, Skagway, and Juneau all have search and rescue capabilities either through separate organizations, through their fire/rescue departments, or both. Overall, providers of public safety would have remained the same as today under all alternatives. The text of the Final SEIS has been reviewed and clarifications made to ensure the information above is clearly represented.

The agencies with the most resources available (State Troopers, JPD, and Capital City Fire and Rescue [CCFR]) indicated that they are operating at minimal staffing levels given the extent of their current responsibilities and service areas. The SEIS and Revised Appendix EE disclose the potential that local agencies may have required further resources to continue providing the same level of service.

2. The EIS contains many studies on avalanche hazards. From our experience icing and freezing rain may be a bigger concern in this coastal corridor. Please include studies of how coastal freeze/thaw weather phenomenon affect roads and document the measures that will be taken to protect the safety of travelers.

RESPONSE: Impacts due to icing, freezing rain, icing on bridge decks, and wind conditions on the highway alternatives would have been no different than for any other road in Southeast Alaska. Alternative 2B would have included a new maintenance station that would have been staffed full time, which would have improved maintenance response times to address adverse weather conditions. The Draft SEIS acknowledged that adverse driving conditions would have occurred on the East Lynn Canal Highway in winter, but anticipated that State maintenance crews would have kept the highway open under all but the most severe conditions. Such severe weather conditions may have called for road closures. DOT&PF and FHWA have disclosed the impacts of potential road closures and have mitigated those effects to the extent that travel delays and closures would have been minimized. Service to and from Juneau during a road closure would have been provided by running a ferry in Lynn Canal. Therefore, even during road closures, the flexibility for travel under the proposed road alternatives would have been at least as good as the existing service.

3. People who fish north of the Katzehin River near the planned location of the terminal report high winds and large swells in this area. We have not found any reports or studies of sea conditions in this area. These should be included in the EIS.

RESPONSE: Multiple studies of wind and waves prepared by The Glosten Associates were used as data sources for the SEIS. These documents are available on the JAI Project website at www.juneauaccess.alaska.gov. Significant research was conducted on the wind and wave climatology in Lynn Canal, as seen in the "Lynn Canal Wind and Wave Climatology Study for Vessel Operations." This study is based on the results of software that uses historical wind and geographic data to forecast nearshore wave heights. The upper magnitude wind speeds (1 minute average) in the middle of Lynn Canal in the Haines/Katzehin vicinity can vary 30 to 68 knots, causing mid canal wave conditions that could potentially prevent ferry sailings. Based on the Glosten Associates' reports, these wind events can be expected to occur 1 to 5 percent of the time, primarily during the months of November through February. Assuming a period of 4 months or 120 days for the worst weather conditions, it can be assumed that 1 to 6 days per year may have been subject to weather conditions that could have prevented a ferry crossing. The projected number of sailings that would have been missed depends on the number of sailings per day and if the inclement weather would have occurred during those sailing times.

Current data for the north and south wind directions suggests relatively low wave height (under 2 feet) near the proposed Katzehin Ferry terminal, regardless of the magnitude of the wind event. The Katzehin Ferry Terminal would have been somewhat exposed to the westerly direction. There is no current data presented for the westerly direction. However, the fetch distance is short and wave heights would have been relatively low. While winds may have been strong, causing difficulty in birthing, the ferry mooring structures at the Katzehin and Haines Ferry Terminals would likely not have been significantly affected by wave and wind conditions from any direction. The ferry would have been able to safely weather storms at either port, assuming the moored vessel would have been properly safeguarded and monitored during extreme storm events.

Preliminary design for the Katzehin Ferry Terminal had a breakwater to the north and south of the terminal. The final design would have included consideration of prevailing wind and wave conditions. The use of this terminal would have been no more difficult than other ferry terminals in Lynn Canal.

4. Many lives have been lost on the Seward Highway, a road that shares similarities to the proposed Katzehin road. Since 2006, planners and residents at numerous public meetings have been calling for a divided highway as the best and most effective engineering enhancement on the Seward Highway. The DSEIS should analyze the cost/benefits of making the road to Katzehin a divided highway.

RESPONSE: A safety comparison with the Seward Highway is not valid, given the tremendous difference in forecasted traffic (655 ADT for East Lynn Canal Highway (Alternative 2B) versus 7,000 to 10,000 ADT on the Seward Highway). The Seward Highway had years of use with growing traffic before additional safety enhancements were installed. The East Lynn Canal Highway was

projected to have 10 times less traffic than the Seward Highway; the much lower traffic would have made for a statistically safer road. DOT&PF would have continually monitored the new road and made safety improvements if warranted. The level of safety upgrades planned for the Seward Highway were not anticipated to be needed for the JAI Project given the much lower traffic forecasted.

2nd slide from DOT&PF presentation: "Funding for the Engineering "E" Seward Highway Traffic Safety

Katzehin Terminal Logistics

Many residents have raised questions about the logistics of the unmanned Katzehin terminal. The DSEIS leaves many of those questions unanswered:

- Where will passengers purchase tickets?
- Who will be responsible for snow removal, lane assignments, propane inspections?
- Are the fast turnaround times realistic? Wait times for passengers seem overly optimistic. How will a "reservationless" system work?
- What amenities will be available for people arriving at the terminal such as bathrooms, electricity and shelter? Will there be telephone service?
- Who will check identification?

RESPONSE: The purpose of the JAI Project SEIS is to evaluate and disclose the proposed project's environmental impacts to meet the requirements of the National Environmental Policy Act (NEPA). Many operational and logistical details are not typically finalized until after an alternative is selected and design/construction moves forward. To the extent these operational details are known at this time (and relevant to understanding the impacts), they have been disclosed in the Draft and Final SEIS.

Responses to questions follow:

- Details of fare collection would have been determined during project design. It is possible fares would have been collected on board and possible fares would have been collected only in one direction.
- DOT&PF would have been responsible for the maintenance activities, including snow removal. Vehicle staging/lane assignment would have consisted of two choices (Haines or Skagway) and would have been clearly identified, allowing drivers to self-select a lane based on their destination. There would not have been propane inspections.
- The “reservationless” system would have worked on a first come, first serve basis, similar to ferries in Washington State and elsewhere.
- Turnaround times are realistic and consistent with turnaround times used by similarly operated ferry systems.
- Katzehin would have had a terminal building, but the size, building requirements, and passenger amenities had not been identified at this stage. Public support facilities would have included a heated terminal building with a waiting area and public restrooms. Telephone service is not planned for the terminal.
- Identification checks would not have been performed.

Parks and Recreation Areas

Section 6.2.1 Identifies parks and recreation areas within the project area. In Skagway, the plan identifies Mollie Walsh Park and Pullen Creek Shoreline Park as municipal parks within the project area. Registry Rock and Dewey Lakes Recreation Area should be added to this list.

RESPONSE: Neither of these areas is subject to use by any of the alternatives addressed in detail in the Draft and Final SEIS. Sections 3.1.1.6 (Land and Resource Uses) and 3.1.1.7 (Parks and Recreation Facilities) of the Draft and Final SEIS address parks and recreation in the project area. Section 6.2.1 referenced in the comment is for park and recreation lands protected by Section 4(f). Dewey Lakes Recreation Area already is mentioned in Section 3.1.1.7. FHWA examined the Dewey Lakes Recreation Area in its analysis for the 2005 Draft EIS and determined it was not a Section 4(f) property. It has not been formally considered since then because no alternative would affect it. Therefore, it is appropriate that it is not addressed in Section 6.2.1.

Registry Rock has been added to Section 3.1.1.7 of the Final SEIS as an attraction, although it appears no entity has designated it for park, recreation, or historic purposes. The 2009 Comprehensive Plan shows current ownership in the area of Registry Rock as Municipality of Skagway, current land use as Commercial, zoning as Industrial, and “Future Growth Designation” as “Waterfront Commercial Industrial.” By Municipality of Skagway definition in its Municipal Code, municipal lands outside the Industrial zoned area are part of Dewey Lakes Recreation Area, so Registry Rock (inside the Industrial zone) is not part of the recreation area. These zoning designations and apparent lack of any separate designation as a park, recreation area, or historic site indicate that Registry Rock is not protected under Section 4(f). Therefore, it is appropriate that Section 6.2.1 does not discuss Registry Rock.

Funding Priorities and Cost Overruns

The Municipality of Skagway is concerned that many transportation projects of local and regional importance will be postponed or cancelled if the State allocates its sparse transportation money to this project. The EIS should also consider the issue of cost overruns which historically have been incurred on mega-projects. The Skagway Ferry Float and the Moore Bridge are two examples of critical local infrastructure that require immediate refurbishment or replacement.

RESPONSE: Prioritizing the use of National Highway System (NHS) transportation funds is the responsibility of DOT&PF. That prioritization is done through the 4-year Statewide Transportation Improvement Program (STIP), which is published in draft form for public review and comment before approval. The STIP is modified each year to account for shifting priorities and project schedules around the State. The STIP is approved by the DOT&PF Commissioner and federal funding partners. The Legislature provides DOT&PF with authority to spend federal money and allocates funding for the State's match through the capital budget. FHWA funds are not available to be spent on routine maintenance on existing highways. It is not possible to indicate specifically which other State transportation projects might have been postponed or cancelled if STIP funds had been allocated for the construction of the JAI Project. Alternative 1 – No Action Alternative has been selected as the preferred alternative and programmed funding will be allocated to other projects. DOT&PF's 2016–2019 STIP (Amendment 3, June 28, 2017) does not include funding for any JAI Project build alternatives.

Construction cost contingency has been applied to all alternatives. Please see the *2017 Update to Appendix D – Technical Alignment Report* in Appendix Z for complete cost estimates of alternatives.

The Municipality requests an opportunity to comment on the Final.

The DSEIS discusses many scenarios that could have a profound effect on the economic future of our community. However many of the supporting documents that are referenced are not included or are buried in the DSEIS and cannot be discovered and retrieved within the timeframe of the comment period. The DSEIS has taken more than two years to produce and requires deep analysis. Many municipalities rely on volunteer committees to develop comments and are handicapped by their own public notice and public meeting requirements. This significantly limits the amount of available time for research and public vetting of comments. We ask that you provide the Municipality the opportunity to comment on the Final SEIS prior to the record of decision.

RESPONSE: FHWA has made the Final SEIS/ROD available. To ease your review of the Final SEIS, FHWA and DOT&PF have marked changes from the Draft SEIS with gray highlighting so that you can focus your search on what is new.

RE: Comments on Juneau Access Draft EIS by Skagway Port Commission

Dear Ms. Garcia-Aline,

The Skagway Port Commission appreciates the opportunity to comment on the Juneau Access Improvements Project Draft Supplemental Environmental Impact Statement (DSEIS). While the Commission is not taking any position on specific alternatives being proposed in the DSEIS it is essential that any alternative being proposed take into account the configuration and use of the Ferry Float in Skagway. The Commission's comments focus specifically on issues related to Port activity and how that activity integrates with the Port as a whole.

The Skagway Ferry Float is a jointly owned facility between the State of Alaska and the Municipality of Skagway. It is a critical piece of infrastructure for the Municipality and an essential component of the Port as a whole. The Municipality utilizes the East side of the existing float and any changes to the existing facility require proper consultation with the Municipality to ensure that present and future use of the facility for municipal purposes is protected and enhanced.

A variety of alternatives proposed in the DSEIS involve modifying the Skagway Ferry Float to accept shuttle ferries. Proposals that involve designs or infrastructure that are a departure from the configuration that presently exists have the potential to disrupt or impede the Municipality's ability to utilize its side of the ferry float. The Commission asks that the Municipality be properly consulted in the design, replacement and implementation process of any additional infrastructure or changes to the existing facility to allow for the docking of the proposed shuttle ferries.

Thank you,

Tim Bourcy, Chair
Skagway Port Commission

Dear Mr. Cochran:

Thank you for your letter, dated November 25, 2014, with your comments on the Juneau Access Improvements (JAI) Project Draft Supplemental Environmental Impact Statement (SEIS). We appreciate the participation of the Skagway Port Commission and Municipality of Skagway in the JAI Project.

We have reviewed your letter and our attached response has been embedded in a reprint of your letter.

We anticipate releasing a combined Final SEIS/Record of Decision very soon. FHWA has identified Alternative 1 – No Action as the Preferred Alternative in the Final SEIS. Governor Walker announced on December 15, 2017, that the “No Build Alternative” is the State’s Preferred Alternative. Please see Section 2.5 of the Final SEIS for further discussion.

Please do not hesitate to contact me at (907) 465-1828 if you have any additional questions or concerns.

Sincerely,

A handwritten signature in blue ink that reads "Greg Lockwood".

RE: Comments on Juneau Access Draft EIS by Skagway Port Commission

Dear Ms. Garcia-Aline,

The Skagway Port Commission appreciates the opportunity to comment on the Juneau Access Improvements Project Draft Supplemental Environmental Impact Statement (DSEIS). While the Commission is not taking any position on specific alternatives being proposed in the DSEIS it is essential that any alternative being proposed take into account the configuration and use of the Ferry Float in Skagway. The Commission's comments focus specifically on issues related to Port activity and how that activity integrates with the Port as a whole.

The Skagway Ferry Float is a jointly owned facility between the State of Alaska and the Municipality of Skagway. It is a critical piece of infrastructure for the Municipality and an essential component of the Port as a whole. The Municipality utilizes the East side of the existing float and any changes to the existing facility require proper consultation with the Municipality to ensure that present and future use of the facility for municipal purposes is protected and enhanced.

A variety of alternatives proposed in the DSEIS involve modifying the Skagway Ferry Float to accept shuttle ferries. Proposals that involve designs or infrastructure that are a departure from the configuration that presently exists have the potential to disrupt or impede the Municipality's ability to utilize its side of the ferry float. The Commission asks that the Municipality be properly consulted in the design, replacement and implementation process of any additional infrastructure or changes to the existing facility to allow for the docking of the proposed shuttle ferries.

RESPONSE: FHWA has selected the No Action Alternative as the preferred alternative for the Juneau Access Improvements Project in the Final SEIS. If a build alternative had been selected that required modifications to the Skagway Ferry Float, DOT&PF would have coordinated those changes to the ferry float with the Municipality of Skagway during design phase of the project development.

Thank you,

Tim Bourcy, Chair Skagway
Port Commission

Ms. Deborah Holman
Juneau Access Improvements Project
Southeast Region
Alaska Department of Transportation and Public Facilities
P.O. Box 112506
Juneau, AK 99811-2506

Dear Ms. Holman,

We are in receipt of your invitation for comment on the Juneau Access Improvements Project Draft Supplemental EIS. We have met with and will continue to work closely with Goldbelt, Inc. on this matter and other projects that impact our traditional lands in the Juneau area.

The Douglas Indian Association (DIA) is the historical federally-recognized tribe of the Juneau and Douglas area whose members originate from the T'aaku Kwáan and A'akw Kwáan clans which have inhabited the Anax Yaa Andagan Yé (Douglas) and Dzantik'i Héeni (Juneau) region since time immemorial. Our traditional and historical territory encompasses the City and Borough of Juneau, as well as some areas to the east and north on Admiralty Island and the Chilkat Peninsula, to the south including Endicott Arm, and to the east into Canada in the areas of the Taku River and Atlin, B.C. (See attached map of our traditional and historic territories.)

After reviewing the project information included with your invitation, the Douglas Indian Association has determined that the preferred alternative is located near and may impact known sites of historic, traditional and cultural importance to DIA. In addition, other areas of significance to the Tribe may be affected as construction moves forward. The Tribe will continue to assert its continued presence as key stakeholders given the well-known ancient Tlingit archaeological sites in the Berners Bay area and the historical occupation of that area by our Tribal ancestors.

Page 4-42 of your document states under Section 4.3.4, "*Consultations with Native Tribes and organizations have not indicated that this alternative would impact any traditional cultural properties.*" It would be helpful to know which "Native Tribes and organization were consulted since DIA, Goldbelt and Sealaska Corporation are fully aware of historic sites in Berners Bay.

Anax Yaa Andagan Ye-Sayeik
Where the Sun Rays Touch First-Spirit Helper

In addition, Page 4-43 states, "DOT&PF and FHWA have consulted with the USFS and the SHPO regarding potential impacts to historic properties in the APE of Alternative 2B. On October 5, 2005, SHPO concurred with FHWA's determination that Alternative 2B would have no adverse effect on any historic property." And "In June 2012, following correspondence from FHWA detailing minor changes to Alternative 2B, the SHPO reconfirmed that a finding of no adverse effect remains appropriate for this alternative."

This is clearly an oversight on the part of SHPO and other agencies considering the evidence of a permanent historic Tlingit winter village with burial sites and petroglyphs in Berners Bay, which is well documented in oral tradition and archaeological research. (Please see the attached Alaska Heritage Resources Survey, which lists additional references on this site.) It is difficult to determine the precise corridor planned by the rough maps in the document, but it likely comes close to this and other sites of historic and traditional importance to the Tribe.

In the spring of 2013, DIA, Goldbelt Heritage Foundation, U.S. Forest Service, and the University of Alaska Southeast's Heritage Program monitored cultural sites in Berners Bay. Several sites were identified, including the Berners Bay Petroglyphs, Echo Cove Cabin, Sawmill Creek shell midden, Sawmill Creek cabin, Sawmill Creek sawmill, and Sawmill Creek shipway. We have attached a map with those sites identified, as well as photos from the survey. Additional surveys to continue to identify additional sites of historic, cultural, and traditional importance to the Tribe are planned.

As a further compelling example of DIA's concerns are that on October 7, 2014, the U.S. Forest Service was notified by campers at a Berners Bay site (along the preferred route) that they had discovered human remains, later found to belong to an "ancient" Native person. (Please see the attached e-mail and photograph resulting from that discovery.)

An additional issue about this preferred alternative is the impact it will have on subsistence resources accessed by our Tribal members, especially in the Berners Bay area. You have documented the existence of many of these resources, yet, some (such as herring in the Lynn Canal and Berners Bay areas) were not mentioned. We respectfully request that the ultimate standard of care be taken to minimize impact to those resources.

As this alternative advocates for construction in areas historically used and occupied by our Tribal ancestors, there will most certainly be sites of archeological importance uncovered. In accordance with 36 CFR 800.5(b), implementation regulations of Section 106 of the National Historic Preservation Act, should this alternative be approved, we would appreciate direct and early consultation with your agency as you move forward with construction, and immediate contact if anything of possible historic or cultural significance to the Tribe is disturbed through any work that is performed. In addition, when approaching areas where potential impact to these kinds of historic and cultural resources exists, we request that a cultural resource specialist be hired to be to monitor on-site construction activity, and that DIA Tribal Government officials or designees be involved in monitoring activities as well.

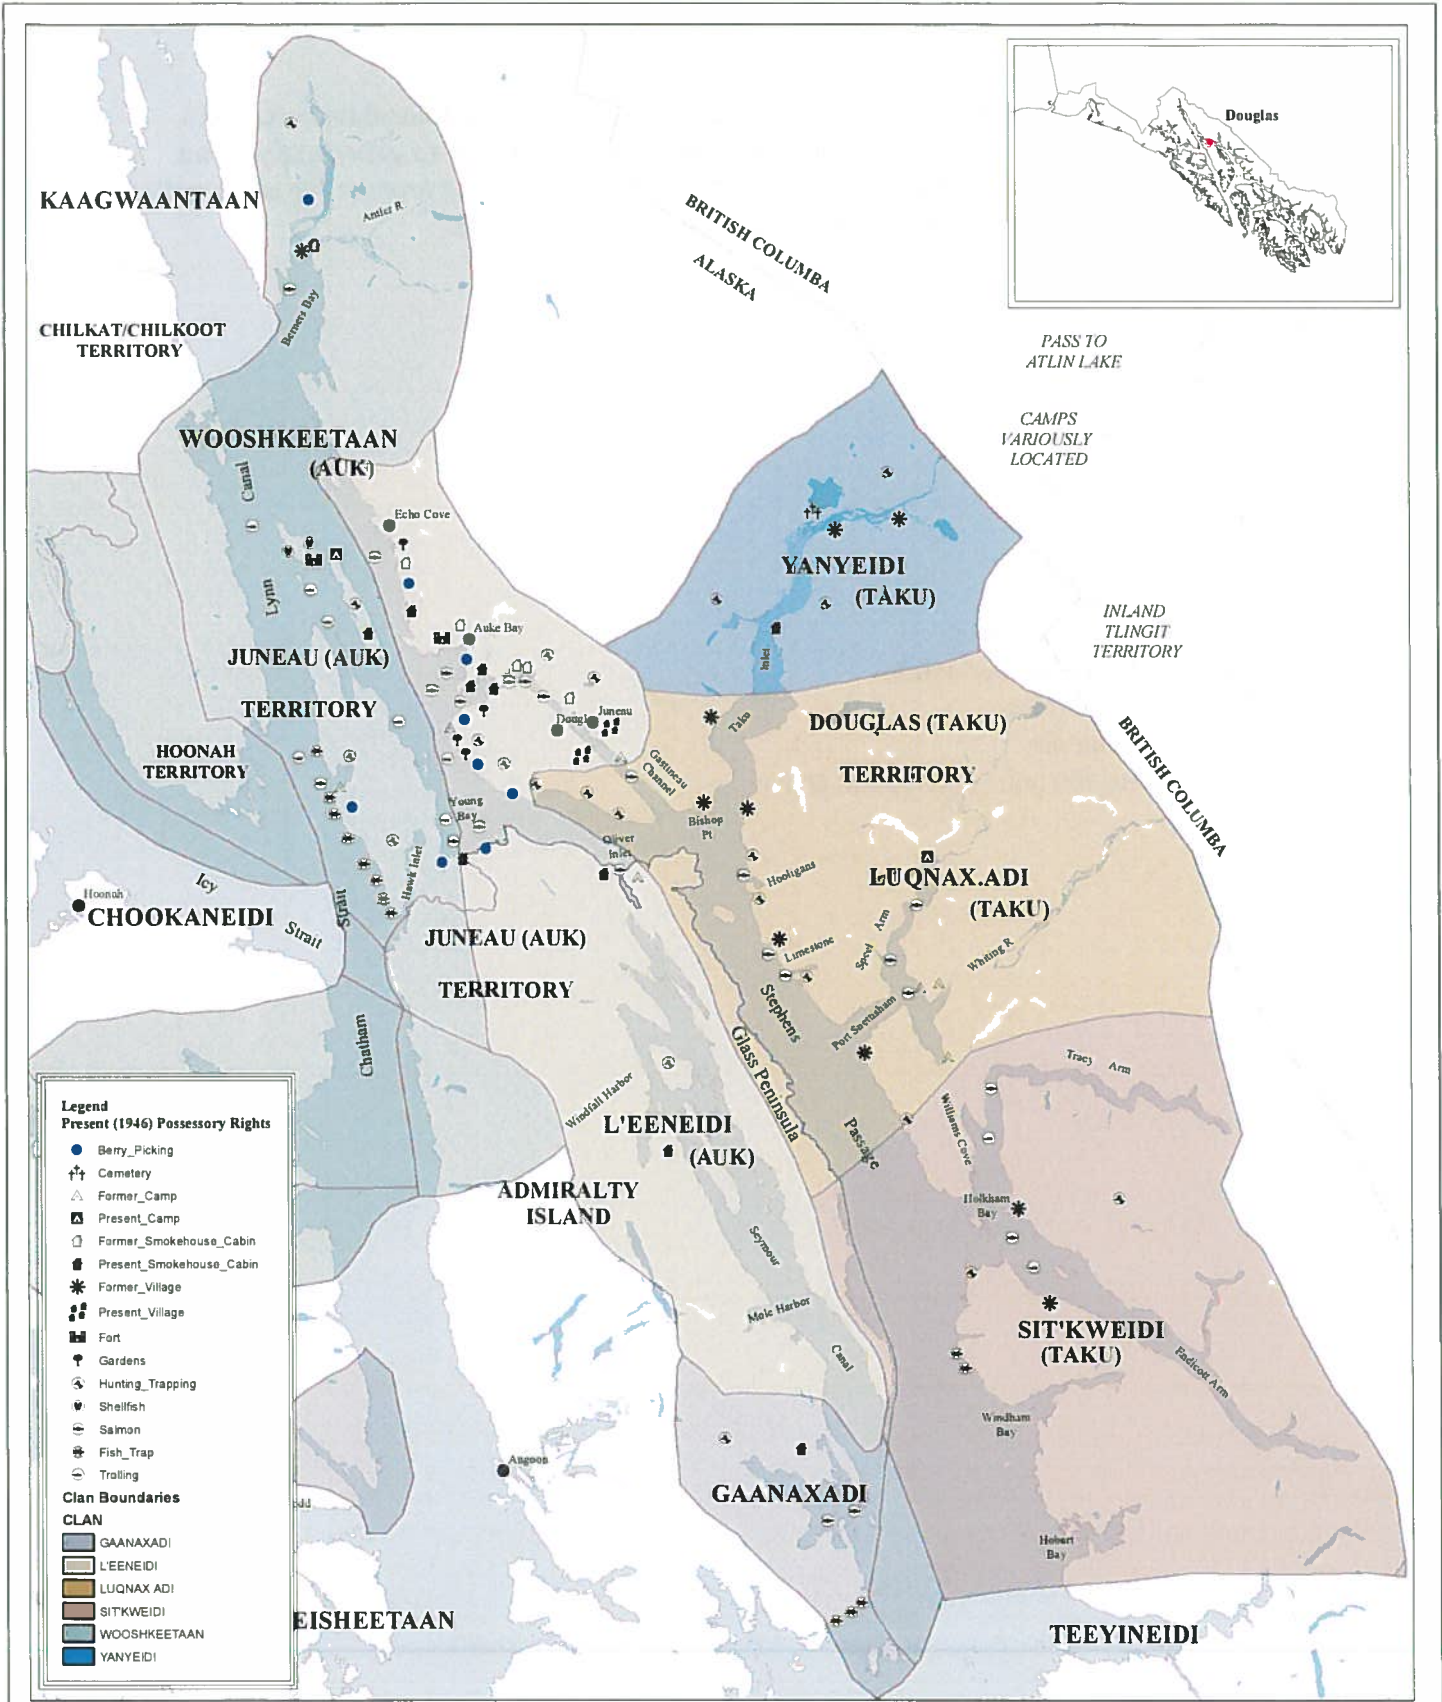

This project will undoubtedly have a yet to be realized impact on traditional resources and sacred sites that are greatly important to the Tribe. We look forward to your vigilance and utmost respect and care regarding our Tribal interests in approaching prospective construction, and to continued communication and cooperation with your agency.

Sincerely,

Andrea Cadiante-Laiti
Tribal Administrator

Site Name(s): BERNERS BAY VILLAGE AND PETROGLYPHS
BERNERS BAY PETROGLYPH SITE

Alternate Name(s):

Associations:

Informal Association(s):

Formal Association(s):

Site Description:

[AHRS] Reported by informants as a permanent village site with winter houses, burials, and petroglyphs. Sealaska investigators located two fence-type grave sites destroyed by vandals on the western cliff above the beach. At the SE end of the site was a large cone or wedge-shaped piece of marble with petroglyphs of concentric rings, faces, eyes, orcas, halibut, a large bird, a wolf, and a bear-like image. Conflict exists between 1979 survey conducted by CPSU and 1982 USFS survey. CPSU investigators reported a 2.6m x 3.3m house pit, one grave house, two graves with balustrades, a petroglyph boulder, and modern camp remains. "Possible" house depression found in 1979 could not be substantiated by subsurface testing in 1982. Investigations in 1994 relocated the burials and petroglyph boulder and identified 3 additional boulders. The total number of petroglyphs at the site is 15. No evidence of middens or depressions were found. [see also JUN-040, Stevens reported a site with similar origin and characteristics, probably the same site.] [DOE] Site contains figure and geometric designs pecked on a large marble boulder above mean high tide line.

Site Significance:

[DOE] Site is said to embody symbolic value in the traditions of the Auke Tlingit. The killer whale is a principal crest for the Wuckitan Clan and the petroglyphs represent their claim to the bay. [AHRS] Reportedly a permanent village site with petroglyphs. May provide information on habitation and settlement patterns while showing past use of the area. Petroglyphs may have ceremonial, economic, or artistic meaning.

Location:

This site extends for approx 0.25 mi. along the NE shore of Berners Bay, at the mouth of the stream N of Sawmill Creek, approx 57km NNW of Juneau, SE Alaska.

Berners Bay Survey Area
 Petroglyphs & Sacred Sites

DIA EPA Department	
Drawn By: Kamal Lindoff	
Checked By: DIA Council	
Date: 11/20/14	

Noted historic debris on the north side of Fish Creek – west of (above) Douglas Highway as well as an historic trail. (Neither of these have been documented.)

Paleo-Shoreline Outcomes

Inventories with Negative results:

No paleoshoreline exposures along Blueberry Hill access trail between parking area and the Treadwell Ditch

No paleoshoreline exposures along 3 small drainages north of 9 Mile Creek west of (above) Douglas Highway. Inventories done to approximately 50m. Also – none noted along Fish Creek between approx. 40m and the highway.

An effort to identify paleoshoreline exposures on 9 Mile creek above Douglas Highway produced negative results, but we aborted the effort early due to the amount of private property we seemed to be trespassing on.

Positive Paleoshoreline IDs and Test Pits

In collecting samples we kept careful vertical control and although many samples were collected in “bulk” we were careful to record depth range where collection occurred. At some locations, shell was plentiful enough that

UAS Campus TP#1 (Cabin Site) – No GM encountered.

UAS Campus TP #2 (Creek) – limited GM

UAS Campus TP 3# (Lake) No GM

UAS Campus Culvert Exposure – Great Exposure – sample not yet collected.

9 Mile TP 1 – No GM encountered

9 Mile TP 2 – GM encountered, bulk sample collected 8-9m

9 Mile TP 3 – Tributary – GM Encountered, bulk sample collected (13 m)

9 Mile TP #4 – Estuary – GM Encountered. Intertidal – following GM down gradient. Elevation uncertain 6-7m?

Peterson Creek #1 – (17 m north of pedestrian bridge) River bottom bulk “grab” sample. Water 2.5’ deep.

Peterson Creek Exposure – upriver. Noted by Dan M and B. Deasis. No sample collected.

Treadwell 2nd Glory Hole TP! – bulk sample collected. Surface grab sample also collected.

Heritage Program UAS/DIA Collaborative Project: Cultural Site Monitoring in Berners Bay (Week 1) and Paleoshoreline Research and Sampling in Juneau Area (Week 2)

May 6 through May 17, 2013

Preliminary Project Summary

What went well

Provided a unique opportunity for 8 UAS students to participate in a direct way with an agency driven effort to monitor archeological sites and a fantastic opportunity for Eric Morrison to get out to Berner's Bay petroglyph site. Three students were of Tlingit heritage – one directly affiliated with Berners Bay. She was able to carry out her duty and privilege of acknowledging and thanking her ancestors, including the bears, the land and the trees, in a nurturing supportive collegial atmosphere. Her opposite, provided balance.

The same cadre of participants (with the exception of Eric Morrison and the switch out of one student) were able to participate in a full week of research into the question of the ages of LGM/early Holocene shorelines in southeast Alaska.

Boat support for 2 days in Berners with awesome help from Matt Thompson.

Monitored Sites and Other Heritage Program Outcomes

JUN 062 – Berners Bay Petroglyphs. We identified the four known petroglyph rocks and observed that on at least one, there are more petroglyphs than have been recorded to date. Students completed a partial inventory of timber extraction related debris at the site and Eric was on hand to make a visual assessment. He also observed the modern campsite.

JUN ___ - Echo Cove Cabin – This site was monitored by a subset of students as a fill in activity when our departure from Echo Cove due to the failed William Henry Repeater.

JUN-673 – Sawmill Creek Shell Midden

JUN-674 – Sawmill Creek Cabin – interestingly we found the site, but no cabin remnants.

JUN – 675 – Sawmill Creek Sawmill

JUN – 676 – Sawmill Creek Shipway

Identified 2 CMTs and fully documented one during transit from outer beach “across” landform (peninsula) west of Sawmill Creek to the Sawmill area sites. Are merits much more intense archeological survey.

Noted a possibly historic cabin (partially intact) in the woods just off the south end of the parking lot at the Blueberry Hills Treadwell Ditch Trail access route. (I don't believe that this cabin has been documented. It's age is unknown.

Auk Bay Elem School TP 1 – (small creek) bulk sample collected.

Auk Bay Elem School TP2 –(muskeg) 2 bulk samples collected. At different depths.

Recommendations:

- Earlier, detailed and realistic – collaboratively reached plans – that mesh with the goals of the program providing the funding.
 - Dan’s course description led students to believe they’d be on an extended field trip to Berners Bay – with travel being by kayak or skiff. This may have been possible, but could not have come to fruition the way Myra had imagined. Full time boat support would have been absolutely essential. Budgeted time for pulling together logistics like boat, food, gear etc would have had to have been increased considerably. Planning that the FS archeologist could “multi-task” – being the only FS sanctioned small boat operator, the only FS sanctioned riffle bearer etc – was not realistic.
 - Eric expected that he would emerge from the trip with an inventory of all the “garbage” at the Petroglyph site and that we’d complete an inventory for archeological sites on the east shore of Berner’s Bay.
- Clarity regarding who/which organization was driving the program.
- Early clearly assigned responsibilities for each organizational representative.
 - I’d been told that FSL folks would take the lead for the paleoshoreline work. When meeting with them one week prior to the project, they revealed to me they’d made no such commitment.
- An agreement structure other than volunteer agreements would be much more effective. FS project leader (myself) became de-facto supervisor for entire crew (7 students, one UAS professor, and DIA’s Environmental Planner). In that role, I had to be with them in the field pretty much the whole time and I had to ensure that they complied with every safety standard we’d expect of employees. Just the supervision, coordination side of things was complex. Pulling together and tracking gear (radios, probes, helmets) daily was work in itself. The responsibility for leading the archeological monitor effort and documentation was another layer.
- Baitchtal had intended to fund me to learn the paleoshoreline research methodology and gain experience. Instead, I was expected to provide expertise and leadership for students eager to learn. It was too early in my learning curve to push me into the role of an “expert.”
- Volunteers – including students – are never free. Added pressures come with students as they expect (and have a right to expect) to have a quality learning experience.

Burners Bay UAS and DIA collaboration survey project, May 6 through May 17, 2013

Gilliam, Myra -FS

From: John Hudson <odonatak@gmail.com>
Sent: Tuesday, October 07, 2014 8:11 PM
To: Cole, Forrest -FS
Cc: Gilliam, Myra -FS
Subject: Human Jawbone found in Berners Bay
Attachments: DSCN6873.JPG

Dear Mr. Cole,

Last July while camping on a beach in Berners Bay with a group of friends, someone in our party found a human jawbone near the high tide line (see photo attached). The bone was turned over to the state troopers and it's my understanding they passed it on to the state medical examiner who determined that it belonged to an "ancient" native person.

I suspect that the bone may have been eroded from a nearby stream bank on Forest Service land, transported to the beach by the stream, and then was washed up by the surf.

I wanted to make you aware of this find in case there is an interest in searching for other human remains in this area. The bone was found at: 58.7384, -134.9341. There are numerous petroglyphs near on this beach.

Thanks for looking into this matter.

Re: Juneau Access Improvements
Draft Supplemental Environmental Impact Statement (SEIS)
Project #711000

Dear Ms. Cadiente-Laiti:

Thank you for your review of the Draft Supplemental Environmental Impact Statement (SEIS) for the Juneau Access Improvements project. The Alaska Department of Transportation and Public Facilities (DOT&PF) in coordination with the Federal Highway Administration (FHWA) circulated the Draft SEIS for public review on September 15, 2014. I apologize for this late response to your November 25, 2014 letter. We are currently in the process of responding to comments. The Final SEIS and Record of Decision cannot be prepared until we complete this effort, since responses to all comments received will be included in the Final SEIS.

You expressed concerns that Alternative 2B (East Lynn Canal Highway to Katzehin, Shuttles to Haines and Skagway) right-of-way road design was located near and may impact known sites of historic, traditional, and cultural importance. Concern was also noted for the impacts to subsistence resources. While Alternative 2B was identified in the Draft SEIS as the preferred alternative, all alternatives are still under consideration.

The FHWA and DOT&PF appreciate your concerns and the sensitivity of these cultural resources. We will be contacting you in the coming weeks to schedule a meeting to discuss your concerns and provide a status update.

Sincerely,

Ms. Deborah Holman
Juneau Access Improvements Project
Southeast Region
Alaska Department of Transportation and Public Facilities
P.O. Box 112506 Juneau,
AK 99811-2506

Dear Ms. Holman,

We are in receipt of your invitation for comment on the Juneau Access Improvements Project Draft Supplemental EIS. We have met with and will continue to work closely with Goldbelt, Inc. on this matter and other projects that impact our traditional lands in the Juneau area.

The Douglas Indian Association (DIA) is the historical federally-recognized tribe of the Juneau and Douglas area whose members originate from the T'aāku Kwáan and A'akw Kwáan clans which have inhabited the Anax̄ Yaa Andagan Yé (Douglas) and Dzantik'i Héeni (Juneau) region since time immemorial. Our traditional and historical territory encompasses the City and Borough of Juneau, as well as some areas to the east and north on Admiralty Island and the Chilkat Peninsula, to the south including Endicott Arm, and to the east into Canada in the areas of the Taku River and Atlin, B.C. (See attached map of our traditional and historic territories.)

After reviewing the project information included with your invitation, the Douglas Indian Association has determined that the preferred alternative is located near and may impact known sites of historic, traditional and cultural importance to DIA. In addition, other areas of significance to the Tribe may be affected as construction moves forward. The Tribe will continue to assert its continued presence as key stakeholders given the well-known ancient Tlingit archaeological sites in the Berners Bay area and the historical occupation of that area by our Tribal ancestors.

RESPONSE: Thank you for your continued input regarding the Juneau Access Improvements (JAI) Project. As reported in Section 3.1.3 of the Draft and Final Supplemental Environmental Impact Statement (SEIS), the Alaska Department of Transportation and Public Facilities (DOT&PF) and Federal Highway Administration (FHWA) understand that the project is located in an area that has been identified as culturally significant to Douglas Indian Association (DIA). As reported in Section 4.3.4 of the Final SEIS, DOT&PF and FHWA understand that Alternative 2B would have been located near known sites of historic, traditional, and cultural importance to DIA. However, the Final SEIS

Anax̄ Yaa Aodagan Ye-Sayeik
Where the Sun Rays Touch First-Spirit Helper

identifies Alternative 1 – No Action as the preferred alternative.

Page 4-42 of your document states under Section 4.3.4, "*Consultations with Native Tribes and organizations have not indicated that this alternative would impact any traditional cultural properties.*" It would be helpful to know which "Native Tribes and organization were consulted since DIA, Goldbelt and Sealaska Corporation are fully aware of historic sites in Berners Bay.

RESPONSE: Identification of prehistoric and historic resources and traditional cultural properties in the SEIS is based on record searches, surveys within the study area, and consultation with Native Tribes and organizations, U.S. Forest Service (USFS), and the Alaska State Historic Preservation Officer (SHPO). Reported sites have not been identified within the Area of Potential Effect (APE) for Alternative 2B (see Section 4.3.4 of the Final SEIS).

As discussed in Section 3.1.3 and Chapter 7 of the Draft SEIS, DOT&PF sent letters in September 2003 to 11 Tribal organizations, of which, six are Federally Recognized Tribes (Chilkoot Indian Association of Haines, Klukwan Inc., Golbelt Inc., Chilkat Village of Klukwan, Sealaska Corporation, DIA, Tlingit and Haida Central Council, Skagway Traditional Council, Auk Kwan Traditional Council, Sealaska Heritage Institute, and Hoonah Indian Association), SHPO, USFS, and National Park Service (NPS), inviting them to participate in the process of identifying cultural properties (prehistoric and historic) and determining the effects of the alternatives on such properties for the 2005 Draft SEIS. DOT&PF conducted follow-up phone calls and face-to-face meetings when requested by the Tribes and Native organizations. In August 2004, FHWA sent letters to these same entities, inviting them to comment on FHWA's determination of eligibility on historic properties for the National Register of Historic Places and determination of potential effects on any historic properties in the APE.

In 2012, SHPO was consulted and concurred with the APE for the project and field methodology. In addition, SHPO concurred with FHWA's determinations of eligibility for all historic properties within the APE of Alternative 2B (with minor changes to the site boundaries) as discussed in Section 4.3.4. The Tribes and Tribal organizations were additionally notified regarding opportunities for input through scoping outreach, the notice of availability, and the public hearing process as part of the 2014 Draft SEIS. FHWA and DOT&PF did not receive scoping comments from Tribes or Tribal organizations but did receive comments from DIA, Sealaska, and Auk Kwan on the Draft SEIS. FHWA and DOT&PF have responded to Draft SEIS comments in Appendix JJ, *Responses to Draft Supplemental Environmental Impact Statement Comments*, of the Final SEIS. The APEs have not changed between SHPO's concurrence and the Draft SEIS. Following the additional consultation described below, FHWA and DOT&PF have reviewed the existing analysis and determined that additional field investigations are not necessary (see paragraph below).

The investigations (research and field studies) of cultural resources presented in the Draft SEIS were a synthesis of several technical reports and memoranda prepared for the JAI Project between 1994 and 2005 regarding historic and archaeological sites in the APE. A follow-up literature review was conducted in 2012 to determine if any new information regarding cultural resources in the APE had become available since 2005. No new cultural resources were identified within the APE.

On February 25, 2016, meetings with Sealaska Corporation, Sealaska Heritage, DIA, Goldbelt Corporation, and SHPO verified that no previously unidentified sites of cultural or historic importance were missed.

In addition, Page 4-43 states, "DOT&PF and FHWA have consulted with the USFS and the SHPO regarding potential impacts to historic properties in the APE of Alternative 28. On October 5, 2005, SHPO concurred with FHWA's determination that Alternative 2B would have no adverse effect on any historic property." And "In June 2012, following correspondence from FHWA detailing minor changes to Alternative 2B, the SHPO reconfirmed that a finding of no adverse effect remains appropriate for this alternative."

This is clearly an oversight on the part of SHPO and other agencies considering the evidence of a permanent historic Tlingit winter village with burial sites and petroglyphs in Berners Bay, which is well documented in oral tradition and archaeological research. (Please see the attached Alaska Heritage Resources Survey, which lists additional references on this site.) It is difficult to determine the precise corridor planned by the rough maps in the document, but it likely comes close to this and other sites of historic and traditional importance to the Tribe.

RESPONSE: To protect sensitive site information, the data and analyses contained in these documents are only summarized in the Draft SEIS, although all of the information therein was used in making determinations of eligibility and findings of effect. For example, the locations of sensitive archaeological and burial sites were not disclosed in the Draft SEIS. It is understandable that a review of the Draft SEIS could lead to confusion in regards to the summary of this site information appearing not to include all site locations.

The Alaska Heritage Resources Survey (AHRs) was reviewed for the SEIS. Section 3.1.3 of the Final SEIS includes information regarding cultural resources within the project's APE, and Section 4.3.4 includes a discussion of project impacts to known historic properties under Alternative 2B (see other relevant Historical and Archaeological impacts sections under each alternative in Chapter 4). Reported locations of known cultural resources were considered during the development of the project. The likely presence of historic properties within the APE for each alternative was established through background research, consultations, and field investigations. FHWA determined that no known historic properties would be directly impacted by any reasonable alternative, and SHPO concurred with the determination that Alternative 2B would have no adverse effect on historic properties.

In a letter response from SHPO to DIA dated April 9, 2015, SHPO stated that:

Regarding the Juneau Access Project, our original concurrence with FHWA's finding of 'no adverse effect,' which was issued in 2005 and which was reevaluated and maintained in 2012, was based on our understanding that the preferred alternative selected—the Alternative 2B alignment—was conditioned upon the complete avoidance of sites of potential concern within the area of potential effects (APE). ... Other sites in the vicinity of the project, such as JUN-00673 (the Sawmill Creek Shell Midden), JUN-00062 (Berners Bay Village & Petroglyph Site), SKG-00138 (Dayebas Creek Cache Pit), JUN-00670 (William Henry Bay Petroglyph), SKG-00136/SKG-01378 (Pyramid Island Shell Midden), and others were completely avoided and listed in the documentation that we received from FHWA as outside of the APE. Therefore, FHWA's finding of effect (and our subsequent concurrence) did not concern these sites as they were not within the APE.

The existence of burial sites and sites of cultural importance in the Berners Bay area was first noted during the initial archaeological literature review for this project, conducted in 1994. Their reported

locations were considered during the development of the inventory design and were factored into the field survey methodology. This design was developed in consultation with archaeologists from the USFS and Alaska Office of History and Archaeology. No known burial sites would be affected by any *alternative*.

FHWA and DOT&PF, along with the SHPO, had meetings on February 25, 2016, with Sealaska Corporation, Sealaska Heritage Institute, DIA, and Goldbelt Corporation to address the concerns expressed in comments on the Draft SEIS. As was discussed during those meetings, the AHRS database was reviewed for the SEIS. Reported locations of known cultural resources were considered during the development of the project, including the historic *Tlingit* winter village with burial sites and petroglyphs in Berners Bay. The presence of any historic properties within the APE for each alternative was established through record searches; surveys within the APE; and consultation with Native Tribes and organizations, USFS, and SHPO. Upon conclusion of these meetings, no previously unidentified sites of cultural or historic importance were identified, and FHWA maintains that their determination of no adverse effect on any cultural resources and historic properties is valid.

In the spring of 2013, DIA, Goldbelt Heritage Foundation, U.S. Forest Service, and the University of Alaska Southeast's Heritage Program monitored cultural sites in Berners Bay. Several sites were identified, including the Berners Bay Petroglyphs, Echo Cove Cabin, Sawmill Creek shell midden, Sawmill Creek cabin, Sawmill Creek sawmill, and Sawmill Creek shipway. We have attached a map with those sites identified, as well as photos from the survey. Additional surveys to continue to identify additional sites of historic, cultural, and traditional importance to the Tribe are planned.

RESPONSE: Thank you for providing information regarding the 2013 monitoring program and sites identified during that work. As mentioned above, the possible existence of burial sites and sites of cultural importance in the Berners Bay area was first noted during the initial archaeological literature review for this project, conducted in 1994. Their reported locations were considered during the development of the inventory design and were factored into the field survey methodology. This design was developed in consultation with archaeologists from the USFS and Alaska Office of History and Archaeology. The likely presence of historic properties within the APE for each alternative was established through background research, consultation, and field investigations. Field and aerial surveys did not identify historic properties within the project APE. Alternative 2B was developed to avoid cultural resources of potential concern. Based on research, consultation, and field investigations, no known historic properties would be directly impacted by any reasonable alternative.

As a further compelling example of DIA's concerns are that on October 7, 2014, the U.S. Forest Service was notified by campers at a Berners Bay site (along the preferred route) that they had discovered human remains, later found to belong to an "ancient" Native person. (Please see the attached e-mail and photograph resulting from that discovery.)

RESPONSE: Thank you for providing this updated information. The Final SEIS identifies Alternative 1 – No Action as the preferred alternative. As stated in Sections 4.8.3, 5.10, and 5.12.1 of the Draft SEIS, if a previously unknown cultural resource or burial site/human remains had been discovered during construction, work in the vicinity of the discovery would have been halted until the discovery was evaluated and appropriate consultation, including with Tribes as appropriate, was conducted per Section 106 of the National Historic Preservation Act. If the discovery had included human remains or associated funerary objects, it could also have been subject to the provisions of the Native American Graves Protection and Repatriation Act (NAGPRA), and Tribal consultation would have been conducted per NAGPRA.

An additional issue about this preferred alternative is the impact it will have on subsistence resources accessed by our Tribal members, especially in the Berners Bay area. You have documented the existence of many of these resources, yet, some (such as herring in the Lynn Canal and Berners Bay areas) were not mentioned. We respectfully request that the ultimate standard of care be taken to minimize impact to those resources.

RESPONSE: The Draft SEIS relied on the latest available information and data. Reporting of subsistence use in the Draft and Final SEIS is based on the USFS Tongass Resource Use Cooperative Survey (1988); the Alaska Department of Fish and Game (ADF&G), Division of Subsistence, *Subsistence Resource Use Patterns in Southeast Alaska: Summaries of 30 Communities* (1994); and Scoping comments. Existing levels of subsistence harvest are discussed in Section 3.1.6 of the Draft SEIS and Section 3.2.4 in Appendix DD, *Land Use Technical Report*, of the Draft SEIS.

Customary and traditional use of herring is noted in Section 3.1.6 of the Draft SEIS and Section 3.2.4 in Appendix DD. Except where specifically called out, herring is included on the subsistence figures and in the text under the general category of finfish.

Project impacts to subsistence resources are discussed in Sections 4.2B.6, 4.3.6, 4.4.6, 4.5.6, and 4.6.6 of the Draft SEIS and Sections 4.1.4.2, 4.1.5.2, and 4.1.6.2 of Appendix DD. FHWA has determined that none of the reasonable alternatives would significantly restrict subsistence uses.

As this alternative advocates for construction in areas historically used and occupied by our Tribal ancestors, there will most certainly be sites of archeological importance uncovered. In accordance with 36 CFR 800.5(b), implementation regulations of Section 106 of the National Historic Preservation Act, should this alternative be approved, we would appreciate direct and early consultation with your agency as you move forward with construction, and immediate contact if anything of possible historic or cultural significance to the Tribe is disturbed through any work that is performed. In addition, when approaching areas where potential impact to these kinds of historic and cultural resources exists, we request that a cultural resource specialist be hired to be to monitor on-site construction activity, and that DIA Tribal Government officials or designees be involved in monitoring activities as well.

This project will undoubtedly have a yet to be realized impact on traditional resources and sacred sites that are greatly important to the Tribe. We look forward to your vigilance and utmost respect and care regarding our Tribal interests in approaching prospective construction, and to continued communication and cooperation with your agency.

Anax Yaa Aodagan Ye-Sayeik
Where the Sun Rays Touch First-Spirit Helper

RESPONSE: As stated in Sections 4.8.3, 5.10, and 5.12.1 of the Draft SEIS, if a previously unknown cultural resource or burial site/human remains had been discovered during construction, work in the vicinity of the discovery would have been halted until the discovery was evaluated and appropriate consultation, including with Tribes as appropriate, would have been conducted per Section 106 of the National Historic Preservation Act. If the discovery had included human remains or associated funerary objects, it could also have been subject to the provisions of NAGPRA, and Tribal consultation would have been conducted per NAGPRA.

No build alternative was anticipated to disturb burials/burial sites in Berners Bay; therefore, no site-specific mitigation was proposed. However, as stated in Section 4.8.3 of the Draft SEIS, if a previously unknown cultural resource or burial site/human remains had been discovered during construction, work in the vicinity of the discovery would have halted until the discovery was evaluated and appropriate consultation, including with Tribes, would have been conducted consistent with Section 106 of the National Historic Preservation Act.

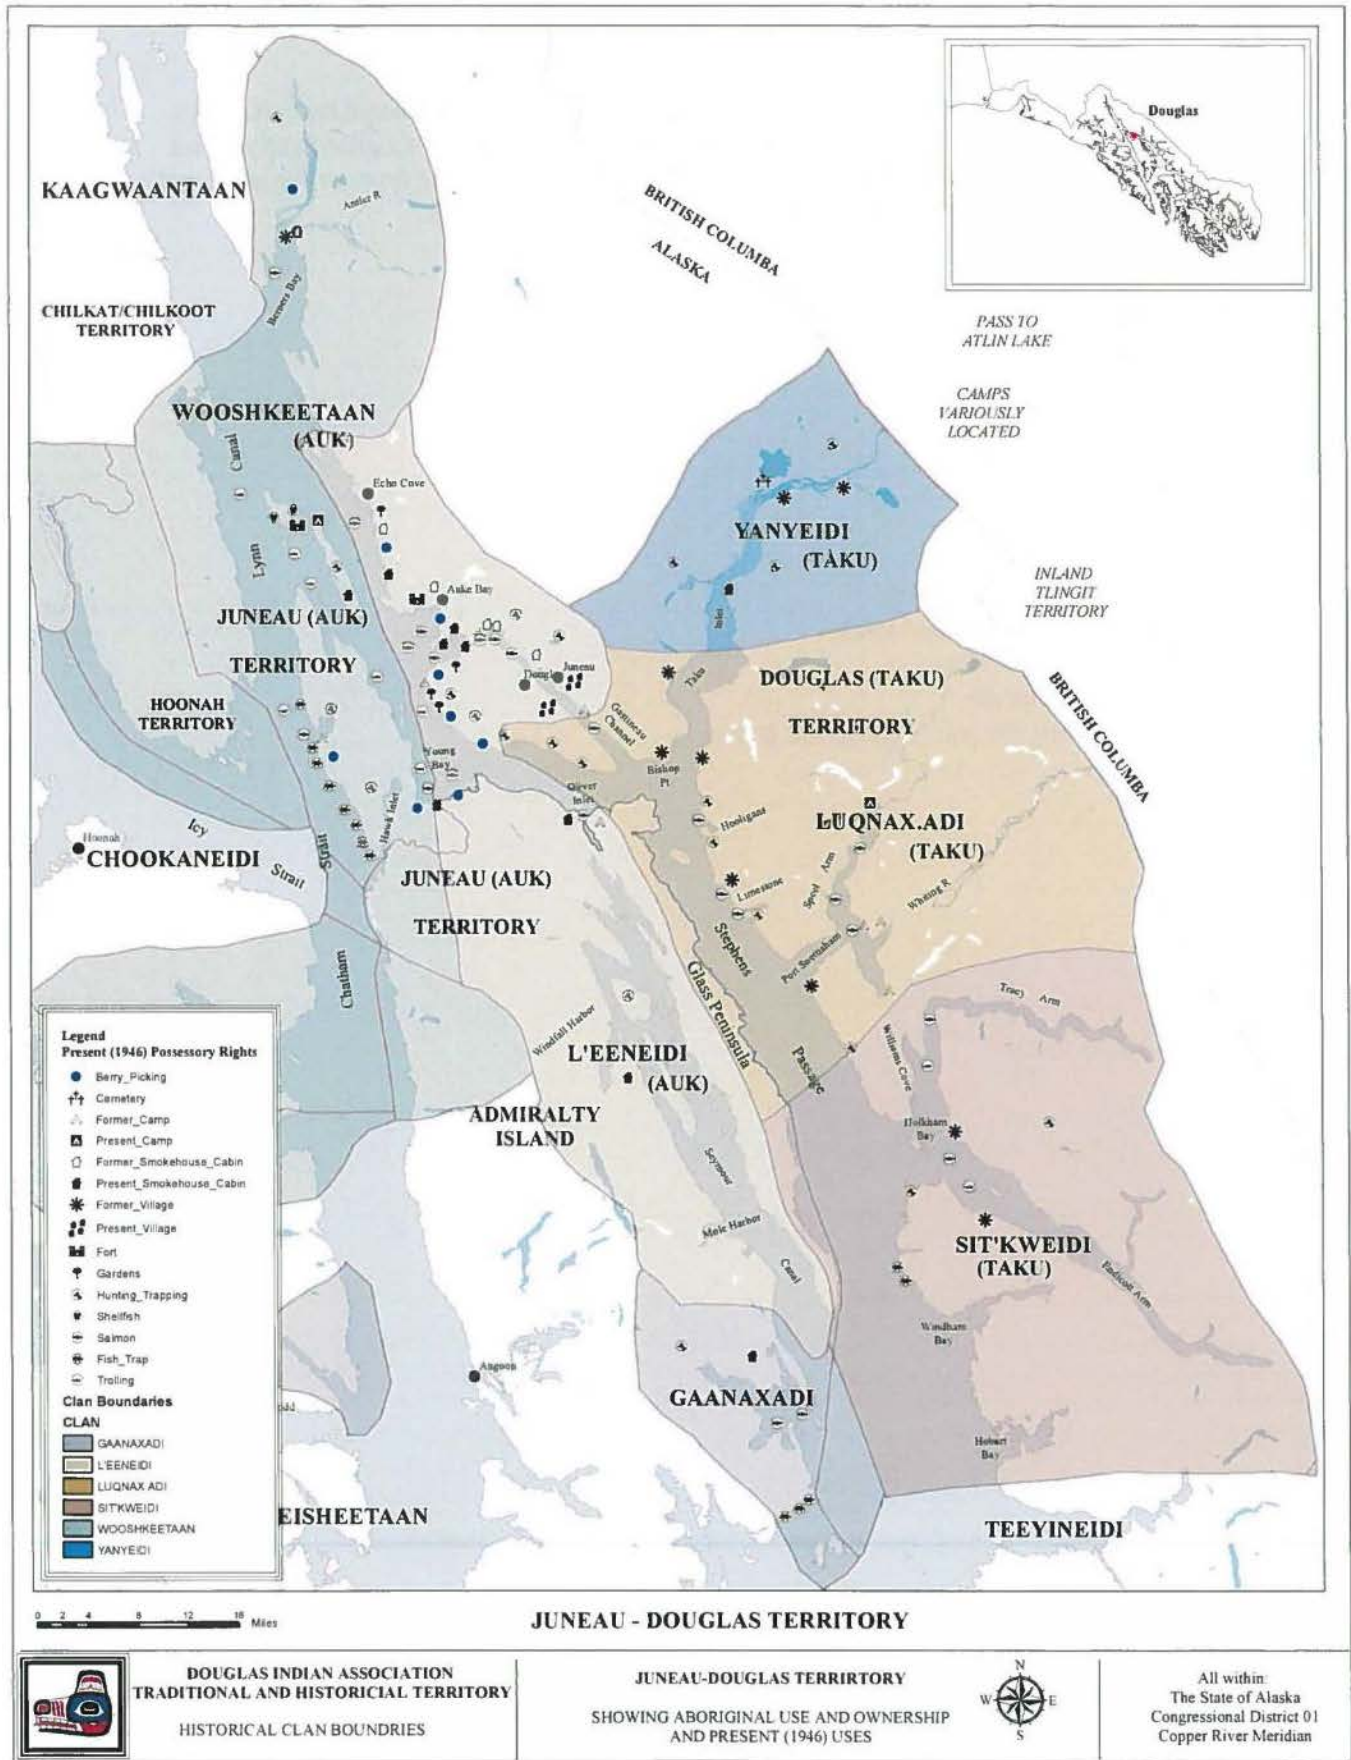

As a result of FHWA and DOT&PF's meetings on February 25, 2016, with Sealaska Corporation, Sealaska Heritage, DIA, Goldbelt Corporation, and the SHPO, it was noted that monitoring in specific areas may have been warranted if a build alternative had been approved. As previously mentioned, the Final SEIS identifies Alternative 1 – No Action as the preferred alternative.

Resource Shape: Point Location Approximate: No
Point Representation: Lat: 58.73807545, Long: -134.93206686 Assigned To: USFS

Site Name(s): BERNERS BAY VILLAGE AND PETROGLYPHS
BERNERS BAY PETROGLYPH SITE

Alternate Name(s):

Associations:

Informal Association(s):

Formal Association(s):

Site Description:

[AHRS] Reported by informants as a permanent village site with winter houses, burials, and petroglyphs. Sealaska investigators located two fence-type grave sites destroyed by vandals on the western cliff above the beach. At the SE end of the site was a large cone or wedge-shaped piece of marble with petroglyphs of concentric rings, faces, eyes, orcas, halibut, a large bird, a wolf, and a bear-like image. Conflict exists between 1979 survey conducted by CPSU and 1982 USFS survey. CPSU investigators reported a 2.6m x 3.3m house pit, one grave house, two graves with balustrades, a petroglyph boulder, and modern camp remains. "Possible" house depression found in 1979 could not be substantiated by subsurface testing in 1982. Investigations in 1994 relocated the burials and petroglyph boulder and identified 3 additional boulders. The total number of petroglyphs at the site is 15. No evidence of middens or depressions were found. [see also JUN-040, Stevens reported a site with similar origin and characteristics, probably the same site.] [DOE] Site contains figure and geometric designs pecked on a large marble boulder above mean high tide line.

Site Significance:

[DOE] Site is said to embody symbolic value in the traditions of the Auke Tlingit. The killer whale is a principal crest for the Wuckitan Clan and the petroglyphs represent their claim to the bay. [AHRS] Reportedly a permanent village site with petroglyphs. May provide information on habitation and settlement patterns while showing past use of the area. Petroglyphs may have ceremonial, economic, or artistic meaning.

Location:

This site extends for approx 0.25 mi. along the NE shore of Berners Bay, at the mouth of the stream N of Sawmill Creek, approx 57km NNW of Juneau, SE Alaska.

Sheet No.

Checked By: DIA Council

Map 1

Date: 11/20/14

Noted historic debris on the north side of Fish Creek – west of (above) Douglas Highway as well as an historic trail. (Neither of these have been documented.)

Paleo-Shoreline Outcomes

Inventories with Negative results:

No paleoshoreline exposures along Blueberry Hill access trail between parking area and the Treadwell Ditch

No paleoshoreline exposures along 3 small drainages north of 9 Mile Creek west of (above) Douglas Highway. Inventories done to approximately 50m. Also – none noted along Fish Creek between approx. 40m and the highway.

An effort to find paleoshoreline exposures on 9 Mile creek above Douglas Highway produced negative results, but we aborted the effort early due to the amount of private property we seemed to be trespassing on.

Positive Paleoshoreline IDs and Test Pits

In collecting samples we kept careful vertical control and although many samples were collected in “bulk” we were careful to record depth range where collection occurred. At some locations, shell was plentiful enough that

UAS Campus TP#1 (Cabin Site) – No GM encountered.

UAS Campus TP #2 (Creek) – limited GM

UAS Campus TP 3# (Lake) No GM

UAS Campus Culvert Exposure – Great Exposure – sample not yet collected.

9 Mile TP 1 – No GM encountered

9 Mile TP 2 – GM encountered, bulk sample collected 8-9m

9 Mile TP 3 – Tributary – GM Encountered, bulk sample collected (13 m)

9 Mile TP #4 – Estuary – GM Encountered. Intertidal – following GM down gradient. Elevation uncertain 6-7m?

Peterson Creek #1 – (17 m north of pedestrian bridge) River bottom bulk “grab” sample. Water 2.5’ deep.

Peterson Creek Exposure – upriver. Noted by Dan M and B. Deasis. No sample collected.

Treadwell 2nd Glory Hole TP1 – bulk sample collected. Surface grab sample also collected.

Heritage Program UAS/DIA Collaborative Project: Cultural Site Monitoring in Berners Bay (Week 1) and Paleoshoreline Research and Sampling in Juneau Area (Week 2)

May 6 through May 17, 2013

Preliminary Project Summary

What went well

Provided a unique opportunity for 8 UAS students to participate in a direct way with an agency driven effort to monitor archeological sites and a fantastic opportunity for Eric Morrison to get out to Berner's Bay petroglyph site. Three students were of Tlingit heritage – one directly affiliated with Berners Bay. She was able to carry out her duty and privilege of acknowledging and thanking her ancestors, including the bears, the land and the trees, in a nurturing supportive collegial atmosphere. Her opposite, provided balance.

The same cadre of participants (with the exception of Eric Morrison and the switch out of one student) were able to participate in a full week of research into the question of the ages of LGM/early Holocene shorelines in southeast Alaska.

Boat support for 2 days in Berners with awesome help from Matt Thompson.

Monitored Sites and Other Heritage Program Outcomes

JUN 062 – Berners Bay Petroglyphs. We identified the four known petroglyph rocks and observed that on at least one, there are more petroglyphs than have been recorded to date. Students completed a partial inventory of timber extraction related debris at the site and Eric was on hand to make a visual assessment. He also observed the modern campsite.

JUN___ - Echo Cove Cabin – This site was monitored by a subset of students as a fill in activity when our departure from Echo Cove due to the failed William Henry Repeater.

JUN-673 – Sawmill Creek Shell Midden

JUN-674 – Sawmill Creek Cabin – interestingly we found the site, but no cabin remnants.

JUN – 675 – Sawmill Creek Sawmill

JUN – 676 – Sawmill Creek Shipway

Identified 2 CMTs and fully documented one during transit from outer beach “across” landform (peninsula) west of Sawmill Creek to the Sawmill area sites. Are merits much more intense archeological survey.

Noted a possibly historic cabin (partially intact) in the woods just off the south end of the parking lot at the Blueberry Hills Treadwell Ditch Trail access route. (I don't believe that this cabin has been documented. It's age is unknown.

Auk Bay Elem School TP 1 – (small creek) bulk sample collected.

Auk Bay Elem School TP2 –(muskeg) 2 bulk samples collected. At different depths.

Recommendations:

- Earlier, detailed and realistic – collaboratively reached plans – that mesh with the goals of the program providing the funding.
 - Dan’s course description led students to believe they’d be on an extended field trip to Berners Bay – with travel being by kayak or skiff. This may have been possible, but could not have come to fruition the way Myra had imagined. Full time boat support would have been absolutely essential. Budgeted time for pulling together logistics like boat, food, gear etc would have had to have been increased considerably. Planning that the FS archeologist could “multi-task” – being the only FS sanctioned small boat operator, the only FS sanctioned riffle bearer etc – was not realistic.
 - Eric expected that he would emerge from the trip with an inventory of all the “garbage” at the Petroglyph site and that we’d complete an inventory for archeological sites on the east shore of Berner’s Bay.
- Clarity regarding who/which organization was driving the program.
- Early clearly assigned responsibilities for each organizational representative.
 - I’d been told that FSL folks would take the lead for the paleoshoreline work. When meeting with them one week prior to the project, they revealed to me they’d made no such commitment.
- An agreement structure other than volunteer agreements would be much more effective. FS project leader (myself) became de-facto supervisor for entire crew (7 students, one UAS professor, and DIA’s Environmental Planner). In that role, I had to be with them in the field pretty much the whole time and I had to ensure that they complied with every safety standard we’d expect of employees. Just the supervision, coordination side of things was complex. Pulling together and tracking gear (radios, probes, helmets) daily was work in itself. The responsibility for leading the archeological monitor effort and documentation was another layer.
- Baitchtal had intended to fund me to learn the paleoshoreline research methodology and gain experience. Instead, I was expected to provide expertise and leadership for students eager to learn. It was too early in my learning curve to push me into the role of an “expert.”
- Volunteers – including students – are never free. Added pressures come with students as they expect (and have a right to expect) to have a quality learning experience.

Burners Bay UAS and DIA collaboration survey project, May 6 through May 17, 2013

Subject: Human Jawbone found in Berners Bay
Attachments: DSCN6873.JPG

Dear Mr. Cole,

Last July while camping on a beach in Berners Bay with a group of friends, someone in our party found a human jawbone near the high tide line (see photo attached). The bone was turned over to the state troopers and it's my understanding they passed it on to the state medical examiner who determined that it belonged to an "ancient" native person.

I suspect that the bone may have been eroded from a nearby stream bank on Forest Service land, transported to the beach by the stream, and then was washed up by the surf.

I wanted to make you aware of this find in case there is an interest in searching for other human remains in this area. The bone was found at: 58.7384, -134.9341. There are numerous petroglyphs near on this beach.

Thanks for looking into this matter.

Juneau Access Improvements Project SEIS
P.O. Box 112506
Juneau, AK 99811-2506

RE: Juneau Access Improvements, Project #71100
Draft Supplemental Environmental Impact Statement (SEIS)

Dear Ms. Holman:

Sealaska Corporation is writing in response to the Draft Supplemental Environmental Impact Statement (SEIS) issued by the Alaska Department of Transportation and Public Facilities (ADOT/PF) in September 2014 on the proposed Juneau Access Improvements, Project #71100. Sealaska has previously gone on record supporting DEIS Alternative 2, East Lynn Canal Highway with Katzechin Terminal. This alternative, now known as Alternative 2B, in the Draft SEIS, best meets the needs of providing access to Juneau while meeting the concerns of the communities of Skagway and Haines.

As also stated in earlier correspondence, Sealaska is aware of several historical sites, one owned by Sealaska, that are within the vicinity of the Alternative 2B right-of-way road design. The Sealaska site is a shamanic site that warrants a broad buffer zone. Sites such as this are considered to be "shamanic landscapes" in recognition of their association with ongoing traditional cultural values, beliefs and practices of Tlingit Indians, and due to the fact that their geographic boundary extends over a larger area than the site of the burial or grave house itself. Sealaska would like to further consult with the ADOT/PF to ensure these sites are not impacted by the project or in the future by proximity to the road, but we would prefer not to identify these sites in a public comment document. Therefore, in-person consultation is requested. Sealaska will also expect to be notified of any potential or realized impacts to Native historical properties, known or newly revealed, as this project develops.

Sealaska is also concerned about the impact on the fisheries resources, in particular subsistence fisheries resources that are important to our Native traditional way of life. We would like to discuss this issue at the in-person consultation meeting, as well, to provide more details regarding those fisheries resources that are important for traditional subsistence uses.

We greatly appreciate any consideration that you can give to these concerns and to the in-person consultation meeting request. Please work through our Lands Manager, Michele Metz, at 907.586.9270 or michele.metz@sealaska.com to follow up on our request for consultation.

Sincerely,

Re: Juneau Access Improvements
Draft Supplemental Environmental Impact Statement (SEIS)
Project #711000

Dear Ms. Metz:

Thank you for your review of the Draft Supplemental Environmental Impact Statement (SEIS) for the Juneau Access Improvements project. The Alaska Department of Transportation and Public Facilities (DOT&PF) in coordination with the Federal Highway Administration (FHWA) circulated the Draft SEIS for public review on September 15, 2014. I apologize for this late response to your November 25, 2014 letter. We are currently in the process of responding to comments. The Final SEIS and Record of Decision cannot be prepared until we complete this effort, since responses to all comments received will be included in the Final SEIS.

You expressed concerns that Alternative 2B (East Lynn Canal Highway to Katzehin, Shuttles to Haines and Skagway) right-of-way road design was located near and may impact known sites of historic, traditional, and cultural importance. Concern was also noted for the impacts to fisheries resources. While Alternative 2B was identified in the Draft SEIS as the preferred alternative, all alternatives are still under consideration.

The FHWA and DOT&PF appreciate your concerns and the sensitivity of these cultural resources. We will be contacting you in the coming weeks to schedule a meeting to discuss your concerns and provide a status update.

Sincerely,

A handwritten signature in blue ink that reads "Gary Hogins".

Dear Ms. Kookesh:

Thank you for your letter, dated November 25, 2014, with your comments on the Juneau Access Improvements (JAI) Project Draft Supplemental Environmental Impact Statement (SEIS). We appreciate the participation of Sealaska Corporation in the JAI Project.

We have reviewed your letter and have made appropriate revisions to the Final SEIS. Our attached responses have been embedded in a reprint of your letter.

We anticipate releasing a combined Final SEIS/Record of Decision very soon. FHWA has identified Alternative 1 – No Action as the Preferred Alternative in the Final SEIS. Governor Walker announced on December 15, 2017, that the “No Build Alternative” is the State’s Preferred Alternative. Please see Section 2.5 of the Final SEIS for further discussion.

Please do not hesitate to contact me at (907) 465-1828 if you have any additional questions or concerns.

Sincerely,

A handwritten signature in blue ink that reads "Greg Lockwood".

RE: Juneau Access Improvements, Project #71100
Draft Supplemental Environmental Impact Statement (SEIS)

Dear Ms. Holman:

Sealaska Corporation is writing in response to the Draft Supplemental Environmental Impact Statement (SEIS) issued by the Alaska Department of Transportation and Public Facilities (ADOT/PF) in September 2014 on the proposed Juneau Access Improvements, Project #71100. Sealaska has previously gone on record supporting DEIS Alternative 2, East Lynn Canal Highway with Katzehin Terminal. This alternative, now known as Alternative 2B, in the Draft SEIS, best meets the needs of providing access to Juneau while meeting the concerns of the communities of Skagway and Haines.

As also stated in earlier correspondence, Sealaska is aware of several historical sites, one owned by Sealaska, that are within the vicinity of the Alternative 2B right-of-way road design. The Sealaska site is a shamanic site that warrants a broad buffer zone. Sites such as this are considered to be "shamanic landscapes" in recognition of their association with ongoing traditional cultural values, beliefs and practices of Tlingit Indians, and due to the fact that their geographic boundary extends over a larger area than the site of the burial or grave house itself. Sealaska would like to further consult with the ADOT/PF to ensure these sites are not impacted by the project or in the future by proximity to the road, but we would prefer not to identify these sites in a public comment document. Therefore, in-person consultation is requested. Sealaska will also expect to be notified of any potential or realized impacts to Native historical properties, known or newly revealed, as this project develops.

RESPONSE: Thank you for providing information regarding cultural resources of concern to Sealaska. To protect sensitive site information, the data and analyses contained in these

documents were only summarized in the Draft SEIS, although all of the information therein was used in making determinations of eligibility and findings of effect. For example, the locations of sensitive archaeological and burial sites was not disclosed in the Draft SEIS. It is understandable that a review of the Draft SEIS could lead to confusion in regards to the summary of this site information appearing not to include all site locations.

Identification of prehistoric and historic resources and traditional cultural properties in the SEIS is based on record searches, surveys within the study area, and consultation with Native Tribes and organizations, U.S. Forest Service (USFS), and the Alaska State Historic Preservation Officer (SHPO). As reported in Section 3.1.3 of the Final Supplemental Environmental Impact Statement (SEIS), the Alaska Department of Transportation and Public Facilities (DOT&PF) and Federal Highway Administration (FHWA) understand that the project is located in an area that has been identified as culturally significant to Sealaska. The Final SEIS identifies Alternative 1 – No Action as the preferred alternative. As reported in Section 4.3.4, DOT&PF and FHWA understand that Alternative 2B would have been located near known sites of historic, traditional, and cultural importance to Sealaska. Alternative 2B was developed to avoid cultural resources of potential concern. The sites referenced in the letter (above) are not located within the Area of Potential Effect (APE) for Alternative 2B (see Section 4.3.4 of the Final SEIS). Based on research, consultation, and field investigations, FHWA determined Alternative 2B would have no adverse effect on historic properties, and SHPO concurred with that determination (see Section 4.3.4).

FHWA and DOT&PF, along with the SHPO, had meetings on February 25, 2016, with staff from Sealaska Corporation, Sealaska Heritage Institute, Douglas Indian Association, and Goldbelt Corporation to address the concerns expressed in comments on the Draft SEIS. As was discussed during those meetings, the Alaska Heritage Resources Survey (AHRIS) database was reviewed for the SEIS. No previously unidentified sites of cultural or historic importance were identified during the February 25, 2016, meeting discussions. Upon conclusion of these meetings, FHWA maintains that their determination of no adverse effect on any cultural resources and historic properties is valid.

Sealaska is also concerned about the impact on the fisheries resources, in particular subsistence fisheries resources that are important to our Native traditional way of life. We would like to discuss this issue at the in-person consultation meeting, as well, to provide more details regarding those fisheries resources that are important for traditional subsistence uses.

RESPONSE: As discussed during the February 25, 2016, meeting, the Draft SEIS relied on the latest available information and data. Reporting of subsistence use in the Draft and Final SEIS is based on the USFS Tongass Resource Use Cooperative Survey (1988); the Alaska Department of Fish and Game (ADF&G), Division of Subsistence, *Subsistence Resource Use Patterns in Southeast Alaska: Summaries of 30 Communities* (1994); and Scoping comments. Existing levels of subsistence harvest were discussed in Section 3.1.6 of the Draft SEIS and Section 3.2.4 in Appendix DD, *Land Use Technical Report*, of the Draft SEIS.

Customary and traditional use of herring was noted in Section 3.1.6 of the Draft SEIS and Section 3.2.4 of Appendix DD. Except where specifically called out, herring was included on the subsistence figures and in the text under the general category of finfish.

Project impacts to subsistence resources were discussed in Section 4.2B.6, 4.3.6, 4.4.6, 4.5.6, and 4.6.6 of the Draft SEIS and Sections 4.1.4.2, 4.1.5.2, and 4.1.6.2 of Appendix DD. FHWA has determined that none of the reasonable alternatives would significantly restrict subsistence uses.

We greatly appreciate any consideration that you can give to these concerns and to the in-person consultation meeting request. Please work through our Lands Manager, Michele Metz, at 907.586.9270 or michele.metz@sealaska.com to follow up on our request for consultation.

Sincerely,

SEALASKA CORPORATION

**Re: Comments on Juneau Access Improvements Project Draft
Supplemental Environmental Impact Statement**

Dear Mr. Haugh,

Thank you for the opportunity to submit comments on the Juneau Access Improvement Project Draft Supplemental Environmental Impact Statement, Project No. STP-000S(131) (the DSEIS). The Alaska Department of Transportation and Public Facilities (the Alaska DOT) prepared the DSEIS in cooperation with the Federal Highway Administration (the FHWA) to consider alternative ways of improving surface transportation in the Lynn Canal/Taiya Inlet Corridor between Juneau and Haines/Skagway.

For the reasons described below, the undersigned groups urge the FHWA to reject the State of Alaska's preferred alternative in the DSEIS and instead support the safer, cheaper, and less environmentally damaging alternative of continued community-to-community ferry service.

**I. The DSEIS's Alternatives Analysis is Arbitrary and Unlawful
Because the Development of Alternatives Lacks the Rigor Required
by NEPA.**

The Ninth Circuit remanded the 2006 Final Environmental Impact Statement (the 2006 FEIS)

for the Juneau Access Improvements Project because the 2006 FEIS failed “to examine a viable and reasonable alternative to the proposed project,” violating the National Environmental Policy Act (NEPA), which requires agencies to “[r]igorously explore and objectively evaluate all reasonable alternatives.” *Se. Alaska Conservation Council v. Fed. Highway Admin.*, 649 F.3d 1050, 1059 (9th Cir. 2011) (quoting 40 C.F.R. § 1502.14(a)). The alternatives analysis is “the heart of the environmental impact statement.” 40 C.F.R. § 1502.14. “The consideration of alternatives requirement . . . guarantee[s] that agency decisionmakers have before them and take into proper account all possible approaches to a particular project (*including total abandonment of the project*) which would alter the environmental impact and the cost-benefit balance.” *Pit River Tribe v. U.S. Forest Serv.*, 469 F.3d 768, 785 (9th Cir. 2006) (quoting *Bob Marshall Alliance v. Hodel*, 852 F.2d 1223, 1228 (9th Cir. 1988)) (alterations and emphasis in original). The FHWA and Alaska DOT, however, have failed to comply with NEPA and the court’s order because the new Alternative 1B has not been “rigorously explore[d]” or developed, leading once again to a skewed comparison of alternatives favoring the agencies’ preferred alternative.

RESPONSE: The Alaska Department of Transportation and Public Facilities (DOT&PF) and Federal Highway Administration (FHWA) dispute the assertion that Alternative 1B fails to comply with National Environmental Policy Act (NEPA) or the Ninth Circuit Court’s order. Alaska Marine Highway System (AMHS) staff and other DOT&PF professionals developed a new alternative based on direction from the Court, shared a draft of that alternative with the public during a new scoping effort for the 2014 Draft Supplemental Environmental Impact Statement (SEIS), took input on the new alternative, and revised that alternative based on the scoping comments received.

The new alternative took into account changes that had occurred to the “existing assets” in the AMHS fleet since the 2006 Final EIS, the capabilities of the vessels in the fleet, and the needs and mission of the fleet to the numerous communities served by AMHS. DOT&PF and FHWA fully disclosed the thought process and evaluation in the Draft SEIS.

Appendix CC of the Draft SEIS describes the efforts undertaken to develop Alternative 1B and documents the data and analysis relied upon to create as reasonable an alternative as possible toward solving the transportation problems in the corridor using only existing assets. Alternative 1B incorporated the following considerations:

- Existing AMHS assets reasonably available and feasible for use in Lynn Canal
- Programmed AMHS assets (decisions by AMHS independent of this project that made new Day Boats available in the fleet)
- Enhancements that could be employed, as suggested by the Plaintiffs, that do not involve substantial initial capital investments

The resulting alternative, Alternative 1B, was rigorously analyzed in context of the project’s purpose and need and as part of NEPA requirements for the consideration of alternatives.

Alternative 1B was added “[i]n direct response to the court ruling.” DSEIS at ES-1. The primary differences between Alternative 1B, the enhanced ferry service alternative, and Alternative 1, the no action alternative, are the use of the *M/V Malaspina* as a summer shuttle

which would otherwise be retired under Alternative 1, a 20 percent reduction in fares for Lynn Canal trips, and an extension in business hours at the reservation call center. *Id.* at ES-3. The effect of these differences amounts to one extra trip per week to Skagway in the summer, a modest reduction in travel time to Skagway in the summer, an increase in capacity in the summer, and a reduction in user costs relative to the no action alternative. *See id.* at ES-16 (Table ES-1), 2-11 (Table 2-2), 2-13 (Table 2-5).

RESPONSE: Alternative 1B was updated based on comments received on the Draft SEIS. In the Final SEIS, the *M/V Malaspina* would provide one round trip per day, 5 days per week on a Skagway-Auke Bay-Skagway route. On the sixth day, the *M/V Malaspina* would sail on the Skagway-Auke Bay-Haines-Skagway route, and on the seventh day, it would sail that route in reverse (Skagway-Haines-Auke Bay-Skagway). This is in addition to the seven trips that could be made by taking the Day Boat ACF from Auke Bay to Haines and transferring ferries and the two weekly mainliner trips (the same as in Alternative 1 – No Action). The trip between Juneau and Skagway on the *M/V Malaspina* takes 6.8 hours, which is 1.3 hour shorter than the 8.1 hours the trip would have using the Day Boat ACFs and transferring in Haines. Chapter 2 and the Executive Summary of the Final SEIS have been updated to address confusion regarding the trip frequency associated with Alternative 1B.

The Ninth Circuit faulted the 2006 FEIS for failing to give “the ‘substantial treatment’ required by NEPA’s implementing regulations to any non-construction alternatives.” *Se. Alaska Conservation Council*, 649 F.3d at 1058 (citing 40 C.F.R. § 1502.14(b)). The court called the 2006 FEIS’s consideration of the no action alternative “cursory” in part because it “assert[ed] that using more ferries would reduce service elsewhere (without explaining the comparative needs for such services).” *Id.* The DSEIS still fails to address system-wide comparative needs and again asserts its goal is to ensure that service elsewhere in the system is not diminished. DSEIS at 7-7, 7-13. Appendix CC, which explains how Alternative 1B was developed, contains a description of why certain vessels are needed on certain routes, but the reasons given do not include even the level of use of those routes, let alone what the demand is and whether demand could still be met using a different schedule than is currently set.

RESPONSE: The Draft SEIS did not fail to address system-wide comparative needs. As the commenter acknowledges, Appendix CC explains how Alternative 1B was developed and describes why certain vessels are needed on certain routes. DOT&PF established a goal that the new alternative would need to address the purpose and need in Lynn Canal, but not by diminishing service elsewhere in the system. As is explained in Appendix CC of the Draft SEIS, DOT&PF considered technical capabilities of the vessels, vessel size, operating conditions, and the effect on the AMHS mission (i.e., whether a vessel could be moved or shared with other routes such that it could provide Lynn Canal service while also maintaining the level of service committed to in the other communities). The examination of each vessel was disclosed in Appendix CC. In part, vessels were rejected as being reasonable for Lynn Canal service because reassigning those vessels to Lynn Canal would be at the expense of reduced service elsewhere. To this extent, DOT&PF considered demand on other routes in the system. As explained in Appendix CC of the Draft SEIS, certain AMHS ferries are not suitable for use in Lynn Canal because relocating/diverting the ferry to Lynn Canal would jeopardize the AMHS mission, including impacts on demand, level of service, and schedule

considerations.

See, e.g., DSEIS, Appendix CC: Development of Alternative 1B–Enhanced Service with Existing Alaska Marine Highway System (AMHS) Assets (2014 App. CC) at 7-8 (May 2014). For example, Appendix CC deems it not reasonable for the *M/V Taku* to assist in improving Lynn Canal transportation because it would “reduc[e] or eliminat[e] service” to Prince Rupert, as the *M/V Taku* is one of few vessels that comply with international safety regulations. 2014 App. CC at 5, 7-8. Appendix CC does not quantify the demand for travel to and from Prince Rupert and the capacity necessary to serve it, whether the route taken by the *M/V Taku* north of Prince Rupert could be altered, since it stops in six other ports, *see* Ex. 9,¹ the demand for the other ports and routes served by the *M/V Taku*, or whether other vessels could be upgraded to comply with international safety regulations. The closest the DSEIS comes to complying with the court’s instructions is an unsupported statement that the *Taku* and *Matanuska* are “needed to meet schedule and demands of Prince Rupert, B.C. run.” 2014 App. CC at 6. This statement does not “explain[] the comparative needs for such services,” *see Se. Alaska Conservation Council*, 649 F.3d at 1058, nor is it sufficient to foster informed decision making.

RESPONSE: DOT&PF and FHWA considered the *M/V Taku* during development of Alternative 1B for the Draft SEIS and explained why it was not a reasonable vessel to move from its duties serving Prince Rupert (see Appendix CC of the Draft SEIS). In making such a determination, DOT&PF considered the schedule, demand, and operating conditions of each of the vessels. The run to Prince Rupert must use a ferry that meets Safety of Life at Sea (SOLAS) regulations. Per the Court’s direction, the SEIS must evaluate an alternative that relies on existing ferry assets and terminals, without new construction. Upgrading an existing AMHS non-SOLAS ferry to be SOLAS compliant would be a major capital investment, which would not be consistent with the Court’s direction.

With limited vessels in the fleet meeting SOLAS requirements, DOT&PF/AMHS determined it was not reasonable to relocate the *M/V Taku* from its mission without service interruption to Prince Rupert (and the other communities on that route). Lynn Canal (Juneau-Haines-Skagway) is at the far northern end of the service area, while Prince Rupert is at the far southern end, making it not possible for the *M/V Taku* to share part of its service week with the Lynn Canal run. As determined in Appendix CC of the Draft SEIS, to permanently move this vessel north would be at the expense of Prince Rupert service.

Note that the *M/V Taku* is not available, as it has been retired and sold. See Revised Appendix CC of the Final SEIS for updated information related to the development of Alternative 1B and changes since the Draft SEIS was issued.

Similar reasons are given for excluding the *M/V Matanuska* and the *M/V Kennicott*, and none of the descriptions of vessels used in Southeast Alaska provides information concerning relative need or demand on the routes each serves. *See* 2014 App. CC at 7-10. This discussion of rerouting existing ferries lacks the rigor necessary to explore a reasonable

¹ The key to the abbreviations used in the Alaska Marine Highway System ferry schedules is included as Exhibit 11.

version of Alternative 1B, and results in almost insignificant differences between the no action alternative and Alternative 1B. See DSEIS at 2-11 to 2-14 (showing an increase of one roundtrip per week in the summer in Lynn Canal and increased capacity during the summer, but no difference in travel time to Haines and only a slight reduction in travel time to Skagway in the summer).

RESPONSE: While it is true that some vessels in the fleet are not at capacity, the commenter does not seem to account for the logistical, technical, and functional challenges involved with trying to move vessels from one part of the service area to another. As explained in Appendix CC of the Draft SEIS, vessels built for specific functions cannot be relocated to Lynn Canal without jeopardizing the mission/function that those vessels are providing in other parts of the system (even if they are not as full as the commenter would like).

In this instance, the commenter recommends examining the demand and moving the *M/V Matanuska* and *M/V Kennicott* for use in Lynn Canal. Regardless of the specific demand and capacities of these vessels, they were designed for and perform very specific functions in the system. As is explained in Appendix CC of the Final SEIS, the *M/V Kennicott* is one of two accredited ocean-going vessels in the AMHS fleet (the other is the *M/V Tustumena*). These vessels are capable of safely making the ocean-going crossing of the Gulf of Alaska, a potentially dangerous endeavor that requires a ship built for such a function and sea conditions. Due to its age and the ongoing cost of repairs, the *M/V Tustumena* is now scheduled to be replaced when construction funding for its replacement is available. However, without major capital refurbishment, the *M/V Tustumena* is not suitable to continue long-term service and was not included as a reasonable component of Alternative 1B. Moving *M/V Kennicott* to serve Lynn Canal means cross-gulf trips would be eliminated, leaving Yakutat without surface access. Yakutat has no road connection, while other communities on the cross-gulf route have road access. This is an unsafe, unpractical, and unreasonable proposal.

Similar problems are involved with trying to use the *M/V Matanuska*, the sister ship to the *M/V Malaspina*. One major difference between the two vessels is that the *M/V Matanuska* is SOLAS compliant, while the *M/V Malaspina* is not. Using the *M/V Matanuska* in Lynn Canal would leave AMHS unable to meet the schedule and demand to Prince Rupert as AMHS has no other SOLAS compliant ferry to take over its route. The *M/V Taku*, the only other SOLAS compliant ferry is not available for use because AMHS has retired it and put it up for sale in March 2017. Nonetheless, because *M/V Matanuska* and *M/V Malaspina* are sister ships, they have very similar operating costs, speeds, etc. In other words, there would be no advantage to considering the *M/V Matanuska* over the *M/V Malaspina* in terms of costs, speeds, etc. DOT&PF and FHWA explained these reasons in Appendix CC of the Draft SEIS. Additional explanation has been added to Appendix CC of the Final SEIS to clear up any potential confusion.

Regarding the suggestions that there are no significant differences between Alternative 1 – No Action and Alternative 1B, it is important to note that there were major changes between the existing conditions and Alternative 1 – No Action in the 2014 Draft SEIS. The addition of two new Day Boat ACF vessels to Lynn Canal in Alternative 1 – No Action already represents a substantive improvement over the existing conditions. In other words, the 2014

Alternative 1 – No Action already represents a substantial improvement over the travel conditions in this corridor than what currently exists. Given the physical limitations and functional, mission-specific needs of the other vessels elsewhere in the system, DOT&PF and FHWA developed the best “system management” solution possible to try to meet the project’s purpose and need. The fact that it does not provide a substantial improvement over Alternative 1 – No Action is a testament to the improvements already accrued by adding the Day Boat ACFs to Lynn Canal.

By withholding pertinent information about relative needs system-wide, the DSEIS continues to skew the analysis against a viable ferry alternative.

RESPONSE: DOT&PF and FHWA did not withhold pertinent information. As was mentioned previously, Alternative 1B was developed by AMHS and other DOT&PF professionals with years of optimization experience. They developed a system management alternative that makes improvements over and above Alternative 1 – No Action.

DOT&PF identified and evaluated Alternative 1B as a competing NEPA alternative. Alternative 1B addresses the Court’s requirement to evaluate an alternative using existing assets. This results in an increase in AMHS service in Lynn Canal that would not require a reduction in service outside Lynn Canal and would be cheaper to operate than the primary road alternatives. There is nothing about the work presented that “skews the analysis against a viable ferry alternative.”

Appendix CC has been revised for the Final SEIS to provide updates and additional explanation about the development of Alternative 1B and the ability of AMHS to improve surface transportation in Lynn Canal using existing assets.

An analysis of relative demand could result in disclosure of inefficiencies elsewhere in the system; these inefficiencies have the effect of constraining service on Lynn Canal.

RESPONSE: Again, DOT&PF evaluated every vessel in its fleet to try to identify those that could reasonably be relocated or share service within Lynn Canal. It is important to note that AMHS and other DOT&PF professionals regularly evaluate the demand, capacity, and efficiency of the overall system. Schedule changes are made, based on a system analysis of demand and community needs. In particular, because the operation and maintenance of the AMHS system is funded out of the State’s general fund, there is great scrutiny and pressure to optimize the efficiency of the service and minimize the costs. The planning that is undertaken, as well as annual schedule and funding discussions, occurs with much involvement from the public and elected officials. DOT&PF contends that this regular planning process, operational funding scrutiny, and annual scheduling process results in a system that is already highly optimized. Despite this, DOT&PF took a hard look at each of the vessels in the fleet, and identified and disclosed the reasons vessels were or were not reasonable to consider for Lynn Canal service. DOT&PF then identified a reasonable “system management” alternative and fully evaluated it in the Draft SEIS.

For example, the Alaska Marine Highway System (AMHS) recently announced a new route to reach ferry docks south of Petersburg and on Prince of Wales Island. The General

Manager of AMHS stated that “We’re working hard to find efficiencies . . . And I’m finding efficiencies here and there.” Ex. 38 at 2. The new route, however, does not appear to be based upon demand. The last time this route was available “ridership did not justify the service,” leading the private operator of that route to characterize it as “pathetic” and “terrible.” Ex. 21 1-2. Another private operator believes that service using landing craft would satisfy demand on this route while minimizing costs. *Id.* at 2. However, AMHS believes that rerouting a ferry to provide service on this route is necessary—not to satisfy unmet demand, but to “avoid a reimbursement fiscal note,” *id.* at 2, of “[m]ore than \$15 million in federal transportation funds” that must be repaid unless the terminals on the route are used by ferries. Ex. 38 at 1.

Although \$15 million may seem like a large sum to repay, it pales in comparison to the over \$500 million price tag of Alternative 2B. This single additional route is not likely the cause of inadequate service in Lynn Canal, but there may be other similar mismatches between service and demand holding the current ferry system back from performing more efficiently. The Alaska DOT should complete the fare study currently underway, which is designed to analyze and restructure the system-wide fare structure, as described in greater detail in Section VII.D. below, and expand its analysis of demand and service on AMHS to determine whether there may be other inefficiencies, such as redundant or excessive service, in order to determine whether it is possible for the ferry system to be redesigned to meet the project’s objectives while meeting demand system-wide.

RESPONSE: Again, as the AMHS official quoted in the comment suggests, DOT&PF considers system wide efficiencies and improvements through its planning and scheduling processes and optimizes the system accordingly. The purpose and need for this project is not to solve problems elsewhere in the system or set minimum service levels—that is a function performed in the DOT&PF/AMHS planning process.

The AMHS is not run as a for profit enterprise. If it were, it would not be running any ferries because every route requires a subsidy. The AMHS operates as a public transportation system more similar to bus services in major cities. To that extent, a minimum level of service is generally established for most routes in the system (i.e., AMHS, as a public agency, provides service to many communities where demand would not be supported by a private operator). To change these “pathetic” routes or “excessive service” would be inconsistent with adopted plans. Many of these communities rely on AMHS as their only surface transportation despite relatively low levels of demand.

The fare study was released in January 2015. The study looked at changes in fares made since the previous rate study was completed in 2008. It also looked for anomalies on routes of similar length within the AMHS system. It considered the development and implementation of a change in tariff policy with the goal of creating a fair and equitable tariff structure. The study did not analyze demand or service to identify inefficiencies.

Additionally, the DSEIS discounts reassignment of vessels without assessing variations on what AMHS has previously contemplated or attempted. The agencies’ failure to consider novel solutions to existing problems, instead of rehashing solutions that have already been deemed unworkable, falls short of taking a hard look at the issue of reassigning vessels to

improve efficiency system-wide.

RESPONSE: While there are many opinions on ways to improve ferry service in Lynn Canal, AMHS cannot meet the purpose and need for the project solely by making changes to the current operational model. Absent the construction of new ferries, any substantial increase in capacity would require a reduction in service outside of Lynn Canal.

Until a system-wide analysis is completed, the agencies cannot explain to the public why there is no better configuration of existing ferry resources and assets. However, given existing, readily available information, the Skagway Marine Access Commission has improved upon the Alternative 1B presented in the DSEIS. See 2014 Skagway Marine Access Commission Comments. The Commission's Alternative 1B Optimized, incorporated here by reference, demonstrates that existing resources may be used to increase the number of trips and the amount of capacity in Lynn Canal while saving over one million dollars per year. *Id.* Alternative 1B Optimized also provides greater flexibility and travel options to passengers. *Id.* With more information and analysis concerning the entire ferry system, Alaska DOT could potentially improve Alternative 1B even more than Skagway Marine Access Commission already has.

RESPONSE: Again, AMHS regularly reviews the ferry system to determine if there is a way to make better use of existing AMHS assets and meet system needs. The commenter's dissatisfaction with the AMHS system and the perceived improvements that the commenter feels could be made to the plan is not the purpose of the Juneau Access Improvements Project SEIS.

DOT&PF took a hard look at each of the vessels in the fleet and identified and disclosed the reasons vessels were or were not reasonable to consider for Lynn Canal Service (Draft SEIS at Appendix CC). They then identified a reasonable "system management" alternative and fully evaluated it in the Draft SEIS. NEPA does not require that every conceivable alternative be evaluated. The Draft SEIS contains a full range of alternatives, and includes an alternative using existing assets as instructed by the Court.

DOT&PF has investigated the Skagway Marine Access Commission's (SMAC's) Alternative 1B Optimized (see Final SEIS at Appendix II).

The information necessary to develop Alternative 1B would also have the potential to improve Alternatives 4A, 4B, 4C, and 4D.

RESPONSE: Components of the SMAC's proposed Alternative 1B Optimized were reviewed and considered for inclusion in Alternatives 4A through 4D and rejected.

Using only existing information, Skagway Marine Access Commission has also significantly improved upon the alternatives involving an increase in ferry assets in developing its proposed Alternative 5, incorporated here by reference. See 2014 Skagway Marine Access Commission Comments. The Alaska DOT should seriously consider Alternative 5 and should also attempt to improve upon it by obtaining a greater understanding and more thorough analysis of the entire ferry system.

RESPONSE: DOT&PF has investigated SMAC's Alternative 5. The analysis can be found in the Final SEIS at Appendix II.

Because the DSEIS fails to support its assumption that reduced service elsewhere would result in unmet demand, its conclusion that ferries may not be reassigned is arbitrary and "does not represent the 'substantial treatment' required by NEPA's implementing regulations to any non- construction alternatives." *Se. Alaska Conservation Council*, 649 F.3d at 1058 (citing 40 C.F.R. § 1502.14(b)).

RESPONSE: The Draft SEIS does not claim that reduced service elsewhere would "result in unmet demand." Appendix CC of the Draft SEIS indicated that moving certain vessels would jeopardize AMHS's mission and explained the impacts to the mission from moving those vessels.

The AMHS cannot easily relocate vessels from one area to another without serious service consequences. In each of these cases, there are people and businesses that rely on the AMHS service they get, even if some consider the demand "pathetic" or the service level provided "excessive."

The conclusion that ferries may not be reassigned is not arbitrary and is explained explicitly in the Final SEIS at Revised Appendix CC.

II. The Comparison of User Benefits in the DSEIS is Skewed Inappropriately in Favor of the Preferred Alternative.

The user benefits analysis is misleading because it underestimates the amount of time users are likely to wait during peak use, provides a ferry fare for the road alternatives which is lower than the likely actual fares, and uses conflicting assumptions regarding vehicle occupancy. These factors result in a lower user cost for Alternatives 2B and 3 than is warranted, and biases the analysis to favor the road alternatives.

First, the fares for Alternatives 2B and 3 are not tied to the existing AMHS ferry fare structure, but all of the ferry alternatives are assigned current AMHS fares, with the exception of Alternative 1B, which affords a twenty percent discount on existing fares. Ex. **, Alternatives - Ferry Fares Memorandum at 1-2; DSEIS at ES-3. The shuttle fares for the road alternatives are far lower than the least expensive current ferry fares. Alternative 2B sets fares of \$15 for vehicles and \$4.50 for adults to Haines and \$24 and \$8, respectively, to Skagway. Ex. **, Alternatives - Ferry Fares Memorandum at 2. Alternative 3 shows fares of \$20 for vehicles and \$7 for transfer from Sawmill Cove and William Henry Bay, and \$22 and \$7.50, respectively, for the shuttle between Haines and Skagway. *Id.* By comparison, the current actual ferry fares between Haines and Skagway, which are among the least expensive in the ferry system, are \$49 for vehicles and \$31 for adults. Ex. 10.²

² As noted in Lynn Canal Conservation's comments on the DSEIS, the existing fare structure is arbitrary and inefficient, with the cost of fares per mile ranging widely across the system. 2014 Lynn Canal Conservation Comments at 43-44. The current fare structure is outdated and should be replaced, and a long-awaited analysis is presently being conducted. *Id.* Once a proposal to adjust fares is made public, those numbers

There is no analysis contained in the fare memo or the DSEIS to explain why the road alternatives' fares are dramatically cheaper, and the effect of this discrepancy is to skew the analysis of user costs toward the road alternatives. Leaving the cost of ferry delay out of the equation, if the existing Haines/Skagway fares are used to calculate total user costs for fares and vehicle, the costs of the road alternatives skyrocket. A trip to Haines under Alternative 2B would cost twice as much as the current system, and a trip to Skagway would be roughly one- and-a-half times the current system:

Fares and costs as currently depicted in Table A-13 (Appendix FF):						
Alternative	vehicle fare	person fare	persons/vehicle	ferry fare	vehicle cost	total
1- Haines	\$86.00	\$37.00	3.3	\$63.06	\$4.48	\$67.54
1-Skagway	\$111.00	\$50.00	3.3	\$83.64	\$0.00	\$83.64
1B- Haines	\$68.80	\$29.60	3.3	\$50.45	\$4.48	\$54.93
1B- Skagway	\$88.80	\$40.00	3.3	\$66.91	\$0.00	\$66.91
2B - Haines	\$15.00	\$4.50	2.3	\$11.02	\$83.99	\$95.01
2B - Skagway	\$24.00	\$8.00	2.3	\$18.43	\$79.51	\$97.94
3 - Haines	\$20.00	\$7.00	2.3	\$15.70	\$75.13	\$90.83
3 - Skagway	\$22.00	\$7.50	2.3	\$32.76	\$79.61	\$112.37
Fares and costs adjusted to reflect current Haines/Skagway AMHS fares:						
2B - Haines	\$49.00	\$31.00	2.3	\$52.30	\$83.99	\$136.29
2B - Skagway	\$49.00	\$31.00	2.3	\$52.30	\$79.51	\$131.81
3 - Haines	\$49.00	\$31.00	2.3	\$52.30	\$75.13	\$127.43
3 - Skagway	\$49.00	\$31.00	2.3	\$52.30	\$79.61	\$131.91

By using ferry fares that are not tied to the current AMHS fare structure, the agencies have skewed the analysis to make the road alternatives seem less expensive.

RESPONSE: DOT&PF disagrees that the user benefit analysis in the Draft SEIS was biased to favor the road alternatives. The user benefits analysis was based on the anticipated typical summer condition (not a peak use) to be consistent with other analysis in the Draft SEIS. The fares for Alternatives 2B and 3 were calculated using a different methodology than the other alternatives.

The ferry fares for the road alternatives were developed using a methodology that is more

should be used in the Juneau Access Improvements Project's cost calculations.

suitable for shorter, shuttle ferry operations that would be used as part of Alternatives 2B and 3. These fares were based on a flat fee to board the ferry and a cost per mile for the transit. These fares were somewhat lower than the existing AMHS fares due to the efficiencies generated from using ferries designed and operated as Day Boats: Day Boats have the ability to operate with drive through loading and unloading and no reservation system expense.

The fares for the ferry alternatives were based on existing AMHS fares and prorated based on distance.

Per your comment, a memo documenting how the fares were developed has been added as an appendix to Revised Appendix AA, *Traffic Forecast Report* in the Final SEIS.

Second, the ferry delay time for Alternative 2B is unsupported and unrealistic because it “assumes half the ferry travelers would arrive randomly and half would schedule their arrival to match the ferry schedule.” DSEIS at ES-7 n.4, 4-59. Thus, the wait time is assumed to be a quarter of the time between arrivals, determined to be 24 minutes for travel to Haines and 31 minutes to Skagway in the summer. DSEIS, Appendix FF: User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses (2014 App. FF), Attachment A at Table A-13 (April 2014)

RESPONSE: Fehr and Peers, the project traffic consultant, made the assumption that half the people arrive at random times and half arrive just prior to departure. Research shows that people tend to try to minimize their wait time by consulting schedules and arriving at the selected time, particularly if the headways between sailings are frequent and departures are reliable.

However, the consequences for missing a ferry due to tardiness or a full boat are substantial: a traveler would have to wait an extra hour and a half to wait for the next shuttle to Haines and two hours for the next shuttle to Skagway. DSEIS at 4-59. A shuttle might be full because the freight currently brought to Haines via AMHS will be unloaded and trucked to Haines using the shuttle. DSEIS at 4-51; *see also id.* at 4-55 (showing that in 2011, AMHS transported 192 vans from Juneau to Haines and 361 vans in the opposite direction). There could be hazards on the road that might delay one’s planned arrival, such as maintenance to remove avalanche debris, the need to slow down to avoid collisions with wildlife, or heavy precipitation. DSEIS at 4-67, 4-84, 3-39. The shuttles can carry 53 19-foot vehicles, but due to the expected increase in recreational vehicle traffic, DSEIS at 2-15, 4-46, the number of vehicles allowed on the shuttle is likely to be more limited in peak season. On top of these concerns, the shuttle will not accept reservations, DSEIS at 4-59 n.21, increasing the pressure for drivers hoping to arrive at their destination at a particular time, or at least not spending a portion of their day at a ferry terminal far removed from most services, to make sure they budget additional time to ensure they make a particular connection. To expect the average wait time in summer to be merely 24-31 minutes, without a system in place to meter the number of vehicles attempting to make the connection, is unrealistic if the road on the east side of Lynn Canal creates as much demand as the DSEIS asserts. By underestimating the ferry delay time for Alternative 2B while stating that the ferry alternatives will result in ferry delay times of 70-156 minutes, the DSEIS skews the user cost analysis to benefit the road alternative. *See also* Ex. 27 at 12-14.

RESPONSE: The consequences of a missed ferry are disclosed in the SEIS. While it is possible that a traveler could arrive at the terminal only to find the ferry had just departed or to find the ferry full and unable to take another vehicle, such scenarios are anticipated to be rare. Once a pattern was established, it is likely that travelers would self-select to days or times anticipated to be less busy. Most of the time, space would be available. For business travelers with tight timelines and little flexibility, private air carriers are available. Even if such travelers missed their desired ferry, they would likely be able to catch the next one a short time later. Under such a scenario, the travel time (including the delay) would still be much less than the current system.

The analysis is not “skewed to benefit the road alternatives.” The ferry capacities and number of sailings were calculated to provide for the projected summer average daily traffic on the road. Given the number of travelers, it is possible some may miss the first ferry on a busy weekend. However, this would not have a substantial effect on the overall travel demand. During typical summer conditions, Alternative 2B would have sufficient capacity to meet demand. The demand estimate takes into account anticipated freight shipments that occur on the AMHS vessels. The SEIS acknowledges and discloses that during weather events and other extreme events (like rockfall) there would be delays and closures. Travel and waiting times are based on average conditions and are the travel times that would be experienced most of the time. Poor weather, mechanical problems, and other delays can also occur with the ferry options. All alternatives have been treated equally, and are based on average operating conditions anticipated to be experienced in Lynn Canal.

A reservation system is not proposed for Alternatives 2B and 3 because it would increase cost and travel time. To accommodate a reservation system, Alternatives 2B and 3 would require an AMHS staff person to be at Katzehin or William Henry Bay/Sawmill Cove to check in travelers. It would also increase travel time because the ferry would have to load all the reservations to determine how many standby travelers it could accommodate. This would have to be done late in the boarding process to accommodate late arrivals. The number of late arrivals is expected to increase because of the frequency of service. If a traveler misses their planned ferry connection, they would only have to wait a few hours for another sailing. Similarly operated systems in North America (for example, in Washington State and British Columbia) and elsewhere typically do not use reservations on short ferry links like those in Alternative 2B and 3.

Removing the need for a reservation system speeds up the overall travel time by removing the associated check-in process, the shuttle ferries will run frequently, thereby reducing the inconvenience. To test the effect that delay has on demand Fehr & Peers ran a sensitivity test, which tested if the ferry delays were to double for all users (except for the Haines-Skagway shuttle in Alternative 3), then the Alternative 2B and 3 forecasts would decrease by around 10 percent. The actual reduction in total users would be much smaller, since there would only be a few days each year where the number of vehicles for a given sailing exceed the capacity of the ferry.

Third, the DSEIS is misleading because the discussion in the body of the report relies on assumptions contrary to the accompanying User Benefit Analyses contained in Appendix FF, leading to a significantly different user picture for the road alternatives. Appendix FF

analyzes user benefits on a per-user basis and uses data from the National Household Travel Survey to determine how many people would be in a car using the road as well as data from AMHS to determine occupancy of a vehicle using the ferry system in Lynn Canal. 2014 App. FF at 38 (citing Traffic Forecast Report); DSEIS, Appendix AA: Traffic Forecast Report (2014 App. AA) at 19 (May 2014). These figures are 2.3 people per vehicle for travelers using the road, and 3.3 people per vehicle for travelers using the ferry. 2014 App. AA at 19. The body of the DSEIS inexplicably calculates costs based on a family of four. DSEIS at ES-7, 1-18, 1-19, 2-12, 2-33, 4-16, 4-29, 4-61, 4-113, 4-149, 4-150, 4-169. *See also* Ex. 27 at 14. The DSEIS never explains why the assumptions concerning user costs in the body of the DSEIS differ from those prepared by experts in Appendix FF. The effect of these differing assumptions is that while Appendix FF demonstrates that user costs will be higher under Alternatives 2B and 3 (the road alternatives) than Alternatives 1 and 1B (the alternatives using existing AMHS assets), the DSEIS claims that user costs will decrease substantially under Alternatives 2B and 3 relative to Alternatives 1 and 1B. *Compare* 2014 App. FF (App. A, Table A-13) *with* DSEIS at ES-16 (Table ES-1).

These misleading figures for ferry fares, delay times, and vehicle occupancy result in a user cost analysis that is inappropriately weighted to favor Alternative 2B.³ Because of these unrealistic estimates, the DSEIS does not “foster both informed decision-making and informed public participation,” and must be revised in order to compare alternatives accurately. *Animal Def. Council v. Hodel*, 840 F.2d 1432, 1436 (9th Cir. 1988) (quoting *California v. Block*, 690 F.2d 753, 761 (9th Cir. 1982)).

RESPONSE: Both the Draft SEIS and Appendix FF were based on the same per person and per vehicle costs. A family of four was used in the Draft SEIS to illustrate the relative costs of alternatives because it represents a common family unit. The Final SEIS has been updated to show costs for other travelers.

The Total/Out-of-Pocket User Cost rows of Table ES-1 in the Draft SEIS referred to the Total and Out-of-Pocket costs for a family of four to travel between Juneau and Haines or Skagway. Table ES-1 in the Final SEIS has been updated to clarify this information.

³ Similarly, the project cost estimates for Alternative 2B are also grossly underestimated, as explained in greater detail in Southeast Alaska Conservation Council’s comments on the DSEIS, and incorporated here by reference. If full costs were included, such as a more realistic cost contingency calculation, AMHS capital and operating costs affected by taking Lynn Canal service out of the system, external costs, and the cost to the Alaska Department of Fish and Game for fish and game management, it would be even more apparent that Alternative 2B suffers from an extremely low benefit-to-cost ratio relative to the other alternatives. *See* 2014 Southeast Alaska Conservation Council Comments.

RESPONSE: The construction contingency for Alternative 2B is appropriate given the level of design development. The segment from Echo Cove to Sweeny Creek was developed through final design in 2006 after the 2006 Record of Decision (ROD), which justifies the 5 percent contingency amount.

³ [see text below response to this comment]

A geotechnical investigation which identified all geologic hazards for Alternative 2B within the segment from Independence Creek to the south bank of the Katzehin River was completed in 2006, and was subsequently updated in 2012 in support of the Draft SEIS. Preliminary geotechnical recommendations were developed to address all identified geologic hazards in response to comments and are reflected in the updated cost estimate in Attachment E of the Update to Appendix D - *Technical Alignment Report* in the Final SEIS. Although additional costs due to geotechnical hazard mitigation have been included in the cost estimate, the final design has not been completed so a 10 percent contingency is appropriate.

From the south bank of the Katzehin River to the proposed Katzehin Ferry Terminal, the contingency amount of 5 percent is appropriate due to the fact that this section of roadway is located on relatively flat terrain and the potential for unforeseen circumstances is low. The greatest portion of the cost for this segment is the Katzehin Bridge. The bridge amounts to over 70 percent of the cost estimate for this segment. Bridge superstructures are well defined with a low potential for unforeseen conditions that would impact cost. The bridge piling size and length estimates are based upon preliminary geotechnical results within the corridor. In addition, there is substantial historic cost data throughout the state that was used to estimate bridge construction costs. This further justifies the 5 percent contingency amount.

The original survey data collection for Alternative 2B was completed in 2002. DOT&PF elected to collect updated survey data for the entire Alternative 2B alignment in 2013 and 2014 to strengthen final design activities. Since 2002, there have been substantial improvements to LiDAR sensors and collection/processing techniques that improve the bare earth surface modeling for design. This updated data collection effort further validated the estimated quantities contained within the construction cost estimate for Alternative 2B. For this reason, the contingency amounts were left unchanged from the Draft SEIS.

The Alaska Department of Fish and Game (ADF&G) confirmed in January 2016 that no additional staff is anticipated to manage additional harvests that may occur as a result of Alternative 2B. Section 4.3.15 of the Final SEIS has been updated to reflect this input from ADF&G.

DOT&PF and FHWA have disclosed the environmental consequences of the proposed alternatives in the Draft and Final SEIS, including the indirect effects described in the comment. EIS documents do not typically present impacts to the environment in financial terms. The “costs” to the physical, natural, and social environment are the main topic of the entire EIS, however, and the EIS discloses all known impacts, both beneficial and adverse, as required by the National Environmental Policy Act. A cost-benefit analysis that attempts to compute a dollar figure for external costs identified above would be highly speculative. Because the indirect impacts have been disclosed quantitatively where possible, and qualitatively elsewhere, FHWA has met its requirements under NEPA. Commitments to manage, mitigate, or avoid environmental damage are part of the project and its costs, as disclosed in the SEIS.

Troubling for several reasons, the DSEIS fails to adequately address safety concerns, including serious dangers posed by avalanches; those safety issues must be analyzed, and the likely increase in acknowledged risk resulting from that analysis will drive up costs

necessary to mitigate those hazards. *See id.* As noted in Southeast Alaska Conservation Council's and Skagway Marine Access Commission's comments, the presently proposed mitigation strategies for avalanches are unrealistic and overstate the extent to which risk is reduced. *Id.*; 2014 Skagway Marine Access Commission Comments.

RESPONSE: The risk reduction factors are consistent with those routinely achieved by modern avalanche programs worldwide. The program proposed for Lynn Canal follows current best practices, with multiple full-time forecasters for daily field presence.

Please refer to the *2017 Update to Appendix J – Snow Avalanche Report*, Section 3.1, Figure 2, for methods used on various highways worldwide, and to the remainder of Section 3, and to Section 6, *Avalanche Mitigation*, where the reduction factors are discussed specifically and in detail, especially Figure 4a, where mitigation factors achieved in other locations are listed.

The discussion in the *2014 Update to Appendix J – Snow Avalanche Report*, Section 6.1 Mitigated AHI Target Calculations, is an analysis of how well the goals were achieved, rather than the calculation of the risk reduction. The risk reduction factors for each path, and for the overall avalanche program are listed in Section 6.3, *Lynn Canal Avalanche Hazard Reduction Methods*, and the raw data and mitigation calculation spreadsheets are available in pdf format online at www.juneauaccess.alaska.gov.

The level of specificity of the 2014 and 2016 Updates to Appendix J is more than adequate for EIS-level evaluation. The experience of the authors and peer reviewers has been updated with resumes in the Final SEIS.

III. The DSEIS's Analysis of Wetlands Impacts is Inadequate.

A. The Analysis of Wetlands Effects is Incomplete.

The analysis of effects to wetlands is inadequate and likely understates the effects of the preferred alternative. Alternative 2B presents much greater quantitative and qualitative effects on wetlands than any other alternative. DSEIS, 2014 Update to Appendix O: Wetlands Technical Report (2014 Update to App. O), Attachment A at A-4 (Table 4-3) (Aug. 2014). But the DSEIS contains little analysis of the importance of wetlands in their respective areas, making it difficult to ascertain what local effects may arise. By segmenting the review of wetlands, essential fish habitat, effects to wildlife, and Steller sea lions, the DSEIS misses the connections between these major components. Ultimately, the lack of broader ecosystem and narrower site-specific syntheses makes it difficult for decision makers and the public to ascribe meaning to the loss of wetlands.

RESPONSE: Impacts to wetlands are discussed by subregion of East Lynn Canal in Section 4.2 of Appendix Z *2014 Update to Appendix O – Wetlands Technical Report* to provide an analysis of wetlands in their respective areas. The subregions include: Berners Bay, Slate Cove to Sherman Point, Sherman Point to Katzehin River, and Katzehin River to Katzehin Ferry Terminal. For each subregion, an evaluation of impacts to functions (e.g. wildlife habitat or fish habitat) and values (e.g. moderately-high value for wildlife habitat function) as well as footprint acreage is provided. Analysis of wetland impacts that overlaps with other natural resources is noted and a reference to those respective reports or chapters in the Draft SEIS is

provided.

The present analysis is an inadequate presentation of the positive and negative effects of Alternative 2B and underestimates its costs, which fails to satisfy the agencies' duty to take a hard look under NEPA at the project itself or to form the basis of the Clean Water Act § 404 permitting analysis.

RESPONSE: The analysis presented in Appendix Z *2014 Update to Appendix O – Wetlands Technical Report* described the potential impacts to wetlands from Alternative 2B and the other project alternatives. Further evaluation of the impacts to wetlands by Alternative 2B was included in the Draft SEIS Appendix Z *Update to Appendix X – Draft Section 404/10 Permit Application and Draft Section 404(b)(1) Analysis*.

The DSEIS's two-page description of effects to wetlands under Alternative 2B utilizes a pattern to introduce the number of acres and type of wetland affected, briefly describe the hydrologic effects, mention the wildlife served by the habitat, and finally imply that the effects will not be great, but this pattern does not describe the effects to the ecosystem as a whole. See DSEIS at 4-73 to 4-75. For example, the section on the west shore of Berners Bay states that palustrine forested wetlands will be affected, and the effects "would include modifying the groundwater recharge functions, the discharge/lateral flow functions, the surface hydrologic control functions, and the sediment retention functions of these wetlands." *Id.* at 4-73 to 4-74. Similar habitat in the surrounding areas "would moderate losses" and "[w]ildlife habitat functions would be reduced, . . . but an abundance of similar habitat is adjacent to the alignment." *Id.* at 4-74. There is no discussion on what types of wildlife are present, whether the adjacent habitat is already at carrying capacity or can support additional animals, or what purposes or functions the affected wetlands served. This description, and the similar descriptions repeated for each stretch along the alignment of Alternative 2B, fails to meaningfully convey the extent and import of the effects to wetlands within the ecosystem.

RESPONSE: Wetland impacts that overlap with other natural resource impacts were noted in the Draft SEIS and references to those respective reports or chapters in the Draft SEIS were provided. Impacts to the broader ecosystem were evaluated based on the primary components that contribute to the ecosystem. This provided a more detailed assessment of the potential impacts that would occur for a higher level approach. Impacts to these primary ecosystem components were evaluated under headings for hydrology and water quality, marine and freshwater habitat and species (including Essential Fish Habitat [EFH]), terrestrial habitat, wildlife, bald eagles, and threatened and endangered species for Alternative 2B in Chapters 4.3.13 through 4.3.17 of the Draft SEIS and in Appendix Z *2014 Update to Appendix N – Essential Fish Habitat Assessment, 2014 Update to Appendix Q – Wildlife Technical Report, and 2014 Update to Appendix O – Wetlands Technical Report*.

When the alignment of Alternative 2B was altered, it increased the amount of essential fish habitat affected at the Katzehin River crossing, but the site-specific effects on this important habitat are not sufficiently addressed. DSEIS, 2014 Update to Appendix N: EFH Assessment (2014 Update to App. N) at 10 (May 2014).

RESPONSE: Per your comment, the site specific effects of the fill on EFH in the Katzehin area are described in Section 4.3.13 of the Final SEIS. The realignments of Alternative 2B since 2004 have reduced EFH impacts associated with highway fill and crossing structures for the Antler, Berners/Lace, and Katzehin rivers. As stated in Section 4.2.2 of the 2014 Update to Appendix N, 25.5 acres of intertidal and subtidal fill is a small portion of the available habitat in Lynn Canal and would have minimal effects on the EFH available in Lynn Canal.

“The Katzehin [River] is one of two rivers in the geographic province with outstanding values for fish, and is a significant contributor to this resources in upper Lynn Canal. The river is very scenic and the pristine condition of the valley is notable with no evidence of past development such as mining trails or timber harvest.” Ex. 41 at 7. The Forest Service has recommended the river for designation under the National Wild and Scenic Rivers Program, describing it as “outstandingly remarkable for its exceptional scenery, active geology, and the productive chum salmon run.” Ex. 47 at E-79. However, it deemed the lowest two miles of the river “unsuitable for such designation because of the transportation corridor proposed by other public agencies between Juneau and Haines and the presence of State-selected lands.” Ex. 48 at A-6.

The Katzehin River provides habitat for coho, chum, and pink salmon, Dolly Varden, eulachon, and Dungeness crab. Ex. 24; Juneau Access Improvements, Supplemental Draft Environmental Impact Statement (2005 SDEIS), Appendix N: Essential Fish Habitat (2005 App. N) at 4-24 (Dec. 2004); 2014 Update to App. N, Attachment A at W-217. The estuarine habitat to be filled under Alternative 2B is especially important for smolt as they transition from freshwater to saltwater, for feeding, and for refuge from predators. Ex. 17 at 6-9; *see also* 2005 App. N, Attachment C at 21 (depicting eulachon habitat needs). The delta of Katzehin River is essential fish habitat for coho and chum salmon and eulachon. 2005 App. N at 5-6. Bridges that infringe on a channel or floodplain can “trap sediment causing the stream to become too shallow and/or warm such that fish will not migrate past the structure,” which is especially problematic for anadromous fish such as coho and chum salmon. Ex. 40 at 4. Studies show that “no truly ‘safe’ threshold road density exists, but rather negative impacts [to fish] begin to accrue and be expressed with incursion of the very first road segment.” *Id.* at 7.

RESPONSE: The cited language for Ex. 40 at 4 is incomplete. Relevant text includes “Undersized culverts and bridges can infringe upon the channel or floodplain and trap sediment...”. The proposed Katzehin River Bridge (2,590 linear feet) would cross over a wide braided plain of the Katzehin River delta. The concern raised that the bridge would infringe on the channel and “trap sediment causing the stream to become too shallow and /or warm” does not apply.

Any reduction in fish habitat at Katzehin River should also be analyzed with respect to the effect on the wildlife depending on those fish for prey.

Significantly, as noted in a study cited by the DSEIS, the Katzehin River supports the closest eulachon spawning site to the Gran Point Steller sea lion haulout, which is designated critical habitat. *See* Womble, Jamie N., et al., Distribution of Steller sea lions *Eumetopias jubatus* in relation to spring-spawning fish in SE Alaska (2005) at 273 (Fig. 1), 274 (Fig. 2) (cited by

DSEIS, 2014 Update to Appendix S: Steller Sea Lion Technical Report (2014 Update to App. S) at 9, 10, 32 (May 2014)). The close proximity to a eulachon spawning run is important because it “decrease[s] foraging costs for sea lions. Use of haulouts close to rich prey resources allows females with dependent pups to conserve travel energy and allocate more resources to pups.” *Id.* at 276. Because Katzeihin River is so close to Gran Point, pups may be able to accompany their mothers, “as the average distance traveled by sea lion pups less than 9 months was ≤ 15 km in SE Alaska.” *Id.* at 276-77. Using haulouts close to eulachon spawning sites is also beneficial for males, as it “should allow [them] to arrive at rookeries in good body condition,” making them “likely to successfully defend territories for longer periods of time and mate with more females, thus increasing their reproductive success.” *Id.* at 280. “Based on analysis of Gran Point sea lion haulout data for 2004-2012, abundance is greatest during March through June, with a peak in May,” and eulachon were one of the “three of the most frequently occurring prey species in Steller sea lion scat samples from Gran Point during the springs of 2001 through 2003.” 2014 Update to App. S at 9, 11. The eulachon run at Katzeihin River is already described as small, 2005 App. N, Attachment C at 18, and, “[w]hile formal eulachon stock assessments have not been conducted in Southeast Alaska, anecdotal evidence and trends from other areas suggest long-term declines in run biomass of this species as well.” 2005 App. N, Attachment C at 41.

Additionally, “the peak use of Gran Point by sea lions from October to November may be associated with autumn-spawning salmon migrating through Lynn Canal.” 2014 Update to App. S at 11. Coho and chum salmon, which are both present in the Katzeihin River, spawn at this time. Ex. 13 at 2 (coho); Ex. 12 at 3. The DSEIS shows that Steller sea lions use the delta of the Katzeihin River as a foraging or haulout area. DSEIS, Fig. 3-19.

Because Katzeihin River “contains a productive run of chum salmon which contributes significantly to the commercial fishery in Chilkoot Inlet,” Ex. 47 at E-79, the effects of habitat loss to chum salmon should also include consideration of impacts to the fishery.

RESPONSE: FHWA and DOT&PF have been consulting with the National Marine Fisheries Service (NMFS) regarding the project and potential effects to Steller sea lions since 1994. Information and collaboration from consultation with NMFS is incorporated into the Final SEIS. The Final SEIS addresses impacts to Steller sea lions from Alternative 2B, including effects to prey species from impacts on estuarine habitat in Section 4.3.13. With DOT&PF and FHWA’s identification of Alternative 1 – No Action as the preferred alternative for the JAI Project, there is no longer a need to complete an EFH consultation.

Given the importance of the habitat to be filled at Katzeihin River for fish, the importance of fish for nearby Steller sea lion critical habitat at Gran Point, and the significant contribution of the Katzeihin River to the commercial chum fishery, the DSEIS should analyze the effects of the increased fill at Katzeihin River. However, this analysis is impossible to find.

RESPONSE: The addition of fill at the Katzeihin River proposed since issuance of the 2006 ROD in intertidal and subtidal areas was proposed to address concerns related to scour at the Katzeihin River bridge abutment for Alternative 2B. This would result in placement of additional materials and an overall increase of 0.64 acre of fill within the Katzeihin River intertidal area, 0.55 acre of which would affect EFH. Construction and long-term effects to

EFH from the ferry terminal north of the Katzechin River are evaluated in Sections 5.4.1.2, 5.4.2.3, and 5.4.2.4 of the *2004 Essential Fish Habitat Assessment* and Sections 2.1.1 and 2.1.2 of the *2005 Addendum to Appendix N -Essential Fish Habitat Assessment*. Due to comments, the site-specific effects of the increased fill on EFH in this area are described in Section 4.3.13 of the Final SEIS. The realignments of Alternative 2B since 2004 have reduced overall EFH impacts associated with highway fill and crossing structures for the Antler, Berners/Lace, and Katzechin rivers. As stated in Section 4.2.2 of the 2014 Update to Appendix N, 25.5 acres of intertidal and subtidal fill is a small portion of the available habitat in Lynn Canal and would have minimal effects on the EFH available in Lynn Canal.

The Wetlands Report avoids the analysis by stating that “[i]mpacts to fish habitat as a result of this fill are discussed in the *2014 Update to Appendix N – Essential Fish Habitat Assessment*.” 2014 Update to App. O at 14. Turning to the Essential Fish Habitat Report, the only discussion of Katzechin River is in a section concerning effects to essential fish habitat at Slate Creek, where the “adverse effects on [Essential Fish Habitat] prey resources” are apparently mitigated by the fact that “[e]ulachon also use the Katzechin River for spawning.” 2014 Update to App. N, Attachment A at W-217. Attachment C of Appendix N describes some potential impacts to eulachon generally, such as acknowledging that bridge construction, maintenance, and use has the potential to degrade eulachon spawning habitat, 2005 App. N, Attachment C at ii, but there is no site-specific analysis of the long-term effects at the only estuarine habitat to be filled under current plans for Alternative 2B. The only mitigation proposed for Katzechin River addresses construction, which will be timed to avoid sensitive life stages of fish. 2005 App. N at 5-6; 2014 Update to N, Attachment A at W-225; 2014 Update to App. S at 27.

Furthermore, there are potential cumulative impacts on the Katzechin River and nearby eulachon which have not been explored. Sanitary wastewater will be discharged at the nearby Katzechin ferry terminal. 2014 Update to App. N, Addendum at W-217.

RESPONSE: Appendix Z *2014 Update to Appendix N – Essential Fish Habitat Assessment* includes an analysis of effects to fish habitat loss and spawning from placement of fill in estuarine waters. As noted above, the site-specific effects of the increased fill on EFH in this area are updated and described in Section 4.3.13 of the Final SEIS. Mitigation for placement of fill in EFH includes construction timing restrictions to protect sensitive life stages of fish. Additional mitigation, if required, will be developed in consultation with NMFS.

Attachment A to Appendix Z *2014 Update to Appendix N – Essential Fish Habitat Assessment* of the Draft SEIS states “Alternative 2B in combination with other reasonable foreseeable projects in the region were evaluated for the potential to impact EFH through changes in water quality. This evaluation considered discharges of sanitary wastewater from marine and ferry terminals as well as marine vessels, leakage of fuels and lubricants from marine vessels, highway stormwater runoff, and catastrophic spills from marine vessels and vehicles using a highway.”

Section 4.3.9.3 of the Final SEIS states that AMHS mainline ferry wastewater discharges in Lynn Canal north of Auke Bay would be eliminated. The ferries that would be used for Alternative 2B would have sanitary waste holding tanks. Sanitary

waste from the ferries would be treated at the existing treatment facilities in Skagway. A sewage treatment facility with a permitted outfall would be installed at the Katzeihin Ferry Terminal to treat sanitary waste from the terminal restrooms. The facility would meet all federal and State water quality requirements. Aeration and ultraviolet light disinfection, similar to the system used at the Auke Bay Ferry Terminal, would be used; therefore, no adverse impacts to water quality would occur. No other reasonably foreseeable actions were identified as potential contributors to a cumulative impact on marine resources in the Katzeihin River area.

“Because their habitat distribution and use of nearshore areas is unclear, it is unknown whether eulachon would be affected by habitat alterations associated with ferry terminal construction activities at the Katzeihin site.” 2005 App. N at 5-14.

By avoiding analysis of the site-specific effects of filling estuarine habitat at Katzeihin River on salmon, eulachon, and the Steller sea lions which depend on them, the DSEIS fails to satisfy Alaska DOT’s and the FHWA’s NEPA obligations to study the project and its effects, and it also fails to provide sufficient information for the U.S. Army Corps of Engineers (the Corps) to determine that there are no unacceptable environmental effects. Because the DSEIS is intended to satisfy all of these agencies’ NEPA obligations for the project and its Clean Water Act § 404 permit, the analysis for the impacts to wetlands caused by the preferred alternative must be rigorous and adequate to compare the effects among alternatives.

RESPONSE: The site-specific effects to fish species from fill in the estuarine habitat at the Katzeihin River for Alternative 2B was presented in Appendix Z *2014 Update to Appendix N – Essential Fish Habitat Assessment* of the Draft SEIS. As noted above, the site specific effects of the increased fill on EFH in this area are also updated and described in Section 4.3.13 of the Final SEIS, as are the effects on prey species and the impacts to Steller sea lions.

The analysis of wetland impacts for all alternatives in Appendix Z *2014 Update to Appendix O – Wetland Technical Report* of the Draft SEIS follows established methods under NEPA. The 2004 *Appendix O Wetlands Technical Report* identifies the individual wetlands potentially impacted by all alternatives, describes their functions, and details the impacts to the functions and values of each wetland. The 2004 document provides the basis for the analysis of all the alternatives and was updated to incorporate additional information in 2005 (*Appendix W – Addendum to Appendix O Wetlands Technical Report*) and 2014 (*Appendix Z 2014 Update to Appendix O – Wetlands Technical Report*). With identification of Alternative 1 – No Action as the preferred alternative, DOT&PF notified the U.S. Army Corps of Engineers (USACE) that it was withdrawing its Section 404/10 Permit Application for the JAI Project.

B. The failure to analyze effects to wetlands equally among alternatives skews the analysis in favor of Alternative 2B.

1. *The two road alternatives are not equally studied.*

Alternative 2B poses greater impacts than the next-damaging alternative, Alternative 3, *see* 2014 Update to App. O at A-4 (Table 4-3), and yet it appears that Alternative 3’s adverse

effects to wetlands have been more thoroughly studied and described. While Alternative 2B was rerouted to avoid some impacts to wetlands, Alternative 3 was not similarly reassessed. This unequal treatment could mislead the public and the decision makers as to the extent of environmental damage caused by the preferred alternative relative to other options.

RESPONSE: The analysis for wetland impacts is sufficiently rigorous and provided an appropriate level of information for all alternatives for a NEPA alternative comparison. The analysis presented in Appendix Z *2014 Update to Appendix O – Wetlands Technical Report* describes the potential impacts to wetlands from all current project alternatives. The wetland mapping refinements that occurred to Alternative 2B after the 2006 ROD were minimal and did not change the order of magnitude of wetlands present. The minor refinements made to the alignment of Alternative 2B during the USACE permitting process were based primarily on other environmental constraints (i.e., bald eagle nests, geotechnical surveys, etc.) and due to the abundance of wetland resources in the region, these changes do not alter the degree of wetland impacts. Small-scale refinements that may result from additional ground surveys of wetlands for Alternative 3 (as completed for the permitting process for Alternative 2B) would not substantially change the practicability or degree of wetland impacts for Alternative 3.

The DSEIS fails to consider adjustments to the non-preferred alternatives which would make the alternatives more practicable.

RESPONSE: As stated above, the SEIS acknowledges that the reason Alternative 2B included some minor re-routings was due to the previous advancement of that alternative through the design and permitting phases of the project. The minor adjustments to other alternatives would not alter the practicability of the alternatives described in the *2014 Update to Appendix X - Draft Section 404/10 Permit Application and Draft Section 404(b)(1) Analysis*.

One of the reasons for not selecting Alternative 3 is due to its effects to Berners Bay. DSEIS, Update to Appendix X: Draft Section 404/10 Permit Application (2014 Update to App. X), Attachment 4 at 15 (Sept. 2014). The importance of protecting Berners Bay and its critical value in the ecosystem is central to this comment letter's signatories. While the agencies have refined the alignment to Alternative 2B to reduce some impacts to wetlands at Berners Bay, DSEIS at 2-16, the remaining effects on this essential habitat still pose a grave threat to the ecosystem, and Alternative 3 presents even greater risks to Berners Bay, largely due to its reliance on a ferry terminal inappropriately proposed to be sited directly in Berners Bay. Alternative 3, in contrast to Alternative 2B, remains "mainly unchanged except for minor shifts to avoid new eagle nests identified in 2012." DSEIS, 2014 Update to Appendix D (2014 Update to App. D): Technical Alignment Report at 23 (May 2014). The failure to reduce impacts caused by the most comparable alternative, while improving the preferred alternative to avoid impacts to the same natural feature, reflects an unwillingness to consider a truly reasonable range of alternatives. The DSEIS reflects no attempt to consider alterations to Alternative 3 which would make it viable, such as the obvious solution of continuing to use Auke Bay instead of building a new ferry terminal in Sawmill Cove, or potentially moving the proposed ferry terminal to a less sensitive site.

RESPONSE: As stated above, adjustments were made to the Alternative 2B alignment after it was selected in the 2006 ROD during the USACE permitting process. The magnitude of the adjustments did not alter the practicability of the alternative, nor would similar adjustments to the other alternatives affect their practicability.

FHWA and DOT&PF have evaluated Alternative 3 because it is a reasonable alternative. As stated in Chapter 5 of the Draft SEIS, and maintained in the Final SEIS, DOT&PF would investigate ways to further reduce impacts to wetlands and intertidal/subtidal areas during final engineering design of a selected build alternative. In Attachment 4 of the *2014 Update to Appendix X - Draft Section 404/10 Permit Application and Draft Section 404(b)(1) Analysis*, provided in Appendix Z of the Draft SEIS, DOT&PF evaluated a modified Alternative 3 (Alternative 3M) that used Auke Bay instead of Sawmill Cove for ferry operations from mid-April to the end of May. Alternative 3M was introduced in the 2008 USACE ROD at the recommendation of EPA to avoid impacts to endangered species and their prey in Berners Bay.

DOT&PF determined that Alternative 3M is not reasonable because the additional length of the marine crossing from Auke Bay to William Henry Bay would reduce flexibility for the State to increase capacity and trip frequency, which would reduce demand and further contribute to the determination of being not reasonable. Based on this evaluation, DOT&PF did not identify Alternative 3M as a reasonable alternative for full evaluation in the Draft SEIS. Potential ferry terminal sites south of Berners Bay for Alternative 3 were determined to not be reasonable during the initial screening process for the Draft SEIS in Section 2.2.

DOT&PF has committed to investigating a facility at Cascade Point if the selected project actions require a ferry terminal in Berners Bay (Draft SEIS, pg. 4-232).

Additionally, the depth of analysis given Berners Bay far exceeds the minimal consideration granted other potentially significant areas. The impacts to Berners Bay are important and their analysis is essential to the discussion, but the analysis of effects to other wetlands should just as rigorous as that for Berners Bay. Alternative 2B affects nearly three times the amount of palustrine forested wetlands affected by Alternative 3, which are described as having high replacement costs; four times the amount of rocky shore beaches; and 3.2 acres of estuarine unconsolidated bottom where Alternative 3 affects no estuarine unconsolidated bottom habitat. 2014 Update to App. O at A-4 (Table 4-3). The effects to the latter two categories comprise modification of 32.1 acres of fish habitat and 7.19 acres of wildlife habitat. *Id.* at A-7 (Table 4- 4). Even if not as many acres at Berners Bay are affected under Alternative 2B as under Alternative 3, that is no excuse for failure to adequately assess the other remaining effects and the values and function of habitat lost. Without rigorous analysis of the effects to all wetlands, the agencies have not fulfilled their duty to take a hard look at environmental effects and cannot determine the degree to which each alternative will result in environmental damage.

RESPONSE: After Alternative 2B was identified as the preferred alternative in the 2006 ROD, additional engineering design and field investigations occurred on Alternative 2B as required by the USACE Section 404 permit process. Because that additional analysis is available, it has been incorporated into the Draft SEIS. Additionally, field delineation of

the Berners Bay wetlands was conducted in 2011 as part of the USACE Section 404/10 permit process for the Glacier Highway Extension project. This provided more refined boundary information for the wetlands in the Berners Bay area but did not affect the functions and values assessed for the wetlands. Functions and values of wetlands across all alternatives, in consideration of their entire footprint and not just at Berners Bay, are assessed in Appendix Z *2014 Update to Appendix O – Wetland Technical Report* of the Draft SEIS.

2. *The effects of transportation-related pollution on wetlands are excluded from analysis.*

The cars traveling on a road proposed under Alternative 2B or Alternative 3 will pose pollution hazards that have not been reviewed in the DSEIS. Mercury and polycyclic aromatic hydrocarbons are known to be present in tailpipe emissions, and both “tailpipe emissions and brake wear debris have been reported to be sources” of copper. Ex. 26 at 8719; Ex. 16 at 1 (noting that “vehicles are becoming the largest source of” polycyclic aromatic hydrocarbons). These pollutants can run off to nearby wetlands and streams and affect the habitat and wildlife present. Yet the DSEIS dismisses any water quality concerns because studies in Anchorage “showed dissolved concentrations of calcium, chromium, magnesium, and zinc to be below the [Alaska Water Quality Standards].” DSEIS at 4-70. “Only dissolved concentrations of copper and lead were noted to be above their [Alaska Water Quality Standards],” and “[p]olynuclear aromatic hydrocarbons were at concentrations below the EPA water quality criteria.” DSEIS at 4-70; *see also id.* at 4-121, 4-172. These assertions do not constitute environmental review of the project’s effects; rather, they are aimed at environmental compliance. True environmental review requires consideration of the effects of a project and an assessment of scientific knowledge concerning those effects.

Polycyclic and polynuclear aromatic hydrocarbons are dangerous pollutants for fish. “The immediate and delayed effects of embryonic exposure to *low levels* of polynuclear aromatic hydrocarbons (PAHs) have been shown to reduce survival to maturity by 50% in exposed pink salmon populations.” Ex. 23 at 351, Abstract (emphasis added). “Sublethal effects [to fish] caused by embryonic PAH exposures include edema of the yolk sac and pericardium, hemorrhaging, disruption of cardiac function, binding to the aryl hydrocarbon receptor (AhR) and CYP1A induction, mutations and heritable changes in progeny, craniofacial and spinal deformities, neuronal cell death, anemia, reduced growth, and impaired swimming.” Ex. 15 at 60.

The fact that Anchorage has exceeded water standards for dissolved copper does not address potential impacts in Lynn Canal. “A large body of scientific literature has shown that fish behaviors can be disrupted at concentrations of [dissolved copper] that are *at or slightly above ambient concentrations* (i.e., background). Ex. 32 at ix. “[Dissolved copper] is a neurotoxicant that directly damages the sensory capabilities of salmonids at low concentrations. These effects can manifest over a period of minutes to hours and can persist for weeks.” *Id.* This pollutant “has the potential to limit the productivity and intrinsic growth potential of wild salmon populations by reducing the survival and lifetime reproductive success of individual salmonids.” *Id.* at x.

Finally, the addition of mercury to an environment dominated by wetlands is of particular concern because wetlands readily convert inorganic mercury to organic methylmercury, meaning that mercury emitted from vehicles on the road is more likely to bioaccumulate. *See Ex. 57 at 2.* Methylmercury’s “primary [human] health effect . . . is impaired neurological development,” including “[i]mpacts on cognitive thinking, memoray, attention, language, and fine motor and visual spatial skills” *Ex. 44 at 1.*

The DSEIS fails to examine the potential effects of vehicle pollution on the environment, thereby ignoring an important aspect of the road alternatives. A full environmental review requires consideration not only of compliance with water quality standards, but also of effects that may occur at concentrations lower than existing standards. Recent scientific studies show that even low levels of polycyclic and polynuclear aromatic hydrocarbons and copper are dangerous for fish, including salmon and herring, and low levels of mercury may pose greater risks when added to an environment predisposed to foster methylation.

RESPONSE: The Draft SEIS examined the potential effects of vehicle pollution on the environment in sections related to air quality, water quality, habitat, and wildlife. Specific to water quality, the Draft SEIS evaluated the potential effects of vehicles traveling on the East and West Lynn Canal highways in Sections 4.3.9 (Alternative 2B) and 4.4.9 (Alternative 3). The evaluation included consideration of pollutants in stormwater runoff and associated water quality of receiving waters. DOT&PF and FHWA have reviewed your comments and reference documents and maintain that the mitigation measures described in Chapter 5 of the Draft and Final SEIS provide reasonable and adequate protection of terrestrial and aquatic systems.

C. The Proposed Mitigation is Inadequately Described.

The mitigation for effects to wetlands as currently described is inadequate and does not accurately portray the potential costs of compensatory mitigation. The FHWA and Alaska DOT intend to provide compensatory mitigation for the effects which are supposedly unavoidable.

However, beyond one small project at Yankee Cove, there are no details or proposals for compensatory mitigation. The road proposed to be built under Alternative 2B is in a relatively pristine area where there may not be many opportunities to restore or replace habitat similar in function to the type destroyed by the road. “Choice in mitigation location should be designed to match or mimic the impacted wetland watershed position in order to maintain watershed-level hydrologic functions.” *Ex. 25 at 27.* Furthermore, mitigation is not an immediate fix; for example, bogs and fens are made up of organic soils that can “take hundreds to thousands of years to develop, and can be among the most difficult type of wetland to restore or create.” *Id.* at 21. The DSEIS provides no analysis or acknowledgment of the lag in time between destruction of wetlands and creation of mitigating wetlands.

The only project mentioned, Yankee Cove, lacks any discussion of what type of habitat is

created and which wetlands it supposedly replaces. At the most basic level, EPA advised FHWA to present the information about the mitigation project in terms of acres, not dollars, and to propose a mitigation plan for the enhancement project as required by 33 C.F.R. § 332.4(c) and 40 C.F.R. § 230.94(c). DSEIS Ch. 7, Sec. 7.8, Environmental Protection Agency (EPA) Comments on Preliminary DSEIS (Feb. 21, 2014) (the EPA Preliminary Comments). The DSEIS still does not identify the acreage of the Yankee Cove project. Further, the Corps questioned whether a ratio of 1:1 would be appropriate for the project. *Id.* Ch. 7, Sec. 7.8, U.S. Army Corps of Engineers (Corps) Comments on Preliminary DSEIS (Feb. 21 2014) (the Corps Preliminary Comments) at 3. Scientists have recommended the use of debit to credit ratios as high as 12:1 for wetlands in Southeast Alaska. *See Ex. 25* at 30. The debit to credit ratio depends on the type of habitat lost and the type of habitat preserved, enhanced, restored, or established. *Id.* at 23. Thus, it is critical to assess the affected wetlands as well as the mitigation site and success of the mitigation in order to determine the degree of compensation for the loss incurred. *Id.* at 17-18. The DSEIS accomplishes neither, making it impossible to assign an appropriate debit to credit ratio.

RESPONSE: With identification of Alternative 1 – No Action as the preferred alternative, DOT&PF notified USACE that it was withdrawing its Section 404/10 Permit Application for the JAI Project. Mitigation costs for all reasonable alternatives were provided in the Appendix Z 2014 Update to Appendix D - Technical Alignment Report. Had the Record of Decision selected an alternative requiring a USACE 404/10 permit, calculations of credits from potential permittee-responsible mitigation projects, as well as the amount of credits to be purchased from an In-Lieu Fee provider would have been detailed in the Compensatory Mitigation Plan approved by the USACE.

First, as discussed above, the impact site assessment is inadequate. The DSEIS assigns replacement values to different types of wetlands but does not explain how these values are calculated. *See* 2014 Update to App. O, Attachment A at A-9 to A-11. Palustrine forested wetlands, by far the most common wetlands in the project area, are assigned a high replacement cost, *id.* at 14, but the rarer estuarine areas are undervalued and should have a higher replacement cost due to their importance for fish habitat. *See id.*, Attachment A at A-11. An assessment of wetlands in the Juneau watershed revealed that “tidal salt marshes (estuarine wetlands) and riverine wetlands (riparian areas and their stream channels) are the least abundant and most heavily impacted type of wetland and forested/scrub wetlands are the most abundant, showing the least impact.” *Ex. 25* at 6. Although restoration of forested wetlands is relatively difficult, *id.* at 21, researchers determined that estuarine wetlands and riverine wetlands complexes are higher priority wetlands due to their lesser abundance. *Id.* at 19. This prioritization is important to assess “if cumulatively we are maintaining or improving the aquatic resources within the watershed” according to the Corps’s “no net loss” wetlands policy. *Id.* at 22. “Prioritization is part of the guidance on how to mitigate for loss,” *id.* at 23, and thus the DSEIS must start with an adequate assessment of the site to be affected.

RESPONSE: Wetland functions and values were evaluated and detailed for each wetland in Appendix Z 2014 Update to Appendix O – Wetlands Technical Report of the Draft SEIS. Attachment 3 of Appendix Z 2014 Update to Appendix X Draft Section 404/10 Permit

Application and Draft Section 404(b)(1) Analysis in the Draft SEIS summarizes the wetland and waterbody rating system used. Although the rating system developed is applicable to all wetlands across all alternatives, Attachment 3 focuses on the ratings specific to Alternative 2B as part of the Draft 404/10 Permit Application. To rate wetlands and waterbodies for the purpose of determining appropriate compensatory mitigation ratios that comply with current regulations, a qualitative assessment was performed to classify wetlands and waterbodies into the following four categories: Category I, II, III, and IV. Category I wetlands and waterbodies are generally less common and high functioning. Category IV wetlands and waterbodies are more common with limited or degraded functions. Impacts of Alternative 2B would be limited to Category II and III wetland and waterbodies.

Second, there is insufficient information concerning the mitigation site and the degree of the project's success. Because the compensatory mitigation is in the form of an in lieu fee project that is not yet "fully functional," DSEIS at 5-11, the Corps "must require sufficient compensation to account for the risk and uncertainty associated with" the project. 33 C.F.R. § 332.3(f)(3). Additionally, after the project was constructed, breakwaters were added to the area to protect the marine facility at Yankee Cove primarily used to transport workers to Kensington Mine. Ex. 33; Ex. 22; Ex. 29; Ex. 19 at 2; DSEIS at 3-11. Construction of "breakwaters . . . may affect marine habitat function for herring by inhibiting migration and disrupting movement, blocking or altering access to nursery areas, modifying food production and feeding; altering or covering shallow vegetated and beach habitats used for spawning, attracting predators and changing physiochemical properties." Ex. 34 at 25. "The construction of the Sitka Harbor breakwaters, for example, decreased water circulation and increased silt deposition, which may have reduced biomass of herring spawn inside the harbor." *Id.* Thus, it is possible that the breakwaters installed after the enhancement project was constructed may reduce the project's effectiveness. The DSEIS fails to provide the information necessary to determine the relative success of the Yankee Cove project, and the "final" report assessing the project notes that "processes of reef maturation can take a decade or more," and "recommend[ed] continued monitoring at annual intervals." Eckert, Ginny, et al., Final Report to Alaska Department of Transportation and Public Facilities: Lynn Canal Marine Habitat Enhancement (2010) at 21 (cited in DSEIS at 5-11). As the U.S. Governmental Accountability Office recommended, to achieve the "national goal of no net loss of wetlands" the Corps should set clear expectations for continued oversight of this mitigation project, "including establishing goals for the number of monitoring reports that should be reviewed and the number of compliance inspections that should be conducted." Ex. 49 at 27.

Even if the mitigation plan were approved pursuant to 33 C.F.R. § 332.4(c) and given a generous ratio of 1:1, the artificial reefs placed at Yankee Cove cover at most a couple acres, meaning almost all of the 61 acres of wetlands affected have yet to be mitigated. If even two acres of wetlands lost were mitigated by the Yankee Cove project, the Alaska DOT still has a long way to go; and if all of its mitigation projects are funded at the same rate per acre, it would result in a total mitigation cost of almost \$10 million, not the \$1.3 million it currently expects to pay. *See* 2014 Update to App. X, Attachment 3 at 9 (explaining that "DOT&PF has paid \$324,000 (2006 dollars) as mitigation for . . . two artificial reefs at Yankee Cove"). Again, the estimate of \$10 million assumes a generous debit to credit ratio of 1:1, which even the draft 404 Permit application concedes is not

realistic. See 2014 Update to App. X, Attachment 3 at 11 (Table 6) (proposing ratios of 2:1 and 1.5:1).

RESPONSE: With identification of Alternative 1 – No Action as the preferred alternative, DOT&PF notified USACE that it was withdrawing its Section 404/10 Permit Application for the JAI Project. Had the Record of Decision selected an alternative requiring a USACE 404/10 permit, DOT&PF would have coordinated with the USACE to develop a Compensatory Mitigation Plan that would have outlined the twelve elements required by the Final Rule for permittee-responsible mitigation projects as part of the Section 404/10 permitting process including an evaluation of the Yankee Cove artificial reef site and identification of additional mitigation required to offset impacts to EFH.

Additionally, the wildlife underpasses designed to provide passage for bears, 2014 Update to App. O at 17, do not mitigate effects to wetlands because they serve terrestrial wildlife, not aquatic wildlife. See the EPA Preliminary Comments; the Corps Preliminary Comments. By failing to address EPA's and the Corps's comments regarding identification of these underpasses as wetlands mitigation, the DSEIS misleads the public.

RESPONSE: Section 5.0 of Appendix Z *2014 Update to Appendix O – Wetlands Technical Report* in the Draft SEIS states that the underpasses are out-of-kind mitigation to offset losses to a portion of the terrestrial wildlife habitat impacted by Alternative 2B. The remaining palustrine and estuarine wetlands (0.2 acre) would be mitigated through In-Lieu Fee compensation based on market value of mitigation costs.

In sum, the Alaska DOT's mitigation plan is incomplete and does not form a sufficient basis for the Section 404 analysis to be performed by the Corps and EPA. Additionally, the plan underestimates the costs of mitigation necessary to offset the loss of 61 acres proposed under Alternative 2B. These costs should be updated and included to better inform the public and decision makers for purposes of NEPA review of the project as well as the Section 404 analysis.

RESPONSE: Mitigation costs for all reasonable alternatives were provided in the Appendix Z *2017 Update to Appendix D - Technical Alignment Report*, which includes cost updates prepared as part of the Final SEIS.

- D. The DSEIS's Analysis of Traffic Forecast and Demand is Flawed and Fails to Discuss Logistical Obstacles Presented by Alternative 2B, and the Information Provided for the Section 404 Permit Application and the Least Environmentally Damaging Practicable Alternative Analysis is Incomplete.

The information provided in the DSEIS and in Alaska DOT's draft application for a Clean Water Act § 404 permit (404 permit) fails to satisfy the agencies' NEPA obligations and improperly restricts the analysis of the least environmentally damaging practicable alternative. Much of the analysis rests on an unreliable calculation of the traffic to be generated under Alternative 2B and the information provided concerning practicability of alternatives varies by alternative. These distortions are inadequate to serve as the basis for

NEPA review and the determination of the least environmentally damaging practicable alternative.

RESPONSE: FHWA has met its requirements under NEPA by evaluating a range of alternatives in accordance with Council on Environmental Quality (CEQ) guidance (40 Code of Federal Regulations [CFR] 1500) and FHWA regulations (23 CFR 771.130).

An evaluation of practicability of the alternatives is required pursuant to USACE guidelines at 40 CFR 230.10(a). A practicable alternative “is available and capable of being done after taking into consideration cost, existing technology, and logistics...” For the JAI Project Draft Section 404(b)(1) Analysis Update presented in Attachment 4 of the *2014 Update to Appendix X - Draft Section 404/10 Permit Application and Draft Section 404(b)(1) Analysis*, provided in Appendix Z of the Draft SEIS, the criteria used to evaluate practicability include project purpose, capital and operating costs, travel time, daily traffic, travel demand accommodated, wetland impacts, and EFH impacts. Through a Memorandum of Agreement, the DOT&PF would develop a Section 404(b)(1) Analysis and present it with the Draft Section 404/10 Permit Application for information purposes only. The USACE would perform its own independent analysis. With identification of Alternative 1 – No Action as the preferred alternative in the Final SEIS, DOT&PF notified USACE that it was withdrawing its Section 404/10 Permit Application for the JAI Project.

As stated in the Draft SEIS, the Alternative 2B design has been modified to avoid all but 0.2 acres of estuarine emergent wetland fill at the Katzehin River. The alignment from Echo Cove to Cascade Point now incorporates the existing road to minimize wetland impacts. The alignment from Cascade Point to Point Sherman has been revised to avoid all lacustrine emergent wetlands. The crossing of the Antler and Lace rivers have been adjusted to avoid documented eulachon spawning habitat and to provide greater separation from estuarine wetlands. In addition to the bridge extensions to provide for wildlife movements along waterbodies, two wildlife underpass bridges have been added over identified high use bear trails. Other actions to minimize adverse impacts would be evaluated further during permitting and final design.

There is no question that Alternative 2B is the most environmentally damaging alternative proposed. It is apparent from the beginning of the DSEIS: Alternative 2B will result in the loss of 412 acres of old growth forest, 61 acres of wetlands, 32 acres of intertidal and subtidal areas, and 37 acres of essential fish habitat, and will affect 136 eagle nests. DSEIS at ES-17 (Table ES- 1). The no-build alternatives will have none of these natural resource impacts, and the ferry alternatives 4A through 4D will encounter a small fraction of these impacts. *Id.* Even the other major road construction alternative, Alternative 3, does not come close to inflicting the amount of damage on the environment, affecting 100 fewer acres of old growth forest habitat, less than half as many acres of wetlands, roughly one-third of the number of acres of intertidal/subtidal areas and essential fish habitat, and half as many eagle nests. *Id.*

The only way the Alaska DOT may receive a permit for the most damaging alternative is to prove that none of the other alternatives is practicable. Practicability is defined by

“taking into consideration cost, existing technology, and logistics in light of overall project purposes.” 40 C.F.R. § 230.3(q). Given the total project life cost of Alternative 2B is similar to Alternative 3 and greater than Alternative 1B, 4C, and 4D, and the net present value relative to the no action alternative for Alternative 2B is much less than Alternatives 4A and 4B, cost is not a major limiting factor. DSEIS at ES-16 (Table ES-1).⁴ The existing technology is the same for all alternatives, as they all include some combination of roads (whether already built or yet to be constructed) and ferries. Thus, it comes down to the issue of logistics in light of the project’s purpose and need.

The Alaska DOT bases its logistical assessment of all of the alternatives on the relative ability of each alternative to meet demand, but the estimate of the supposed demand in Lynn Canal is not reliable. See 2014 Update to App. X, Attachment 4 at 13, 15. Additionally, the assessment does not include any logistical issues afflicting Alternative 2B, such as the possibility “that a shuttle is taken out of service due to breakdown, staff problems, or funding shortfalls”; hurdles facing private companies expected to accommodate foot passengers; or the challenge of having ferry terminals “over 30 miles from existing ferry terminals and all of the support services that complement them.” See *id.* at 14 (discussing logistical problems expected to arise under Alternative 3). The information provided is misleading and incomplete for purposes of NEPA review, and a fuller picture of the facts is necessary in order to make the determination of which alternative is the least environmentally damaging and practicable.

RESPONSE: The commenter is commenting on a Draft 404(b)(1) analysis. This information is provided to USACE for information purposes and not used to determine the State or FHWA’s preferred alternative. The USACE would have performed its own independent 404(b)(1) analysis, if DOT&PF had continued the permit application process.

The unconstrained traffic model is the measure of demand in the corridor. It represents the number of trips desired to be made by the traveling public. In other words, it is the demand. Only by evaluating alternatives against this measure can FHWA determine if they are providing capacity to meet demand. Comparing alternatives to the unconstrained travel demand not only identifies how well the alternatives meet demand, but it also identifies the number of trips not occurring due to operational and logistical constraints. This would be important to meeting DOT&PF and FHWA’s goal of “providing fast, safe, efficient, and convenient transportation at the lowest cost (49 USC §101)”.

Under CEQ guidance, DOT&PF and FHWA are afforded substantial deference over the elements of purpose and need. Evaluating the alternatives in light of the project purpose can only occur through identification of both the travel demand accommodated and the travel demand not accommodated (unmet demand).

Logistical considerations were evaluated in the *2014 Update to Appendix X - Draft*

⁴ As noted by the Corps, the purposes of reducing state and user costs are not relevant to the 404 permit determination because including cost components “would narrowly restrict the Clean Water Act (CWA), Section 404 alternatives analysis to just one alternative,” so only total project costs should be considered in this analysis. Corps Preliminary Comments at 2.

Section 404/10 Permit Application and Draft Section 404(b)(1) Analysis. If a build alternative had been chosen as the preferred alternative, the Draft 404(b)(a) analysis would have been updated to include additional logistical considerations such as:

- Out of service ferries: While Alternative 2B and Alternative 3 use three ferries in the summer and two in the winter, with Alternative 2B, even if two of the three ferries are not available, access can still be provided to both Haines and Skagway. However, Alternative 3 is designed to use a minimum of two ferries. If only one ferry is available, the system cannot operate as a single ferry. Alternative 3 could not simultaneously provide service between William Henry Bay and Sawmill Cove and between Haines and Skagway (40 miles to the north). To provide daily service, the West Lynn Canal Road would have to be bypassed in favor of marine service.
- Foot passengers: Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS discussed accommodating foot passengers.
- Homeports: Alternative 3 would have two remote ferry terminals. Shuttle ferries would be homeported at Sawmill Cove, including fueling and all routine service. With Alternative 2B, shuttle ferries would be homeported in Haines and Skagway.

1. *The traffic levels and demand forecast are unreliable and rest on flawed grounds.*

The draft analysis provided for the 404 permit and the DSEIS focus on traffic levels and demand, and the purpose of the project is “to provide improved surface transportation to and from Juneau within the Lynn Canal corridor” which will, among other things, “[p]rovide the capacity to meet transportation demand in the corridor.” DSEIS at 1-10. To the extent the State’s asserted need to “[p]rovide the capacity to meet transportation demand” is relevant to the 404 permit analysis, the determination of the demand in the corridor and what each alternative is likely to achieve is of paramount importance. However, the assumptions underlying the current determination of demand have significant flaws, making the assessment of demand unreliable. Despite the acknowledged “complexity and uncertainty associated with predicting traffic in Lynn Canal,” 2014 App. AA at 7, the DSEIS forges ahead to make this estimate the centerpiece of its analysis.

As noted in Lynn Canal Conservation’s comments on the DSEIS (2014 Lynn Canal Conservation Comments), and incorporated here by reference, the assumption that there is large unmet travel demand in Lynn Canal is faulty. *See* 2014 Lynn Canal Conservation Comments at 5-12. The history of the ferry system shows that the increase in the opportunity to travel in Lynn Canal has not been met by an increase in travel; rather, the resulting travel has actually decreased as the opportunity to travel increased. *Id.* at 6 (comparing data for 1988 and 1991, high ferry use years, with 2007, which had lower ridership despite more opportunities to travel). Similarly, when the faster *M/V Fairweather* operated in Lynn Canal in 2004-2005, substantially reducing travel time and increasing vehicle capacity, there was little change in overall ridership. *Id.* at 6-7. Finally, a decrease in user costs in the past did not significantly increase ridership. *Id.* at 7. Thus, three major inputs to the choice models for determining demand – opportunity to travel, travel time, and user costs – have previously been adjusted in Lynn Canal without a corresponding growth in use. *See* 2014 App. AA at 6.

RESPONSE: The assumptions underlying the current determination of demand do not have significant flaws. The estimates of demand are reliable and based on current data and accepted modeling practices. A Total Demand Model was developed as a starting point based on empirical data derived from actual travel conditions observed in Alaska and Western Canada from communities with similar geographic characteristics as Juneau. Based on the project team's research, there were no indicators that travel behavior in Juneau (and for the most part Skagway and Haines) would differ substantially from that of other Alaskan and Canadian communities if full highway access were available. While Juneau is geographically isolated, it is not significantly more remote than other communities where data was collected.

The project team made every effort to produce conservative forecasts, and reached the conclusion that Juneau residents would travel in a similar manner to other Alaskan residents. Even today, Juneau residents travel only slightly less on a per household basis than the average Alaskan household, indicating that not much difference exists. Vehicle ownership per capita in Juneau, Haines, and Skagway is also comparable to other Alaska areas.

Next, a travel choice model was used that calculated the probability of travel for a given alternative by comparing travel times, cost, and convenience against the total demand results. This travel choice model was validated against existing travel conditions within Lynn Canal using established statistical modeling procedures and was independently peer reviewed by a professor who specializes in traffic forecasting.

The commenter makes statistically invalid claims about short-term operational changes that have occurred in Lynn Canal over the years. While it is true that AMHS has tried various service changes to refine service, including price changes, schedule changes, fast ferries, etc., these service refinements have never been implemented together in a fully developed alternative.

The commenter has selected data sets that are too small to make statistically valid correlations and suggests that the traffic forecast in Lynn Canal is faulty. However, it is not within accepted modeling practice or statistical analysis to rely on one or two years of data to surmise a statistically valid correlation (or the lack of one).

It is also as invalid to pick individual years to demonstrate a positive correlation in the data. For example, between 1989 and 1991 round trips increased from 240 to 290 and passenger demand increased from 115,742 to 131,865; numerous other hand-picked years could be identified to suggest a different correlation. Frequency of service is not the only factor in people's decision to travel. Other factors include costs, schedule, or economic conditions in the given year cited.

Each of these factors would need to be known to make an accurate assessment. Moreover, the supply in capacity varies from year to year. Because capacity is not consistent, trip planning can be difficult for the traveling public. Conclusions drawn from data over short periods using an inconsistent variable are suspect.

None of the tests replicate the improvements proposed in the SEIS. And none of the

service changes was run long enough to provide a true test. Furthermore, simply adjusting one or two variables in a complex system and only running them for a short time does not equate to a test of the demand that would develop if the alternatives proposed in the SEIS were to be implemented.

Furthermore, the methodology used to predict traffic forecast and demand is also flawed because it is based on the concept of “unconstrained demand,” and previous traffic forecasts have not come close to accurately predicting the traffic volume in advance of other changes to the ferry system. *See* 2014 Lynn Canal Conservation Comments at 7-9. First, the household survey data which factor into the model do not include any cities with a similar geography or population to Juneau. *Id.* at 8-9. The surveys of Juneau residents resulted in dramatically different estimates of travel. *See* Ex. 27 at 4-5. Second, the concept of “unconstrained demand” is misapplied, because the DSEIS uses the term to refer to “the number of vehicles that would travel between Juneau and Haines or Skagway if there were no impediments to travel other than ownership of a vehicle and the cost of fuel for that vehicle.” DSEIS at ES-5; *see also* 2014 Lynn Canal Conservation Comments at 8, 14-15. The way this term is defined is meaningless because it fails to take into account full costs and the impediments to travel that cannot be removed. *See* Ex. 27 at 3. For this road, some impediments may include the danger of avalanches, risk of wildlife collisions, sharp curves, and the need for ferry systems to reach Haines even if a road were built all the way to Skagway. In order to assess an alternative’s practicability, the alternative should be compared against what is actually possible in Lynn Canal, and not on an unachievable, unrealistic goal. Third, as the 2005 Draft Environmental Impact Statement noted, measuring unmet travel demand is “difficult,” “imprecise,” and uncertain. 2005 SDEIS, Appendix C: Traffic Forecast Report (2005 App. C) at 15 (Oct. 2004).

The output generated by the model to determine demand on a particular alternative is based on seven coefficients: five are taken from another travel model, and the other two were added for this project. Ex. 27 at 5-6. The added coefficients appear to double-count some factors by including redundancies such as time effects. *Id.* at 6-8. If just one of these coefficients is removed, the demand for the preferred alternative looks vastly different than that portrayed by the DSEIS, and is much more similar to the no-build alternatives. *Id.* at 7 (Fig. 1). These errors and discrepancies have a significant impact on the reliability of the model; the estimate for travel by Juneau residents under Alternative 2B currently provided in the DSEIS is nearly double what residents actually indicated in a survey. *Id.* at 7.

RESPONSE: As stated in the Traffic Forecast Report, the results from the 2009 National Household Transportation Survey (NHTS) and 2002 Anchorage Household Travel Survey (AHTS) were used to develop trip generation and trip dissipation rates for the total demand model. The NHTS results were filtered to vehicle trips (including personal and commercial travel) from households that had similar geographic characteristics to households in Juneau.

In addition, a Total Demand Model was developed based on empirical data derived from actual travel conditions observed in Alaska and Western Canada from communities with similar geographic characteristics as Juneau. The ‘unconstrained’ reference was to a situation with a full road connection that did not require a ferry connection. Based on the

project team's research, there were no indicators that travel behavior in Juneau (and for the most part Skagway and Haines) would differ substantially from that of other Alaskan and Canadian communities if full highway access were available. While Juneau is geographically isolated, it is not significantly more remote than other communities where data was collected. The project team made every effort to produce conservative forecasts, and reached the conclusion that Juneau residents would travel in a similar manner to other Alaskan residents. Even today, Juneau residents travel only slightly less on a per household basis than the average Alaskan household, indicating that not much difference exists. Vehicle ownership per capita in Juneau, Haines, and Skagway is also comparable to other Alaska areas.

There were several Total Demand model approaches considered by the study team. Two methods were selected as being most representative of likely conditions along Lynn Canal. Each of these two different models were developed independently and resulted in similar estimates of travel volume along Lynn Canal.

The travel model considers the following factors:

- Total trip time (considered separately for auto travel time and ferry travel time)
- Total trip cost (considered separately for auto operating costs and ferry fares)
- Ferry wait times
- Ferry departure convenience (boat capacity, number of sailings per day, departure/arrival times)
- Convenience/comfort factor related to driving (ability to make a trip without considering a schedule, ability to stop at interim locations for recreation or comfort)

These model factors are not redundant. As part of the modeling, the team performed a correlation analysis to ensure that the variables were adequately independent. The model was then estimated and calibrated to the Lynn Canal conditions. One cannot just remove one or more of the factors of the model and still end up with a valid result. If factors were removed, then the model would have to be re-estimated, which would yield unknown results.

DOT&PF and FHWA acknowledge that developing a traffic forecast for Lynn Canal is complex. Because there is no road linking communities in Lynn Canal, a forecast of surface transportation demand cannot be conducted in a conventional manner. All traffic demand models attempt to predict future demand based on assumptions and data available in the present. To the extent that they are predicting a future, unknown condition, all demand models are "hypothetical." The modelers of the current effort used quantitative methods to validate the model and estimated demand using more than one methodology to provide greater certainty that the forecast was grounded on real data and based on repeatable, valid methodologies.

Additionally, "the purpose and need for the JAI Project is to provide improved surface transportation to and from Juneau within the Lynn Canal corridor," DSEIS at 1-10, which all of the action alternatives accomplish. *Id.* at ES-6 (Fig. ES-1), ES-16 (Table ES-1). *See also* 2014 Lynn Canal Conservation Comments at 12-21 (discussing in detail each element of the purpose and need statement and the respective flaws associated with each element). Part of the purpose and need statement is to "[p]rovide the capacity to meet

transportation demand in the corridor.” DSEIS at 1-10. Yet, as described in greater detail in the Southeast Alaska Conservation Council’s comments on the DSEIS and incorporated here by reference, the DSEIS analyzes the alternatives by determining how much each would *increase* demand. See 2014 Southeast Alaska Conservation Council Comments. This interpretation of the purpose and need statement is arbitrary and unreasonably restricts comparison of alternatives.

RESPONSE: The Alternatives are not analyzed by how much each would “increase demand.” The analysis of alternatives requires a determination of the level of demand that would be generated based on the degree to which travel by motor vehicle is constrained by ferry service, compared with unconstrained demand wherein travel is assumed to be possible via a direct link by road. There is an underlying latent demand for travel in the corridor (unconstrained demand) and more or less of that demand will be realized with each alternative, depending on the attributes of that alternative such as the constraints imposed by the ferry link. All alternatives increase demand relative to Alternative 1 – No Action, but none meet the unconstrained demand because all alternatives include a ferry link.

The analysis documenting the needs and the alternative analysis are not arbitrary. The demand for travel in the corridor already exists. All of the reasonable alternatives satisfy the purpose and need to varying degrees, including the marine alternatives. Some alternatives do this better than others. DOT&PF and FHWA want to select and build a transportation solution that maximizes the number of people who will use it, while also considering costs to the State and users and balancing environmental impacts. Those alternatives that come closer to satisfying the overall, unmet demand for travel in the corridor (i.e., that more people will use) are superior in meeting the purpose and need for the project.

Furthermore, the DSEIS’s application of the purpose and need statement with respect to meeting demand reflects an interpretation that is arbitrarily narrow, and appears to work backwards from the preferred alternative to ensure that nothing but Alternative 2B will serve the reinterpreted project purpose and need. By using an unrealistic definition of “unconstrained demand” and failing to provide any objective measures to indicate how much capacity must be increased or how great a reduction in travel time is acceptable, the Alaska DOT has essentially waited until it forecasted a traffic demand number for its preferred alternative and then declared that nothing less will satisfy the purpose and need, thus reversing the course of proper analysis and running afoul of the 404 permitting process. “Obviously, an applicant cannot define a project in order to preclude the existence of any alternative sites and thus make what is practicable appear impracticable. This court in *Hintz* quite properly suggested that the applicant's purpose must be ‘legitimate.’” *Sylvester v. U.S. Army Corps of Engineers*, 882 F.2d 407, 409 (9th Cir. 1989) (citing *Friends of the Earth v. Hintz*, 800 F.2d 822, 833 (9th Cir. 1986)). Additionally, this unreasonably narrow approach to the project’s stated purpose and need runs afoul of NEPA. The project’s purpose should not prevent full consideration of reasonable alternatives based on an arbitrary interpretation of demand.

RESPONSE: DOT&PF and FHWA did not use an unrealistic definition of unconstrained demand, as has been answered elsewhere in this document. The purpose and need

addresses the transportation needs in Lynn Canal. DOT&PF and FHWA data have demonstrated that there is considerably higher demand for travel than is currently met by the existing system. However, due to high costs, slow travel times, limited capacity, and other inconveniences, the system does a poor job at serving corridor demand. These problems are documented in Chapter 1 of the Draft SEIS.

The CEQ directs federal agencies to grant substantial deference to the lead federal agency with expertise in the stated field, in this case the FHWA, in determining the purpose and need for transportation projects.¹ DOT&PF and FHWA have been consistent over the years in proposing a purpose and need that reflects a desire on the transportation agencies of satisfying that demand. Meeting transportation demand is a legitimate purpose for pursuing a transportation project. More generally, the purpose of investment in public transportation infrastructure is to improve transportation opportunities for the largest number of people in the most cost-effective manner.

A quantifiable target for each purpose and need factor is not required by NEPA. DOT&PF and FHWA selected the preferred alternative in the Draft SEIS by balancing each alternative's ability to meet the purpose and need and its effects on the environment, which are described throughout the document and appendices. The Draft SEIS provided information regarding the performance of each alternative relative to Alternative 1 – No Action. The reasoning behind the identification of Alternative 2B as preferred is provided in the Draft SEIS in the Executive Summary and in Chapter 2 under the heading Identification of the Preferred Alternative. With respect to its performance relative to the project's purpose and need stated in Chapter 1, Alternative 2B accommodates the highest demand, provides the greatest capacity, has the shortest travel times, provides the greatest frequency of service, has the lowest cost per vehicle transported, and has the second lowest operations and maintenance costs of any of the build alternatives (see Table ES-1 of the Draft SEIS). The final selection of an alternative will be in the ROD, a separate FHWA decision document to be issued following publication of the Final SEIS.

The Alaska DOT should analyze each alternative's ability to improve surface transportation relative to the no action alternative. Each would increase capacity and shorten travel times, thereby providing greater flexibility and opportunity. DSEIS at ES-16 (Table ES-1). The extent to which each would meet demand is an inexact science given the problems associated with its estimation here, and should be accorded less weight than other factors.

RESPONSE: The Draft SEIS does analyze each alternative's ability to meet the purpose and need and compares each alternative against Alternative 1 – No Action. A summary of this comparison is found in Table ES-1. All the reasonable alternatives satisfy the purpose and need to varying degrees, including the marine alternatives. Some alternatives, however, do this better than others.

¹ CEQ. 2003. Letter to the Honorable Norman Y. Mineta from James L. Connaughton regarding purpose and need. Available on the internet at: <https://ceq.doe.gov/docs/ceq-regulations-and-guidance/regs/CEQPurpose2.pdf>

FHWA.02003. Guidance on "Purpose and Need." Available on the internet at <https://www.environment.fhwa.dot.gov/guidebook/Gjoint.asp>

All traffic demand models attempt to predict future demand based on assumptions and data available in the present. To the extent that they are predicting a future, unknown condition, all demand models have uncertainty. The demand model used for this project was developed based on empirical data derived from actual travel conditions observed in Alaska and Western Canada from communities with similar geographic characteristics as Juneau. The modeling was developed by travel modelers at Fehr & Peers. This firm was specifically identified and hired for its expertise in the travel modeling field, and the approach and results were peer reviewed by an independent university professor with expertise in travel modeling and travel behavior prior to the results being accepted for use in the Draft SEIS. No particular weight was given to any element of the purpose and need.

In its identification of a preferred alternative for the Draft SEIS, FHWA examined how each of the alternatives meets each of the elements of the overall purpose and need for the project and what effects each alternative could have on the natural and human environment. Identification of Alternative 2B as the preferred alternative in the Draft SEIS is addressed in Section 2.5 of that document, which indicates that DOT&PF and FHWA considered multiple factors.

2. *Other logistical factors must be considered for Alternative 2B.*

None of the potential logistical problems affecting practicability of Alternative 2B is mentioned in the DSEIS, despite a discussion of these same factors with respect to Alternative 3. *Compare* 2014 Update to App. X, Attachment 4 at 13 *with id.* at 14-15. In summer, three ferries would serve Alternative 2B – one between Katzehin and Haines, one between Katzehin and Skagway, and one between Haines and Skagway. DSEIS at 2-15. During winter, only two shuttles would be available, canceling direct service between Haines and Skagway and thereby increasing the travel time between these two towns. *Id.* Similarly, Alternative 3 uses three ferries in the summer (two between Sawmill Cove and William Henry Bay, and one between Haines and Skagway), and two in the winter (using only one between Sawmill Cove and William Henry Bay). *Id.* at 2-19 to 2-20. The effects of one of those shuttles being out of service seem to be equally severe under either alternative, because in the summer, one of the routes under Alternative 2B would not be served or would be served at the expense of the other two routes if one ferry were not available, and under Alternative 3, the service between Sawmill Cove and William Henry Bay would be cut in half. In the winter, a breakdown in a ferry under Alternative 3 might mean a temporary disruption in service between Haines and Skagway, but for Alternative 2B, under normal operating conditions the service between Haines and Skagway would never be direct at this time of year. However, this logistical concern is discussed only in reference to Alternative 3, *see* 2014 Update to App. X, Attachment 4 at 14, thereby skewing the analysis to favor Alternative 2B.

RESPONSE: The commenter is commenting on a draft 404(b)(1) analysis. This information is provided to USACE and not used to determine the State or FHWA's preferred alternative.

The logistical problems mentioned with respect to Alternative 3 were not discussed in

this analysis because they do not apply to Alternative 2B.

The three-ferry system for Alternative 2B would provide more route flexibility. Even if two of the three ferries were not available, access could still be provided to both Haines and Skagway

Alternative 3 is designed to use a minimum of two ferries. If only one ferry were available, the system could not provide service between William Henry Bay and Sawmill Cove and between Haines and Skagway (40 miles to the north).

As to foot passenger traffic and the logistical problems of serving walk-on passengers, it appears that the Alaska DOT is only selectively concerned as to their plight. In response to public concerns regarding the preferred alternative's effect on walk-on passengers, the DSEIS states that "the purpose of the JAI Project is not specifically to move people wishing to travel without a vehicle, but rather to provide improved surface access to Juneau." DSEIS at 7-9. The analysis in the DSEIS explicitly declines to account for walk-on passengers. *Id.* at 2-10 n.10. As an initial matter, the interpretation of the project's purpose and need to exclude consideration of walk-on passengers is arbitrary. The project's purpose "is to provide improved surface transportation," DSEIS at 1-10, and there is no reason to restrict surface transportation to people using cars.

RESPONSE: The project's purpose did not "exclude consideration of walk-on passengers." The purpose of the project is to provide surface transportation to and from Juneau in the Lynn Canal corridor. Surface transportation is not restricted to people using cars. Walk-on passengers are accounted for in the project's demand estimates and changes to how walk-on passengers would be affected by the project alternatives are disclosed.

Generally, the purpose of investment in public transportation infrastructure is to improve transportation opportunities for the largest number of people in the most cost-effective manner possible. It is not practical or reasonable to expect infrastructure improvements to enhance travel opportunities for all travelers, from all locations, for all travel purposes. Replacing ferry service with a highway would require a change in travel behavior for some travelers, perhaps at some increased expense and inconvenience, while a much larger number of travelers would be able to travel at lower expense and greater convenience.

FHWA and DOT&PF did not exclude consideration of or explicitly decline to account for effects to walk-on passengers in the assessment of impacts in the Draft SEIS. The impacts to walk-on passengers are disclosed in Sections 4.2.7, 4.3.7, 4.4.7, 4.5.7, and 4.6.7 of the Draft SEIS.

The Ground Transportation Services section of Sections 3.1.4.1 and 3.2.4.1 of the *Socioeconomic Technical Report* (Appendix EE of the Draft SEIS) describes how walk-on passengers would travel if a highway were constructed and point-to-point ferry service were discontinued. DOT&PF anticipates the private sector operating a bus/van shuttle service to accommodate walk-on passengers if that demand developed and it was shown to be profitable.

Additionally, the effects of the project on walk-on passengers must be analyzed with respect to all alternatives, and yet the DSEIS only analyzes the effects of Alternative 3 on walk-on passengers. 2014 Update to App. X, Attachment 4 at 14. Similar logistical hurdles, however, may be presented by Alternative 2B which could hinder a private company's ability to serve walk-on passengers, and the DSEIS has not considered these effects. For example, the inconvenience of providing van service on both side of Lynn Canal, including service to the Sawmill Cove terminal 40 miles north of Juneau is discussed with respect to Alternative 3, *id.*, but the distance from Juneau to the Katzechin ferry terminal is much farther than the distance from Juneau to Sawmill Cove, meaning that if a private company had a set number of buses stationed in Juneau, it would be able to make more trips to Sawmill Cove than to Katzechin, allowing greater flexibility and more opportunities to make the trip. The lack of flexibility inherent in the longer trip to Katzechin might result in inconvenience for passengers who might have to take a bus at a certain time to allow some passengers to make the connection to Haines while forcing others to wait until the Skagway shuttle arrives. Towards Juneau, again, some passengers arriving from one community may have to wait until passengers from the other community arrive before their bus departs, and the private carrier may be limited in its ability to provide services to waiting passengers at this remote terminal. These delays for walk-on passengers and the logistical problems of providing private carrier service to and from Katzechin are completely and intentionally ignored, despite similar logistical problems addressed for Alternative 3. *See* 2014 Update to App. X, Attachment 4 at 14-15.⁵

RESPONSE: This comment refers to the draft 404(b)(1) analysis. This information was provided to USACE to support a conclusion that Alternative 3 is not practicable.

Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS describe impacts to pedestrians and bicyclists for both Alternatives 2B and 3, respectively. These sections discuss the potential for a bus/van service to develop. Alternative 3 presents a logistical problem for foot passengers and bus/van service because of the two remote terminals—a private carrier would need to have one or more vehicles on either side of Lynn Canal or transport its vehicle(s) across Lynn Canal on the shuttle, which would likely add to the cost of the shuttle and increase transit, affecting the operational schedule. The logistical problem for foot passengers under Alternative 2B is limited to the East side of Lynn Canal—a private carrier would only need to transport passengers between the remote terminal at Katzechin and a depot in Juneau because the shuttle ferry would deliver foot passengers to the Haines and Skagway ferry terminals, which are currently accessed by foot passengers.

Per your comment, the Final SEIS has been revised to indicate that depending on the bus/van shuttle times and the frequency of services, some Alternative 2B foot passengers would have less flexibility and opportunity to travel. The Final SEIS has also been clarified to indicate that Alternative 3 foot passengers may also have to rely on shuttle

⁵ Lynn Canal Conservation and Skagway Marine Access Commission have also provided thorough analyses of the existing use of ferries by walk-on passengers (or foot passengers) and the potential effects on walk-on passengers posed by different alternatives. Their comments are incorporated here by reference. *See* 2014 Lynn Canal Conservation Comments at 1-5; 2014 Skagway Marine Access Commission Comments. The Smart Mobility report demonstrates the flaws in the DSEIS's current analysis with respect to walk-on passengers. Ex. 27 at 10-12.

service for travel on the west side of Lynn Canal.

Finally, “the remote location of the Alternative 3 ferry terminals” is cited as being “logistically challenging for maintenance.” *Id.* at 14. Similarly, Alternative 2B may face logistical problems due to the remoteness of the ferry terminals at Katzehin, Haines, and Skagway. “[C]ertain activities, such as maintenance, fueling, refilling potable water tanks, and emptying sewage holding tanks, have to be done on a daily basis. Currently, in Lynn Canal, Auke Bay is the only terminal where these activities can be performed. To perform these activities in Haines or Skagway, the terminals would need to be upgraded.” DSEIS at 2-8. If one of these terminals were upgraded, it would be more than 30 miles away from the next existing ferry terminal providing these services, i.e., Auke Bay. While this may not be an “insurmountable obstacle,” neither is this logistical factor an “insurmountable obstacle” for Alternative 3, but it was nonetheless raised as “a contributing factor that combined with other factors” in the analysis of the logistics under Alternative 3. 2014 Update to App. X, Attachment 4 at 14.

None of these logistical challenges is discussed for Alternative 2B, but all of these concerns are addressed for Alternative 3. *See id.* at 13-15. With so little difference between the logistical hurdles faced by Alternative 2B and 3, it is disingenuous not to disclose these problems with respect to the preferred alternative. Without disclosure and consideration of the logistical problems that may arise under Alternative 2B, the DSEIS cannot serve as the basis for the Corps’s and EPA’s analysis of the least environmentally damaging, practicable alternative.

RESPONSE: This comment refers to the draft 404(b)(1) analysis. This information was provided to USACE to support a conclusion that Alternative 3 is not practicable and was not used to determine the State or FHWA’s preferred alternative.

Section 2.2.10 of the Draft SEIS acknowledges that certain maintenance activities for the ferries would need to be done on a daily basis, and Auke Bay is the only facility at the present time where those activities can be performed. Alternatives 2B and 3 would need to homeport ferries at Haines and Skagway (Alternative 2B) and Sawmill Cove (Alternative 3) and would require upgrades at those ferry terminals to perform daily maintenance functions. Since the Haines and Skagway terminals are associated with established communities, it would be easier to get fuel and service materials there (similar to Auke Bay) as compared to Sawmill Cove. This adds to the impracticability of Alternative 3, as noted in the draft 404(b)(1) analysis.

IV. The Juneau Access Project Must Comply With the Tongass Land Management Plan’s Provisions for Protecting Old Growth Habitat.

The DSEIS explains that the Juneau Access road corridor would overlay lands that are designated as old growth land areas (Old Growth Habitat LUD) under the Tongass Land Management Plan (the Forest Plan). The DSEIS erroneously asserts that the project does not have to comply with the Forest Plan’s prescriptions for the Old Growth Habitat LUD. The DSEIS also fails to address the effects of the Juneau Access Project on the Tongass National Forest’s old growth reserve system.

A. The Forest Plan Does Not Exempt the Juneau Access Project From Complying With Old Growth Habitat Requirements.

The Forest Plan establishes management criteria for the Old Growth Habitat LUD that specifically require that the Forest Service conduct an analysis “to determine if other feasible routes avoiding this [Land Use Designation] exist during the project environmental analysis process” before allowing construction of a new road. Forest Plan at 3-61. According to the DSEIS, no such analysis was completed. The DSEIS asserts that the Forest Plan exempts the Juneau Access Project from the management criteria applicable to old growth habitat protections because the project is in a Transportation and Utility Systems “window.” See DSEIS at 3-4. The DSEIS concludes that the old growth “prescriptions that state ‘new road construction is generally inconsistent’ and that [the Forest Service] must perform transportation analysis regarding feasible avoidance routes are applicable only to proposed road development outside the [Transportation and Utility Systems Land Use Designation].” *Id.*

Even if the Juneau Access corridor is in a window, the Forest Service must still comply with the specific requirements of the Old Growth Habitat LUD management prescriptions. See Forest Plan at 1-3 (where there is a conflict between the forest-wide standards and guidelines and the standards and guidelines for a specific Land Use Designation, the specific management prescriptions control). Windows, moreover, apply only where “the applied management direction will not conflict with future designation” of a Transportation and Utility System. See Forest Plan at 4-32. Thus, if an area is to be treated as a window, as the DSEIS contends, it means only that it is no longer an avoidance area and becomes an area “potentially available” for a Transportation and Utility System, provided such use does not conflict with the management direction for the underlying Land Use Designation. *Id.* Given each Land Use Designation in the Forest Plan has a different set of standards and guidelines, the Forest Service must separately determine that a road would not conflict with those area-specific management prescriptions. The limitations on road construction are different in various Land Use Designations. The standards and guidelines for the Old Growth Habitat LUD, which govern the areas at issue here, provide that the Forest Service must determine that no feasible alternatives are available before allowing construction through this Land Use Designation.

RESPONSE: The Forest Plan has been revised since this comment was submitted, and the Transportation and Utility System (TUS) Land Use Designation (LUD) has been eliminated. Instead, the Forest Plan now addresses transportation issues through Transportation Systems Corridors (TSCs). The Forest Plan provides Standards and Guidelines for TSC that take precedence over the Standards and Guidelines for other LUDs, such as the Old Growth Habitat LUD, but only at the time a major transportation project is formally proposed. The TSC is specifically designed to address State projects that appear in adopted transportation plans or that would occur in easements established by law, such as the 4407 easements established under Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) and amended by the Fixing America's Surface Transportation (FAST) Act.

The State of Alaska currently holds an easement interest in each transportation and utility

corridor established by Congress under SAFETEA-LU Section 4407. Once the State of Alaska determines the precise location of a highway facility within a Section 4407 corridor, the U.S. Forest Service (USFS) must issue recordable documentation of the Congressionally established easement. Congress stated its intent that “the Secretary of Agriculture will not withhold or deny the issuance of an easement for a proposed transportation or utility project that otherwise has all necessary construction permits and authorizations from other State and Federal agencies” (Senate Report 114-80, at pages 23-24, July 15, 2015). While the Secretary of Agriculture and USFS may be required to make a finding under the Roadless Rule and may need to complete a NEPA decision for a plan amendment related to adjusting Old Growth Habitat LUD boundaries, these would be internal decisions and would not have a bearing on approval of a road alternative. The State believes the Secretary of Agriculture and USFS do not have authority to determine whether or where highway construction would occur in the Congressionally granted transportation and utility easement.

B. The DSEIS Fails to Disclose the Impacts on the Tongass’s Old Growth Habitat Conservation.

The DSEIS explains that “[l]ands on both sides of Lynn Canal, in the vicinity of the [Juneau Access Improvement] Project, contain substantial but sometimes discontinuous old-growth forest habitat.” DSEIS at 3-62; *see also id.* at 3-4—3-8. It recognizes that designated areas of the forest are preserved as old growth forest habitat in medium or large old growth reserves or as small reserves in Old Growth Habitat LUD. *Id.* at 3-62. The DSEIS acknowledges these areas “are the key components of the forest’s old-growth habitat conservation strategy, which is meant to protect wildlife species as well as the forest itself, with emphasis on the viability of key indicator wildlife species.” *Id.* This system of reserves is “designed to maintain a functional and interconnected old-growth ecosystem” across the Tongass. *Id.* (quoting Forest Plan at D-6). The DSEIS admits that various alternatives would affect this reserve system. *Id.* at 4-79. For example, the DSEIS explains that Alternative 2B, the preferred alternative, “would impact three mapped small old-growth reserves established under the reserve system.” *Id.*

Even assuming the Forest Plan allowed such an action, the DSEIS fails to address the consequences of losing that habitat. The DSEIS’s only assessment of these impacts is an effort to quantify the number of acres of old growth forest that would be lost. The DSEIS, for example, simply states that “[i]f this alternative were selected, the [Forest Service] in consultation with [the Alaska Department of Fish and Game] and [the Fish and Wildlife Service] would adjust boundaries to make the Old-Growth Habitat LUDs meet the requirements of the old growth reserve system established in the [Forest Plan].” *Id.* at 4-80.

The DSEIS, however, fails to provide any assessment of the impacts various alternatives would have on the Tongass’s reserve system. As the Forest Service explained in its comments, “the purpose of the [DSEIS] is to ‘analyze the impact’ of the alternatives on affected resources,” but the DSEIS fails to disclose, analyze and characterize any of the impacts the reserve system. DSEIS Ch.7, Sec. 7.8, Forrest Cole letter to Tim A. Haugh (Feb.24, 2014) at 9. The DSEIS lacks any information that would inform the determination of “whether the affected old-growth reserve components would still meet

the criteria established in Appendix K of the [Forest Plan], and Appendix D of the [Forest Plan environmental impact statement].” *Id.*

RESPONSE: The Draft SEIS addresses the consequences of losing old growth habitat. It is not accurate to state that the only assessment of these impacts is an attempt to quantify the number of acres of old growth forest that would be lost. The effects of the loss of habitat as a result of the project has been principally recorded in sections addressing terrestrial habitat and wildlife, with related information in wetlands and water habitat sections (generally sub-Sections 12-17 under each alternative in Chapter 4), and in associated technical reports. The link between the land management discussion and the terrestrial habitat and wildlife discussions has been strengthened in the Final SEIS, with better cross-references and language more clearly linking the sections.

To clarify the process, if the State and FHWA had selected Alternative 2B as the preferred alternative, the USFS would have been prompted to adjust its Old Growth Habitat LUD boundaries as required in its plan. It is not a DOT&PF or FHWA action. The USFS process for examining whether the boundaries need to be changed was undertaken for Alternative 2B by USFS, ADF&G, and U.S. Fish and Wildlife Service (USFWS) since publication of the Draft SEIS, and results have been incorporated into the Final SEIS. Modifications to small Old Growth Reserve boundaries are recommended; therefore, a Forest Plan amendment and associated USFS NEPA decision would be needed.

SAFETEA-LU did not grant specific rights-of-way or easements or exempt them from environmental requirements.

The DSEIS contends that Section 4407 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users, Pub. L. 109-59 (2005) (SAFETEA-LU) overrides several applicable requirements, including those in the Roadless Rule. The DSEIS explains that “[i]f for some reason [the Alaska DOT] could not use all or a portion of this easement or the alignment was shifted outside this easement, [the FHWA] would secure a transportation easement across Tongass National Forest through a federal land appropriation process authorized by 23 [U.S.C. §] 317.” *Id.* at 4-35.

According to the DSEIS, “[t]he State of Alaska believes an analysis under the Roadless Rule (of whether other reasonable and prudent alternatives exist that do not use Inventoried Roadless Areas) is not required for this project because Congress authorized the granting of the SAFETEA-LU 4407 transportation easements.” *Id.* at 4-3. The DSEIS explains that “[t]he Roadless Rule prohibits road construction in inventoried roadless areas, unless road construction is conducted under an exempted circumstance, including when a road is ‘provided for by statute or treaty.’” *Id.* at 3-6 (quoting 36 C.F.R. § 294.12(b)(3)). The DSEIS asserts that Congress granted transportation and utility easements to the State of Alaska for each side of Lynn Canal and “[b]ecause the [Juneau Access] Project easement is provided by statute, an analysis of other ‘reasonable and prudent’ alternatives need not be conducted prior to the [Forest Service’s] issuance of the 4407 easement.” *Id.*

As an initial matter, Section 4407 of SAFETEA-LU references a map of state and federal

easements and rights-of-way in southeast Alaska; it does not unambiguously grant any particular rights-of-way or easements. *See United States v. Union Oil Co.*, 549 F.2d 1271, 1273 n.5 (9th Cir. 1977) (Where the conveyance of federal land is at issue, “nothing passes except what is conveyed in clear language . . .”) (quoting *United States v. Union Pac. R.R. Co.*, 353 U.S. 112, 116 (1957)).

Here, the language in Section 4407 offers no legal descriptions of the purported conveyances (e.g., township, section, and range). After SAFETEA-LU’s enactment, the Forest Service and State of Alaska executed a memorandum of understanding, which memorialized the parties’ interpretation of SAFETEA-LU; the memorandum of understanding directly contradicts the interpretation advanced in the DSEIS. According to the memorandum of understanding, the Forest Service and the State interpret Section 4407 largely as a measure to streamline the process for granting rights-of-way needed by both the State and the Forest Service. The memorandum of understanding specifically recognizes, contrary to the assertions in the DSEIS that the provision does not displace other laws and that the parties can only grant the easements and rights-of-way identified if the conveyance is “consistent with their respective obligations to protect scenic, archaeological, recreation, and fish and wildlife values, resources and habitats on National Forest System lands and State of Alaska lands.” Memorandum of Understanding between U.S. Forest Service and Alaska Department of Natural Resources, FS Agmt. No. 06MU-11100100-151, State of Alaska Agmt. No. ADL 107516, at 1 (Sept. 22, 2006). Indeed, the Alaska U.S. District Court has ruled Section 4407 “does not identify any easement with specificity” and that the memorandum of understanding was negotiated due to the statute’s “vague nature.” *Se. Alaska Conservation Council v. Fed. Highway Admin.*, 1:06-CV-00009 JWS, 2013 WL 5532835, at *2 (D. Alaska Oct. 3, 2013).

Additionally, the DSEIS’s contrary interpretation focuses entirely on the portion of Section 4407 that reads “notwithstanding any other provision of law.” DSEIS at 3-6 n.3. The DSEIS, however, ignores the fact that “notwithstanding” phrases are not dispositive and courts regularly interpret similar language to be narrower than the potential scope of the phrase. *See United States v. Novak*, 476 F.3d 1041, 1046-47 (9th Cir. 2007) (noting that “notwithstanding any other provision of law” phrases are “not always construed literally” and must be read in context) (citations omitted); *Nw. Forest Res. Council v. Pilchuck Audubon Soc’y*, 97 F.3d 1161, 1167 (9th Cir. 1996) (finding that similar “notwithstanding” language did not preempt National Forest Management Act regulations where nothing in the language indicated an intent to preempt those regulations). Courts consider the language and structure of the statute and the relevant legislative history in interpreting the scope of such phrases. *See, e.g., Nw. Forest Res. Council*, 97 F.3d at 1166-67 (considering language of Rescissions Act); *In re Glacier Bay*, 944 F.2d 577, 582-83 (9th Cir. 1991) (examining structure of provisions of conflicting laws); *Miller v. United Food & Commercial Workers Union*, 708 F.2d 467, 470-71 (9th Cir. 1983) (considering legislative history).

In sum, the DSEIS erroneously suggests that Section 4407 of SAFETEA-LU grants the State specific rights-of-way or easements. SAFETEA-LU does not exempt conveyances from other applicable requirements like the Roadless Rule because Section 4407 affords the Forest Service considerable discretion in approving those conveyances, including

requiring the State to comply with all applicable Federal laws and regulations for all federally funded highway projects.

RESPONSE: Section 4407 does not explicitly “afford” the USFS any discretion in approving the conveyances. It is silent on the matter, except to state that Congress granted the easements within a certain area, and the area includes Inventoried Roadless Areas. The Draft SEIS does not “suggest that Section 4407 of SAFETEA-LU grants the State *specific* rights-of-way or easements” (emphasis added). Rather, SAFETEA-LU and the FAST Act granted general easements defined by a wide corridor on an accompanying map. Because Congress enacted wide areas from which to define the specific easement, the State of Alaska and USFS developed an MOU to specify how the easements would be made specific. Language in the Final SEIS has been reviewed and revised as necessary for clarity on these points.

V. The Roadless Rule Prohibits the Juneau Access Project Absent Specific Findings, Which Have Not Been Made in this Case.

As a general matter, the Roadless Rule prohibits road construction and reconstruction in inventoried roadless areas of the National Forest System. 36 C.F.R. § 294.12(a) (2001). The DSEIS does not explain why the Juneau Access Project qualifies for an exemption and, as a result, the road construction is impermissible.

The Roadless Rule provides for a specific exemption for Federal Aid Highway projects. Road construction is permissible where the Regional Forester concludes that:

The Secretary of Agriculture determines that a Federal Aid Highway project, authorized pursuant to Title 23 of the United States Code, is in the public interest or is consistent with the purpose for which the land was reserved or acquired and no other reasonable and prudent alternative exists

Id. § 294.12(b)(6). The DSEIS does not disclose that any of the required findings have been examined or even that the information has been disclosed.

RESPONSE: Section 4.1.1 of the Draft SEIS describes the existing conditions and context in which DOT&PF would pursue a final right-of-way for roads under the various alternatives. The SEIS does not report “required findings” because no findings have been made. Any USFS decision or finding would occur in a separate USFS decision document following publication of the Final SEIS.

The Roadless Rule provides a number of exceptions for certain classes of road projects, and each exception has its own prerequisite requirements. The comment refers to the Roadless Rule exception for highway projects where easements are granted under the authority of 23 United States Code (USC) 317. Congress granted to the State of Alaska transportation and utility easements along the east and west sides of Lynn Canal under the authority of SAFETEA-LU Section 4407, as amended. The Roadless Rule exception for rights granted by statute or treaty only requires a determination by the Secretary of Agriculture that the congressional grant exists (36 CFR 294.12(b)(3)). The USFS has been provided information and is independently aware of the existence of Section 4407’s

Congressionally granted highway easements on the east and west sides of Lynn Canal.

VI. The DSEIS Fails to Comply with NEPA's Regulatory Requirements Regarding Missing and/or Incomplete Information.

The DSEIS acknowledges missing information, but it does not comply with NEPA's regulatory requirements governing missing or incomplete information. *See* 40 C.F.R. § 1502.22. Some of this information has never been made available, and other information is outdated due to the lapse in time since the 2006 FEIS was issued. The air quality modeling, for example, is based on a now-defunct alternative with fewer ferries, and the modeling is also inadequate because it fails to incorporate marine vessels at all. In other instances, the information will only be obtained after an alternative is selected. For example, additional studies concerning the risks of geological hazards, presence of amphibian ponds, and adjustments to ferry fares have not yet been completed and there is no indication that a final decision will be postponed until that information is available. All of this information is highly relevant and should be obtained before decision makers select an alternative.

RESPONSE: FHWA and DOT&PF strongly disagree with the assertion that the Draft SEIS does not comply with NEPA's regulatory requirement regarding missing or incomplete information. The document is comprehensive and complete. Impacts of the project alternatives have been disclosed to a reasonable level for public review and for decision makers to identify an alternative that best meets the purpose and need for action.

FHWA and DOT&PF have updated information in the Final SEIS to refresh data, correct errors and omissions, or in other ways respond to comments on the Draft SEIS, as appropriate. For example, the air quality analysis has been updated for the Final SEIS with a study of ferry emissions associated with each alternative (see Appendix Z *2017 Update to Appendix T - Air Quality Modeling Memorandum*). Additional studies were also completed and new information provided for the Final SEIS to address comments on geological hazards and ferry fares.

DOT&PF did not conduct additional studies that would have had excessive costs and would not provide essential information to make a reasoned choice among alternatives. A specific survey for amphibian ponds potentially affected by each alignment was not conducted for the Draft and Final SEIS. Rather, DOT&PF and FHWA assumed that the open water and emergent wetlands identified in the wildlife habitat studies were sufficiently representative of potential amphibian habitat to determine and compare potential impacts of the project alternatives. The alignment of Alternative 2B was shifted to avoid open water and emergent wetlands. As stated in Section 4.3.15.3 of the Draft and Final SEIS, a pre-construction survey would be conducted to confirm the highway would not impact amphibian ponds.

“[T]he very purpose of NEPA's requirement that an EIS be prepared for all actions that may significantly affect the environment is to obviate the need for . . . speculation by insuring that available data is gathered and analyzed prior to the implementation of the proposed action.” *Found. for N. Am. Wild Sheep v. U.S. Dep't of Agric.*, 681 F.2d 1172, 1179 (9th Cir. 1982). Thus, an agency's starting point for any NEPA analysis is to collect

and describe baseline data about the environment in which the activity is to occur, because, “[w]ithout establishing . . . baseline conditions . . . there is simply no way to determine what effect [an action] will have on the environment and, consequently, no way to comply with NEPA.” *Half Moon Bay Fishermans’ Mktg. Ass’n v. Carlucci*, 857 F.2d 505, 510 (9th Cir. 1988); *see also Ctr. for Biological Diversity v. Bureau of Land Mgmt.*, 422 F. Supp. 2d 1115, 1163 (N.D. Cal. 2006) (baseline is the “heart of the EIS” and must “be accurate and complete”).

When an agency confronts incomplete or unavailable information as part of the environmental review process, NEPA regulations explain how the agency must address that information in the environmental impact statement. *See Mont. Wilderness Ass’n v. McAllister*, 666 F.3d 549, 559- 561 (9th Cir. 2011). “[T]he agency shall include the information in the environmental impact statement” if the missing information is: (1) “relevant to reasonably foreseeable significant adverse impacts;” (2) “essential to a reasoned choice among alternatives;” and, (3) “the overall costs of obtaining it are not exorbitant.” 40 C.F.R § 1502.22(a) (emphasis added); *see also Save Our Ecosystems v. Clark*, 747 F.2d 1240, 1249 (9th Cir. 1984). The regulations place the burden on the agency to make these determinations and explain its rationale in the environmental impact statement. *Native Vill. of Point Hope v. Salazar*, 730 F. Supp. 2d 1009, 1018 (D. Alaska 2010) (“Furthermore, ‘It is well established that an agency’s action must be upheld, if at all, on the basis articulated by the agency itself,’ rather than on post-hoc rationalization by its lawyers.” (quoting *Or. Natural Desert Ass’n v. Bureau of Land Mgmt.*, 531 F.3d 1114, 1141 (9th Cir. 2008), amended and superseded, 625 F.3d 1092 (9th Cir. 2008))). The missing information, moreover, must be “gathered and analyzed prior to the implementation of the proposed action.” *Save Our Ecosystems*, 747 F.2d at 1248 (emphasis in original); *id.* at 1249 (“[S]ection 1502.22 clearly contemplates original research if necessary.”); *see also Cabinet Res. Grp. v. U.S. Fish and Wildlife Serv.*, 465 F. Supp. 2d 1067, 1100 (D. Mont. 2006) (setting aside environmental impact statement, concluding that failure “to attempt any assessment of the importance of the missing information calls into question the validity of the [agency’s] conclusions about the impacts of the proposed action”).

The DSEIS notes numerous instances of relevant information that is not yet available or has not been updated since the 2006 FEIS. FHWA and the Alaska DOT have not indicated that the costs of obtaining this information is exorbitant, and in some cases, the agencies plan to obtain the information prior to construction. However, delaying analysis of effects until after an alternative is selected conflicts with NEPA’s purpose of informing decisions before they are made. The DSEIS should be put on hold until this information is obtained in order to ensure that the decisionmakers and the public are fully informed of the environmental consequences of this project.

RESPONSE: The Final SEIS is the culmination of years of analysis of all issues identified by the public and agencies during numerous scoping and review periods, including review of the Draft SEIS. The information provided in this Final SEIS represents the most recently available information available for resources on issues relevant to the proposed action and alternatives evaluation. It includes updated information from new studies that have been conducted in the project area by DOT&PF

or other agencies as part of their own reporting requirements, or for other purposes. Impacts of the project alternatives have been disclosed to a reasonable level for the decision makers to identify an alternative that best meets the purpose and need for action and would have the least environmental impact (recognizing that one alternative may not meet both tests).

A. Risks of geologic hazards

The DSEIS explains that “[t]he potential risks associated with other geologic hazards, such as landslides (potentially affecting Alternatives 2B and 3), karst (potentially affecting Alternative 3), geochemical properties of waste rock (potentially affecting Alternatives 2B and 3), and outburst floods, would be further evaluated in geotechnical and hydrologic studies conducted in support of final design and construction.” DSEIS at ES-9. This information is clearly relevant to reasonably foreseeable significant adverse impacts, because the risks to be studied will bear on the safety of the roads as well as the environmental impact of construction, maintenance, and use of the roads. It is critical to disclose these risks now so that decisionmakers may make a reasoned choice among alternatives, as the issues of safety and environmental impact are two of the biggest concerns in this project, and not all of the alternatives carry these risks. *See also* 2014 Skagway Marine Access Commission Comments. Finally, there is no suggestion that the cost is too exorbitant, as the studies will eventually be done.

RESPONSE: Per your comment, the description of geologic hazards in the Final SEIS and Technical Alignment Report has been revised to include additional information based on recent geotechnical studies.

B. Survey of amphibian ponds

Similarly, a “pre-construction survey would be conducted to confirm the highway would not impact any amphibian ponds.” DSEIS at 4-87. However, a pre-decisional survey would help inform decisionmakers if there is a substantial difference among alternatives in the extent to which amphibians would be affected by a road alternative. Little information is currently available as to the locations where amphibians are present. Additionally, it can be difficult to predict where they may be, as wood frogs breed in ephemeral pools which may not be present at the time of a survey unless properly timed. Ex. 18 at 6. This issue is important because there is great concern about the high incidence of physical deformities present in wood frogs in Alaska, and these abnormalities have been linked to proximity to roads. Ex. 37 at 1009, 1013. A survey timed to find amphibian ponds when they are most likely to be present should be completed before the final decision is made as to which alternative to select.

RESPONSE: A specific survey for amphibian ponds potentially affected by each alignment was not conducted for the Draft and Final SEIS. Rather, DOT&PF and FHWA assumed that the open water and emergent wetlands identified in the wildlife habitat studies were sufficiently representative of potential amphibian habitat to determine and compare potential impacts of the project alternatives. The alignment of Alternative 2B was shifted to avoid open water and emergent wetlands. As stated in Section 4.3.15.5 of the Draft and Final SEIS, and if Alternative 2B had been selected, a pre-construction

survey would have been conducted to confirm the highway would not impact amphibian ponds.

C. Air quality modeling

The air quality modeling is inadequate to consider the effects of Alternative 2B because it has not been updated to reflect any differences between the now-defunct Alternative 2 and Alternative 2B, and it continues to omit consideration of any ferry or marine vessel emissions. The DSEIS asserts that the air quality modeling completed for the 2006 FEIS assesses emissions similar enough to those expected to be caused by Alternative 2B. DSEIS at 4-8 to 4-9. The air quality modeling was performed for Alternative 2, and Alternative 2's maximum peak week average daily traffic volume was 3,250 vehicles, while Alternative 2B's maximum figure is 3,160 vehicles. "Because the updated (2014) 30-year PWADT volumes are slightly lower than the Alternative 2 traffic volumes, CO emissions would be slightly lower or approximately equal to the 2004 modeled results." DSEIS, 2014 Update to Appendix T: Air Quality Modeling Memorandum (2014 Update to App. T) at 10 (May 2014). However, the modeling for Alternative 2 did not include marine vessel emissions because "Juneau has no reported exceedances of CO with much larger port facilities, larger concentration of marine vessels, and larger frequency of marine vessel operations." 2005 SDEIS, Appendix T: Air Quality Modeling Memorandum (2005 App. T) at 5 (Oct. 2004).

Under Alternative 2B, ferries are expected to use more fuel than on-road vehicles – 1.26 million gallons per year compared to just over 1 million gallons. DSEIS at 4-188. Alternative 2B's ferries are also expected to consume more fuel than those projected under Alternative 2, which estimated 775,000 gallons of fuel per year. 2005 SDEIS at 4-148 (Table 4-65). Alternative 2 differed from Alternative 2B in that it did not include a shuttle between Haines and Skagway. 2006 FEIS at 2-5 to 2-6. This difference in fuel consumption is relevant because the primary source of emissions on marine vessels is their diesel engines. "Per ton of fuel consumed, ship engines are one of the highest polluting combustion sources worldwide," emitting pollutants such as carbon monoxide, carbon dioxide, nitrogen oxides, sulfur oxides, and particulate matter. Ex. 36 at 9. Alternative 2B's ferries will be energy-intensive because the short trips mean a higher percentage of time will be spent turning, slowing down, or accelerating to approach or leave a dock. *Id.* at 13.

Whether Juneau has reported exceedances of ambient air quality standards is not the sole determining factor as to whether air quality will suffer in the Haines-Skagway-Katzeihin area. Other factors include the potential for dispersion of airborne pollutants, which is ranked very low at the project area, App. T at 3; the likelihood that, since the shuttle ferries will operate on tight schedules for 16-hour days in the summer, they will leave their engines idling in port; and background emissions caused by the high volume of cruise ship traffic in Skagway and the town's status as an important transshipment center, DSEIS at 3-27. The cumulative emissions are likely to be more concentrated in Skagway than in Juneau because the Port of Skagway serves ferries, cruise ships, and freight in one facility, *see* Ex. 39, while Juneau has a ferry terminal and commercial loading facility at Auke Bay, and cruise ship docks and another commercial loading facility downtown. *See* Ex. 55.

Juneau also has “cold-ironing” capability, allowing cruise ships to connect to electricity at berths and turn off their engines, which eliminates the majority of emissions while docked. Ex. 36 at 17. A decrease in air quality in the Skagway-Haines-Katzeihin area could potentially be harmful to residents’ health, reduce visibility, and deter tourists from visiting.

Because the air quality modeling is outdated and never included the emissions of marine vessels, FHWA and the Alaska DOT should conduct new air quality modeling for each alternative in order to better inform the decision makers about potential environmental and human health consequences.

RESPONSE: The Draft SEIS relied on the modeled vehicle emissions for Alternative 2 from the 2004 analysis because the traffic projections of that alternative were higher than, but comparable to, the 2014 projections for Alternative 2B. DOT&PF has conducted additional air quality analysis to determine the effects of ferry and marine vessel emissions on air quality in the general study area and at ferry terminals associated with each alternative. The Final SEIS includes the effects of ferry emissions in the evaluation of air quality for all alternatives.

The Ferry Vessel Air Quality Analysis (see Attachment 1 to the *2017 Update to Appendix T - Air Quality Modeling Memorandum* in Appendix Z of the Final SEIS) considers how air quality in the Haines-Skagway-Katzeihin area would be affected by the alternatives. The analysis identified that the largest increases of air pollutants in Skagway would be 3 percent greater than existing conditions for carbon monoxide, 6 percent greater for nitrogen dioxide, and 2 percent greater for particulate matter (Alternatives 2B and 4A), without accounting for project ferry activity displacing any existing vessel traffic. Because the percent change under any alternative would be low and because the air quality in the area is generally good, dispersion modeling was not conducted.

Environmental Protection Agency (EPA) regulations indicate that dispersion modeling has least uncertainty in areas with good long-term data and relatively flat terrain: “Areas subject to major topographic influences experience meteorological complexities that are extremely difficult to simulate. Although models are available for such circumstances, they are frequently site-specific and resource intensive.” The area is an attainment area for air quality, and the emissions for ferry vessel traffic would be below the EPA *de minimis* levels; therefore, general conformity does not apply. Given good existing conditions and low projected increases, dispersion modeling is not warranted. The Final SEIS evaluates the potential cumulative effects of ferry vessel emissions on air quality in Skagway, where it would contribute to the emissions associated with existing marine vessel activity at the port.

Changes to air quality that would result from the project alternatives have been updated in the Final SEIS to include emissions associated with ferry vessels. These emissions were compared to existing emissions for rural areas such as Haines to ascertain the net change with each alternative. An updated discussion of air quality for each alternative as it relates to human health consequences has been provided in the Final SEIS. The analysis demonstrates that no harm to human health or the environment would result from project-related emissions.

D. Fare study

As also noted in the comments raised with respect to development of Alternative 1B, the DSEIS still lacks a comprehensive analysis of whether the ferry system is already running at maximum efficiency. The State has a contract with Northern Economics, Inc. to develop “tariff policy and fare structure” system-wide, which could present a step towards making the analysis of relative demand across the system since the contract requires consideration of “how potential fare changes would impact ridership and revenue levels.” Ex. 6 at 9. Although originally scheduled to be completed by April 30, 2014, the Alaska Department of Transportation and Public Facilities (Alaska DOT) has issued several contract extensions, and the fare study has not yet been released. Ex. 5. The FHWA refuses to delay the NEPA process to allow timely consideration of the fare study, asserting that “it is entirely separate from the JAI project.” See DSEIS Ch. 7, Sec. 7.8, David C. Miller, FHWA, Letter to Stan Selmer, Mayor of Municipality of Skagway (Oct. 10, 2013), at 2; DSEIS Ch. 7, Sec. 7.8, Sandra A. Garcia-Aline, Letter to Mark Schaefer, Mayor of Municipality of Skagway (Aug. 20, 2014), at 1. However, by using reductions in service elsewhere as a factor limiting the increase of service in Lynn Canal, the agencies have brought the entire ferry system into play.

RESPONSE: The Draft SEIS did not fail to address system wide comparative needs. As the commenter acknowledges, Appendix CC explains how Alternative 1B was developed and describes why certain vessels are needed on certain routes. DOT&PF established as a goal that the new alternative would need to meet the purpose and need in Lynn Canal but not by diminishing service elsewhere in the system. As explained in Appendix CC, DOT&PF considered technical capabilities of the vessels, vessel size, operating conditions, and the effect on the AMHS mission (i.e., could a vessel be moved or shared with other routes such that it could provide Lynn Canal service while also maintaining the level of service committed to the other communities). The examination of each vessel is disclosed in the Appendix CC.

In part, certain vessels were rejected as being reasonable for Lynn Canal service because it was found that reassigning vessels to Lynn Canal would be at the expense of reduced service elsewhere. To this extent, DOT&PF did consider demand on the other routes in the system. As explained in Appendix CC of the Draft SEIS, seven of the 11 existing AMHS ferries are not suitable for use in Lynn Canal because relocating/diverting the ferry to Lynn Canal would jeopardize the AMHS mission, including impacts on demand, level of service, and schedule considerations. The AMHS Tariff Analysis was completed in January 2015 and was made publicly available on the AMHS website. The results of this study do not have an impact on this project.

The importance of marketing and pricing in “stimulat[ing] use and revenue regardless of the particular technology, itineraries, equipment, and speed of future AMHS operations” was recognized in 2000. Ex. 28 at 1. The purpose of the Alaska DOT’s current contract is to develop “tariff policy and fare structure” and analyze “how potential fare changes would impact ridership and revenue levels.” Ex. 6 at 9. Two mayors from Skagway have expressed interest in seeing this fare study, DSEIS Ch. 7, Sec. 7.8, Stan Selmer, Mayor of Municipality of Skagway, Letter to FHWA (Sept. 6, 2013); *id.*, Ch. 7, Sec. 7.8, Mark Schaefer, Mayor of Municipality of Skagway, Letter to FHWA (July 28, 2014), and the

Southeast Alaska Conservation Council and Skagway Marine Access Commission have requested a copy of records resulting from the fare study. Ex.

56. These requests have been denied because the fare study has not been completed. However, the information contained in the fare study is highly relevant and essential to a reasoned choice among alternatives because it may present ways to reduce fares, increase ridership, and increase revenues, thereby reducing the costs to users and the government and increasing demand by utilizing more of the capacity currently available. Furthermore, its cost is clearly not exorbitant; the most recent contract extension still limits the amount of the contract to \$59,975. Ex. 5 at Amendment No. 5. The project should not proceed until this important study is completed and its results disclosed to the public.

RESPONSE: The *AMHS Tariff Analysis* was completed in January 2015 and was made publicly available on the AMHS website. The fare study examined AMHS tariff rates and tariff rates for similar ferry systems. The study looked at changes in fares made since the previous rate study was completed in 2008. It also looked for anomalies on routes of similar length within the AMHS system. It considered the development and implementation of changes in tariff policy with the goal of creating a fair and equitable tariff structure. The study did not analyze demand or service to identify inefficiencies. DOT&PF and FHWA have determined that the results of this study do not have a direct bearing on this project. The methodology for assigning fares for this project is described in Appendix A of the *Revised Traffic Forecast Report* (Appendix AA of the Final SEIS).

E. Wildlife studies for the west side of Lynn Canal.

Since 2006, the Alaska Department of Fish and Game has conducted field studies on brown bears, moose, mountain goats, and wolverines. DSEIS at 3-68 to 3-70. These studies, however, have focused only on the Alternative 2B proposed alignment, and have not added to information known about the west side of Lynn Canal along the Alternative 3 route. See White, Kevin S., et al., *Mountain goat population ecology and habitat use along the Juneau Access road corridor, Alaska* (2012) (White et al., 2012b) at 3 (Figs. 1 & 2) (mountain goats)⁶; White, Kevin, et al., *Moose population ecology and habitat use along the Juneau Access road corridor, Alaska* (2012) (White et al., 2012a) at 3 (Fig. 1) (moose)⁷; Flynn, Rodney W., et al., *Spatial Use, Habitat Selection, and Population Ecology of Brown Bears along the Proposed Juneau Access Improvements Road Corridor, Southeast Alaska* (2012) (Flynn et al., 2012) at ix, 3 (bears)⁸; Lewis, Stephen B., et al., *Spatial Use, habitat Selection, and Diets of Wolverines along the Proposed Juneau Access Improvements Road Corridor, Southeast Alaska* (2012) (Lewis et al., 2012) at 6 (wolverines)⁹; see also DSEIS at 4-134 (“Brown bear populations and their seasonal movements were not studied by Flynn et al. (2012) on the west side of Lynn Canal”). A reasoned choice among alternatives cannot be made if similar information is not available, and Alaska DOT should fund additional studies designed to inform decision makers of the current status, locations, and threats to wildlife along the proposed Alternative 3 road on

the west side of Lynn Canal.

The little information available concerning these animals points to a need for greater study and understanding of their habitat use on the west side of Lynn Canal. Studies covering the west side of Lynn Canal may help provide greater context for the results of the east side studies, such as whether the east side wildlife are at greater risk of further population declines caused by a road.

Low-elevation habitat is important in the winter for mountain goats and is used by brown bears for foraging in salt marshes and at river mouths. DSEIS 3-70, 4-234. Moose spend most of their time “at elevations below 500 feet during all seasons.” *Id.* at 3-69. On the east side of Lynn Canal from Eldred Rock to Mount Villard, the topography includes portions that are “very steep,” DSEIS at 4-41, and the road alignment in this section covers areas of high use by mountain goats in winter. *See* White et al., 2012b, Apps. 17a-17c, Apps. 18a-18f. In contrast, topography from William Henry Bay to Sullivan Island on the west side of Lynn Canal is described as “rolling to steep hills,” DSEIS 4-97, and from Sullivan Island to Chilkat River the “topography is very flat.” DSEIS at 4-98. The differences in topography could mean that there is more low-elevation habitat available on the west side, but a study is needed to determine what areas are used by wildlife. The amount of winter habitat could potentially have an effect on survival, as most mountain goat deaths occur during winter. Ex. 50 at 1739. Preliminary results from ongoing studies show that different populations of mountain goats in southeast Alaska have experienced different levels of decline in recent years. Ex. 51 at 7 (Table 2). For moose on the east side of Lynn Canal, “[a]nnual survival of adult females (87%) and associated calves (25%) was low, relative to the nearby *Gustavus* population.” White et al., 2012a at 1. If studies show that the west side population is not as vulnerable as the east side population of mountain goats, moose, or any other wildlife, this information would be useful to decision makers in selecting the final alternative.

More specifically, the threats faced by each species studied on the east side of Lynn Canal may be more or less severe on the west side. With respect to moose, for example, the data gathered “indicate the Berners Bay population is relatively small (ca. 85-120 moose), declined in recent years and is characterized by relatively low productivity as a result of severe winters and low calf recruitment.” *Id.* at 13 (citing fig. 11). In contrast, the DSEIS reports that “[m]oose distribution is more widespread on the west side of Lynn Canal than on the east side,” with “moose populations that are connected with larger populations” DSEIS at 4-135. This means that “moose mortality from traffic crashes would be more likely with Alternative 3 compare with other alternatives.” *Id.* Without similar data available for each side of Lynn Canal, it is difficult to weigh the potential impacts to moose. On the one hand, the east side population may be more vulnerable due to the low numbers and higher mortality already present. On the other hand, the relatively larger population on the west side may pose greater potential for moose-vehicle collisions. Without studying the location and size of the moose population on the west side, it is impossible to compare these effects meaningfully.

For brown bears on the east side of Lynn Canal, loss of one bear represents two percent of

the population because the population is so small. Flynn et al., 2012 at 65. Due to the “displacement and strong avoidance at distances ranging from 500 m to 3 km” from roads as well as the likely increase in human-bear conflicts resulting in bear mortality, the Alternative 2B route poses serious threats to brown bears. *Id.* at 61-62; *see also id.* at 24-25 (table 4) (showing that almost all collared bears were reported within 1 km of proposed road corridor), 21 (Fig. 4) (depicting road corridor overlapping with narrow corridor used by bears to travel to and from Katzehin River). Because of this vulnerability, the Alaska Department of Fish and Game recommended additional big game hunting restrictions to cover the entire road corridor on the east side of Lynn Canal. *Id.* at 68. In contrast, the DSEIS contains no estimate of the population size of brown bears on the west side of Lynn Canal, no information regarding the likelihood that the bears use habitat in close proximity to the proposed Alternative 3 route, and no assessment of whether big game hunting would have to be restricted on the west side. *See generally* DSEIS at 4-134. The DSEIS fails to provide sufficient information to make an informed choice concerning which alternative(s) may pose an unacceptably high risk to brown bear survival in the project area.

The mountain goats habitat on the west side of Lynn Canal “may intersect” with the Alternative 3 route, but the DSEIS asserts that “there is more potential wintering habitat between the Chilkat Mountains and Lynn Canal for goats to use as refuge from human disturbance.” DSEIS at 4-135. These statements are unsupported by citation to studies similar to the White et al, 2012b study which closely tracked the location of mountain goats on the east side of Lynn Canal to determine their overlap with the Alternative 2B route. *See* White et al., 2012b, Apps. 18a-18o. Due to the steep decline in mountain goat population on the east side of Lynn Canal from 2006 to 2010, *see id.* at 16 (Table 7), information concerning population levels on the west side of Lynn Canal would also be helpful to compare the relative risks each alternative poses to mountain goats.

Finally, the information pertaining to wolverines is insufficient on both sides of the Lynn Canal. While some data were collected on the east side of Lynn Canal, very few traps were placed close to the proposed Alternative 2B route, *see* Lewis et al., 2012 at 6 (Fig. 3), and no traps were placed “along Lynn Canal and the Katzehin River areas because the budget was not sufficient . . .” *Id.* at 7. On both the east and west sides, the DSEIS concludes that “local extirpation of wolverines in the entire project area is unlikely because of the location of the highway at the edge of their habitat, and the low site fidelity of wolverines in southeast Alaska.” DSEIS at 4-85, 4-136 (citing Lewis et al., 2012, although the study did not collect data on the west side of Lynn Canal). Without a comprehensive study of wolverines along either road alignment, however, these assertions carry little weight for decision makers comparing the effects of each alternative on wolverines.

The data collected and analyzed in wildlife studies since 2006 is important to inform decision makers of the effects of Alternative 2B, but the studies must be expanded to cover habitat affected by Alternative 3 in order to allow a reasoned comparison among all alternatives.

Studies covering the west side of Lynn Canal would provide more information about Alternative 3, place the studies covering the east side into context with the surrounding

areas, and disclose potential risks applying to road alternatives that are unlikely to apply to ferry alternatives.

RESPONSE: The best available information has been used to analyze effects to wildlife species, such as brown bear, wolverines, mountain goats, and moose. In some cases, available information on populations in Lynn Canal is limited (such as that for wolverines).

ADF&G studies in the East Lynn Canal project area were not conducted to provide information to support an evaluation of potential effects of Alternative 2B in the SEIS. Rather, they were conducted as mitigation required in the FHWA 2006 ROD for the JAI Project to assist ADF&G in the management of those populations through an understanding of population size and location within Lynn Canal. Extrapolation of regional data to areas in proximity and with similar topography and habitat types is appropriate for an alternatives analysis under NEPA and is commensurate with other NEPA evaluations.

Additionally, Section 4.4 of the *2014 Update to Appendix Q – Wildlife Technical Report*, provided in Appendix Z of the Draft SEIS, uses several broad conclusions from the ADF&G studies to develop a reasonable analysis of potential effects from the construction, operation, and maintenance of Alternative 3 on the west side of Lynn Canal. To not apply these conclusions in the JAI Project NEPA evaluation would limit a reasonable analysis of these effects due to the lack of region-specific information.

VII. The DSEIS Fails to Disclose the Juneau Access Project’s Impacts on Wildlife.

A. The DSEIS Fails to Assess the Project’s Impacts on Mountain Goats.

The DSEIS fails to adequately assess the impacts of the project on mountain goats despite several years of study dedicated to gathering baseline data in the project area. It lacks site-specific information, a discussion of impacts to each genetically distinct population, and a meaningful assessment of cumulative impacts. These issues are critical to address in light of the 47% decrease in overall population of Lynn Canal mountain goats from 2006 to 2010. White et al., 2012b at 16 (Table 7).

Despite years of detailed GPS and VHF tracking and data collection, the DSEIS and the studies commissioned by the Alaska DOT fail to provide site-specific information about where mountain goats’ use of the area in the winter intersects with the proposed road alignment of Alternative 2B, and what effect that overlap is likely to have. By comparison, a very similar study conducted on brown bears included a figure depicting the frequency of bear crossings of the proposed Alternative 2B corridor for each one-kilometer segment. See Flynn et al., 2012 at 31 (Fig. 11). The final mountain goat study prepared for Alternative 2B states that “fine-scale highway design that integrates field visits to identify traditionally used mountain goat trails, mountain goat GPS location data and geotechnical highway construction constraints is recommended in order to maximize efficacy of mountain goat-vehicle collision planning and mitigation.” White et al., 2012b at 18. However, the accompanying figures show that there is high use by mountain goats of the area on both sides of the road alignment from Brown all the way north to Katzehin

River. *Id.* at 62-69. Furthermore, the study also notes that critical winter habitat consists of a closed canopy conifer forest which allows for reduced snow depth, greater forage, and reduced costs of locomotion. *Id.* at 13. The location data collected during the course of the study and the information known about the habitat available along the road alignment should be sufficient to identify potential bottlenecks where goat-vehicle collisions may be more likely, or where the remaining habitat could be insufficient to support the number of goats currently using certain sites.

RESPONSE: The studies conducted by ADF&G were funded by the DOT&PF as mitigation to determine population densities to aid ADF&G in harvest analysis. Section 4.3.13 of the Draft SEIS includes Figure 3-21, which illustrates these potential high use areas as they relate to project alternatives based on information from the studies.

The Draft SEIS considered all the locations of high mountain goat use that would intersect the Alternative 2B alignment. Section 4.3.13 of the Draft SEIS included Figure 3-21, which illustrated potential high use areas as they relate to project alternatives based on information from the studies. Section 4.13.3 of the Draft SEIS identified that the Alternative 2B alignment would intersect winter habitat for mountain goats. As requested by the ADF&G, wildlife crossing signage in areas of high mountain goat use as identified by ADF&G would be incorporated into the road design.

Significantly, the studies conducted since the 2006 FEIS show that the mountain goats in Lynn Canal consist of three genetically distinct populations. *Id.* at 8. The DSEIS notes some impacts to individuals, and concludes that habitat fragmentation “is not likely to impact the area’s mountain goat population.” *See* 2014 Update to App. Q at 23. But between individuals and the overall population, the DSEIS misses an important biological level: the effect on each of the three genetically distinct populations of mountain goats in Lynn Canal. The sharp declines in population from 2006 to 2010 varied among these populations, with the Sinclair Mountain and Lions Head population suffering greater declines of 53%, the Mount Villard population declining similarly by 52%, and the East Berners population declining by 19%. *See* White et al., 2012b at 16 (Table 7); *see also id.* at 8 (describing three genetically distinct populations). The Sinclair Mountain/Lions Head population declined the most, and it is also the population with the greatest overlap of its range with the road alignment. *See id.* at 3 (Figs. 1 & 2).

RESPONSE: FHWA recognizes that genetically distinct populations of mountain goats are found along the alignment of Alternative 2B. However, the overall impacts to the population in Lynn Canal were evaluated for effects in Section 4.3.13 of the Draft SEIS as mountain goat populations are managed by the ADF&G at the game unit level for populations in Lynn Canal, not at the genetic level.

The DSEIS puts some stock in the fact that mountain goat numbers “rebounded modestly by 2011,” 2014 Update to App. Q at 14, but omits that the following winter “was characterized by particularly severe winter conditions” and saw “relatively low survival rates.” Ex. 52 at 8. At Lions Head and Sinclair Mountain, aerial surveys counted 24% fewer goats in 2012 than 2011, and 37% fewer at Mt. Villard. *Id.* at 17-19. “Given that population growth rates are most sensitive to adult survival rates . . . , the observed low survival rate [of the winter of 2011/2012] is likely to result in further declines in local

populations.” *Id.* at 8. With each genetically distinct population estimated to have fewer than 400 individuals in 2011—before the severe 2011/2012 winter further reduced their numbers—the DSEIS needs to grapple with whether the additional reduction in critical winter habitat, in addition to other cumulative effects, may make it impossible for each population to recover from the severe winters over the past decade.

RESPONSE: Best available information from ADF&G regarding winter habitat areas is included in the Final SEIS. Appendix Z *2017 Update to Appendix Q – Wildlife Technical Report*, Section 4.3.4.4, includes uncertainty associated with habitat fragmentation due to construction activities. Per your comment, Section 4.3.15.3 of the Final SEIS discusses the impacts on mountain goat winter range due to habitat fragmentation from construction.

The DSEIS also lacks a sufficient discussion of cumulative impacts on mountain goats in the project area. The Wildlife Report lists potential goat-vehicle collisions, avalanche control fatalities, increased hunting access, and increased possibility of poaching as potential effects, but does not provide any estimate of how much the populations might decline due to these important factors. *See* 2014 Update to App. Q at 24. Critically, mountain goats are known to forage in avalanche chutes during winter, meaning not only that they will be disturbed by helicopters and blasting from avalanche control operations, but also that “the likelihood exists for mountain goats to be killed in human instigated avalanches that occur during routine control activities.” White et al., 2012b at 18. While the Wildlife Report proposes to mitigate this risk by hazing the goats, 2014 Update to App. Q at 40, the recent research studies make no such recommendations. Instead, researchers recommend that “avalanche control crews examine[] avalanche chutes for the presence of mountain goats prior to blasting and adjust[] avalanche control scheduling to occur during times when mountain goats were not present in avalanche paths.” White et al., 2012b at 18.

Additionally, the cumulative impacts section entirely fails to consider Kensington Mine operations, tourism, or climate change. Alaska Department of Fish and Game recognizes that “mountain goats are particularly sensitive to industrial disturbance activities such as helicopter overflights and blasting. In coastal Alaska, helicopter tourism (flight-seeing in summer, helicopter skiing in winter) is an increasingly popular activity and management agencies are particularly concerned about its effects [on] mountain goat populations. Industrial activities such as mining, road construction and hydroelectric development also have the potential to have detrimental effects on mountain goat populations.” Ex. 2. Because the Kensington Mine is located in the Lions Head study area, it has the potential to place additional stress on the population in Lions Head/Sinclair Mountain, which, as discussed above, appears to be the population most at risk. *See* Ex. 52 at 8-9. Climate change could also reduce goats’ ability to survive severe winters because “mortality tends to be higher after a hotter summer, and this may be related to forage. . . . It’s also possible heat stress could be a factor as well – goats are best equipped for winter, not summer.” Ex. 54 at 5. Expected increases in temperature due to climate change are likely to place additional stress on mountain goats and the availability of forage, which is already at risk due to the footprint of the road.

RESPONSE: Section 4.3.15.3 of the Draft SEIS included a description of the impacts of

vehicular collisions on mountain goat. Due to poor visibility in winter, the proposed highway could create the potential for vehicle collisions. Wildlife crossing signage in areas of high brown bear, moose, and mountain goat use as identified by ADF&G would be incorporated into the road design. Quantitative estimates of collisions were not completed but given the population levels and anticipated traffic volumes mortality from vehicular collisions is not expected to have population level effects.

Section 4.3.15 of the Final SEIS is updated to reflect that avalanche control activities would likely occur during spring and could result in mortality to mountain goats because avalanche chutes are in steep habitat preferred by goats, and are occasionally used for forage. The noise from avalanche detonation would be noticeable to mountain goats. Although mountain goats may react to sounds from avalanche detonation, they return to their previous behavior within an hour or so after isolated disturbances. The noise created by the resulting avalanche would be no different than that from naturally occurring avalanches. Cumulative impacts to mountain goats are discussed in Section 4.9.2.12 of the Draft SEIS. Additional details have been included in the Final SEIS.

Finally, in addition to a comprehensive and meaningful analysis of the project's direct, indirect, and cumulative effects on mountain goats, FHWA and the Alaska DOT should examine mountain goats' place in the ecosystem. Bears and wolves are known to prey on mountain goats, and wolverines also scavenge goats. *Id.* at 5. Because the deer population on the east side of Lynn Canal is considered to be "very small," DSEIS at 4-84, mountain goats may be particularly important prey in the project area.

RESPONSE: The analysis and ecological importance of mountain goats in the project area was discussed in Section 4.3.15 of the Draft SEIS and in Appendix Z *2014 Update to Appendix Q – Wildlife Technical Report*. Per your comment, details on mountain goats as a prey species has been added to Section 4.3.15 of the Final SEIS.

B. The DSEIS Fails to Assess the Project's Impacts on Wolves.

The DSEIS fails to disclose or in most cases even discuss adverse effects on the Alexander Archipelago wolf (the wolf). As an initial matter, it ignores the fact that earlier this year, the U.S. Fish and Wildlife Service (the Fish and Wildlife Service) determined that the wolf's dwindling numbers mean that the species might have to be listed for protection under the Endangered Species Act (ESA). *See* Exs. 45, 46 (concluding a petition to list the wolf under the ESA presented "substantial scientific or commercial information indicating that listing the Alexander Archipelago wolf may be warranted"). The Service based its conclusion on the critical finding that removing old growth habitat reduces habitat quality and availability for Sitka black-tailed deer, the primary prey of wolves in Southeast Alaska. The DSEIS ignores the loss of deer and wolf habitat created by the highway.

RESPONSE: On January 5, 2016, the USFWS published a "not warranted" 12-month finding in the Federal Register. The finding determined that the Alexander Archipelago wolf does not warrant federal protection under the federal Endangered Species Act.

Section 4.3.15 of the Draft SEIS provided an assessment of project effects on terrestrial

mammals, including wolves and Sitka black-tailed deer, due to habitat loss, avoidance of roads, and vehicle collisions. Per your comment, Section 4.3.15 of the Final SEIS includes the pertinent information from the 2004, 2005, and 2014 wildlife technical reports and incorporates recent information on the effects of increased hunting and trapping pressures on Alexander Archipelago wolves, as well as wolf habitat use and loss as a result of Alternative 2B.

The DSEIS also fails to explain the effects of inhibiting wolves from using particular areas and thereby reducing prey accessibility. *See* DSEIS at 4-85. Indeed the agency admits it lacks information regarding the importance of these areas for wolves. For example, the DSEIS explains that “[s]ome wolves use estuarine areas to feed on marine mammals and fish, but the importance of these areas for wolves in the Berners Bay area is not known.” *Id.* at 4-85. The DSEIS fails to comply with the requirements for confronting this unknown information. *See* 40 C.F.R. § 1502.22.

RESPONSE: Section 4.3.15 of the Final SEIS includes a discussion on the prey accessibility impacts for wolves from habitat fragmentation from Alternative 2B.

The DSEIS ignores the fact that building a road increases hunting and trapping pressures on wolves. *See, e.g.*, DSEIS at 4-181 (limiting discussion to highway inhibiting use of this area by wolves). The rate of wolf harvest increases with density of roads, which provide access to hunters and trappers. Ex. 35. The DSEIS also disregards the effects of illegal take, which has been estimated to be as much as 46 percent of wolf mortality. Ex. 35 at 1547. The agency cannot ignore the adverse effects caused by the increased access created by a new highway.

In sum, the DSEIS provides little more than cursory references on a handful of pages to address the consequences of a highway on a species that is on the verge of an ESA listing. The FHWA must confront and disclose the consequences of this project, as well as the additional development it will facilitate, on this imperiled wolf.

RESPONSE: Information regarding hunting and trapping pressures on wolves that would have resulted from Alternative 2B is incorporated in Section 4.3.15 of the Final SEIS.

The DSEIS Fails to Assess the Project’s Impacts on Steller Sea Lions.

The effects of the project on Steller sea lions are discussed thoroughly in Southeast Alaska Conservation Council’s comments on the DSEIS, which are incorporated here by reference. *See* 2014 Southeast Alaska Conservation Council Comments. Additionally, because the DSEIS fails to consider adequately other environmental effects which have a bearing on Steller sea lions, such as the effects to estuarine habitat supporting prey species, discussed *supra*, the DSEIS’s conclusions with respect to Steller sea lions are also inadequate.

RESPONSE: FHWA and DOT&PF have been consulting with NMFS regarding the project and potential effects to Steller sea lions since 1994. Information and collaboration from consultation with NMFS is incorporated into the Final SEIS. The Final SEIS addresses impacts to Steller sea lions from Alternative 2B, including effects

to prey species from impacts on estuarine habitat in Section 4.3.13 This additional information does not change our conclusions regarding the potential impacts to Steller sea lions and their forage fish, which are discussed in Section 4.3.3 of the *2014 Update to Appendix S – Steller Sea Lion Technical Report*, provided in Appendix Z of the Draft SEIS.

VIII. The Analysis and Treatment of Bald Eagles is Unexplained and Arbitrary.

According to the latest eagle nest surveys, “[a] total of 136 bald eagle nests are located less than 0.5 mile from the work limits of” Alternative 2B, of which 99 nests are within 660 feet and 63 of the 99 nests are within 330 feet of construction activity. DSEIS, 2014 Update to Appendix R: Bald Eagle Technical Report (2014 Update to App. R) at 12 (May 2014). The DSEIS asserts that “it is not practicable to limit construction” to the time period outside of bald eagle breeding season, as recommended by the Fish and Wildlife Service’s National Bald Eagle Management Guidelines (Eagle Guidelines) (cited by DSEIS at 4-12, 4-216, 10-22, and 2014 Update to App. R at 6, 15, 16). *Id.* at 15. The Alaska DOT expects to apply for disturbance permits for all nests within 660 feet of construction and 0.5 mile of blasting activities. *Id.*

This assessment is inadequate. Blasting is also to be avoided within 0.5 mile of communal roosting sites, Eagle Guidelines at 14, but it appears that the Alaska DOT has not conducted a survey to determine the possible locations. Helicopters are not to be used within 1000 feet of nests during the breeding season, which begins in February in Alaska, *id.* at 6, 14, meaning that avalanche control activities that utilize helicopters could disturb up to 46 nests. DSEIS at 4-88.

RESPONSE: Sections 4.3.16, 4.4.16, 4.6.16, and 4.8.12 of the Draft SEIS incorporated the evaluation of effects to bald eagles during operation and construction from the *2004 Appendix R – Bald Eagle Technical Report* and *2014 Update to Appendix R – Bald Eagle Technical Report*. Also, Section 5.7 of the Final SEIS has been updated to clarify that a pre-construction survey would be conducted for bald eagles if a build alternative were selected. As described in the *2014 Update to Appendix R – Bald Eagle Technical Report*, surveys conducted since 1997 have not indicated the presence of communal roosting sites along the project.

As explained in Section 5.2 of the *2014 Update to Appendix R - Bald Eagle Technical Report*, bald eagle nests located in or near the avalanche prone areas may be impacted by intermittent helicopter operations and blasting noise. Charges would be dropped into avalanche trigger zones generally located well above timberline, relatively far from eagle nests along the shoreline. Response to such disturbances may include flushing from the nest, or abandoning the nest (Steidl and Anthony, 2000). Maintenance blasting along avalanche prone areas of Alternative 2B could occur within 0.5 mile of up to 46 nests in the most severe snow circumstances, but in a typical spring only a fraction of that total might be affected. DOT&PF would coordinate with USFWS to determine if a Disturbance Permit is necessary for annual maintenance blasting in avalanche areas.

Finally, because this project will result in the loss of 412 acres of old growth forest habitat and require clearcutting along the road’s path with adequate shoulders, *id.* at 4-47, 4-79,

the Alaska DOT should consult with the Fish and Wildlife Service to determine whether it would also be appropriate to apply the guidelines with respect to timber harvesting operations, which recommend avoiding clearcutting and removal of overstory trees within 330 feet of nests and avoiding harvesting operations during breeding season within 660 feet of nests. Eagle Guidelines at 13.

Given the Alaska DOT believes it cannot comply with any of these guidelines, its request to the Fish and Wildlife Service will be for a permit to disturb an unprecedented number of nests and communal roosts. A permit may only be issued if the disturbance is “[c]ompatible with the preservation of the bald eagle . . . , including consideration of indirect effects and the cumulative effects of other permitted take and other additional factors affecting eagle populations.” 50 C.F.R. § 22.26(e)(2)(i); *see also* 16 U.S.C. § 668a (Interior Department may permit taking of eagles if “compatible with the preservation of the bald eagle”).

RESPONSE: Other projects completed by DOT&PF have been granted permits under the Bald Eagle and Protection Act from USFWS and have received set back variances from the City and Borough of Juneau. As stated in Section 4.8.12.6 of the Draft SEIS, the USFWS may require additional monitoring or mitigation as a stipulation of a permit approval. The City and Borough of Juneau previously issued a bald eagle set back variance for roadway construction Echo Cove to Sweeny Creek as part of a project in the vicinity.

The DSEIS does not provide any basis for analyzing whether the disturbance of such a large number of eagles in most of their range along the east side of Lynn Canal is compatible with the preservation of the bald eagle, and makes no mention of other permitted takes or other factors affecting the local and regional eagle populations. For example, a permanent loss of an eagle nest was permitted recently at the Juneau airport, Ex. 14, and there have been eagle strikes at the airport in the past, including during nesting season. Ex. 53 at 2. These and other factors must be analyzed to determine whether the direct, indirect, and cumulative effects may pose a threat to preservation of local and regional eagle populations.

RESPONSE: Section 4.9 of the Draft SEIS included an evaluation of cumulative effects on bald eagles. Past, present, and reasonably foreseeable projects in combination with the proposed project would result in the loss of a small amount of habitat, no loss of known nest trees for bald eagles, and no measurable loss of food sources. In light of the ability for bald eagles to habituate to human presence, the cumulative impact of increased human presence in the region is not likely to have a population-level effect on bald eagles.

Even if permitted, the Fish and Wildlife Service may impose significant restrictions beyond what the Alaska DOT seems to expect at this time and potentially require compensatory mitigation, which will likely add to the cost of building the road. These costs should be estimated and disclosed to the public for a more accurate picture of the full costs of building a road.

RESPONSE: Mitigation of project impacts on bald eagles would have been site-specific and based on where bald eagle nests are used in the future. Mitigation, if necessary, would have been included as part of the Bald and Golden Eagle Protection Act permitting process and given the anticipated impacts and past practices mitigation costs would have been minimal or no additional cost.

IX. The DSEIS Treats Climate Change in an Arbitrary Fashion.

The DSEIS aptly acknowledges that “There is consensus among the scientific community that the earth’s climate is changing, that the change will accelerate, and that human greenhouse gas . . . emissions (primarily carbon dioxide [CO₂] emissions) are the main source of this accelerated change in climate.” DSEIS at 4-200. The calculation of how this project will contribute to climate change is particularly important due to Alaska’s susceptibility to the effects of climate change, relatively high rate of change, and its responsibility as an emitter of higher per-capita greenhouse gasses from transportation and industrial sectors than other states. *See id.* at 4-200, 4-229. Additionally, 35% of greenhouse gas emissions in Alaska and more than 50% of greenhouse gas emissions in Juneau arise from transportation. *Id.* at 3-45. FHWA and the Alaska DOT must take a hard look at the contributions to climate change resulting from this project, and have missed some important contributing factors.

The short analysis given to this critical issue underestimates greenhouse gas emissions. The amount of fuel consumed does not include ferry fuel used during loading or unloading, DSEIS at 4-188, nor the fuel used by vehicles while idling at the ferry terminal. *Id.* at 4-202. Depending on what the remote Katzehin ferry terminal ultimately includes, it is possible that drivers will prefer to wait in idling vehicles if there is inadequate waiting room or heating in the terminal, and as discussed elsewhere in these comments, drivers may arrive at terminals well in advance in order to ensure a spot on the ferry of their choosing.

Additionally, the greenhouse gas emissions were calculated by multiplying the amount of fuel used by the amount of greenhouse gas emitted per gallon of gasoline. *Id.* But ferry engines run on diesel, which “creates about 15% more [carbon dioxide] per gallon” than gasoline, i.e., about 10,180 grams carbon dioxide per gallon of diesel. Ex. 43. Using the correct number to determine carbon dioxide emitted by ferries in Alternative 2B results in an increase of 1,587.8 metric tons of carbon dioxide annually. *See* DSEIS at 4-188 (1,260,000 gallons of fuel used by ferries x 10.18 x 10⁻³ metric tons of CO₂/gallon of diesel = 12,826.8 metric tons of carbon dioxide), 4-202 (current calculations estimate 11,239 metric tons of carbon dioxide).

The analysis also fails to disclose climate change impacts stemming from timber harvest “due to the change in the ability to sequester carbon once the trees have been cut.” DSEIS, Ch. 7, Sec. 7.8, Forrest Cole, U.S. Forest Service, Letter to FHWA (Feb. 24, 2014) at 6. Contrary to a typical Forest Service timber sale, where second growth trees are expected to sequester some carbon as they grow, the road and its shoulders will be kept clear of trees and will not benefit from regeneration. No other construction-related greenhouse gas emissions are included in the analysis, either. Finally, the analysis omits

any reference to the social cost of carbon, which federal agencies use to estimate the value of damages associated with a small increase in greenhouse gas emissions. If applied to only the ferry and vehicle figures already disclosed, the social cost of greenhouse gas emissions arising under Alternative 2B for the year 2050 is \$1,658,153. *See* Ex. 42 (using the corrected estimate of greenhouse gas emissions for ferries calculated above, 12,826.8, plus the estimate for vehicle emissions at DSEIS 4-202, 8,991, equals a total of 21,817.8 metric tons of carbon dioxide, which is then multiplied by the 3% discount rate for the social cost of carbon in the year 2050, which is \$76/metric ton of carbon dioxide). FHWA and the Alaska DOT should recalculate the total greenhouse gas emissions expected to result from the project at the appropriate rates for different fuel types and convert these figures into the social cost of carbon for the life of the project in order to better compare and evaluate the alternatives. In light of the disproportionate effects felt by Alaska generally and the responsibility Alaska must take for its per capita emissions, a substantial portion of which arise from the transportation sector, the climate change analysis presently offered is inadequate to address this important environmental effect.

RESPONSE: FHWA based its discussion on FHWA internal guidance for addressing Climate Change in environmental documents. FHWA is satisfied that the information provided in the Final SEIS is consistent with FHWA guidance and adequate for the proposed action.

For projects located in nonattainment areas, analysis of idling vehicle emissions, and possibly those associated with loading/unloading of ferries, are conducted via hot-spot CO and PM analyses; however, because the project is in an attainment area, hot-spot analyses are not required. Furthermore, the speculative nature of idling emissions as described in the comment would be difficult to characterize with any level of accuracy. Therefore, FHWA's opinion is that the current analysis of roadway vehicular emissions is sufficiently conservative for identifying impact conditions.

Updated emissions estimates from ferry vessels are included in the Final SEIS, including CO₂e estimates from diesel fuel consumption. CO₂e calculations associated with construction of the project would be well below the significance threshold of 25,000 MT per year. Additionally, these emissions would be temporary and would represent a negligible contribution to climate change. Therefore, FHWA's opinion is that the qualitative discussion of GHG emissions from construction activities is sufficiently conservative for assessing impact conditions.

The social cost of carbon is an estimate of the costs, expressed in monetary value, by damage caused by each additional metric ton of carbon dioxide put into the atmosphere. The damage includes health impacts, economic dislocation, agricultural changes, and other effects that climate change can impose on humanity. This value is generally incorporated into a cost-benefit analysis. The social cost of carbon is difficult to calculate, however, and estimates by economists vary widely. The Interagency Working Group on the Social Cost of Greenhouse Gases (IWG, formerly the Interagency Working Group on the Social Cost of Carbon) continues to develop methods for estimating the social cost of carbon. In its most recent Technical Support Document on this subject, IWG provided estimates ranging from \$11 to \$56 per metric ton of CO₂ in 2015, based on averages from three different

models and depending on discount rates (IWG, 2016). The social cost of carbon increases over time because future emissions are expected to produce larger incremental damages as physical and economic systems become more stressed in response to greater climatic change, and because Gross Domestic Product is growing over time and many damage categories are modeled as proportional to Gross Domestic Product. By 2050, the estimates of the social cost of carbon range from \$26 to \$95 per metric ton of CO₂ (IWG, 2016).

According to CEQ guidance, NEPA does not require monetizing costs and benefits and, when there are important qualitative considerations, the weighing of the merits and drawbacks of alternatives should not use a monetary cost-benefit analysis (40 CFR 1502.23). With respect to GHG emissions, use of a monetary cost-benefit analysis should be appropriate and relevant to the choice among alternatives being considered, (CEQ, 2016).

FHWA has determined that using the social cost of carbon methodology to assess the impacts of the JAI Project alternatives would not be appropriate and relevant to the choice among alternatives; therefore, the methodology is not part of this NEPA analysis. This determination was made for the following primary reasons: 1) the wide range and uncertainty in placing estimates of the value of carbon renders the social cost of carbon methodology speculative and 2) the quantitative analysis of GHG emissions for the JAI Project alternatives indicates their contribution would be a relatively minor contribution to global emissions.

X. The DSEIS's Subsistence Analysis Does Not Comply With the Alaska National Interest Lands Conservation Act.

The analysis reflected in the DSEIS does not comply with the requirements of the Alaska National Interest Lands Conservation Act of 1980 (ANILCA), which requires that decisions regarding projects on federal lands in Alaska to address impacts on subsistence hunting and gathering uses. In this instance, the FHWA has offered little more than vacuous assertions regarding the impacts various alternatives will have on subsistence practices.

RESPONSE: FHWA has met its obligations under the Alaska National Interest Lands Conservation Act (ANILCA). Section 810 of ANILCA (16 USC Section 3120) requires an evaluation of the effects on subsistence uses of projects located on federal lands. ANILCA (Section 803) defines subsistence uses as the “customary and traditional uses by rural Alaska residents of wild, renewable resources for direct personal or family consumption as food, shelter, fuel, clothing, tools, or transportation; for the making and selling of handicrafts articles out of non-edible byproducts of fish and wildlife resources taken for family or personal consumption; for barter, or sharing for personal or family consumption; and for customary trade.” As defined in ANILCA, “rural” residents live in a community or area that is “substantially dependent on fish and wildlife for nutritional and other subsistence uses.”

Title VIII of ANILCA (Section 810(a)) requires that an evaluation of subsistence uses and needs be completed as part of any federal agency determination to “withdraw, reserve,

lease, or otherwise permit the use, occupancy, or disposition of public lands.” Specifically, ANILCA 810(a) requires an evaluation based on three specific issues: 1) the effect of use, occupancy or disposition on subsistence uses and needs; 2) the availability of other lands for the purpose sought to be achieved; and 3) other alternatives that would reduce or eliminate the use, occupancy, or disposition of public lands needed for subsistence purposes (16 USC § 3120).

Most of the land crossed by the highway segments for Alternatives 2B and 3 are in the Tongass National Forest or the Haines State Park. Therefore, there is very little land along these alternative alignments available for development. The Draft SEIS evaluated potential impacts to subsistence uses protected under ANILCA and concluded that no alternative would significantly restrict subsistence usage. Project impacts to subsistence resources were discussed in Sections 4.2B.6, 4.3.6, 4.4.6, 4.5.6, and 4.6.6 of the Draft SEIS and Sections 4.1.4.2, 4.1.5.2, and 4.1.6.2 in Appendix DD of the Draft SEIS. FHWA has determined that none of the reasonable alternatives would significantly restrict subsistence uses.

In enacting ANILCA, Congress sought “to protect the subsistence way of life for rural residents and the resources upon which they depend, as well as to obviate the need for future legislation regarding environmental conservation and subsistence uses.” *John v. United States*, 720 F.3d 1214, 1218 (9th Cir. 2013) cert. denied, 134 S. Ct. 1759 (U.S. 2014) (internal quotation omitted). To accomplish this purpose, “Title VIII of ANILCA provides that, ‘[e]xcept as otherwise provided in this Act and other Federal laws, the taking on public lands of fish and wildlife for nonwasteful subsistence uses shall be accorded priority over the taking on such lands of fish and wildlife for other purposes.’” *Id.* (quoting 16 U.S.C. § 3114).

The DSEIS recognizes that subsistence practices are important both economically and culturally to the communities of Klukwan, Haines, and Skagway. DSEIS 3-30—31. The DSEIS, however, fails to provide even basic information regarding existing levels of harvest in the area despite the fact that this information is readily available from the Alaska Department of Fish and Game.

RESPONSE: The Draft SEIS relied on the latest available information and data. Reporting of subsistence use in the Draft and Final SEIS is based on the USFS Tongass Resource Use Cooperative Survey (1988), the Alaska Department of Fish and Game (ADF&G), Division of Subsistence, *Subsistence Resource Use Patterns in Southeast Alaska: Summaries of 30 Communities* (1994), and scoping comments. Ongoing DOT&PF communication with ADF&G indicates that no more recent information is currently available. Existing levels of subsistence harvest are discussed in Section 3.1.6 of the Draft SEIS and Section 3.2.4 in Appendix DD of the Draft SEIS.

The DSEIS also acknowledges impacts on subsistence resource populations and habitats, but does not assess the magnitude of those effects. *See, e.g.*, DSEIS at 4-57, 4-109. Indeed it offers little more than conclusory assertions. The agency ultimately provides no analysis or evaluation, rather it simply concludes that various alternatives “would not significantly restrict subsistence uses.” *See, e.g.*, DSEIS at 4-57. The lack of information and analysis is unlawful.

RESPONSE: As outlined above, FHWA has met its obligations under ANILCA. Project impacts to subsistence resources were discussed in Sections 4.2B.6, 4.3.6, 4.4.6, 4.5.6, and 4.6.6 of the Draft SEIS and Sections 4.1.4.2, 4.1.5.2, and 4.1.6.2 in Appendix DD of the Draft SEIS. FHWA has determined that none of the reasonable alternatives would significantly restrict subsistence uses.

Additionally, the Forest Service, in its comments, also explained that the DSEIS's "subsistence analysis does not conform to US Forest Service standards presented in Forest Service Handbook 2090.23." DSEIS, Ch. 7, Sec. 7.8, Forrest Cole U.S. Forest Service, Letter to FHWA (Feb.24, 2014) at 8. The Forest Service told FHWA that "[t]he analysis for each alternative needs to address each evaluation criteria and present a finding." *Id.* (explaining that the finding might require notices, hearings, and other determinations). The lack of information and analysis renders any decision arbitrary because the conclusions are unsupported.

In sum, the FHWA has not fulfilled its obligations under ANILCA to protect subsistence practices and resources.

RESPONSE: FHWA has met its obligations under ANILCA.

XI. The DSEIS Fails to Consider Cumulative and Indirect Impacts of Increased Mineral Development.

The DSEIS fails to rigorously explore the potential cumulative and indirect effects of the Juneau Access Improvements Project resulting from development in the area. The scope of an EIS must include consideration of cumulative impacts, which are those which result "from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions," as well as indirect impacts, defined as those "caused by the action and . . . later in time or farther removed in distance, but are still reasonably foreseeable." 40 C.F.R. §§ 1508.7, 1508.8(b), 1508.25(c). "Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use," *id.* § 1508.8(b), and building a road on either side of Lynn Canal through currently roadless areas would certainly present a major change in use, while increasing the potential for growth in mineral development.

The DSEIS concedes that Alternative 2B would benefit the Kensington Mine "by facilitating the transport of goods and services to the mine site from Juneau and making it more convenient for workers in Juneau, Skagway, and Haines to reach the site." DSEIS at 4-37. Although the current plan for the mine is to produce until about 2020, the operating life could be extended if more ore is discovered. *Id.* at 4-220 to 4-221. The reduction in transportation costs makes it more likely that Kensington Mine will expand, because the anticipated income need not be as high to break even if transportation of workers and supplies costs less. *Cf. id.* at 4-37. In fact, Kensington Mine already has plans for expansion; it filed an application for a hardrock exploration permit at Johnson Creek in June 2014. Ex. 4. Yet the DSEIS never addresses what the mine expansion might mean

for habitat for mountain goats, wolves, eagles, or the many marine species utilizing the adjacent and downstream Berners Bay, the effect of an expansion on wetlands and water quality, and the activities likely to take place that may disturb wildlife, such as blasting. Because expansion of Kensington Mine is reasonably foreseeable even if the road were not built, and is made more likely to occur as an indirect effect of the road, FHWA and the Alaska DOT must take a hard look at the cumulative effects posed by the mine.

The DSEIS also dismisses the likelihood “that any mineral deposits in the region would be developed solely because of this improved access,” because “[d]evelopment of mineral resources is capital intensive, involving many other costs besides access.” DSEIS at 4-37. Although construction of a road may not be the sole reason a mineral deposit is developed, the Alaska DOT’s Roads to Resources program certainly suggests that it is an important factor. The purpose of the Roads to Resources program is “to design and build projects that support development of natural resources,” starting with the identification of “resource development projects that require construction of transportation access.” Ex. 7. For example, the Roads to Resources project for the Ambler mining district is proposed because “[t]here are substantial mineral resources in the region, but access has been a significant obstacle to development.” Ex. 1 at 1.

There is “high mineral potential” in North Lynn Canal, and a database of mineral prospects shows many prospects around Berners Bay, Kensington Mine, and along the route for Alternative 3 on the west side of Lynn Canal. *See* Ex. 3 at 3-195; Exs. 30, 31. The Juneau State Land Plan contemplates a road “to support mining along the USFS-owned shoreline and the state shorelands parallel to the Berners River. There are also federal mining claims on the Upper Antler and Gilkey Rivers. If these claims are developed, ground access may be proposed along these two rivers from their mouths to their headwaters.” Ex. 3 at 3-203. It also notes that “[o]ver the long term, roads and utility corridors that provide improved access to mining or serve as part of a regional transportation and utility system may be considered.” *Id.* at 3-204. The State cannot claim that the possibility of increased mineral development is not reasonably foreseeable when it has been planning for roads to provide improved access to mineral deposits for over two decades. The DSEIS simply fails to analyze the effects of a potential increase in mineral development for both Alternative 2B and Alternative 3.

Because the development of either proposed road is likely to increase mineral development in Lynn Canal and near the important habitat of Berners Bay, FHWA and the Alaska DOT are required to consider the cumulative effects of such development. The failure to do so renders the DSEIS inadequate.

RESPONSE: Per your comment, the Final SEIS has been updated with new information pertaining to reasonably foreseeable future exploration associated with the Kensington Gold Project and potential cumulative impacts to habitat for mountain goats, wolves, and eagles; marine species using the adjacent and downstream Berners Bay; wetlands and water quality; and disturbance to wildlife from activities such as blasting (see Section 4.9.2).

The Draft SEIS (page 4-37) acknowledged that a highway would provide easier and less

expensive access to mineral resources, but access alone does not determine whether a mineral deposit would be developed. FHWA and DOT&PF are not aware of specific mining prospects that would go into development if a road were built, hence the statement “It is unlikely that any mineral deposits within the region would be developed **solely** because of this improved access” (emphasis added). If this project were a Roads-to-Resources project, DOT&PF would look for more certainty in the development of mineral resources with the development of the road. While the development of Alternative 2B or 3 could increase mineral development along Lynn Canal, there is no specific reasonably foreseeable future mining action, other than the Kensington Mine Expansion. In this case, anticipating mineral development as a result of highway access would be speculative. Section 4.9.1.1 of the Final SEIS has been updated to most recent information on Kensington Mine.

Lynn Canal Conservation Comments on the 2014 Juneau Access Draft Environmental Impact Statement

Background Information

Lynn Canal Conservation (LCC) is a grassroots conservation organization based in Haines, Alaska. The Alaska Marine Highway (AHMS) is a non weather-dependent, vital transportation link for our members who access Juneau regularly for business, medical and dental appointments, pleasure, and jet travel. LCC has made substantive comments during each previous Juneau Access comment opportunity, including comments on the Southeast Alaska Transportation Plans (SATP), and we incorporate those comments into the record by reference. If FHWA needs duplicate copies, please let us know.

General Comments

The 2014 Juneau Access Draft Environmental Impact Statement (DSEIS) retains fatal flaws of the 2006 FEIS analysis, and avoids addressing substantive comments made during prior comment and scoping periods. The Juneau Access analysis as presented continues to use faulty assumptions to arrive at conclusions that are disputed by actual data presented in the DSEIS, rendering these conclusions arbitrary and capricious. The continued use of faulty methodologies prejudices the analysis and biases the results.

RESPONSE: The Federal Highway Administration (FHWA) and Alaska Department of Transportation and Public Facilities (DOT&PF) strongly disagree with the assertion that the Draft SEIS retains flaws, avoids addressing substantive comments, uses faulty assumptions, and is arbitrary and capricious. Responses to specific concerns regarding information included in or omitted from the Draft Supplemental Environmental Impact Statement (SEIS) are provided elsewhere in this letter.

The range of alternatives does not include a true No Action alternative.

RESPONSE: The No Action Alternative consists of the highway and ferry system that existed as of 2014, plus improvements programmed by DOT&PF. Programmed improvements are described in Section 2.3.1 of the Draft SEIS. Including programmed improvements as part of a No Action Alternative is appropriate practice for preparation of an EIS when these improvements are already committed.

The court ordered alternative (1B) does not pass a “common sense” test, is not a true Transportation System Management (TSM) alternative as claimed, and is not designed to meet the stated purpose and need.

RESPONSE: DOT&PF and Alaska Marine Highway System (AMHS) staff developed a new alternative based on direction from the U. S. District Court for the District of Alaska

(and upheld by the U.S. Court of Appeals for the Ninth Circuit), shared a draft of that alternative with the public during a new scoping effort for the Draft SEIS, took input on the new alternative, and revised that alternative based on comments received. The new alternative took into account the changes that had occurred to the “existing assets” in the AMHS fleet since the 2006 Final EIS, the capabilities of the vessels in the fleet, and the needs and mission of the fleet in regard to the numerous communities served by AMHS. DOT&PF and FHWA fully disclosed the thought process and evaluation in the Draft SEIS. Appendix CC, *Development of Alternative 1B – Enhanced Service with Existing Alaska Marine Highway System (AMHS) Assets*, of the Draft SEIS described the efforts undertaken to develop Alternative 1B and documented the data and analysis relied upon to create as reasonable an alternative as possible toward solving the transportation problems in the corridor using only existing assets. Alternative 1B incorporated the following considerations:

- Existing AMHS assets reasonably available and feasible for use in Lynn Canal
- Programmed AMHS assets (decisions by AMHS independent of this project that made new Day Boats available in the fleet)
- Enhancements that could be employed that do not involve substantial initial capital investments

The resulting alternative, Alternative 1B, was rigorously analyzed in the context of the project’s purpose and need and as part of National Environmental Policy Act (NEPA) requirements for the consideration of alternatives.

Alternative 1B was developed by AMHS and other DOT&PF professionals with years of optimization experience. They were able to develop a system management alternative that makes improvements over and above Alternative 1 – No Action. DOT&PF identified and evaluated Alternative 1B as a competing NEPA alternative. Alternative 1B addresses the Court’s requirement to evaluate an alternative that makes improvements using existing assets. Alternative 1B uses existing assets and results in an increase in AMHS service in Lynn Canal that would not require a reduction in service outside Lynn Canal.

The purpose and need statement, identical to what has been found inadequate in the past, is still flawed, has been criticized by the EPA, and has again been rejected by the Army Corps of Engineers.

RESPONSE: The purpose and need statement for the FHWA NEPA evaluation has not been found inadequate or flawed. The purpose and need addresses the transportation needs in Lynn Canal. DOT&PF and FHWA data have demonstrated that there is considerably higher demand for travel than is met by the existing system. However, due to high costs, slow travel times, and other inconveniences, the system does a poor job at serving corridor demand. These problems are documented in Chapter 1, *Purpose and Need*, of the Draft SEIS. The Council on Environmental Quality (CEQ) directs federal agencies to grant substantial

deference to the lead federal agency with expertise in the stated field, in this case the FHWA, in determining the purpose and need for transportation projects.¹

The U.S. Army Corps of Engineers (USACE) did not “reject” the FHWA purpose and need for the Juneau Access Improvements (JAI) Project. The USACE has a different process and its own responsibilities in developing an overall purpose statement. In its project purpose statement for consideration of alternatives for the Section 404 evaluation, USACE did not include the FHWA purpose and need statement components, to reduce State and user costs.

Additionally new geological information has been released since the previous EIS process suggesting there will be considerable significant new impacts to the human environment as a result of implementing the preferred alternative. Although this new information is mentioned in the DSEIS, it has not been evaluated to a level required by the National Environmental Policy Act (NEPA). That is, while extensive information is presented on 41 avalanche paths, there is little information or analysis regarding 99 geological hazards identified since the 2006 Record of Decision.

RESPONSE: The 2017 Update to Appendix D - *Technical Alignment Report* (provided in Appendix Z of the Final SEIS) includes a discussion of the geologic hazards along the Alternative 2B alignment.

For the above stated reasons, the DSEIS fails to meet the requirements of the National Environmental Policy Act and a new document must be prepared for public review rather than the planned simultaneous Final Supplemental EIS and Record of Decision.

RESPONSE: The Draft SEIS meets NEPA requirements. FHWA and DOT&PF have updated information in the Final SEIS to correct errors and omissions, or in other ways respond to comments on the Draft SEIS. There is no need to prepare a new document for public review because the Final SEIS contains the analyses and information needed by FHWA to make a decision on the project in compliance with NEPA requirements.

Walk-on Passengers

A huge flaw of the DSEIS analysis continues to be that it simply does not account for walk-on passengers. Since the DSEIS still does not assess the percentage of passengers using the Alaska Marine Highway System (AMHS) that are walk-ons, despite repeated requests for this information in Lynn Canal Conservation’s (LCC) 2005 and 2006 comments, the DSEIS must use the only reliable information available. Simply stating “AMHS passenger fares do not distinguish walk-on passengers from vehicle drivers and vehicle passengers”²

¹ CEQ. 2003. Letter to the Honorable Norman Y. Mineta from James L. Connaughton regarding purpose and need. Available on the internet at: <https://ceq.doe.gov/docs/ceq-regulations-and-guidance/regs/CEQPurpose2.pdf>

² DSEIS at 7-13

is not sufficient. A September, 2000 report prepared for the AMHS and the Alaska Department of Transportation (DOT) found that 45% of all AMHS passengers traveled without vehicles in summer and spring, and 39% were walk-on passengers in winter.³ The McDowell Group interviewed 1700 passengers between 1999 and 2000 for this study.⁴ It is likely that this information is still highly accurate because traffic patterns and volumes in Lynn Canal have been consistent from 2000 through the present.⁵

RESPONSE: The Draft SEIS does discuss walk-on passengers. The road alternatives (2B and 3) represent a shift in the way transportation would be provided in the corridor—away from a primarily public transportation mode that would operate more like a public transit service, to a highway system where private vehicles would provide most of the transportation (shorter, publicly-owned shuttle ferries would provide links connecting the roadways). DOT&PF and FHWA recognize that this shift would have had an effect on walk-on passengers. Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS describe impacts to “Pedestrians and Bicyclists” for Alternatives 2B and 3, including walk-on passengers. The information includes estimates of how many walk-on passengers might be affected and how they would have been affected, including the anticipated changes in fares.

It is true that DOT&PF and FHWA do not anticipate that walk-on passengers would have continued to find it convenient to have someone drive them to the ferry terminal like they do today. Walk-on passengers are currently able to ride on a subsidized ferry for a long portion of the trip, and under Alternative 2B or 3 they would have needed to drive or be driven for most of the route. The Draft SEIS anticipated that many current walk-on passengers that own vehicles would likely choose to travel by car if a highway were available in the Lynn Canal corridor. Travelers without vehicles would have needed to rent vehicles, take a commuter flight, or travel on private carriers if they develop service to accommodate this demand. The percentage of AMHS walk-on passengers that would choose to travel in their own vehicle if Alternative 2B were selected for the project would depend on a variety of factors such as the cost, frequency, and convenience of a bus or van service.

Section 4.3.7.5 and 4.4.7.5 of the Draft SEIS and Section 3.1.4.1 of the *Socioeconomic Effects Technical Report* included further information on impacts to walk-on passengers, including the potential for bus/van service.

It is incorrect to state that “traffic patterns and volumes in Lynn Canal have been consistent from 2000 through the present.” A review of the 2000 and 2015 *AMHS Annual Traffic Volume Report* data (travel solely within Lynn Canal) indicates a reduction in pedestrian (26

³ 2000 McDowell, Alaska Marine Highway System Marketing and Pricing Study, Volume 1 at 65. Since most travel occurs in the summer, the 45% figure will be used for the purpose of these comments. This study was mentioned on many occasions in LCC’s 2005 and 2006 JAI comments.

⁴ *Id* at 6

⁵ DSEIS at 1-9, Table 1-1

percent) and vehicle (14 percent) travel since 2000 in Lynn Canal. The source document for the 46 percent walk-ons is dated 2000. With the reduction in pedestrians and vehicle traffic, the 2015 walk-on rate is estimated to be 30 percent. Additional information regarding the forecast of walk-on passengers has been added to Appendix AA of the Final SEIS.

As with the 2005 and 2006 JAI EIS documents, the 2014 DSEIS does not deal with AMHS walk-on passengers in a meaningful or realistic manner. Instead, “capacity and demand analysis in this document focuses on vehicles.”⁶ The methodology used divides the average number of ferry passengers by the average number of ferry vehicles and puts all walk-ons into strangers’ vehicles.⁷ This is an inaccurate portrayal of existing AMHS service.

This analytical obliteration of walk-on passengers is captured in the following statement: “In Lynn Canal, the only two available modes are auto/ferry and airplane.”⁸ There is no further analysis of the highly utilized travel mode of walk-on ferry service. The analysis takes an important AMHS public transportation service and gives it zero value. An analysis where benefits to almost half the travelers are wrongly characterized is meaningless. The absurdity of the analysis is readily apparent from the statement that “passengers were converted to vehicles.”⁹ Since it is truly impossible to “convert” a passenger to a vehicle, the DSEIS analysis should not be used to justify dismantling a public transportation system in order to build the preferred alternative.

For example, the analysis becomes highly skewed when allocating travel times, an element of purpose and need, because walk-on passengers do not have to check in 1 to 2 hours in advance of sailing – a requirement only for vehicular traffic. Putting these passengers into hypothetical vehicles adds non-existent wait-time to marine travel for walk-on passengers, which not only unfairly increases the travel time for marine alternatives, but also skews the user benefit analysis when a user “cost” is charged for non-existent wait time, thereby increasing the “cost” of ferry travel for the purpose of analysis. The entire DSEIS analysis becomes meaningless because two of five purpose and need elements - decreasing travel time and decreasing user costs - are wildly inaccurate for 45% of passengers.

RESPONSE: As mentioned previously, the Draft SEIS does address walk-on passengers. The analysis does not put “all walk-ons into strangers’ vehicles.” The analysis uses vehicles and passengers per vehicle as a means to compute valid statistics and to convert estimates between the two metrics.

The Draft SEIS accurately portrays the existing AMHS service in the affected environment chapter (see Section 3.1.7). The commenter objects to the fundamental change in the way transportation would be provided under the road alternatives. Instead of providing point to point “transit” service like the current AMHS service, these alternatives would operate like

⁶ DSEIS at 1-13

⁷ 2014 Appendix AA at 8

⁸ 2014 Appendix AA pdf page 116

⁹ 2014 Appendix pdf page 119

highways elsewhere in the state, except that they would have short shuttle ferry linkages.

Under Alternative 2B, a substantial segment of current walk-on traffic would be expected to convert to personal vehicle travel. Cost is currently a principal deterrent for ferry travel with a vehicle. As described in Table 4-27 of the Final SEIS, under the No Action Alternative, the one-way out-of-pocket cost for a driver and 19-foot standard vehicle between Juneau and Haines is \$129.50. Under Alternative 2B, the one-way out-of-pocket costs for a driver and vehicle would be \$34.50. Adding vehicle operating costs would result in a total user cost of \$131.50 for the No Action Alternative and \$69 for Alternative 2B. This substantial decrease in the cost of travel between the No Action to Alternative 2B would prompt many more travelers to take their own vehicles. The cost to a walk-on passenger would be \$39 under Alternative 1 – No Action. Not counting ground transportation (transportation to/from the Katzehin and Auke Bay Ferry Terminals), under Alternative 2B, the cost would be \$5; with ground transportation included, the cost is projected to be between \$42 and \$60, which would be about the same or only slightly more than the cost of a walk-on passenger under Alternative 1 – No Action. Further, the substantial increase in overall traffic associated with Alternative 2B represents more opportunities for walk-ons to travel with family, friends, and acquaintances.

More generally, the purpose of investment in public transportation infrastructure is to improve transportation opportunities for the largest number of people in the most cost-effective manner possible. It is not practical or reasonable to expect infrastructure improvements to enhance travel opportunities for all travelers, from all locations, for all travel purposes. Replacing ferry service with a highway would require a change in travel behavior for some travelers, perhaps at some increased expense and inconvenience, while a much larger number of travelers would be able to travel at lower expense and greater convenience. The ten-fold increase in traffic from No Action to Alternative 2B would be the result of lower cost and more convenient travel opportunities for a much larger segment of the region's population.

There is no “analytical obliteration of walk-on passengers.” Under Alternative 2B, walk-on passengers would find it inconvenient to get to Katzehin. DOT&PF and FHWA expect that under the road alternatives, many passengers that currently walk on would drive themselves. It is incorrect to suggest there is “no further analysis of walk-on ferry service” in the Draft SEIS. The Ground Transportation Services section of Sections 3.1.4.1 and 3.2.4.1 of the *Socioeconomic Technical Report* (Appendix EE of the Draft SEIS) describes how walk-on passengers would travel if a highway were constructed and point-to-point ferry service were discontinued. DOT&PF anticipates the private sector operating a bus/van shuttle service to accommodate walk on passengers if that demand developed and it was shown to be profitable. The impacts to walk on passengers are also disclosed in Sections 4.2.7, 4.3.7, 4.4.7, 4.5.7, and 4.6.7 of the Draft SEIS.

It is important to note that Skagway has the only ferry terminal in Lynn Canal that is within reasonable walking distance from residential areas. All other existing terminals must be reached by private vehicle or private carrier. These trips are considered to use both automobile and ferry modes of transportation. In other words, most walk-on ferry passengers currently use a vehicle at one end of their trip or the other, or both.

By AMHS policy, walk-on passengers have the same two hour check-in time as vehicles in Juneau and one hour in Haines and Skagway. The early check in is necessary to avoid delayed departures due to passengers checking in just before the scheduled departure.

The source document for the 45 percent walk-on rate is dated 2000. A review of the 2000 and 2015 *AMHS Annual Traffic Volume Report* (travel within Lynn Canal) indicates a 14 percent reduction in vehicle travel and a 26 percent reduction in pedestrian travel. The 2015 walk-on percentage within Lynn Canal is estimated to be 34 percent in summer only and 30 percent for the year. Additional information regarding the forecast of walk-on passengers has been added to Appendix AA of the Final SEIS.

In addition to skewing the comparison of reasonable alternatives - the basis for choosing a preferred alternative – the analysis ignores the valuable AMHS service of providing public transportation between Juneau, Haines, and Skagway. While this existing service provides tremendous value to the traveling public, and would be eliminated by implementing the preferred alternative, it has no value on paper for the purpose of this analysis, and even negative value in terms of travel time and user cost. Therefore, the analysis inaccurately represents marine transportation alternatives, guaranteeing they will lose when compared with a road.

RESPONSE: It is inaccurate to suggest that the existing service is given “no value for the purpose of this analysis.” Costs, benefits, and other metrics are evaluated for the existing service as well as the build alternatives. These metrics allow comparison to the build alternatives (e.g., see Table ES-1). DOT&PF and FHWA have extensively evaluated each of the alternatives equally and objectively. The analysis does not inaccurately represent the marine transportation alternatives. Each alternative used a consistent start and end point to ensure variables such as travel time, waiting time, and costs were treated consistently across the alternatives.

Regarding the cost/value of travel time, assigning dollar costs to travel time is a reflection of the fact that all time has value. And, all time has a cost in terms of trade-offs with other ways that time could be spent. If ferry travel were purely a benefit, then slower trips would have greater value than faster trips. Clearly, many Lynn Canal ferry travelers enjoy aspects of the ferry ride, but it is also true that most travelers prefer shorter travel times (fast ferry) to longer travel times (conventional ferry), all other things being equal. It is also true that some travelers

would prefer driving their own vehicles to riding a ferry over the same route.

The DSEIS wrongly assumes that travel aboard a ferry is time wasted rather than time spent enjoying the ride. Therefore a time cost is assessed to ferry travel. But most passengers actually enjoy the time spent on the ferry and use that time to relax, view the scenery, and meet and talk to new people.¹⁰ Ferry passengers “are traveling primarily for pleasure”. In fact, pleasure travel accounts for 3/4 of summer Lynn Canal traffic and 2/3 of year round traffic.¹¹ Even though it is suggested that “pleasure travelers may not consider time spent in certain types of travel **as a cost, but rather as a benefit**”¹² no attempt is made to quantify that benefit and assign a positive monetary value for time spent on the ferry. Therefore it goes against all logic to assign time costs **against** ferry travel. That is, the DSEIS methodology erroneously assigns a cost to a benefit. Since the model used assigns costs when travelers are actually being benefited, its use obviously skews the results in favor of a road. 2005 SDEIS Appendix C admits that user benefits based on the value of time are “arbitrary”¹³ and “imprecise”¹⁴ and only work in instances where “faster is better.”¹⁵

RESPONSE: It is true that people value travel times differently based on various factors: work versus pleasure, weather conditions, etc. In developing the choice model coefficients, ferry travel time was not considered as onerous as automobile travel time because other activities can be accomplished during the trip. A similar approach is often used in other mass transit modes such as commuter rail forecasting. As such, the travel model gave 20 percent less penalty to the ferry travel time compared to automobile travel time. In other words, the model coefficient was adjusted to account for the benefits described by the commenter. This relationship was derived from other regions that have ferry service and driving options, and was used to validate the travel model results to existing ferry demand within the corridor.

Nevertheless, DOT&PF and FHWA do not consider assigning a positive value to more time spent riding on the ferry a reasonable assumption. While it is true, some people ride the ferry for pleasure, the same could be said for driving—some driving trips could also be considered for pleasure and thus deserving of being assigned a positive factor. The assigned factors are consistent with standard methodologies for evaluating travel time costs in forecasting/modeling. Regarding the cost/value of travel time, assigning dollar costs to travel time is a reflection of the fact that all time has value. And, all time has a cost in terms of trade-offs with other ways that time could be spent. If ferry travel were purely a benefit, then slower trips would have greater value than faster trips. Clearly many Lynn Canal ferry travelers enjoy aspects of the ferry ride, but it is also true that most travelers prefer shorter travel times (fast ferry) to longer travel times (conventional ferry), all other things being

¹² *Id.*, emphasis added

¹³ 2005 Appendix C at 30

¹⁴ 2005 Appendix C at 28

¹⁵ *Id.* at 29

equal. It is also true that some travelers would prefer driving their own vehicles to riding a ferry over the same route.

The commenter's references to the 2005 Supplemental Draft EIS are misleading. The full quote is as follows:

“Assignment of dollar values to time is a broadly accepted method of comparing transportation alternatives. Because of the wide variation among user needs, preferences and financial means, it is inherently an imprecise process. In the absence of a detailed understanding of market preferences, however, assignment of dollar values allows an overall estimate of how users perceive the cost/value relationship for each alternative. The values allow us to draw conclusions about when and how often travelers would use an alternative if it were available” (Appendix C, page 28).

Similarly, the 2005 Supplemental Draft EIS does not “admit” that user benefits based on the value of time “only work in instances where ‘faster is better’.” The full quote states: “Rather than attempt to capture the subtleties of pleasure value, the model accepts the fundamental principal of transportation utility that faster is better. Experience has shown that this is a reasonable approach to predicting traffic. Shorter travel times and more convenient schedules are assumed to be net improvements in service that lead to additional traffic. To this end, time saved is counted as a benefit and assigned a dollar value.” (Appendix C, page 28.)

Further, actual costs to walk-on passengers if Alternative 2B is implemented are mentioned but not appropriately incorporated into the analysis. There is no rationale given for how the DSEIS arrives at a conclusion that bus fares (if a bus service indeed materializes from the private sector) will be about what it currently costs to travel on a ferry.¹⁶ For those walk-ons who will be forced to fly because they are not traveling with a vehicle and because Katzehin bus service may not materialize or may be infrequent, the expense of Juneau access triples.¹⁷ Availability and costs for car rental will make Alternative 2B prohibitive for many travelers.

RESPONSE: The Draft SEIS provides a rationale for how it arrives at its conclusions about bus fares. As explained in Appendix EE of the Draft SEIS (page 129) cited by the commenter, case studies were considered and potential operators were interviewed. The cost of a potential bus service is discussed in Section 4.3.7.5 of the Draft SEIS. Cost, frequency, and convenience of a bus or van service would depend on the projected size of the market for such a service. The Draft SEIS estimates that cost to be in the range of \$40 to \$60 one-way between Juneau and Haines or Skagway based on projected shuttle fares and rates on similar existing bus services.

¹⁶ 2014 Appendix EE at 129

¹⁷ DSEIS at 3-32

Per your comment, additional information about the cost for existing walk-on passengers, such the additional for plane or rental car, has been incorporated into Sections 4.3.7.5 and 4.4.7.5 of the Final SEIS.

Despite claims to the contrary, evidence presented in the appendices shows at best a small - and at worst a non-existent - likelihood of private sector bus service from Juneau to the Katzehin. For example, Capital Transit “is unlikely to provide service.”¹⁸ If bus service does materialize, it could make one or two round trips per day in summer. This greatly decreases flexibility and opportunity to travel for all walk-ons and is not accounted for in the 2B analysis. Service providers might be interested if there was a demand and if it were “financially lucrative.” But no such ground service exists at Auke Bay currently,¹⁹ so the probability seems small that Katzehin service would materialize. The difficulties of this hypothetical bus service are apparent in that “scheduling would be a significant challenge for bus service operators.”²⁰ And “the seasonality of demand would also present a scheduling challenge, with significant variations in demand even within the summer season.”²¹ Existing operators commented that off-season service “could be difficult” due to estimated winter volume.²²

The summary given is that Katzehin bus service “may be of interest to the private sector” with an every other day service to Haines and Skagway.²³ The projected 2006 cost was \$35 to 50 one way, and with inflation would be \$40 to \$60 one way.²⁴ With the addition of shuttle ferry fares, this would cost more than existing service, as calculated in a later section of these comments. Even though the 2006 analysis concluded that “the private sector would be expected to respond aggressively” to the market,²⁵ interviews with shuttle operators “**did not support this conclusion.**” Also “there is a lack of independent shuttle companies that might provide said service.”²⁶ Given the sum of this information, despite rosy projections of “aggressive” response to a new market, on the ground reality indicates that there is not much interest and therefore private sector service is unlikely to materialize.

RESPONSE: It is not true that the Draft SEIS does not account for the concerns raised by the comment in its Alternative 2B analysis. Under Alternative 2B, it would be cheaper for many households to drive rather than travel as walk-on passengers under Alternative 1 – No Action. It is anticipated that most people who currently walk on to the ferries will drive because it is anticipated to be cheaper.

Because DOT&PF is not a transit service, it cannot guarantee that bus service would be available. The Draft SEIS (Section 4.3.7.5) discloses the potential for transit or a private bus service to develop. If it were not developed, or until it were to develop, travelers without a vehicle would be affected and those affects are disclosed in the Draft and Final SEIS. Also, as mentioned in Section 4.3.7.5 of the Final SEIS, travelers would also have the option of renting a vehicle or taking a commuter flight.

This utter lack of concern for 45% of the traveling public is relatively recent. When an East Lynn Canal road was originally proposed, the state recognized the importance of providing public transportation, and the 1999 SATP stated the state would either provide ground transportation or enter into a contract with the private sector “to ensure reliable and convenient ground transportation” for walk-ons.²⁷

RESPONSE: The 1999 Southeast Alaska Transportation Plan (SATP) did not propose State involvement for shuttle service in Lynn Canal. The SATP did propose State involvement for service on Wrangell and Mitkof Island road systems (1999 SATP, pg. 36).

If bus service were provided, which is contrary to the evidence presented, it would not meet each Katzehin ferry, but only once or twice a day or perhaps every other day.²⁸ This is less than or at best equal to the current AMHS opportunity to travel. This means that all those passengers put into other people’s vehicles for the purpose of this analysis do not receive the attributed benefits of increased opportunity to travel and decreased travel costs currently assigned to them in the 2B analysis, rendering the analysis arbitrary and capricious.

RESPONSE: As previously mentioned, the Draft SEIS does not suggest that, for the road alternatives (2B and 3), ferry passengers would be put into other people’s vehicles. The analysis assumes that a good portion of the people who own vehicles would choose to drive those vehicles because of the substantially lower costs and shorter travel times. Walk-on passengers that do get rides with family or friends (or via private shuttles) would also benefit from improved travel times. If private shuttles were to go even once per day, that would be the same opportunity to travel as currently provided, and if they went more than that, the opportunity to travel would be improved. The State’s responsibility, however, is to provide transportation facilities between communities, not the transportation itself. Recognizing the change in travel patterns for walk-on passengers, the Final SEIS thoroughly discloses potential impacts to this segment of travelers in Section 4.3.7.5 for Alternative 2B.

A large segment of walk-on passengers consists of teams traveling in Southeast Alaska for school competitions including basketball, volleyball, track, cross-country, DDF, music, etc.²⁹ The DSEIS fails to analyze impacts to school districts for increased travel costs due to the necessity of traveling with vehicles large enough to transport teams, or else fly, should 2B be implemented. It is admitted that students travel to competitions by ferry and plane but

²⁷ 1999 SATP at 36

²⁸ 2014 Appendix EE at 129

²⁹ 2014 Appendix EE at 87 – 90

“flying students to events is expensive and is subject to weather.”³⁰ While implementing 2B would have the most impact on Haines and Skagway teams, it would also impact the rest of Southeast teams when they travel to Haines and Skagway for school activities. Currently the AMHS offers half price discounts for groups of 10 or more students to facilitate school activities.³¹ Since regional competitions are vastly important to all Southeast communities, these impacts must be assessed.

RESPONSE: Additional information about student transportation has been added to the Final SEIS (see Sections 4.3.5, 4.3.7, 4.4.5, and 4.4.7). The cost and logistics of transporting students to/from interschool events would change under Alternatives 2B and 3. The exact costs of transporting school teams is not known. The cost of student travel depends on many factors, such as the number of students and the need to overnight away from home. It is anticipated that some trips would cost less on the existing ferry system and some trips may cost more, compared to trips on the East and West Lynn Canal Highways. School districts may have to arrange for transportation between Katzehin and Juneau with a private transportation provider or fly out of Haines or Skagway instead of Juneau. As explained in Section 1.4.1.1 of the Draft SEIS, providing transportation for foot travelers is not a primary responsibility of DOT&PF. FHWA and DOT&PF acknowledge that student transportation between Lynn Canal communities would change as a result of the project if Alternative 2B or 3 were selected. Section 4.3.7.4 and Table 4-25 of the Final SEIS include updated user cost information.

Further, many passengers travel without a vehicle simply because many Lynn Canal community households do not own a vehicle. This is true for 9.5% of Juneau households, 7.8% of Haines households, and 3.5% of Skagway households.³² Clearly these individuals who are now served by walk-on ferry service will not benefit by implementing Alternative 2B. Impacts to this large percentage of Lynn Canal residents have simply been left out of the analysis.

RESPONSE: Effects to residents without vehicles have not been left out of the analysis. Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS and Section 3.1.4.1 of the *Socioeconomic Effects Technical Report* disclosed the number of households that do not have a vehicle and discussed the impacts to this population.

Also omitted are impacts to elders and the disabled, currently able to ride a ferry to and from Juneau.

RESPONSE: Based on this comment, additional information regarding impacts to elderly and disabled passengers has been added to Sections 4.3.7.5 and 4.4.7.5 of the Final SEIS and Sections 3.1.4 and 3.1.5 of the *Socioeconomic Technical Report* (Revised Appendix EE).

³⁰ 2014 Appendix EE at 90

³¹ Personal communication from Haines School Board President Anne Marie Palmieri

³² 2014 Appendix EE at 127

Like other passengers, elders and the disabled traveling by ferry would continue to need to make accommodations for traveling on the highway portion of their trip between Lynn Canal communities, whether that is from Auke Bay to Juneau or Katzehin to Juneau. Providing transportation for foot travelers is not a primary responsibility of DOT&PF. Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS describe how pedestrians and cyclists would be accommodated and includes an analysis of the potential for a bus or van service to develop in Lynn Canal.

Economic impacts will be felt by individuals traveling to Juneau to access the airport, because there is no reasonably priced place to leave a vehicle for an extended period of time.

RESPONSE: DOT&PF and FHWA do not deny that Alternative 2B would result in impacts to individuals traveling to Juneau to access the airport. Airport on-site long-term parking is \$14/day and \$75/week. Parking within a 5-minute walk from the terminal is \$5/day and \$100/month (2016). Based on this comment, additional information has been added to the Final SEIS in Sections 4.3.7.5 and 4.4.7.5.

Also impacts will be felt by individuals from one-vehicle households who are traveling alone without a vehicle when that vehicle needs to remain at home to provide work transportation. The number of one-vehicle households in Lynn Canal communities is sizeable: 35.1% of Juneau, 45.9% of Haines, and 34.1% of Skagway.³³

RESPONSE: The Draft SEIS disclosed the number of one-vehicle households. It is not accurate to expect that all of these one-vehicle household would be affected, because many one-vehicle households only have one person in them (or perhaps one driver). The *Socioeconomic Technical Report* (Revised Appendix EE) has been updated to recognize that people who share a car with others may be inconvenienced if one household member were using the vehicle to travel on Alternative 2B or 3.

To conclude, the NEPA requirement that an agency take a “hard look” at effects to the human environment has simply not occurred for 45% of existing AMHS walk-on passengers. In its analysis of assessing benefits, the DSEIS failed to accurately assess the costs of removing an important existing public transportation service.

RESPONSE: The Draft SEIS does assess effects to walk-on passengers. The road alternatives (2B and 3) represent a shift in the way transportation would be provided in the corridor—away from a primarily public transportation mode that would operate more like a public transit service, to a highway system where private vehicles would provide most of the transportation (shorter, publicly owned shuttle ferries would provide links connecting the roadways). DOT&PF and FHWA recognize that this shift would have had an effect on walk-on passengers. Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS described impacts to

³³ 2014 Appendix EE at 127

“Pedestrians and Bicyclists” for Alternatives 2B and 3, including walk-on passengers. The information included estimates of how many walk-on passengers might be affected and how they would have been affected, including the anticipated changes in fares.

The Draft SEIS did assess the cost of the changes to walk-on travel patterns associated with the highway alternatives. Under Alternative 2B, a substantial segment of current walk-on traffic would likely to convert to personal vehicle travel. Cost is currently a principal deterrent for ferry travel with a vehicle. As described in Table 4-27 of the Final SEIS, under Alternative 1 – No Action, the one-way out-of-pocket cost for a driver and 19-foot standard vehicle between Juneau and Haines is \$129.50. Under Alternative 2B, the one-way out-of-pocket costs for a driver and vehicle would be \$34.50. Adding vehicle operating costs to results in a total user cost of \$131.50 for the No Action Alternative and \$69 for Alternative 2B. This substantial decrease in the cost of travel between the No Action and Alternative 2B would prompt many more travelers to take their own vehicles. The cost to a walk-on passenger would be \$39 under Alternative 1 – No Action. Without ground transportation included (transportation to/from the Katzeihin and Auke Bay Ferry Terminals), under Alternative 2B, the cost would be \$5; with ground transportation included, the cost is projected to be between \$42 and \$60 which is about the same as or only slightly more than the cost of a walk-on passenger under Alternative 1 – No Action. Further, the substantial increase in overall traffic associated with Alternative 2B will represent many more opportunities for walk-ons to travel with family, friends, and acquaintances.

The vast majority of Lynn Canal region households have cars. For example, according to the U.S. Census Bureau’s 2010-2014 American Community Survey 5-Year Estimates, 7.6 percent of Haines households do not have a vehicle available, 33 percent have one vehicle, 37 percent have two vehicles, and 23 percent have three or more vehicles. In Juneau, 8.5 percent of households do not have a vehicle available, 35 percent have one vehicle, 39 percent have two vehicles, and 18 percent have three or more vehicles.

More generally, the purpose of investment in public transportation infrastructure is to improve transportation opportunities for the largest number of people in the most cost-effective manner possible. It is not practical or reasonable to expect infrastructure improvements to enhance travel opportunities for all travelers, from all locations, for all travel purposes. Replacing ferry service with a highway would require a change in travel behavior for some travelers, perhaps at some increased expense and inconvenience, while a much larger number of travelers would be able to travel at lower expense and greater convenience. The ten-fold increase in traffic from No Action to Alternative 2B would be the result of lower cost, more convenient travel opportunities for a much larger segment of the region’s population.

As described in the Draft SEIS at Appendix FF – *User Benefit, Life-cycle Cost, and Total*

Project Life Cost Analyses-Lynn Canal traffic under Alternative 1 – No Action and Alternative 1B is estimated at 285 and 378 annual average daily users in 2021, respectively. Even if half of that traffic was walk-on, and none of that walk-on traffic converted to personal vehicle use under Alternative 2B, walk-ons would only account for about 7 percent of the Alternative 2B’s 1,913 daily users in 2021. If half of that original walk-on traffic converted to personal vehicle use, only 3 to 4 percent of Alternative 2B traffic would be walk-on. Even doubling or tripling the user cost (to account for shuttle service costs and somewhat longer travel times) for this small segment of the total traffic would have no consequential effect on the results of the User Benefits Analysis.

In summary, regarding the impact of Alternative 2B on walk-on travelers, if the number of unaccommodated walk-on travelers were a significant portion of the traveling public, the private sector would respond with commercial service. If the number of unaccommodated walk-ons were relatively small, commercial service might be less convenient and more costly. It is DOTPF’s responsibility is to provide infrastructure that serves the largest number of travelers in the most efficient way possible, not fully serve the needs of every member of every segment of the traveling public.

Sections 4.3.7 and 4.4.7 of the Final SEIS provide additional information pertaining to walk-on passengers and potential impacts from Alternatives 2B and 3, which require travel by road over the majority of the trip between Juneau and Haines/Skagway.

Major Faulty Assumptions

If data presented in the DSEIS renders the assumptions made invalid, then conclusions drawn from those assumptions are arbitrary and capricious. A significant portion of the purpose and need analysis is based on meeting a travel demand that is not grounded in reality and is appropriately described in a hypothetical context.³⁴

A major faulty assumption is that there is a large unmet travel demand in the Lynn Canal corridor, and that “low” Lynn Canal Average Annual Daily Traffic (AADT) is an indication that the “AMHS is not meeting the travel demand in the Lynn Canal.”³⁵ Additionally the assumption is made that by increasing the opportunity to travel and decreasing travel times and user costs, travel will increase by as much as 500%.³⁶ The DSEIS states that travel opportunity, travel time, and user costs are “interrelated” elements of purpose and need³⁷ and will be further discussed in a later section. That said, **there is no statistical correlation between the 25 years of Lynn Canal travel data presented in the DSEIS and any of these “interrelated” purpose and need elements.**

RESPONSE: All traffic demand models attempt to predict future demand based on

³⁴ DSEIS at 4-4

³⁵ DSEIS 1-13

³⁶ DSEIS 1-10 and 1-11

³⁷ Id 1-10

assumptions and data available in the present. To the extent that they are predicting a future, unknown condition, all demand models are “hypothetical.” A Total Demand Model was developed as a starting point based on empirical data derived from actual travel conditions observed in Alaska and Western Canada from communities with similar geographic characteristics as Juneau. Based on the project team’s research, there were no indicators that travel behavior in Juneau (and for the most part Skagway and Haines) would differ substantially from that of other Alaskan and Canadian communities if full highway access were available. While Juneau is geographically isolated, it is not significantly more remote than other communities where data was collected. The project team made every effort to produce conservative forecasts, and reached the conclusion that Juneau residents would travel in a similar manner to other Alaskan residents. Even today, Juneau residents travel only slightly less on a per household basis than the average Alaskan household, indicating that not much difference exists. Vehicle ownership per capita in Juneau, Haines, and Skagway is also comparable to other Alaska areas.

Next, a travel choice model was used that calculated the probability of travel for a given alternative by comparing travel times, cost, and convenience against the total demand results. This travel choice model was validated against existing travel conditions within Lynn Canal using established statistical modeling procedures and was independently peer reviewed by a professor who specializes in traffic forecasting.

The commenter claims that 25 years of data from AMHS are evidence that “there is no statistical correlation” to the interrelated purpose and need elements. While AMHS has tried various service changes to refine service, including price changes, schedule changes, fast ferries, etc., these service refinements have never been implemented together in a fully developed alternative. None of the tests, replicate the improvements proposed in the SEIS. And none of the service changes was run long enough to provide a true test. It is not within accepted modeling practice or statistical analysis to rely on one or two years of data to surmise a statistically valid correlation (or the lack of one). Furthermore, tweaking one or two variables in a complex system and only running them for a short time, does not equate to a test of the demand that would develop if one of the build alternatives proposed in the SEIS had been implemented.

Opportunity to travel

Table 1-1 of the DSEIS presents 25 years of actual vehicle and passenger volumes from 1988 through 2012. This large and important database represents actual travel patterns with varying levels of travel opportunities, longer and faster travel times, and standard and reduced user costs. In 1988, a total of 266 Lynn Canal AMHS roundtrips were offered with a resulting AADT of 81 vehicles and 117,045 passengers. By contrast, in 2007, when there was 63% more opportunity to travel, (434 roundtrips versus 266) AADT decreased by 12% to 72, and passenger volume decreased by 33% to 90,433. If the assumption that increased demand will result from providing significantly more opportunity to travel is valid, then

data from 2007, which offered the **most** Lynn Canal trips of any database year should have the most Lynn Canal traffic. Instead, significantly increasing the opportunity to travel resulted in 12 and 33% less vehicle and passenger traffic in 2007 respectively, than 1988. Similarly, the year with the most volume, 1991, had only 66% of the travel opportunity provided in 2007, yet had 24% more vehicle volume and 46% more passenger volume. Even the year with the least travel opportunity, 1989 with 240 round trips, had more passengers and vehicles than 2007. This decline in ridership occurred during a period of regional population growth exceeding 30%.³⁸

Another example showing this correlation to be false occurred between 2011 and 2012, when roundtrips decreased in frequency by 14% (from 344 to 296). The DSEIS assumption would predict decreased travel, yet actual traffic volumes show small increases. These are just a few of many examples that illustrate that 25 years of actual Lynn Canal data does not support the underlying assumption of a correlation between increasing opportunity to travel and increased demand.

RESPONSE: Numerous factors go into people's decision to travel. Pulling individual years out of past AMHS travel data is not a valid prediction method. It is misleading and an inaccurate use of the data. It is just as invalid to pick individual years to demonstrate a positive correlation in the data (as an example, between 1989 and 1991, round trips increased from 240 to 290 and passenger demand increased from 115,742 to 131,865—numerous other hand-picked years could be identified incorrectly suggesting a correlation). The reason this approach is invalid is that frequency of service is not the only factor in people's decision to travel—other factors include costs, schedule, or economic conditions in the given year cited. Each of these factors would need to be known to make an accurate assessment. Moreover, the supply in capacity varies from year to year. Inconsistent supply in capacity makes it difficult for the traveling public to plan. When the variable being tested is not consistent long enough for the public to plan and respond, drawing conclusions from the data, as was done by the commenter, is suspect.

The traffic demand estimate was developed based on empirical data derived from actual travel conditions observed in Alaska, British Columbia, and Yukon from communities with similar geographic characteristics as Juneau. It was validated against existing travel demand by ferry within Lynn Canal. To forecast traffic demand for each of the alternatives, the model considered various factors relating to travel time, cost, and convenience of travel.

In developing the forecast, the project team looked at changes in travel options in Lynn Canal during the periods noted above. Ferry ridership demand changes occur for various reasons. The travel choice model is sensitive to several variables including: travel time, travel cost, and frequency of travel. The model was calibrated to match empirical evidence from 1997-1998 and 2004-2007 as closely as possible. The evidence suggests that cost and

³⁸ DSEIS 1-13

convenience of travel are more likely to affect travel behavior than ferry travel time when compared with existing service levels.

In response to comments, the project team modified one of the model variables (i.e., the service index) from its initial formulation to reflect the reduced effect of travel times on the forecasted demand. In accordance with standard modeling procedure, the model was calibrated to base year conditions (see Revised Appendix AA). Given that the model did a good job of matching existing Lynn Canal ridership means that the travel choice model was reasonably validated and applied.

Travel Time

Similarly, the DSEIS claim that generally, “the longer the travel time, the less the actual demand,”³⁹ is not only not supported, but is refuted by historical data. **Table 1-1 shows there is absolutely no correlation between decreasing travel time and increasing ridership.** Travel time substantially decreased in 2004 and 2005 when the fast ferry M/V Fairweather operated in the Lynn Canal as the day boat.⁴⁰ A fast vehicle ferry cuts mainline travel time by a whopping 45% or by 3.2 hours between Haines and Juneau⁴¹ and by an even more whopping 55% (5 hours) for Skagway/Juneau travel.⁴² Despite this substantial time-savings, during this 2-year period of fast vehicle ferry service, AMHS Lynn Canal traffic was well below average traffic volumes for the 25-year analysis period presented in the DSEIS. That is, when service between Juneau and Haines, and Juneau and Skagway took 45 to 55% longer due to travel on conventional ferries, the average passenger volume was 104,811 as compared to the fast ferry passenger volume of 97,285 in 2004 and 91,293 in 2005, showing decreases in travel of 7 to 13%.

Similarly, AADT for the 25-year analysis period was 77, and fast ferry AADT fell below this 25-year average with 74 in 2004 and 70 in 2005 – or 4 to 9% less demand. Additionally, 2005 provided the second most opportunity to travel in the 25-year database. Coupling increased travel opportunity with decreased travel time still shows a lack of increased traffic. In fact, 2005 ranks 21 out of 25 for traffic volumes.

Two years of actual data shows the assumption that there is a correlation between decreased travel time and increased demand to be utterly false. This is corroborated, but buried deep inside an appendix: “AMHS ridership data indicated that while the Fairweather reduced the travel time and increased the vehicle capacity to Haines and Skagway, there was little change in overall demand for travel in the Lynn Canal during this time period.”⁴³ The data shows that people actually enjoy their time spent aboard the AMHS, and the fallacy that “faster is better” will be discussed further in a later section.

RESPONSE: As discussed above, people’s travel decisions are complex. Pulling individual

³⁹ DSEIS 1-11

⁴⁰ Id.

⁴¹ Id.

⁴² Id.

⁴³ 2014 Appendix AA pdf page 112

years out of past AMHS travel data is not a valid prediction model. It is misleading and an inaccurate use of the data. Numerous factors go into people's decision to travel and the interplay between those variables is complex. Two years of data is insufficient to draw conclusions of a correlation.

The commenter's use of the quote: "AMHS ridership data indicated that while the *Fairweather* reduced the travel time and increased the vehicle capacity to Haines and Skagway, there was little change in overall demand for travel in the Lynn Canal during this time period." The very next sentence indicates that: "It is noteworthy, however, that while total travel demand didn't change during this time, there was a noticeable increase in demand between Juneau and Skagway due to the direct service provided by the *Fairweather* fast ferry, which greatly reduced travel times between the two communities."

These quotes are not, as the commenter suggests, a corroboration of their supposition, buried deep in an appendix. The section in question is discussing the effort to calibrate the travel model and is not a finding that there is lack of correlation between travel time and demand. To the contrary, the travel modelers demonstrate a strong correlation between reducing travel time and responsiveness of demand. Appendix AA indicates, "The travel choice model addresses the issue of latent demand in the Lynn Canal corridor. Latent demand is unrealized demand for travel that is currently suppressed (i.e. trips not made today) because of high travel time and costs." (See Appendix D, Choice Models, in Draft SEIS Appendix AA).

Finally, the commenter makes a leap in logic to correlate raw travel demand data correlating it to their reasoning (i.e., with enjoyment in riding the ferry). As stated earlier, most travelers prefer shorter travel times (fast ferry) to longer travel times (conventional ferry), all other things being equal.

User Costs

The assumption that decreasing user costs will increase traffic demand did not occur in 2011 when discounted fares were tried and then discontinued because State revenues decreased without significantly increasing ridership.⁴⁴ In fact looking at the travel demand for 2011, with decreased fares and 11% more opportunity to travel than the 25 year average, travel volume was down by 11% from the vehicular average and 22% for passengers. Further, for this year of decreased fares, travel opportunity was above average, yet passenger volume was the second lowest on record and vehicle volume was the third lowest on record for the 25-years of data presented in the DSEIS.⁴⁵

RESPONSE: As discussed above, people's travel decisions are more complex than is described in the comment. Pulling individual years out of past AHHS travel data is not a valid prediction model. It is misleading and an inaccurate use of the data. Numerous factors

⁴⁴ 2014 Appendix CC at 25

⁴⁵ DSEIS Table 1-1

go into people's decision to travel. Pulling data from one year is insufficient to test the commenter's hypothesis.

To conclude, cumulative impacts from faulty assumptions and ignored data preclude the required "hard look" at effects to the human environment required by NEPA.

RESPONSE: The commenter has not documented "faulty assumptions." The commenter selected a data set too small to make statistically valid correlations and tried to present them as suggestions that the traffic forecast in Lynn Canal is faulty. It is not within accepted modeling practice or statistical analysis to rely on one or two years of data to surmise a statistically valid correlation (or the lack of one).

DOT&PF and FHWA did not rely on "faulty assumptions," nor did they "ignore data." The demand estimate used for this project was developed based on empirical data derived from actual travel conditions observed in Alaska and Western Canada from communities with similar geographic characteristics as Juneau. The model starts out defining a condition that the modelers called "unconstrained demand." This level of demand predicts how many people would want to travel between Juneau and Haines/Skagway if there were a road the entire way. This predictive condition was based on the assumption that people in Juneau, Haines, and Skagway would exhibit similar travel patterns given the opportunity to travel by road as other similarly situated communities.

Based on the project team's research, there are no indicators that travel behavior in Juneau, Skagway, and Haines would differ substantially from that of other Alaskan and Western Canadian communities if full highway access were available. Based on the data collected, the project team is confident that Juneau residents would travel in a similar manner to other Alaskan residents. Even today, Juneau residents travel only slightly less on a per household basis than the average Alaskan household, even though they do not have full road access. Vehicle ownership per capita in Juneau, Haines, and Skagway is also comparable to other Alaska areas.

The forecast only used the unconstrained demand as an upper bound to bracket the overall demand in the corridor. Each forecast, for each of the alternatives, scales down from the unconstrained demand based on factors of cost, travel time, schedule convenience, etc. Using such factors to predict traveler's choices and behavior amongst competing alternatives is a common modeling practice and is used in nearly every traffic model. By factoring the demand down from the unconstrained demand based on costs, travel time, and convenience, the model predicts reasonable estimates of travel behavior based on the relative merits of the alternatives.

Moreover, more than one approach to predicting future travel behavior was used by the project team. Two methods were selected as being most representative of likely conditions

along Lynn Canal. Each of these two different models was developed independently and resulted in similar estimates of travel volume along Lynn Canal. These approaches were developed by travel modelers at Fehr & Peers. This firm was specifically identified and hired for its expertise in the travel modeling field, and its approach and results were peer reviewed by an independent university professor with expertise in travel modeling and travel behavior prior to the results being accepted for use in the Draft SEIS. The methodology and results of both approaches are fully disclosed in the associated technical report and summarized in the Draft SEIS.

Faulty Methodologies

The JAI analysis continues to use faulty methodologies in addition to the erroneous assumptions just discussed. Methodologies that substantially bias the analysis to selecting a road alternative include traffic forecasts, user cost/benefit analysis, and not realistically incorporating or assigning a positive value to the AMHS service of accommodating walk-on passengers and unaccompanied freight vans. Speculative traffic forecasts, misapplied user cost/benefit analysis, and failure to include a meaningful analysis of walk-on traffic bias the comparison of alternatives, rendering the comparison utterly meaningless in terms of NEPA.⁴⁶

Traffic Forecast and Travel Demand

The accuracy of the traffic forecast presented in the DSEIS is suspect for several reasons. Firstly, with the benefit of hindsight, it is a statement of fact that **not one prior traffic forecast presented in any previous JAI documents has proven to be accurate**. Based on this track record, it is illogical to assume this DSEIS traffic forecast will be accurate. Secondly, this traffic forecast is based on the concept of “unconstrained demand” which is a hypothetical construct, as will be discussed later. Thirdly, flaws in the methodology inflate anticipated AADT for road alternatives. And lastly, historical traffic demand has remained consistent and flat, despite many attempts to incorporate changes that were – and still are - predicted to increase ridership, as previously discussed.

Previous Traffic Forecasts

If the DSEIS chooses to rely on predictions of increased demand rather than data that predicts flat demand, it must demonstrate that its current ability to predict demand will be more accurate than its past ability to predict demand. That is, in the table entitled “1996 Estimated Annual Traffic Volumes”, the 1997 Juneau Access DEIS predicted that with improved marine access, Lynn Canal AMHS user demand would be 77,000 vehicles in 1996 or 211 ADT.⁴⁷ In 1998, regular Lynn Canal day boat service began, substantially improving marine access, with daily same time arrivals and departures.⁴⁸ Yet the 1998 actual ADT was 81, only 38% of the forecasted vehicle volume. In 2004 marine access again improved dramatically with the addition of fast ferry service that halved travel time.⁴⁹

⁴⁶ 40 CFR 1500.1(b), and 1502 at .1, .14(a), and .24

⁴⁷ 1997 DEIS at 2-7

⁴⁸ DSEIS at 1-10

⁴⁹ Id.

Yet 2004 ADT was 74⁵⁰, only 35% of the volume forecast. Instead of coming to the conclusion that none of the predicted volume increases have occurred, and therefore Lynn Canal AMHS really does meet the demand, the 2014 DSEIS relies on yet another speculative traffic forecast.

RESPONSE: Taking a forecast prepared in 1996 for a specific alternative and comparing it to vastly different conditions in select years many years later is misleading. The build alternatives identified and forecast in 1996 were not implemented and so a valid post-construction evaluation of the accuracy of forecasts was not possible. The traffic forecast of Alternative 1 – No Action from that time also cannot be meaningfully assessed, as operations in Lynn Canal have change from year to year. To suggest that other improvements and operational tests made in Lynn Canal should somehow have generated the same traffic forecasts as the 1996 build alternatives is inaccurate. Unless the same alternatives identified in 1996 were built and operated the same, comparisons are meaningless. Moreover, modifications made to a schedule or fare, and only run for a year or two, would not lead to a fair comparison of the forecast estimate. As discussed above, pulling one or two years of data to try to prove a correlation is inaccurate. To do so on alternatives that were not even implemented is misleading.

The 2005 SDEIS admits, although buried in an appendix, that traffic demand projections are based on speculation rather than hard data: the “demand model is a simplification of a very complex transportation demand environment.”⁵¹ Measuring unmet traffic demand is “difficult” and “imprecise”⁵² and fraught with “uncertainty.”⁵³

RESPONSE: The 2005 and 2014 models are not “based on speculation rather than hard data.” Furthermore, the model is not “fraught with uncertainty.” All traffic demand models attempt to predict future demand based on assumptions and data available in the present. To the extent that they are predicting a future, unknown condition, all demand models have “uncertainty.” The forecasts produced on the JAI Project use the best available data and traffic demand forecasting models that represent the latest thinking and state-of-the-art practice in transportation planning.

While not nearly as forthcoming regarding the limitations of traffic forecasting, the 2014 DSEIS also admits to problems with forecasts in an appendix: “It is important to recognize the *complexity* and *uncertainty* associated with predicting traffic in Lynn Canal for eight different alternatives over a 30-year forecast period.”⁵⁴ It is even more complex for this situation because “there is no established method for determining total demand for highway travel from a community without road access.”⁵⁵ A new (and untested) model was created

⁵⁰ DSEIS Table 1.1

⁵¹ 2005 Appendix C at 25

⁵² 2005 Appendix C at 15

⁵³ 2005 Appendix C at 16

⁵⁴ 2014 Appendix AA at 7, emphasis added

⁵⁵ Id at 13

using household survey data and highway traffic volumes.⁵⁶ The appendix states that in an ideal situation, household survey data would be calculated from Alaskan households with similar geographic characteristics and similar populations as Juneau.⁵⁷ But the only Alaskan households in the database are from Anchorage and Fairbanks. Neither city has similar geography or population to Juneau⁵⁸ and both have existing road access. The rest of the database is from Idaho, Montana, Wyoming, Colorado, North and South Dakota, Nebraska, Kansas, Oklahoma, and Utah,⁵⁹ tossing the concept of similar geographical characteristics out the window. While stating that the ideal database would be X, it is in fact Y, casting doubt on the reliability of the forecast model. That is, the model is only as good as the data, which is admittedly not “ideal.” Given this model was created specifically for this project, it cannot be tested for accuracy, except after the fact. This untested model, where complexity and uncertainty are admitted limitations, arrives at 1240 as the number to be used for unconstrained demand.

RESPONSE: The total demand estimate used for this project was based on empirical data derived from actual travel conditions observed in Alaska, British Columbia, and Yukon from communities with geographic characteristics that are similar to those in Juneau. The commenter only reports a portion of the data collected. The model input analysis also includes Anchorage, Fairbanks, and Whitehorse (as regional centers like Juneau), and includes analysis of similar coastal communities, including Prince Rupert and Port Hardy, British Columbia; and Seward, Homer, Valdez, Haines, and Skagway, Alaska (see Appendix AA, *Traffic Forecast Report*). In terms of travel demand, these communities are very similar, as each has a limited number of road access points. For example, Anchorage has one road connection going north and one going south, while Valdez has only one road connection. The travel model is not “even more complex” because of Juneau’s lack of road access. The *Revised Traffic Forecast Report* states that “two different models were used to ensure a reasonable demand forecast, since there is no established method for determining the total demand for highway travel from a community without road access.”

It is untrue to suggest that the model is “untested.” The total demand estimate developed for this project was based on empirical data derived from actual travel conditions observed in Alaska, British Columbia, and Yukon from communities with geographic characteristics similar to those in Juneau. In fact, there were several Total Demand Model structures considered by the study team. Two methods were selected as being most representative of likely conditions along Lynn Canal. Each of these two different models were developed independently and resulted in similar estimates of travel volume along Lynn Canal. These approaches were developed by travel modelers at Fehr & Peers. This firm was specifically identified and hired for its expertise in the travel modeling field, and its approach and results were peer reviewed by an independent university professor with expertise in travel modeling

⁵⁶ Id.

⁵⁷ Id.

⁵⁸ 2014 Appendix AA pdf page 94

⁵⁹ Id.

and travel behavior prior to the results being accepted for use in the Draft SEIS.

The results of the model were validated against the existing transportation system. In other words, as is standard modeling practice, the team developed the model and tested it to see how well it predicts travel on the existing system for a known year. Because the model is able to predict existing traffic within an acceptable range, it is considered valid as a starting point for use in predicting future conditions. As previously discussed, this is a standard approach to truth-testing a model and its assumptions. The methodology and results of both approaches are fully disclosed in the associated technical report and summarized in the Draft SEIS.

Comparing the 2006 EIS traffic forecast model with the 2014 traffic forecast model shows wide discrepancies between the two. For example, for Alternative 2B, the 2014 forecast predicts 220% more traffic in the first year and 123% more traffic in year thirty than the 2006 forecast model.⁶⁰ The wide difference between these predictions indeed shows that traffic forecasting is “imprecise” and fraught with “uncertainty”. Yet the 2014 DSEIS analysis relies on these traffic forecast numbers. Invalid assumptions generate unreliable data, which renders the conclusions arbitrary and capricious.

Another example showing the unreliability of forecasts is the discrepancy between Lynn Canal corridor passenger profiles. That is, the 2006 Forecast Report estimates 24% of East Lynn Canal traffic would come from outside the Lynn Canal area. The 2014 forecast claims this will only be 8%,⁶¹ or a third of what was expected in 2006.

Since past forecast models failed to accurately predict current demand, there is no reason to believe the projections used in the 2014 DSEIS are anything but more speculation, particularly in the context of how different the forecasts are for the anticipated demand for the preferred alternative between the 2006 and 2014 JAI documents. As will be explained later, the 2014 flawed forecast, biases the selection of the preferred alternative, and violates NEPA.⁶²

RESPONSE: The forecasts completed for the project vary between 2006 and 2014 for a number of reasons. First, they are based on different methodologies. Second, they were produced nearly 10 years apart. And third, they have different end years. Each model took into account the most current factors and data available at the time they were produced and each used a valid methodological approach.

DOT&PF considered using the same approach as was done in 2006, which was based on latent demand derived from household surveys, but determined the current approach would provide more accurate results. Commenters on the 2006 EIS indicated that the household

⁶⁰ 2014 Appendix AA at 30

⁶¹ 2014 Appendix FF at 87

⁶² 40 CFR 1500.1(b), 1502.1, 1502.24

surveys overstated demand and that there was a lack of data to support the number of trips made by non-Lynn Canal residents.

Updating the household survey was considered but there was a substantial concern about the possibility for the survey results to be tainted by the notoriety of the project. Given the small sample population and the strong feelings related to the project (both for and against) there was concern that respondents might try to sway the results and not give accurate responses. Moreover, asking respondents how many times they might use a certain alternative, given varying travel times and costs, is extremely difficult for most people to accurately estimate.

Again, the commenter relies on a statistically invalid method in their example to try to make their argument. It is unacceptable practice in modeling or statistics to take one year of data and use it to make accurate predictions or correlations. Pulling one input assumption, from two different methodologies, conducted by two different modelers, years apart and finding a difference does not imply that the modeling is faulty. As is disclosed in the technical studies, and cited by the commenter, predicting the future is difficult. Modelers use the best available data, make assumptions, test those assumptions to validate the model, and do their best to make reasonable predictions. Such an approach was taken to produce the current forecasts. The forecast was prepared by professionals with expertise in their field, and reviewed by an independent professor who specializes in traffic forecasting. Nothing about the methodology or approach was “flawed,” “biased,” “fraught with uncertainty,” or “based on invalid assumptions.”

User Costs and Benefits Analysis

The EPA criticized the 1997 DEIS for use of an AASHTO methodology that was not designed to compare road travel with marine travel: “We feel that a direct, side-by-side comparison of the economic modeling results cannot be made because the methodology employed was not designed to evaluate ferry systems.”⁶³ NEPA requires an agency “to respond in a substantive and meaningful way” when given specific criticism for using an inappropriate methodology.⁶⁴ Yet 17 years later, the DSEIS analysis again relies on this same, flawed methodology.

RESPONSE: The Draft SEIS does not rely on the user benefit Analysis, but includes it. In addition, the Draft SEIS includes a Life Cycle Cost Analysis, a Total Project Life Costs, and a User Cost/Benefit Analysis.

Necessary information regarding the applicability and serious limitations of the AASHTO methodology is hidden in the 2005 appendices. Appendix V clearly states that the AASHTO user benefit model was never intended to be applied to a new road in an

⁶³ 1997 EPA comments at 7

⁶⁴ Council on Environmental Quality “40 Most Asked Questions Concerning CEQ’s NEPA Regulations,” 46 Fed. Reg. 18026 -18034 (March 23, 1981)

undeveloped area; but rather to evaluate options in an existing road system.⁶⁵ Since Alternative 2B would be a new road in an undeveloped area, the model does not apply and should not be used, period. 2005 Appendix E confirms this: “The AASHTO formula was designed primarily for evaluating highway projects that make **marginal** changes to **existing** highways or highway networks. . . . Most of these improvements cause only small changes in costs and traffic.”⁶⁶ Clearly this model is still as inappropriate as it was when we criticized its use during the 2005 and 2006 JAI NEPA process.

RESPONSE: Appendix FF acknowledges the challenges of employing a traditional American Association of State Highway and Transportation Officials (AASHTO) methodology in evaluating projects involving modes of transportation other than roads. However, the AASHTO methodology, customized for the JAI Project with the specific modifications noted in the User Benefit Analysis, remains appropriate and the best available approach for measuring user benefits associated with each alternative. Further, sensitivity analysis allowed for testing of model inputs and results most closely related to problematic aspects of the AASHTO methodology, such as frequency delay costs.

Again in 2014, AASHTO methodology limitations are acknowledged in the appendices. “Shortcomings” are noted for “projects that involve modes of travel other than roads and highways, or that would cause large changes in traffic or costs of travel. The Juneau Access project has all of these characteristics.”⁶⁷ Even though the 2014 analysis slightly modifies the AASHTO methodology, the results are still flawed, emphasizing road benefits and attributing costs to ferry travel that aren’t really costs at all, but actually benefits, as previously discussed.

The methodology attributes a cost (as a percentage of wages that could have been earned) to traveling in the Lynn Canal whether or not that traveler is a wage earner (e.g., a retiree or a juvenile). With this model, time becomes money and faster travel becomes a benefit that saves “user costs.” That is, in addition to actual costs such as fares and gasoline, costs of time are also assigned.⁶⁸ But data shows that most passengers actually enjoy time spent on the ferry and use that time to relax, view the scenery, and meet and talk to new people.⁶⁹ Ferry passengers “are traveling primarily for pleasure”. In fact, pleasure travel accounts for 3/4 of summer Lynn Canal traffic and 2/3 of year round traffic.⁷⁰ Even though it is suggested in previous JAI analysis that “pleasure travelers may not consider time spent in certain types of travel **as a cost, but rather as a benefit**”⁷¹ the methodology used in the current DSEIS analysis still “charges” for time spent on the ferry under the concept of “costs of travelers time.”⁷² When this artificial charge for a perceived benefit becomes an attributed cost and gets added to the ferry fare, the cost of ferry travel increases

⁷¹ Id., emphasis added

⁷² DSEIS at 4-5

dramatically, biasing the analysis. Therefore, when comparing the purpose and need element of decreasing user costs, ferry alternatives are designed to lose because the methodology artificially inflates those costs. The only admission of the benefits of ferry travel compared to road travel is in an appendix: “All else being equal, people would rather pay slightly more for ferry service than driving. This reflects the lower-stress nature of ferry travel.”⁷³

RESPONSE: While it is true that people value travel times differently based on various factors: work versus pleasure, weather conditions, etc., assigning costs in this way is a standard methodology to estimating travel. While the commenter suggests that people value their time on the ferry, the same could be said for driving. Many people drive for pleasure, and surely there would be people who would derive pleasure from driving a new road.

The suggestion by the commenter that an “artificial charge for a perceived benefit was added to ticket cost of the ferry,” thereby “biasing the analysis,” is incorrect. To the contrary, recognizing that other activities can be accomplished during the ferry ride, and based on indications that ferry travel time is not as onerous as automobile travel time, the model gave 20 percent less “weight” to the ferry travel time compared to automobile travel time. In other words, the model coefficient was adjusted to account for the benefits described by the commenter. This relationship was derived from other regions that have ferry service and driving options and was used to validate the travel model results to existing ferry demand within the corridor. Similar practices are employed in other mass transit modes (e.g., commuter rail) where other activities can be accomplished during the trip, effectively reducing the “costs” perceived by the user.

Regarding the cost/value of travel time, assigning dollar costs to travel time is a reflection of the fact that all time has value. And, all time has a cost in terms of trade-offs with other ways that time could be spent. If ferry travel were purely a benefit, then slower trips would have greater value than faster trips. Clearly, many Lynn Canal ferry travelers enjoy aspects of the ferry ride, but it is also true that most travelers prefer shorter travel times (fast ferry) to longer travel times (conventional ferry), all other things being equal. It is also true that some travelers would prefer driving their own vehicles to riding a ferry over the same route. In addition, most travelers are using a Lynn Canal ferry to travel between Haines/Skagway and Juneau and are not taking the ferry trip as a purely pleasure trip.

Finally, the user benefits analysis is only one analysis of many used to identify and disclose meaningful differences among the alternatives. In addition to user costs, DOT&PF and FHWA have considered net present value, lifecycle costs, total project life costs, construction costs, maintenance and operations costs, out-of-pocket user costs, and breakeven analysis to provide a well-rounded picture of the economic tradeoffs amongst the alternatives.

⁷³ 2014 Appendix AA pdf page 116

By using a methodology not designed for comparing a new road to an existing ferry system, the DSEIS creates artificial costs for ferry travel that do not exist in reality. The methodology further skews the comparison in favor of road-building by not assigning time costs for road travel that are reasonably foreseeable, such as delays for winter driving conditions and predicted road closures. Nor does the analysis account for the fact that walk-on passengers do not have to check-in 1 to 2 hours prior to ferry departure, wrongfully attributing wait times to the 45% of marine highway passengers that travel without a vehicle,⁷⁴ as previously discussed.

RESPONSE: The user benefits analysis was based on the traffic forecast. The Traffic Forecast Model was specifically designed to compare the travel characteristics among the marine and road/ferry alternatives. It should be noted that all of the alternatives include roads at both ends with a ferry link in the middle. The length of the road link versus the ferry link varies, as does the speed of the ferries. For Alternatives 2B and 3, the ferry links would be short shuttle ferries, with the greatest length traversed via road in a private vehicle, while the other alternatives have a long ferry link with relatively short road links at each end.

The “time costs” for roads are accurately assessed in the travel model upon which the user benefits relies. Road travel times are based on the posted travel speed and are consistently applied to all alternatives. Ferry travel times were based on average operating conditions, observed wait and loading times, and AMHS policies (e.g., check-in times). Similar to road travel being delayed by weather, ferries can also be delayed by weather as well as break downs, extended time for loading/unloading or mechanical delays. No time penalty has been added to those alternatives either. All alternatives are forecast based on an annual average basis, and all alternatives were treated equally. DOT&PF and FHWA have disclosed the impacts of potential road closures and have mitigated those affects to the extent that travel delay should be minimized.

By AMHS policy, walk-on passengers have the same two hour check-in time as vehicles in Juneau and one hour in Haines and Skagway. The purposes of the early check-in is to avoid delayed departures caused by passengers checking in right before scheduled departure.

Of note, the source document of the 45 percent walk-on rate is dated 2000 and is no longer accurate. A review of the 2000 and 2015 AMHS *Annual Traffic Volume Report* (travel within Lynn Canal) indicates a 14 percent reduction in vehicle travel and a 26 percent reduction in pedestrian travel. The 2015 walk-on percentage within Lynn Canal is estimated to be 34 percent in summer only and 30 percent for the year.

For the user cost analysis, a “user” is defined as a 19-foot vehicle carrying 4 passengers.⁷⁵ This definition defies all logic because 45% of all “users” do not travel with a vehicle, as

⁷⁴ 2000 McDowell at 65

⁷⁵ DSEIS at ES-7

established earlier in our comments. In the real world, a “user” is “a **person** who uses.”⁷⁶ Given that a vehicle cannot be a “user”, the analysis proceeds based on a vehicle carrying a mythical family of 4, when actual travel patterns show local vehicle occupancy of 2.2⁷⁷ and data shows an average Juneau household size of 2.6.⁷⁸ Basing all cost comparisons on this *mythical* family when *actual* family size is much smaller, and *actual* travel statistics show about half of this vehicle occupancy rate, serves to overstate user costs on ferries, and underestimate user costs on roads, biasing the analysis. This family of 4 analysis is used even though the DSEIS admits that each vehicle on 2B would carry an average of 2.3 people.⁷⁹

RESPONSE: A user was not “defined as a 19-foot vehicle carrying 4 passengers.” Just as suggested by the commenter, users are travelers who “use” the transportation system (in this case either ferries or roads). Fares reported in the Draft SEIS, which reference a family of four, were included in the Draft SEIS only as an example. User costs and user benefits were calculated for all users, not just a “mythical family of four” The methodology (User and Non-user Benefit Analysis for Highways) upon which the user costs and user benefits were computed clearly defines these terms. The methodology suggested by the commenter is not how the analysis was conducted. See the “Methodology and Data” section of Appendix FF for an accurate description of the methodology employed.

Additionally, according to the Government Accounting Office (GAO), most departments of transportation do not use this type of cost benefit analysis because “measuring all the potential benefits and costs of proposed highway and transit investments can be challenging and subject to several limitations and sources of error” including: not figuring in all potential benefits, accurately predicting travel demand, and “routinely” omitting benefits to non-car owners.⁸⁰ According to this GAO study, even if the methodology were used appropriately, there still would be significant problems with relying on the numbers it generates. In our past JAI comments, LCC has argued that this seriously flawed methodology should be dropped, and we again make the same point.

RESPONSE: The purpose of the user benefit analysis conducted as part of the Draft SEIS was to determine which alternatives serve the largest number of travelers at the lowest possible cost. It is but one tool used to understand the economic implications of each transportation improvement alternative, along with Life Cycle Costs (Total and Net Costs), Total Project Life Costs (Total Funds and State Funds, Total and Net Costs for each), Total Project Life Costs less Residual Values per Vehicle (Total Funds and State Funds, Total and Net Costs for each), and others. A total of 15 different metrics are used in the Draft and Final

⁷⁶ Oxford Dictionary, 1998 edition

⁷⁷ 2014 Appendix FF at 64

⁷⁸ DSEIS at 3-21

⁷⁹ DSEIS at 4-45

⁸⁰ January 24, 2005 Government Accounting Office report, GAO – 05 –172, “Highway and Transit Investments: Options for Improving Information on Projects’ Benefits and Costs and Increasing Accountability for Results.”

SEIS to assess the economic characteristics of the alternatives, from a stand-alone perspective and in relation to one another.

The Juneau Access User Benefit Analysis was conducted in accordance with the methodology established by AASHTO, with needed modifications to account for the unique challenges associated with measuring traveler costs and benefits across the wide range of multi-modal transportation alternatives considered in the SEIS. Because of the complexity of the JAI Project economic analysis, a wide range of metrics were developed and considered by DOT&PF and FHWA.

Regarding practices elsewhere in country, in addition to the statement quoted in the comment, the Government Accountability Office (GAO) report also notes that: “Officials we surveyed and visited said they considered a project’s potential benefits and costs when considering project alternatives but often did not use formal economic analyses to systematically examine the potential benefits and costs.” GAO goes on to note: “Nevertheless, the increased use of economic analysis, such as benefit-cost analysis, could improve the information available, and ultimately, lead to better-informed transportation investment decision making.” Recognizing that user benefit and life cycle cost analyses do not capture a wide range of other potential household, commercial, industrial, and community benefits associated with improved Lynn Canal access, the DOT&PF and FHWA effort to include a broad set of economic metrics in the JAI Project SEIS is entirely consistent with GOA’s recommendation to employ economic analysis in transportation investment decision making.

Finally, the DSEIS does not quantify known external costs of a road including - but not limited to - increased public safety and emergency response costs, loss of wildlife, loss of wilderness values, etc. These are real costs of roads, some of which can be quantified, and others must at least be incorporated into the decision-making process. “When a cost-benefit analysis is prepared, discuss the relationship between that analysis and any analysis of unquantified environmental impacts, values and amenities. For purposes of complying with the [National Environmental Policy] Act, the weighing of the merits and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis and should not be when there are important qualitative considerations.”⁸¹ This means that qualitative considerations regarding ferry travel should have been considered as merits – but were not, and it also means that the external costs of public safety, emergency response, pollution, wildlife, and wilderness values that “are not included”⁸² should have been included. In the context of NEPA, the DSEIS fails to weigh the true merits and drawbacks for each alternative. Instead, incorrect assumptions, misused data, and obvious shortcomings of models and methodologies preclude the required “hard look” at environmental effects in the context of NEPA.

⁸¹ 40 CFR 1502.23

⁸² 2014 Appendix FF at 2

RESPONSE: DOT&PF and FHWA have disclosed the environmental consequences of the proposed alternatives in the Draft and Final SEIS, including the indirect effects described in the comment. EIS documents do not typically present impacts to the environment in financial terms. The “costs” to the physical, natural, and social environment are the main topic of the entire EIS, however, and it discloses all known impacts, both beneficial and adverse, as required by NEPA. A cost benefit analysis that attempts to compute a dollar figure for the types of impacts identified above would be highly speculative. Because the indirect impacts have been disclosed quantitatively where possible, and qualitatively elsewhere, FHWA has met its requirements under NEPA. Commitments to manage, mitigate, or avoid environmental damage are part of the project and its costs, as disclosed in the SEIS.

Purpose and Need

Purpose and need has not changed from the 2006 analysis. As stated in previous LCC JAI comments, the EPA rejected two out of five purpose and need statements⁸³, as has the Army Corps of Engineers.⁸⁴ Even though we do not agree with the validity of the stated purpose and need, we will analyze each of five purpose and need “elements” in terms of its ability to “help evaluate. . . project alternatives to meet or approach the overall goal of improving surface transportation to and from Juneau in the Lynn Canal corridor.”⁸⁵ The Army Corps of Engineers framed the project goal as improving surface transportation “between the Lynn Canal communities of Juneau, Haines and Skagway.”⁸⁶ The Corps choice of language better addresses the fact that this project will change transportation opportunities for all three communities, including transportation between Haines and Skagway, while the DSEIS language narrowly focuses on getting to and from Juneau.

RESPONSE: FHWA, as the lead agency for this transportation project, defines the purpose and need under NEPA, not the Environmental Protection Agency (EPA) or USACE. It is inaccurate to suggest that EPA and USACE “rejected” elements of the purpose and need. The commenter is confusing the overall purpose statement under Section 404 of the Clean Water Act with FHWA’s responsibility under NEPA. Under the Clean Water Act, an overall purpose statement is defined, and it is not necessary for that overall purpose to be identical to the transportation purpose and need.

The purpose and need statement for the project is to improve surface transportation to and from Juneau. DOT&PF and FHWA have updated the data in Chapter 1 of the Draft SEIS since 2006 and have reconfirmed the project purpose and need. Because Juneau is a regional hub, with a substantial population and employment base, the demand for travel in and out of Juneau has been identified as driving the primary needs of the project. The existing level of

⁸³ LCC 2005 DSEIS comments at 1

⁸⁴ DSEIS at 1-10

⁸⁵ DSEIS at 1-10

⁸⁶ Id.

demand and service between Haines and Skagway has not been identified to be a problem and, therefore, FHWA has not included it as a component of the purpose and need under NEPA.

In addition, the CEQ directs federal agencies to grant substantial deference to the lead federal agency with expertise in the stated field, in this case the FHWA, in determining the purpose and need for transportation projects. Neither the EPA nor USACE suggested that the FHWA revise the purpose and need statement. The USACE did remove the two cost components in developing their overall project purpose statement in preparation for their Section 404 analysis.

That said, during adjudication of the 2006 EIS, the court noted that ferry service has improved dramatically over 20 years and that it could be argued that the goal of improving surface transportation has already been met.

RESPONSE: DOT&PF and FHWA disagree that ferry service has improved dramatically over the last 20 years. DOT&PF and FHWA have updated the data in Chapter 1 of the Draft SEIS since 2006 and have reconfirmed the project purpose and need. The No Action Alternative still does a marginal job at meeting the corridor demand, has poor travel times, and limited opportunities and flexibility for travel. All of the reasonable alternatives considered in the Draft SEIS addressed this purpose and need relative to Alternative 1 – No Action. As explained in the Draft SEIS, Alternative 2B, the preferred alternative, best meets the purpose and need for the project.

As previously stated, the DSEIS assumes that if there were more frequent trips that took less time and cost less money, that demand would increase – and these make up three of five purpose and need elements. However, as detailed earlier, historical data shows each of these three assumptions to be false. Further, there are only two ways to access Juneau: by air and by surface transportation. The 2004 SATP recognized the limitations of air travel: “flight delays and cancellations due to weather are common in Southeast Alaska, particularly in the winter months. Poor weather conditions can result in multi-day gaps in service with planes not able to fly until conditions improve. These gaps are particularly problematic in emergency situations, such as when medical evacuation is required.”⁸⁷

Being weather dependent, air travel is not reliable. The DSEIS acknowledges this. Lynn Canal air travel “is often constrained by fog, high winds, or snow storms and can be delayed up to several days in the fall, winter and spring.”⁸⁸ If built, the preferred alternative would replace the only available non-weather dependent option – AMHS travel - with Alternative 2B, a second weather dependent option with 150 identified hazards, to be discussed later. For now suffice it to say that maintenance costs will not “provide active snow plowing and patrolling 24 hours per day. During major snow storms and heavy avalanches, staffing is not adequate to ensure trafficable roads at all times, and highway

⁸⁷ 2004 SATP at 41

⁸⁸ DSEIS at 1-7

closures for avalanche monitoring and clean-up will be necessary.”⁸⁹ Due to the unpredictable nature of anticipated road closures, reliability should be – but is not – an element of purpose and need. That is, if travelers are limited to two ways to access Juneau and both are weather-dependent, where weather events are “common”, the goal of improving surface transportation in the Lynn Canal corridor cannot be met. That is, opportunity to travel will decrease at all times during inclement weather. Weather-dependent travel would have to be evaluated in the DSEIS but for the fact that DOT has consistently refused to add reliability to purpose and need. Reliability has come up each time the public has had an opportunity to comment on JAI and the SATP. That reliability is still absent from consideration speaks to the continued pro-road bias of JAI documents, because Alternative 2B will not be reliable, as will be detailed later.

RESPONSE: Safety and reliability are included in a purpose and need statement for a project only if there is a demonstrable existing safety or reliability problem on the transportation link being considered. Although AMHS sailings are missed due to Lyn Canal weather, safety and reliability are not a substantial problem with the current system; therefore, neither safety nor reliability are part of the purpose and need for this project. That said, the Draft and Final SEIS does discuss reliability in terms of new potential for delay (e.g., avalanche) of the various alternatives.

Please note that under Alternative 2B, the ferry shuttle is available to connect Auke Bay with Haines/Skagway during road closures.

Scoping comments often sited safety and reliability together. For example, regarding the preferred alternative, scoping “comments received focused primarily on safety and reliability.”⁹⁰ And again, regarding purpose and need, comments indicated that safety and reliability should be included.⁹¹ The intent for taking scoping comments is acknowledged as “identifying the significant issues” in order to “clearly define the environmental issues and alternatives to be examined.”⁹² Due to weather constraints and an extremely large number of identified avalanches and geological hazards – about 150 in 22 miles of 2B road – continued requests to include safety and reliability as purpose and need elements are understandable and reasonable. The response to the public scoping plea for including safety and reliability in purpose and need due to a real assessment that opportunity to travel to and from Juneau decreases when only weather-dependent options exist was “answered” by a statement that “design standards require that all alternatives presented be safe modes of travel.”⁹³ A direct and meaningful response to issues of safety and reliability regarding purpose and need is completely absent, and is a major failing of the DSEIS. In this context, the statement that the DSEIS “has been developed to address issues raised by the public ad agencies during scoping”⁹⁴ is disingenuous.

⁸⁹ 2014 Appendix FF at 61

⁹⁰ DSEIS at 7-7

⁹¹ DSEIS at 7-16

⁹² DSEIS at 7-1 referencing 40 CFR 1501.7 and CEQ guidance, 1984

⁹³ DEIS at 7-16 and 17

⁹⁴ DSEIS at ES-14

RESPONSE: Safety and reliability are included in a purpose and need statement for a project only if there is a demonstrable existing safety or reliability problem on the transportation link being considered. Safety and reliability are not a substantial problem with the current system; therefore, neither safety nor reliability are part of the purpose and need for this project.

DOT&PF and FHWA have taken the issues raised during scoping seriously and have addressed the issues raised. Safety and reliability not being identified as key reasons for undertaking this project does not mean safety and reliability are not addressed. The effects of the primarily road alternatives (2B and 3) on safety and reliability were disclosed in the Draft SEIS (see Technical Alignment Report, Snow Avalanche Report and Chapter 4 per alternative, in the Geology, Socioeconomic Resources and Transportation sections).

Absent the necessary purpose and need elements of safety and reliability, each alternative is evaluated on whether it meets the stated purpose and need. A fair evaluation would indicate that marine alternatives can and do meet purpose and need as well as - and sometimes better than - the preferred alternative. This has not been the case in past JAI documents and continues to be the case in this one, with obvious violations of 40 CFR 1502.14(a).

RESPONSE: The SEIS does not violate 40 Code of Federal Regulations (CFR) 1502.14(a). DOT&PF and FHWA have identified and evaluated reasonable alternatives in direct response to the stated purpose and need for the project. The Draft SEIS indicated that the marine alternatives do meet elements of the purpose and need to varying degrees. In fact, for some individual purpose and need elements, some marine alternatives meet the purpose and need better than some of the road alternatives.

Element 1: “Provide the capacity to meet transportation demand in the corridor.” According to DSEIS analysis, none of the alternatives accomplishes this because “each of the JAI Project alternatives would capture only a fraction of [unconstrained] demand.”⁹⁵ The DSEIS differentiates between demand generated by a “hypothetical” road⁹⁶ from Juneau to Skagway – termed “unconstrained demand” - and demand generated by each alternative. Since all alternatives have ferry links, “none of the reasonable alternatives would generate the level of unconstrained demand.”⁹⁷ The DSEIS discussion then becomes irrelevant because the stated purpose and need is not about unconstrained demand but actual demand. Regarding actual demand, all alternatives meet the demand for that mode. If it were about unconstrained demand the purpose and need should read as follows: “provide capacity to meet unconstrained demand.” Yet the analysis proceeds as if this purpose and need element is indeed the case.

Since all marine alternatives are designed to “have the capacity to accommodate the

⁹⁵ DSEIS at 4-4

⁹⁶ DSEIS at 4-4

⁹⁷ DSEIS at ES-5

demand they would generate” based on assumptions of travel time and costs,⁹⁸ the stated purpose and need element is totally meaningless. That is, all alternatives meet the stated purpose and need regarding demand. Any statements that Alternative X only meets Y% of unconstrained demand only serves to bias the selection to a road alternative. Even though all marine alternatives “have the capacity to accommodate the demand”, using the analysis presented in the DSEIS, all marine alternatives are designed to fail because they don’t meet the restated demand, which is based on a “hypothetical” situation. This precludes the objective evaluation required by 40 CFR 1502.14(a).

“Unconstrained” or “hypothetical”⁹⁹ demand comes from a “what if” scenario. That is, if a road could be built to Skagway (impossible due to Section 4(f) limitations),¹⁰⁰ or a bridge could span Lynn Canal to connect Juneau with Haines (not possible due to cost and technical feasibility limitations), then huge numbers of vehicles would travel in the corridor. What follows is an irrational analysis based on a hypothetical situation having nothing to do with reality. Yet this analysis is a major basis for comparing alternatives and ultimately determining the selection of a preferred alternative that will be built in a real - rather than hypothetical - world. Even so, the DSEIS still has to reword the stated purpose and need in order to make the preferred alternative look superior. That is, instead of the stated purpose and need to “provide the capacity to meet transportation demand in the corridor” – which all alternatives meet - a rationalization for choosing Alternative 2B becomes to “generate and accommodate the greatest projected traffic demand.”¹⁰¹ To “generate and accommodate” is *significantly different* from “provid[ing] the capacity” to meet the transportation demand. This is an example that shows how the DSEIS manipulates the purpose and need statement to reach the desired outcome of selecting 2B as the preferred alternative. We have already discussed how actual demand is being met by the AMHS.

RESPONSE: The commenter is mischaracterizing the purpose and need for the project. The Draft SEIS discussion regarding transportation demand is not irrelevant. Data have demonstrated that there is considerably higher demand for travel than is currently met by the existing transportation system. However, due to high costs, slow travel times, and other inconveniences, the system does a poor job at serving corridor demand. This is the transportation problem to be solved in this corridor—there is a much higher demand for travel than is being served because of the problems with the current ferry system. These problems are documented in Chapter 1 of the Draft SEIS.

Building a system that satisfies the greatest projected demand in consideration of the costs is not based on “irrational analysis” or a “hypothetical situation having nothing to do with reality.” The unconstrained demand is real and does exist—it is “actual demand.” Based on the population and travel characteristics of the region, the travel forecasters are able to predict what the unconstrained demand is for travel in this corridor. It is DOT&PF and

⁹⁸ DSEIS at ES-6

⁹⁹ DSEIS at 2-31

¹⁰⁰ DSEIS at 4-4

¹⁰¹ DSEIS at 2-32

FHWA's responsibility as providers of the transportation infrastructure to try to make improvements on this National Highway System (NHS) route that meet the demands of the traveling public. The information provided to make this decision was prepared by specialists in travel forecasting, engineering, and economics based on real world data and accepted modeling practices.

The purpose and need statement is to provide capacity to meet transportation demand in the corridor. This has remained consistent throughout the project's development. Each of the reasonable alternatives satisfies the purpose and need to varying degrees in that they provide greater capacity than the No Action Alternative and they each have been designed to accommodate the demand that would occur given differences in attributes such as cost, travel time, and convenience. In other words, there is an underlying latent real demand for travel in the corridor (unconstrained demand) and more or less of that demand would be realized with each alternative depending on the attributes of that alternative. The Draft SEIS used the term "generate," which does not clearly communicate the situation. The phrasing "realize and accommodate" has been substituted in the Final SEIS for the phrasing "generate and accommodate" to try to clear up confusion.

DOT&PF and FHWA want to select and build a transportation solution that maximizes the number of people who will use it, while also considering costs to the State and users and balancing environmental impacts. In selecting the preferred alternative for the Draft SEIS, those alternatives that come closer to satisfying the overall unconstrained demand for travel in the corridor (i.e., that more people will use) were deemed as better fulfilling that purpose and need factor (See Chapter 1 of the Final SEIS).

All traffic demand models attempt to predict future demand based on assumptions and data available in the present. To the extent that they are predicting a future, unknown condition, all demand models are "hypothetical." The total demand model used for this project was developed based on empirical data derived from actual travel conditions observed in Alaska and Western Canada from communities with geographic characteristics similar to those in Juneau. The model starts out defining a condition that the modelers called "unconstrained demand." This level of demand predicts how many people would want to travel between Juneau and Haines/Skagway if there were a road the entire way—this is the unmet demand in the corridor. This predictive condition was based on the assumption that people in Juneau, Haines, and Skagway would exhibit similar travel patterns given the opportunity to travel by road like other similarly situated communities. This estimate defines an upper bound representing the number of trips that would occur if costs and travel times were commensurate with road travel. Based on the project team's research, there are no indicators that travel behavior in Juneau, Skagway, and Haines would differ substantially from that of other Alaskan and Canadian communities if full highway access were available. Based on the data collected, the project team is confident that Juneau residents would travel in a

similar manner to other Alaskan residents.

The forecast only used the unconstrained demand as an upper bound to bracket the overall demand in the corridor. Each forecast, for each of the alternatives, scales down from the unconstrained demand based on factors of cost, travel time, schedule convenience, etc. In other words, as costs, or travel time, or inconvenience increases, more and more people will decide not to make the trip. Using such factors to predict traveler's choices and behavior amongst competing alternatives is a common modeling practice and is used in nearly every traffic model. By factoring the demand down from the unconstrained demand based on costs, travel time, and convenience, the model predicts reasonable estimates of travel behavior based on the relative merits of the alternatives. The difference between the unconstrained demand and the demand anticipated to be achieved by each of the proposed alternatives represents unmet demand.

The purpose and need statement does not indicate that alternatives must satisfy the unconstrained demand level. As the commenter indicates, because all of the alternatives have a ferry connection, none of them reach that level. There is nothing irrational about transportation providers wanting to identify, select, and build alternatives that maximize the usefulness of the investment of the transportation facility as measured by the number of people who will use it.

More generally, the purpose of investment in public transportation infrastructure is to improve transportation opportunities for the largest number of people in the most cost-effective manner possible. It is not practical or reasonable to expect infrastructure improvements to enhance travel opportunities for all travelers, from all locations, for all travel purposes. Replacing ferry service with a highway would require a change in travel behavior for some travelers, perhaps at some increased expense and inconvenience, while a much larger number of travelers would be able to travel at lower expense and greater convenience. The ten-fold increase in traffic from No Action to Alternative 2B would be the result of lower cost and more convenient travel opportunities for a much larger segment of the region's population.

In addition to meeting demand for vehicle transportation in the corridor (because all alternatives "meet the projected traffic demand for that mode") marine alternatives also haul freight and provide transportation for walk-on passengers. This huge benefit of providing "public transportation"¹⁰² is not attributed a value in the DSEIS. The DSEIS merely dismisses the benefits to walk-on passengers and freight haul in a footnote: "To compare alternatives that have both road and ferry segments, this analysis focuses on automobile capacity of the ferries. Ferries also transport walk-on passengers."¹⁰³ The note in the 2006 FEIS was a little more revealing: "Note: The capacity and demand analysis in

¹⁰² DSEIS at 1-7

¹⁰³ DSEIS at 2-10

this document focuses on vehicles. On inter-city surface routes, the primary responsibility of the state is to provide a transportation facility and not the transportation itself. Because of the nature of the AMHS, the facilities to move vehicles also accommodate walk-on passengers. However, this is a secondary function that is not provided on other highways in the state.”¹⁰⁴ This could be a minor point if the number of passengers traveling without vehicles were small, but this is not the case. 55% of passengers travel with a vehicle and 45% do not.¹⁰⁵ A methodology that takes 45% of AMHS passengers and puts them in vehicles belonging to strangers, renders that analysis absurd.

The purpose of the DSEIS is to compare reasonable alternatives to No Action, and No Action happens to accommodate walk-on passengers and freight. The utter lack of meaningful analysis in this regard renders the DSEIS hopelessly inadequate.

RESPONSE: In meeting the demand for travel, walk-on demand and freight demand are included in the overall demand estimates and are addressed by element 1 of the purpose and need. FHWA and DOT&PF acknowledge that the highway alternatives would change an AMHS system that currently operates more like a public transportation system; however, the State’s responsibility is to provide transportation facilities, not the transportation itself.

Contrary to the commenter’s assertions that walk-on and freight analysis occurs in just one footnote, the Draft SEIS provided a full impact analysis of the highway alternatives (2B and 3) to walk-on passengers and freight movement in Sections 4.3.7 and 4.4.7 with additional details provided in Appendix EE. Moreover, walk-on passengers would be allowed on the proposed shuttle ferries under the road alternatives. However, DOT&PF and FHWA realize this use of the ferry link would no longer be as convenient and passengers that currently find it convenient to walk on would not find it so under the road alternatives. The impacts associated with these changes were analyzed and compared to Alternative 1 – No Action in those same sections.

The 45 percent walk-on rate is a result of analysis reported in 2000. From 2000 through 2015, for travel solely within Lynn Canal, pedestrians declined 26 percent and vehicles declined by 14 percent. The AMHS 2015 data suggest an annual walk-on rate of 30 percent.

Similarly, freight movements are also analyzed. Freight movement by barge or truck and ferry is largely dependent on the materials being shipped and the time-sensitivity of those materials. As noted in Section 4.3.7, for example, Alternative 2B would allow freight to move from Juneau to Haines/Skagway mostly by truck; however, truck shipments cost more per pound than barge shipments. Also, freight movement may change. Currently, shippers are able to send an unaccompanied container/van on the ferry (with no trailer or driver on the ferry). Under Alternatives 2B and 3, shippers would no longer be able continue that practice.

¹⁰⁴ 2006 FEIS at 1-10

¹⁰⁵ 2000 McDowell at 65

Freight via the road would have to be transported by a driver and trailer, which increases the cost of transporting freight. However, shippers would pay less in ferry fares. Shippers are expected to continue using the most cost-effective method of shipping freight in Lynn Canal. Additional information regarding impacts to freight has been added to the Final SEIS and Appendix EE.

Again, the methodology does not take AMHS passengers and put them in vehicles belonging to strangers. The analysis uses the overall number of people who travel in Lynn Canal (including all walk-on passengers) and uses known metrics of how many people travel per vehicle to compute estimates of how many vehicles would need to be accommodated in the future. DOT&PF and FHWA predict that travelers using the proposed alternatives would be in their own vehicles, and since 91 percent of Lynn Canal residents live in households with at least one vehicle, many of those travelers would use those vehicles to make the trips. The same situation occurs on all other highways in Alaska, and the road alternatives (2B and 3) are predicted to operate similarly. Additional information regarding the impacts to passengers that continue to walk on has been added to the Final SEIS and Appendix EE in the transportation impacts discussion associated with each alternative.

Element 2: “Provide flexibility and improve opportunity for travel.”

“All the build alternatives...would increase the opportunity for travel in Lynn Canal and would provide more flexibility for travelers.”¹⁰⁶ Therefore all build alternatives satisfy this purpose and need element. DSEIS analysis attempts to show that roads meet the objective better than marine alternatives, using a consistently biased presentation. As one example (and there are so many), the DSEIS gives the following reasons why marine options restrict flexibility and opportunity for travel:

- “Travelers must make reservations for vehicles in advance.”
- “Changing reservations can be problematic.”
- “Travelers must plan trips to coincide with ferry schedule departures and arrivals.”
- “A 1- to 2-hour check-in time is required.”
- “Trips can be delayed by unforeseen events including vessel mechanical problems, inclement weather, and last minute requests to serve an additional port south of Juneau.”
- “Reservation changes are limited to regular business hours.”
- “Border crossings are restricted at night. . .inconveniencing travelers going beyond Haines and Skagway.”
- “When ferries do not have vehicle space available, travelers may register at the ticket counter 2 hours before sailing for standby space; however, there is no guarantee of boarding.”¹⁰⁷

If this were a fair comparison of alternatives, as required by NEPA, the DSEIS would have included similar, and sometimes identical, reasons why Alternative 2B restricts flexibility and opportunity to travel. A balanced discussion comparing the benefits of marine

¹⁰⁶ DSEIS ES-6

¹⁰⁷ Originally printed in the 2006 FEIS at 1-11, and included verbatim in the 2014 DSEIS

transportation with Alternative 2B could have – but did not - include the following (taken from LCC’s 2006 FEIS comments): Alternative 2B restricts flexibility and opportunity to travel because

RESPONSE: The commenter is quoting from Chapter 1 - Purpose and Need—a list of reasons that the No Action service does not offer acceptable flexibility. This is a list of problems/challenges that limit flexibility on the existing system. It is not a “comparison of alternatives” as suggested by the commenter. The Purpose and Need chapter does not compare alternatives, it serves to document the reasons for undertaking the project. DOT&PF and FHWA consider that all reasonable alternatives satisfy the purpose and need for the project to varying degrees. However, some alternatives do a better job than others.

DOT&PF and FHWA presented analysis for the pros and cons of the alternatives based on their relative merits in meeting the individual elements of the purpose and need, comprehensively meeting the purpose and need in consideration of all of its elements and in the variety of impacts discussed by the commenter. Information related to items raised by the commenter can be found in Chapter 4 of the Final SEIS under the impacts discussion for each alternative.

- “Travelers cannot make reservations for vehicles in advance.” While having to make a reservation might be a disadvantage under some circumstances, having a reservation is an advantage because it guarantees that one will indeed be able to travel. With Alternative 2B, a person can drive from Juneau to the Katzehin ferry terminal whenever the road is not closed (and it can never be known in advance when this might occur), but because a reservation cannot be made, there is no guarantee of being accommodated. If a traveler hoped to catch the last ferry of the day and could not because it was full, travel opportunity vanishes for that day. In fact 2B would only accommodate 47% of peak week travel demand.¹⁰⁸ In this case, increased “flexibility” means travelers must be “flexible” when their traveling schedule is not accommodated, and they have to drive all the way back to Juneau.

RESPONSE: Under Alternatives 2B and 3, there would have been multiple sailings every day, giving travelers multiple opportunities to sail. Similar to today, travelers would have had to make their travel plans based upon the perceived popularity of their desired sailing. For example, if people wanted to travel on a holiday weekend, they would make their AMHS reservations further in advance, knowing that would be a popular time to travel. If the space is already sold out, they would have lost their availability to travel during that time. Similarly, under Alternatives 2B and 3, during popular travel times, people may have had to arrive early for a sailing to ensure the ferry has space for them. Under Alternatives 2B and 3, AMHS would have had the ability to increase the number of sailings to accommodate more travelers if there is sufficient demand by extending operating day and making an extra run (by paying overtime, for example). Because the shuttle ferry link is relatively short, this is

¹⁰⁸ DSEIS at 4-58

possible. With the longer ferry runs leaving from Auke Bay, it is difficult to add an additional ferry run to accommodate peak demand, because of the long sailing times.

- “Changing reservations can be problematic” under some circumstances, but not being able to make reservations can be more problematic, as discussed above.

RESPONSE: Under Alternatives 2B and 3, travelers would have had to adjust their travel behavior to account for not being able to make a reservation on the ferry. During peak weeks, this may have meant travelers arrive earlier than normal to ensure they were able to make a sailing. As noted above, under Alternatives 2B and 3, AMHS would have had an easier ability to increase the number of sailings to accommodate more travelers during peaks due to the short run times.

- “Travelers must plan trips to coincide with ferry schedule departures and arrivals.” This is true for all alternatives, including the preferred alternative, because all alternatives include at least one ferry segment.

RESPONSE: While it is true that travelers must plan their trips to coincide with the ferry schedule under all alternatives, Alternatives 2B and 3 would have provided travelers with the option of multiple sailings every day during the summer compared to other alternatives that may only have one sailing per day. If a traveler misses one sailing or it is full, they would have had to wait until the next one. With the other alternatives, travelers missing a sailing would have to wait until the next day.

- “No check-in time is required.” Walk-on passengers can walk-on and walk-off a ferry for all marine alternatives with virtually no check-in time. For marine options, travelers with vehicles who wish to chance the ferry can accommodate them can drive on the ferry at the last minute with virtually no check-in time. With Alternative 2B, travelers always take a chance the ferry cannot accommodate them. With Alternative 2B, when the ferry is full, travelers would experience a 1.5 hour wait time for the next ferry to Haines and a 2.5 hour wait time for the next ferry to Skagway, assuming there was another scheduled ferry for that day.

RESPONSE: By AMHS policy, walk-on passengers have the same two hour check-in time as vehicles in Juneau and one hour in Haines and Skagway. Passengers must be on board the ferry 15 minutes prior to departure. In Lynn Canal, vehicles typically check in 2 hours prior to sailing. Currently, while it may be possible for a walk-on passenger or vehicle to board a ferry with virtually no check-in time, there is the possibility that they may be denied boarding and their space given to a standby traveler. In addition, if many travelers arrive at the ferry terminal close to the sailing time, and if all late arrivals are boarded, it may result in the ferry leaving the terminal after its scheduled departure time. Alternatives 2B and 3 would still accommodate walk-on passengers just as they do today.

- “Trips can be delayed by unforeseen events, including vessel mechanical problems, and inclement weather.” Trips will be delayed when the Katzechin ferry will not be able to dock because “exposure to the west is still evident and some berthing losses can still be expected.”¹⁰⁹ These lost dockings will occur because the state decided not to invest an additional \$35 million in breakwaters.¹¹⁰ There is no information on the number of days or dockings likely missed per year due to wind conditions. In addition to lost dockings due to wind conditions, Alternative 2B will be closed for avalanches. It is impossible to predict in advance when closures would occur. This means there would be trip delays or trip cancellations that would result in decreased flexibility and opportunity for travel. Other unforeseen events that could delay trips for Alternative 2B include poor winter driving conditions (heavy snowfall, blowing snow, glare ice, fog, etc) and closures due to clearing rock, land and debris slides from the 99 identified geological hazards, to be discussed later.

RESPONSE: During the project reconnaissance effort, engineers examined the best way to create alternatives that would function well and identified the ferry terminal locations based on such factors as depth of water, protection from large waves, ability to protect the mooring, terrain on shore for the approach roads, parking, circulation, and the operational needs of the ferry, including the length of the ferry run. Significant research was conducted on the wind and wave climatology in the Lynn Canal, as seen in the referenced study, *Lynn Canal Wind and Wave Climatology Study for Vessel Operations*. This study is based on the results of software that uses historical wind data and geographic data to forecast nearshore wave heights.

For Alternative 2B, missed ferry sailings would likely be the result of wind and wave conditions in the middle of Lynn Canal and not at the ferry terminal sites. From the current data, an assumption of one to six days of potential vessel cancellations per year can be reasonably expected.

The upper magnitude wind speeds (one minute average) in the middle of Lynn Canal in the Haines/Katzechin vicinity can vary 30 to 68 knots, causing mid-canal wave conditions that could potentially prevent ferry sailings. Based on the Glostens reports, these wind events can be expected to occur one to five percent of the time; primarily during November through February. Assuming a period of four months or 120 days for the worst weather conditions, it can be assumed that one to six days per year may be subject to weather conditions that could prevent a ferry crossing. The projected number of sailings that would be missed depends on the number of sailings per day and whether the inclement weather occurs during those sailing times.

Current data for the north and south wind directions suggests relatively low wave height (under two feet) near the Katzechin Ferry Terminal site, regardless of the magnitude of the

¹⁰⁹ 2005 SDEIS Appendix D, Attachment D at 6

¹¹⁰ Id.

wind event. The Katzehin Ferry Terminal is somewhat exposed on the western side. There is no current data presented for the westerly direction. However, the fetch distance is short and wave heights should be relatively low.

While winds may be strong, causing difficulty in berthing, the ferry mooring structures at the Katzehin and Haines Ferry Terminals would not likely be significantly affected by wave and wind conditions from any direction. The ferry can safely weather storms at either port, assuming that the moored vessel is properly safeguarded and monitored during extreme storm events.

If conditions at Katzehin prevent a ferry sailing or if the road to Katzehin is closed, AMHS has the ability to use the Auke Bay Ferry Terminal if needed to minimize the disruption to travelers.

The Draft SEIS acknowledges that adverse driving conditions would occur on the East Lynn Canal Highway in the winter, but anticipates that State maintenance crews would keep the highway open under all but the most severe conditions. Such severe weather conditions may call for road closures. DOT&PF and FHWA have disclosed the impacts of potential road closures and have mitigated those effects to the extent that travel delays and closures would be minimized. Service to and from Juneau during a road closure would be provided by running a ferry in Lynn Canal. Therefore, even during road closures, the flexibility for travel under the proposed road alternatives would be at least as good as the existing service. All alternatives are forecast based on an annual average basis, and all alternatives were treated equally.

Service and cancellations on the marine alternatives can also occur, and like the road alternatives, travel times are based on the average. The Juneau Access plan provides for alternative ferry transportation between Haines, Skagway, and Juneau in the event of a road closure of more than one day. The maximum anticipated duration of any avalanche related road closure is two days. The Alaska Class Ferries would be used and have a capacity of 53 vehicles, which modeling shows to be enough capacity for the route. If during these closures, more vehicles need to be transported, then additional sailings would be made.

- “Reservation changes are not possible because there are no reservations.” For some travelers it may be a greater hardship not being able to make a reservation than having to change a reservation.

RESPONSE: See previous answer under Bullet 1 above.

- “Border crossings are restricted at night.” Since all day boat options are planned to arrive in Haines and Skagway during daylight hours, this is a non-issue for all alternatives.

RESPONSE: Border crossings are an issue for mainliner travel, and do sometimes occur at night. Mainliners are a component of Alternatives 1, 1B, and 4A through D.

- “When ferries do not have vehicle space available. . .there is no guarantee of boarding.” Alternative 2B is a first-come/first-served system, and there is never a guarantee of boarding the ferry of your choice. If there is no vehicle space available for the ferry of your choice you will have to wait for the next sailing (1.5 hours to go to Haines and 2.5 hours to go to Skagway), or the next day if the last ferry is at capacity.

RESPONSE: See previous answer under Bullets 1, 2, and 3 above.

The DSEIS also fails to evaluate the loss of flexibility and opportunity to travel in winter when driving conditions are frequently so treacherous, that even if the road were open, and one had an appropriate vehicle, many people would still find it too dangerous an harrowing to drive. Acknowledgment of this is buried in an appendix: Traffic “would probably decrease during severe conditions.”¹¹¹ Discussion of the dangers posed by 41 avalanches and 99 geological hazards will occur in a later section. These acknowledged dangers will decrease flexibility and opportunity to travel on Alternative 2B, but the analysis fails to account for these reasonably foreseeable events.

RESPONSE: The Draft SEIS does not fail to evaluate winter travel conditions and the consequences of those conditions. Contrary to the assertion that this discussion is buried in an appendix, relevant information can found in Sections 3.2.1.2, 4.1.6.2, 4.3.7.2, 4.3.8.2, 4.4.7.2, and 4.4.8.1 of the Draft SEIS.

The Draft SEIS acknowledges that adverse driving conditions would occur on the East Lynn Canal Highway in the winter, but anticipates that State maintenance crews would keep the highway open under all but the most severe conditions. Such severe weather conditions may call for road closure. DOT&PF and FHWA have disclosed the impacts of potential road closures and have mitigated those effects to the extent that travel delays and closures would be minimized. All alternatives are forecast based on an annual average basis, and all alternatives were treated equally. DOT&PF has committed to running ferries in Lynn Canal if the road were to be closed for extended periods. In this way, even during road closures, the proposed road alternatives would be at least as good as the existing service.

Similar arguments as those made by the commenter could be made about the primarily ferry alternatives. There are times when sea conditions cause cancellations, delays, ferry turn-arounds, and reduced ridership, and there are times when the proposed ferries would be out of service for maintenance or overhauls. The analysis does not penalize the ferry alternatives for a decrease in flexibility for such circumstances. Again, all alternatives were evaluated

¹¹¹ 2014 Appendix J at 197

equally and fairly.

Element 3: “Reduce travel times between the communities.”

All alternatives reduce travel times over a true No Action alternative. That is the status quo – the true No Action alternative - is the service that existed in 2014 when the DSEIS was prepared and will continue to exist in 2015 and beyond until two ACF’s come on line, namely M/V Malaspina day boat service.¹¹² ACF wait times are half Malaspina wait times. FVF travel for walk-on passengers is faster than 2B, as we discussed in our 2006 comments.¹¹³ Haines/Skagway travel times nearly double in winter on 2B.¹¹⁴ Even though this is acknowledged as fact, the DSEIS states “travel times between Haines and Skagway under Alternative 2B would remain unchanged relative to the No Action alternative.”¹¹⁵ This statement is blatantly false for six months of the year and the analysis does not factor in these longer travel times.

RESPONSE: Alternative 1 – No Action consists of the highway and ferry transit system existing as of 2014, plus improvements programmed by DOT&PF in the Statewide Transportation Improvement Fund and the two State-funded Alaska Class Ferries currently under construction at the time of this Final SEIS, and the stated AMHS plans call for their use in Lynn Canal. Programmed improvements are described in Section 2.3.1 of the Draft SEIS. Including programmed improvements as part of Alternative 1 – No Action is common practice in preparation of EISs where the improvements are already committed; this does not violate NEPA and is consistent with FHWA policy and guidance. There is no guarantee that any AMHS asset would be deployed in Lynn Canal as service is constantly changing. However, DOT&PF and FHWA have determined that Alternative 1 – No Action described in the Draft SEIS is an appropriate representation of the State transportation system in Lynn Canal if no action were taken under the JAI Project.

Second, ferry travel times are based on AMHS experience as well as documented wait times, loading and unloading times, and AMHS policies. The times assumed in the Draft SEIS for Alternatives 2B and 3 are based on proven examples of similarly operated ferry systems that load and unload quickly, based on terminal and vessel design and drive through loading and unloading operations. The times expressed in the Draft SEIS are achievable. The operating model for Alternative 2B and 3, in particular, would be different from existing AMHS operations. No check-in would be required. Vehicles would drive straight on without turning or backing into position and would drive straight off. Such measures, coupled with simpler ticketing and security procedures, would help make loading and unloading efficient. Each of the alternatives has a ferry link and none of the alternatives' travel times were penalized for potential ferry delays.

¹¹² DSEIS at 3-32

¹¹³ LCC 2006 comments at 5

¹¹⁴ 2014 Appendix FF pdf page 140

¹¹⁵ DSEIS at 4-60

Travel times (including average wait time) were computed for average operating conditions, expected to occur most of the time. AMHS has investigated means to reduce the two-hour check-in time at Auke Bay. Current Auke Bay check in times are based on requirements developed over time to make the check-in, sorting, and loading/unloading as efficient as possible for AMHS operations. Such times are necessary to deal with ticketing, reservations, and security, and to allow for sufficient loading and unloading time. Based on years of experience, AMHS has developed their check-in time into a policy to minimize delays in the operations. Cutting time out of the check-in time increases the risk of delayed departures.

Third, the citation (113) quoted is for summer operations, not winter operations. Chapter 4 in the Final SEIS has been updated to clarify the statement in Section 4.3.7.3. Also, it is important to note Haines-Skagway service is not part of the purpose and need for the JAI Project.

No speed reductions are factored in for winter driving conditions along the preferred alternative. For example, Appendix J anticipates times when only one lane of the highway would be open, necessitating flaggers,¹¹⁶ yet no delays are attributed to this reasonably foreseeable condition. A 45 mph speed is assumed, through blowing and drifting snow, on icy roads, and for other normal northern Southeast Alaska winter driving conditions. But even during good summer weather, even though there is a plan to develop six scenic pullouts,¹¹⁷ there is no delay factored in for people actually using them.

RESPONSE: To provide a fair comparison, travel speeds have been based on average conditions and average drivers, and have been applied consistently across all of the alternatives. Similar arguments to those made by the commenter relative to the road alternatives could also be made for the marine alternatives. Weather also affects travel speed and safety for marine vessels. Heavy seas or head winds can and do affect travel times for the vessels. For both the road and ferry alternatives, the extreme conditions are not factored into the travel times.

Of note, while pullouts are included in the proposed design for the road alternatives, they would only be used by travelers wanting to use them. These travelers have chosen to increase their trip length by stopping at a pullout. Discretionary stops by some travelers is not a valid reason to change travel time calculations.

The DSEIS assumption that half of 2B travelers would arrive at random times and half would arrive just prior to departure and therefore experience no wait time¹¹⁸ is absurd. The only legitimate analysis would be for all travelers to arrive at random times, with some peak travel times, days, or months, having full ferries necessitating waiting for the next departure. It is no more feasible for half the ferry capacity - 26 vehicles - to arrive

¹¹⁶ 2014 Appendix J at 225

¹¹⁷ DSEIS at 4-34

¹¹⁸ DSEIS at 4-59

exactly when the ferry leaves than it was in the 2006 analysis where all road traffic was assumed to arrive to coincide with ferry departures. Under the scenario presented, either the ferry will leave on time stranding vehicles, or it will load these last minute vehicles and be delayed. Ferry delays have implications for increasing costs and not being able to make all daily sailings, to be discussed later. An assumption that demand is evenly spread throughout the day, week and month is both unwarranted and illogical, and belied by DSEIS references to peak travel periods.

RESPONSE: It is not “absurd” to assume that half the number of passengers arrive at random times and half arrive just prior to departure. Research shows that people tend to try to minimize their wait time by consulting schedules and arriving at the selected time, particularly if the headways between sailings are frequent and departures are reliable. It would not be legitimate, based on the research, to assume that all travelers arrive at random times. The analysis assumes that the ferry would leave on time, and people would time their travel to meet the schedule. Those who time their arrival too late would be left behind. Travelers mistiming the ferry departure could occur with any of the alternatives.

The travel times are based on averages, not outliers such as people mistiming the ferry departure. Loading on the shuttle ferries would have been more efficient under Alternatives 2B and 3. The loading times were based on proven examples of similarly operated ferry systems that load and unload quickly, based on terminal and vessel design and on drive through loading and unloading operations. This makes it more likely that late arriving vehicles could have been accommodated as compared to the other alternatives.

To test the effect wait time has on demand, Fehr & Peers ran a sensitivity test, which analyzed a scenario under which ferry delays doubled for all users (except for the Haines-Skagway shuttle in Alternative 3). The analysis showed that if that were the case then Alternative 2B and 3 forecasts would decrease by around 10 percent. The actual reduction in total users would be much smaller, since there would only be a few days each year where the number of vehicles for a given sailing exceed the capacity of the ferry.

The roadway alternatives (2B and 3) would operate differently than the rest of the AMHS and would be more like the shuttle ferry to the Ketchikan airport. People would drive a longer road with a relatively short transit on the ferry (approximately 27 minutes for the Katzechin-Haines shuttle under Alternative 2B). While it is possible that a traveler could arrive at the terminal only to find the ferry had just departed or to find the ferry full and unable to take another vehicle, such scenarios are anticipated to be rare. Once a pattern was established, it would be likely that travelers would self-select to days or times anticipated to be less busy. Most of the time, space would be available. For business travelers with tight timelines and little flexibility, private air carriers are available. Even if such travelers missed their desired ferry, they would likely be able to catch the next one a short time later. Under such a scenario, the travel time (including the delay) would still be much less than under the

current system. The ferry capacities and number of sailings were calculated to provide for the projected summer average daily traffic on the road. It is anticipated that patterns would develop, travelers would learn when "rush hour" would be, and enough people would avoid those times that few would be delayed. Removing the need for a reservation system speeds up the overall travel time by removing the associated check-in process; the shuttle ferries would run frequently, thereby reducing the inconvenience.

With regard to the last sentence of the comment, the Draft SEIS assumed and presented information about summer peaks and discusses peaks during the day (e.g., the first or last ferries of the day might see higher demand). Capacity of the system is designed to accommodate demand; however, the Draft SEIS indicated that for the shuttle ferries at Katzehin, "some ferries may be at maximum capacity, resulting in travelers having to wait for the next ferry or change their preferred ferry time." This is anticipated to occur during peak times (e.g., Friday afternoon on a 3-day weekend in the summer). The Draft SEIS indicated that during peak times and for specific events, additional sailings would be provided to meet the demand. In such cases, AMHS would add ferry trips by operating on longer daily schedules.

Element 4: "Reduce state costs for transportation in the corridor." According to Table ES-1, Alternative 2B is **the most expensive** alternative to build. In terms of project life costs, it is the 4th most expensive to build of eight alternatives. It comes in as the third most expensive to maintain and operate and has the second worst Net Present Value.¹¹⁹ It was determined that "none of the 'action' alternatives are worth more than they cost considering state and federal resources."¹²⁰ The best overall values in terms of actual expenditures are No Action followed by Alternative 4C, LCC's preferred alternative. With this rubric, Alternative 2B comes in sixth of the eight alternatives.¹²¹ Life Cycle Cost is "the most practical criterion" when "it is impractical to assign dollar values to benefits."¹²² We have already discussed the faulty methodology used to assign monetary costs and benefits, and have already discussed how no costs were assigned to known impacts of roads.

RESPONSE: DOT&PF and FHWA believe that the economic analysis presented in the SEIS is a reasonable approach for comparing the economics of the alternatives, but the economics are just one consideration among an array of others addressed qualitatively and quantitatively in the SEIS. Regarding the economic measures cited by the commenter, DOT&PF and FHWA did not identify the preferred alternative in the Draft SEIS based solely on the economic analyses, nor are they required to. The analysis indicates that none of the action alternatives shows that economic benefits outweigh costs. Alternative 2B accommodates the highest demand, provides the greatest capacity, has the shortest travel times, provides the greatest frequency of service, has the lowest cost per vehicle

¹¹⁹ DSEIS Table ES - 1

¹²⁰ 2014 Appendix FF at v

¹²¹ 2014 Appendix FF at 72, Table 22

¹²² 2014 Appendix FF at 68

transported, and has the second lowest operations and maintenance costs of any of the build alternatives. The decision in the Draft SEIS balanced these benefits, taking into consideration the impacts described throughout the document and appendices.

The only way that 2B can be shown to “reduce” state cost is by using a cost per vehicle analysis. Data is manipulated by using a faulty “induced” forecast¹²³ (as previously discussed) that inflates the number of vehicles, which decreases costs on a per vehicle basis. In this questionable scenario, Alternative 2B barely beats out Alternatives 3 and 4D.¹²⁴ 2B is cost effective only when artificial “benefits” are factored in.¹²⁵ We have already discussed the unreasonable way “benefits” are attributed. Even if one accepts the speculative number of “induced” vehicles, and accepts the “benefits” as valid, Net Present Value is only an “optimal” choice “if there are no budgetary constraints.”¹²⁶ However budgetary constraints are enormous, both for State and Federal Highway funds. That is, “the federal highway trust fund is no longer sufficient to cover surface transportation needs and . . . state funding . . . is expected to decrease.”¹²⁷ Therefore, “judging JAI alternatives on the basis of total project life costs could be a hallmark of prudence, in terms of avoiding fiscal risks to the State.”¹²⁸ As stated previously, when project life costs are evaluated, the preferred alternative comes in sixth of eight alternatives. Therefore, it would be fiscally prudent to not select Alternative 2B.

RESPONSE: The reasoning behind the identification of Alternative 2B in the Draft SEIS is provided in the Executive Summary and Chapter 2 under the heading Identification of the Preferred Alternative. The selection of Alternative 2B as the preferred alternative in the Draft SEIS was not made solely on cost, although cost was a consideration. The decision was strongly based on how well the alternative satisfied the purpose and need for the project, stated in Chapter 1. As presented in Table ES-1, Alternative 2B accommodates the highest demand, provides the greatest capacity, has the shortest travel times, provides the greatest frequency of service, has the lowest cost per vehicle transported, and has the second lowest operations and maintenance costs of any of the build alternatives. The decision balanced these benefits, taking into consideration the impacts described throughout the document and appendices.

The cost analysis does not include actual, existing AMHS revenues from berths, food, or beverage sales because they would be “minor.”¹²⁹ However, when LCC analyzed these revenues in our 2005 SDEIS comments, we found that these “minor” revenues totaled \$863,435 in 2002, or 13.5% of total Lynn Canal AMHS revenue. Over the 30-year analysis period this would result in \$25,903,050 of additional revenue to the state that has not been

¹²³ 2014 Appendix FF at 80

¹²⁴ 2014 Appendix FF at 75, Table 25

¹²⁵ 2014 Appendix FF at viii

¹²⁶ 2014 Appendix FF at 18

¹²⁷ 2014 Draft SATP at 2

¹²⁸ 2014 Appendix FF at 24

¹²⁹ 2014 Appendix FF at 63

included in the analysis.¹³⁰ Further, an assumption is made that no reservation costs will be applied for Alternative 2B. It is illogical to assume the need to take reservations on 2B is allayed by frequency of sailings, because there is a higher level of projected demand in relation to available space. The assumption that demand will be evenly distributed over the hours of the day, days of the week, and months of the season is faulty and therefore delays will occur during periods of peak demand. Either the analysis must include delays, or add in costs of the AMHS reservation system for 2B.

RESPONSE: Ferry revenues associated with stateroom and passenger services sales had not been included in the Draft SEIS User Benefit and Life Cycle Cost Analysis because those revenues are small relative to passenger and vehicle fare revenues and would not change the ranking of alternatives. However, to eliminate uncertainty around the effects of including annual stateroom and passenger services revenues, the Life Cycle Cost Analysis was revised to include estimates of those revenues.

As stated in Section 2.3.3 of the Draft SEIS, reservations will not be taken for Alternative 2B; therefore, there are not costs associated with a reservation system. Removing the need for a reservation system speeds up the overall travel time by removing the associated check-in process, the shuttle ferries will run frequently, thereby reducing the inconvenience. Systems throughout North America, and elsewhere, typically do not use reservations on short ferry links like those in Alternative 2B, including systems in Washington State and British Columbia. To test the effect that delay has on demand, Fehr & Peers ran a sensitivity test, which indicated Alternative 2B and 3 forecasts would decrease by around 10 percent if the ferry delays were to double for all users (except for the Haines-Skagway shuttle in Alternative 3). The actual reduction in total users would be much smaller, since there would only be a few days each year where the number of vehicles for a given sailing exceed the capacity of the ferry.

As with purpose and need element 1, the only way 2B reduces costs to the state is by rewriting the purpose and need element from “reduce state costs” to “have the lowest cost to the state *on a per vehicle basis.*”¹³¹

RESPONSE: The purpose and need statement has not been rewritten; it remains the same as in the 2006 FEIS. The same measures presented in Table S-1 from 2005 were repeated in Table ES-1 in the 2014 Draft SEIS, including the measure “Net State Cost Per Vehicle.” As previously discussed, all of the reasonable alternatives satisfy the purpose and need to varying degrees. Some alternatives do this better than others. DOT&PF and FHWA want to select and build a transportation solution that maximizes the number of people who would use it, while also considering costs to the state and users and balancing environmental impacts.

¹³⁰ LCC 2005 SDEIS comments at 8 and 9

¹³¹ DSEIS at 2-32, emphasis added

There is nothing manipulative about transportation providers wanting to identify, select, and build alternatives that maximize the usefulness of the investment in the transportation facility as measured by the percentage of total demand accommodated. Alternative 2B, the preferred alternative in the Draft SEIS, was found to best satisfy the overall corridor demand at the lowest cost per trip. In other words, it had the best return on investment. Replacing ferry service with a highway would require a change in travel behavior for some travelers, perhaps at some increased expense and inconvenience, while a much larger number of travelers would be able to travel at lower expense and greater convenience. The ten-fold increase in traffic from No Action to Alternative 2B would be the result of lower cost and more convenient travel opportunities for a much larger segment of the region's population.

While the DSEIS relies on cost per vehicle to support its selection of 2B, the 2004 SATP recognized a cost per vehicle comparison was faulty because "it was considered to be too general and simplistic."¹³² The SATP concluded "a breakout of the relevant cost and relevant data necessary to make an accurate comparison [between roads and ferries] is not readily available."¹³³ The assessment of "too general and simplistic" is still highly accurate.

Element 5: "Reduce user costs for transportation in the corridor."

In our 2005 SDEIS comments we stated "perhaps the greatest SDEIS failing is that all evaluation is based on costs and benefits for passengers traveling with vehicles,"¹³⁴ and true costs and benefits for walk-ons, are ignored. Under Alternative 2B the fate of 45% of AMHS passengers would be dependent upon each of them having an available, reliable vehicle¹³⁵, or a bus service that may or may not materialize from the private sector. Cost for hypothetical bus service is estimated to range from \$40 to 60 one way.¹³⁶ Adding the anticipated \$3.85 Haines-Katzehin passenger shuttle fare¹³⁷ to the bus fare, it would cost a walk-on passenger between \$43.85 and \$63.85 one way. The current AMHS fare for a Haines/Juneau walk-on is \$37 (and cheaper for seniors and students). Therefore, for 45% of current users, Alternative 2B would **increase** out-of-pocket expenses by \$6.85 to \$26.85 each way. This is a **19 to 73% fare increase** over the No Action Alternative (and even greater for seniors and students). Since bus service is not guaranteed the only other option is to fly which would about quadruple the expense for walk-on passengers.¹³⁸ While this reality is acknowledged in the DSEIS: walk-ons "would be forced to rent vehicles, take a commuter flight, or travel on private carriers" should they develop,¹³⁹ these anticipated additional costs for walk-ons are not figure into the analysis, rendering that analysis invalid.

¹³⁴ LCC SDEIS comments at 17

¹³⁵ The decision to dismantle a functioning public transportation system brings into question EO 12898 and how low income households may be disproportionately impacted has not been adequately addressed.

¹³⁶ 2014 Appendix EE at 129

¹³⁷ 2005 Appendix W at 181

¹³⁸ DSEIS at 1-18

¹³⁹ DSEIS at 4-64

RESPONSE: The 45 percent walk-on rate used by the commenter is likely sourced to analysis by the McDowell Group reported in 2000. Based on AMHS information, DOT&PF believes the current percentage of walk-on passengers to be closer to 30 percent, as the number of people walking on the ferry has declined over the past 15 years. Under Alternative 2B, a substantial segment of current walk-on traffic would be expected to convert to personal vehicle travel because of the convenience and reduced cost to do so. With implementation of Alternative 2B, the percentage of walk-on travel is anticipated to drop to 3 percent of the overall travel.

DOT&PF and FHWA have evaluated the impacts to walk-on passengers and reported those in the Draft SEIS, including out-of-pocket user costs. DOT&PF and FHWA find it likely (according to interviews with transit providers) that bus service would develop if there is sufficient demand and it is profitable to do so. DOT&PF and FHWA recognize that 91 percent of the households in Lynn Canal communities own vehicles. Many current walk-on passengers who own vehicles would likely choose to travel by car if a highway were available in the Lynn Canal corridor. The Draft SEIS described the impacts to those travelers who would choose to walk on. DOT&PF is not making an assumption that private bus service will be available. The Draft SEIS indicated that a private ground transportation provider would be anticipated to offer service to the Katzechin Ferry Terminal if demand develops and it is shown to be profitable.

Information presented in the Draft SEIS illustrates user prices for a family of four as an example of the fare structure. Based on this comment and others, additional information about the anticipated fares for an adult ferry passenger and a 19-foot vehicle have been added to Chapter 2 of the Final SEIS. Chapter 4 of the Final SEIS has been updated to compare the total user cost and total out-of-pocket user cost for a family of four in a 19-foot vehicle, a driver with a 19-foot vehicle, and a walk-on passenger.

DOT bases its entire cost analysis on a hypothetical family of 4, even though the actual average household sizes are 2.6 people in Juneau, 3.4 people in Haines, and 2.5 people in Skagway.¹⁴⁰ Even though statistics from the border stations show that there is an average of 2.3 individuals per vehicle.¹⁴¹ Even though the average AMHS itinerary is 2.5.¹⁴² Instead of using actual data to determine user costs, an inflated and mythical 4 people per vehicle biases the cost per trip data. This is one more example of how the DSEIS uses hypothetical situations when it has actual data that could more accurately represent reality. This hypothetical situation overstates user costs except when vehicles carry more than 4 passengers. Since most vehicles carry less than 4 passengers, the analysis is clearly skewed.

¹⁴⁰ DSEIS at 3-21, 3-24, 3-26

¹⁴¹ DSEIS at 4-45

¹⁴² 2014 Appendix CC at 19

RESPONSE: DOT&PF did not base the cost analysis on a hypothetical family of four. Fares reported in the Draft SEIS that reference a family of four were included only as an example. User costs were calculated for all users, not just a “hypothetical family of four.” To help clarify, additional information about the anticipated total user cost and total out-of-pocket user cost for the various travel markets (walk-on passengers, drivers with a 19-foot vehicle, and a family of four with a 19-foot vehicle) has been added to the Final SEIS. The commenter’s assertion that actual data was not used or that inflated or mythical information was used is false. Fares for the ferry alternatives are based on actual AMHS data. For shuttle ferry runs using drive through loading and unloading procedures, data from Washington State and Vancouver, B.C. was extrapolated for Alternatives 2B and 3. The methodology and data for calculating fares is fully disclosed in Appendix AA.

Lastly, user costs not only include out-of-pocket expenses, but “costs of time.”¹⁴³ User “costs” for road alternatives “are less than any marine alternative...mainly because of the inclusion of time as a user cost.”¹⁴⁴ We have already shown that ferry passengers value their time spent on the ferry. The methodology used charges a cost for what is actually a benefit, biasing the comparison of alternatives, rendering the analysis invalid under NEPA standards.

RESPONSE: As previously discussed, people value travel times differently based on various factors: work versus pleasure, weather conditions, etc. Comparing the choice model coefficients, ferry travel time is not as onerous as automobile travel time. The model gave 20 percent less weight to the ferry travel time compared to automobile travel time. This relationship was derived from other regions that have ferry service and driving options and was used to validate the travel model results to existing ferry demands within the corridor.

Alternatives

Providing an adequate range of alternatives is “the heart of the environmental impact statement.”¹⁴⁵ Not only does the DSEIS fail to include a range of alternatives that sharply define the issues and provide a clear basis for choice among options, but the alternatives identified are neither “objectively evaluated,” nor “rigorously explore[d].”¹⁴⁶ The preferred alternative is presented in the best light using a “best case” scenario, and marine alternatives are presented in the worst light using “worst case” scenarios. We have already provided many examples of this bias.

RESPONSE: The range of alternatives presented in the Draft SEIS is adequate and have been objectively evaluated and rigorously explored. The range of alternatives included various lengths of road and ferry connections and different types of ferries used in those connections to improve surface transportation between Juneau and Haines/Skagway. Also included is an alternative that would enhance service using existing AMHS assets.

¹⁴³ 2014 Appendix FF at iv

¹⁴⁴ 2014 Appendix FF at 79

¹⁴⁵ 40 CFR 1502.14

¹⁴⁶ 40 CFR 1502.14(a)

In response to comments on the Draft SEIS, FHWA and DOT&PF have investigated variations on the alternatives suggested in comments on the Final SEIS and presented that analysis in Section 2.2 and Appendices CC and II of the Final SEIS.

Alternative 2B was not presented using a “best case” scenario, nor were the marine alternatives presented using “worst case” information. All of the alternatives carried through the environmental analysis have been evaluated and presented to a comparable and appropriate level of detail for making an informed decision. The ability of each alternative to meet the purpose and need of the project has been quantified. The Draft SEIS reported the nature and magnitude of the environmental impacts of each project alternative without bias. More detail is available for Alternative 2B because it was the selected alternative in the 2006 ROD and moved forward to permitting and design. To not include the relevant information obtained for that corridor in years following the 2006 ROD would be disingenuous; however, to bring all alternatives to the same level information is not reasonable or necessary.

No Action

A true No Action alternative would describe the current system so that proposed changes can be measured and evaluated. “The ‘no action’ alternative may be thought of in terms of continuing with the present course of action until that action is changed.”¹⁴⁷ Also, “CEQ regulations allow the status quo to properly be the no action alternative.”¹⁴⁸ An EIS has been found to violate NEPA if it does not include a valid no action alternative.¹⁴⁹ Yet the no action alternative presented in the DSEIS includes assets “that have not yet been constructed” as of DSEIS printing.¹⁵⁰ The no action alternative “is not a direct continuation of the 2013-2014 ferry service” but the AMHS “current plan” that “reflects the *most likely* AMHS operations.”¹⁵¹ Not only is there no guarantee that assets would be deployed as planned, this alternative cannot be actualized until the ACF ferries come on line, one in 2016 and the second in 2017.¹⁵²

The record shows the AMHS has had many plans that were not actualized. For example, the 2004 SATP “planned” for the M/V Aurora to operate as the Haines/Skagway shuttle in 2005.¹⁵³ In 2006, AMHS “planned” for the Aurora to begin shuttle service in 2007.¹⁵⁴ But the Aurora has yet to serve in that capacity in the Lynn Canal. Similarly, the M/V Fairweather “was designed and sized to provide daily same-time-of-day service between Auke Bay and Sitka”¹⁵⁵ but it was instead deployed in the Lynn Canal in 2004 and 2005.¹⁵⁶ Initially the AMHS “plan” for the ACF shuttle was for a 350-foot vessel.¹⁵⁷ But the Governor instead declared in December of 2012 that the state would build two smaller

¹⁵⁶ DSEIS at Table 1-1

¹⁵⁷ DSEIS at 2-5

boats.¹⁵⁸ Further, “typically AMHS operational changes occur at the discretion of the AMHS from season to season.”¹⁵⁹ These examples illustrate that AMHS plans don’t necessarily become actualized. To base a No Action alternative on a plan that may or may not happen, where changes can be made from “season to season” at the “discretion of the AMHS” plays fast and loose with NEPA No Action requirements.

RESPONSE: The No Action Alternative is a continuation of the AMHS’s policies and reflects the most likely AMHS operations in the absence of any capital improvements specific to the JAI Project. The No Action alternative consists of the highway and ferry system assets existing as of year 2014 plus improvements programmed by DOT&PF in the Statewide Transportation Improvement Program (STIP), and the two State funded ACFs currently under construction at the time of this Final SEIS. Programmed improvements are described in Section 2.3.1 of the Draft SEIS. Including programmed improvements as part of a No Action alternative is appropriate practice for preparation of an EIS where these improvements are already committed. To illustrate the identification of the No Action (or No Build) alternative, some guidance from FTA may illuminate the discussion (FTA routinely deals with public transit vehicles which are analogous to ferries):

“The No-Build alternative provides the baseline for establishing the environmental impacts of the alternatives, the financial condition of the transit operator, and the cost-effectiveness of the TSM alternative. It also establishes much of the information needed for the DEIS Chapter 1 on Purpose and Need since it examines horizon year travel demand and its impact on a largely unimproved transportation system. This alternative is defined to include those transportation facilities and services that are likely to exist in the forecast year. All elements of the No-Build alternative must be part of each of the other alternatives except where an alternative replaces services or facilities inside the corridor.

To provide a basis of comparison in the Draft SEIS that preserves the NEPA requirements to evaluate all federal actions with a significant potential impact on the social, economic or physical environment, the No-Build alternative must include the following features:

- *The maintenance of existing facilities and services in the study corridor and region;*
- *The completion and maintenance of committed projects in the study corridor that have successfully completed their environmental review; and*
- *The continuation of existing transportation policies.*

Within these guidelines, there are two possible definitions of the No-Build option outside the study corridor. Choice among these is determined by the local situation, particularly the degree of certainty that other transportation improvements will be made between now and the horizon year. The possible definitions include:

¹⁵⁸ DSEIS at 2-7

¹⁵⁹ DSEIS at 2-5

1. *An alternative that incorporates “planned” improvements that are included in the fiscally constrained long-range plan for which need, commitment, financing, and public and political support are identified and may reasonably be expected to be implemented.*
2. *A conservative definition that adds only “committed” improvements – typically those in the annual element of the Transportation Improvement Program or local capital programs – together with minor transit service expansions and/or adjustments that reflect a continuation of existing service policies into newly developed areas. In some metropolitan areas with severe financial constraints, this definition may involve no improvements to transportation facilities or transit services in the corridor beyond routine maintenance and replacement.*

The first definition is the typical definition of the No-Build alternative, but it does entail some risk in that the inclusion of “planned” improvements may lead to a set of alternatives that incorporate projects that may not happen. The second option recognizes whatever improvements are essentially certain to occur because they are simply incremental responses to growth in the corridor and have been programmed by the region.”

From: http://www.fta.dot.gov/12304_9717.html#251_The_No-Build_Alternative

DOT&PF and FHWA’s definition of Alternative 1 – No Action reflects the more conservative approach described in #2 above. It includes only committed improvements and reflects a continuation of existing service policies (e.g., check-in times, reservations). The Day Boat ACFs are currently under construction at the time of this Final SEIS. Similarly, the Haines Ferry Terminal improvements are also slated for construction in 2019.

Additionally, there is no guarantee that the ACF’s will indeed be deployed in the Lynn Canal. The DSEIS admits that “the ACF program was made to develop vessels that better meet AMHS needs in Southeast Alaska and was a state action independent from the JAI project.”¹⁶⁰ It is illogical for a project that is stated to be independent from JAI, and not expected to come online until 2016 and 2017 to be the No Action alternative for a 2014 DSEIS. In fact, in a 2013 ACF study commissioned by DOT, the first priority use of the ACF’s is for the Juneau/Haines and Juneau/Skagway routes, i.e., Alternatives 4C and D. The second priority routing is for other AMHS established routes from Juneau to Angoon, Gustavus, Hoonah, and Tenakee; or from Ketchikan to Metlekatla. The third priority routing is to function as the Katzehin shuttle for Alternative 2B.¹⁶¹ The decision to make ferries that don’t yet exist, and may be deployed elsewhere, the No Action alternative is arbitrary and capricious.

RESPONSE: As indicated in this comment, the intention of the committed to and

¹⁶⁰ DSEIS at 2-7

¹⁶¹ Draft Design Concept for Day Boat ACF, 2/25/13, at 9

programmed ACF vessels is to provide service in Lynn Canal. In keeping with common practice, programmed improvements have been included in the Draft SEIS and the known/planned information has been incorporated. All alternatives are compared fairly and equally against this alternative. The planned priority for the Day Boat ACFs is on the Juneau-Haines and Haines-Skagway routes. The decision to include committed, programmed ferries, and their planned operation, is in keeping with common practice as evidenced by FTA guidance (see http://www.fta.dot.gov/12304_9717.html#251_The_No-Build_Alternative).

Current, existing operational AMHS Lynn Canal service consists of the M/V Malaspina day boat and mainline service.¹⁶² This true No Action alternative is described as such in the 2006 Juneau Access Record of Decision.¹⁶³ Since the first ACF is not scheduled to be completed until 2016, the Malaspina will provide Lynn Canal day boat service in 2015. This existing service can and should provide the baseline for comparing alternatives. The DSEIS uses the concepts of “existing” conditions and the need for a “baseline” in the context of evaluating the affected environment.¹⁶⁴ It also should have applied these same concepts of “existing” and “baseline” when identifying the No Action alternative. In fact, tables in Appendix FF compare existing service with the chosen No Action alternative and these tables show differences in AADT, passenger capacity, ferry travel times, ferry delay times, loading times, percentages of traffic routed through Haines and Skagway, etc.¹⁶⁵ The information in these tables was used to ascertain user costs as compared to No Action, but by not having a proper No Action alternative, user costs are inaccurately portrayed. As another example, the selected No Action alternative would provide 50% more summer service between Haines and Skagway than existing service.¹⁶⁶ Further, the selected No Action alternative would reduce state costs from “actual 2013 costs” for existing Malaspina day boat service.¹⁶⁷ Therefore, the DSEIS statement that No Action would not change the capacity or operations¹⁶⁸ is blatantly false. That is, the real No Action alternative has a 167-vehicle capacity¹⁶⁹ where the DSEIS No Action alternative has a daily capacity of 93.¹⁷⁰ In contrast, the ACF No Action alternative can only provide hypothetical data since these vessels have yet to be built and therefore have not been tested. The DSEIS No Action alternative is a planned outcome that may change, rather than the existing on-the-water reality. Absent a valid No Action alternative, a true comparison of alternatives becomes impossible and the DSEIS violates the “heart” of NEPA.

RESPONSE: Tables cited in Appendix FF and elsewhere show existing conditions compared to Alternative 1 – No Action because they are different. As is already explained, it is common, accepted, and even recommended practice to include committed improvements

¹⁷⁰

in the transportation system as part of Alternative 1 – No Action. Presenting such information does not mean user costs or other metrics are “inaccurately portrayed.” In fact, including the committed Day Boat ACFs makes Alternative 1 – No Action more accurate, as these committed vessels **are being** built and **will be** operating in Lynn Canal.

As indicated in this comment, the intention of the ACF vessels is to provide service in Lynn Canal. In keeping with common practice, programmed improvements were included in the Draft SEIS and the known/planned information has been incorporated, and all alternatives are compared fairly and equally against this alternative. Because the programmed improvements already represent improvements to the Lynn Canal corridor, if anything, including the programmed ACFs tends to downplay the project purpose and need. Moreover, the benefits of each of the alternatives are less apparent, when compared to Alternative 1 – No Action with the programmed improvements. The decision to include committed, programmed ferries is in keeping with common practice as evidenced by FTA guidance (see http://www.fta.dot.gov/12304_9717.html#251 The No-Build Alternative).

The Draft SEIS at page 4-14 does not make the statement that the “No Action Alternative would not change the capacity or operations.” The Draft SEIS fully discloses that Alternative 1 – No Action represents the Lynn Canal Service in place as of 2014, but incorporates the programmed Day Boat ACFs. As is standard practice, demand and capacity, and operations of that system (with the programmed changes), is carried forward out to the forecast year for the SEIS (in this case, 2055).

Citing a no action capacity from the 2006 ROD (footnote 168) is inaccurate. The capacity of the system in 2006 does not reflect the changes that occurred from 2006 to 2014, (including the commitment by the State to add Day Boat ACFs into Lynn Canal).

The assertion that Alternative 1 – No Action can only provide “hypothetical data” is without merit. Engineering information (e.g., costs, travel speeds, capacity) and travel forecasting information developed for all of the alternatives are based on the best available information and professional engineering. The information provided for Alternative 1 – No Action is not different. In fact, every EIS evaluates alternatives based on future conditions, and therefore must make similar engineering and forecasting judgments about build and no build alternatives and the resulting effects.

The commenter has reported the Lynn Canal capacity incorrectly at footnote 170 (the commenter has only presented Auke Bay-Haines capacity, excluding Auke-Bay-Skagway Capacity). The actual Lynn Canal capacity for Alternative 1 – No Action is 154 vehicles in summer.

Alternative 1B

Alternative 1B is court-ordered. The 9th Circuit ruled that DOT “could make more efficient use of assets it currently owns.”¹⁷¹ Unfortunately, this is not the case for 1B. 1B retains two ACF ferries and adds the Malaspina. This is a change from the 2012 scoping alternative 1B where use of the Fairweather was “deemed reasonable” and appropriate.¹⁷² Scoping comments were favorable.¹⁷³ But then the Governor reduced the size of the ACF, and Fairweather engines were replaced, making it not possible for the Fairweather to make one round trip between Juneau and Haines and one round trip between Juneau and Skagway in 12 hours.¹⁷⁴

What is not analyzed is whether the Fairweather is able to make two roundtrips between Haines and Juneau daily, because this routing is shorter. This would leave one ACF for the Juneau/Skagway roundtrip, and one ACF for the Haines/Skagway shuttle. Since reducing travel time is a stated purpose and need, and also one objective for developing Alternative 1B,¹⁷⁵ retaining some level of available fast ferry service would be reasonable and prudent, particularly since this was the alternative presented during the public review process.

RESPONSE: The 9th Circuit ruled that DOT&PF and FHWA **must evaluate** an alternative that makes improvements using existing assets. FHWA and DOT&PF disagree that Alternative 1B does not make more efficient use of the use of assets it currently owns. Alternative 1B demonstrates an improved condition in comparison to Alternative 1 – No Action.

DOT&PF and FHWA have provided full disclosure in Appendix CC of the process and reasoning that went into developing Alternative 1B. The dismissal of the Fast Vehicle Ferry (FVF) *Fairweather* as an asset available for service in Lynn Canal is explained in the appendix. In March 2013, litigation regarding recurrent problems with the engines of the *FVF Fairweather* and *FVF Chenega* was resolved. Essentially, the engines were not designed to run at the speeds needed to make two daily round trips between Juneau and Haines/Skagway in a 12-hour window. Without modification of the Skagway Ferry Terminal allowing for drive through loading and unloading, the ACF cannot be reasonably scheduled daily for the Juneau/Skagway leg due to the 12-hour operation rule. With the two ACFs available for Lynn Canal, there are other routes that need the speed of the FVF.

Instead, the Malaspina is deployed in 1B, and it is deployed from Skagway. The Malaspina has greater vehicle capacity than the ACF (88 versus 53)¹⁷⁶ giving Skagway a summer capacity of 201 vehicles per day versus 129 for Haines.¹⁷⁷ Yet historic data shows that 60%

¹⁷¹ 2014 Appendix CC at 3

¹⁷² 2014 Appendix CC at 9

¹⁷³ Id at 13

¹⁷⁵ DSEIS at 2-7

¹⁷⁶ DSEIS at 2-12 and 13

¹⁷⁷ Id at 2-13

of Lynn Canal traffic goes to Haines and 40% to Skagway.¹⁷⁸ Deploying the *Malaspina* in Skagway when Haines has a greater volume of traffic, is the antithesis of “making more efficient use of assets.” In addition to putting the greater capacity vessel in the smaller demand port of Skagway, the *Malaspina* adds significantly more total capacity than demand,¹⁷⁹ and is therefore obviously the wrong vessel for the court ordered alternative. This is admitted, in an appendix, which states that the *Malaspina* is not a good “match” for 1B and a Taku-sized vessel would be a “better match.”¹⁸⁰ “The *Malaspina* is larger than required” for both summer 1B service and winter mainline service and therefore 1B is designed to have excess capacity.¹⁸¹ With no assessment given for the Prince Rupert demand, it is not possible to determine that the Taku could not be deployed in 1B, since the *Matanuska* would still be available for that service.

RESPONSE: The rationale for the selection of the *M/V Malaspina* is described in Appendix CC – *Development of Alternative 1B*. Note that the *M/V Taku* is not available, as it has been retired and sold. The Final SEIS does indicate the *M/V Malaspina* is oversized for the Lynn Canal summer service; however, given AMHS’s mission and available vessels, the *M/V Malaspina* continues to be the preferred choice for Alternative 1B. The routing of the *M/V Malaspina* in the Final SEIS demonstrates the flexibility of deploying the vessel to meet demand in Lynn Canal.

The 1B alternative developed by DOT does not withstand scrutiny in the context of designing marine portions that best meet purpose and need “while not inflating costs.”¹⁸² Alternative 1B is designed to increase costs to the state with no resulting appreciable increase in ridership. That is, 1B calls for reducing fares by 20% and increasing call center hours.¹⁸³ But information provided in the DSEIS appendices shows that both of these actions have been ineffective in increasing ridership. Namely, “additional staffing and longer [call center] hours would have little benefit in improving ridership.”¹⁸⁴ This is particularly true today when more people are booking on-line than at the call center, which accounts for only 25% of bookings.¹⁸⁵ AMHS managers corroborated there was no net benefit gained from increasing call center hours until 9 pm when this was tried before.¹⁸⁶ Increasing call center hours will cost \$125,000 annually for only one benefit – call-waiting time would decrease from the terribly inconvenient averages of 76 seconds in 2011 and 71 seconds in 2012.¹⁸⁷ In other words, no benefit at all.

RESPONSE: It is not possible to meet all purpose and need factors using only existing

¹⁸⁷ Id.

assets. Adding capacity or speed increases cost. Passing those costs on to travelers reduces demand and increase user costs. DOT&PF and FHWA have endeavored to develop the best alternative they can using only existing assets. The fact remains that increasing capacity or travel speed costs more. DOT&PF and FHWA considered fare reductions and enhancements in the call center because the plaintiffs in the 2006 lawsuit suggested those very kinds of improvements were needed to help maximize ridership. These considerations were evaluated and included only to the extent they made Alternative 1B more competitive.

The statement that reducing fares is ineffective is incorrect. DOT&PF and FHWA commissioned studies to determine the effects of fare reductions and based Alternative 1B's fare reduction on the results of that analysis. The analysis is documented in the attachments to Appendix CC (*Estimated Ferry Travel on Internal Lynn Canal Links with Price Reductions*, by Northern Economics and *Estimated Ferry Draft JAI Alternative 1B Fare Sensitivity Analysis* by Fehr & Peers).

Study results on the elasticities for passenger vehicles for both the Juneau-Haines and Juneau-Skagway runs identify elasticities that are in the -1.2 to -1.3 range. Elasticity is a measure of how demand will change given a change in price. These elasticity coefficients imply that if fares for passenger vehicles are lowered by a marginal amount, the number of cars using the ferry will increase by percentages that are greater than the percentage decrease in prices. For example, if ferry fares drop by 10%, the number of vehicles that use the ferry will go up more than 10%.

In the travel forecasting completed for the project, Fehr & Peers developed a travel forecasting model that includes price sensitivity. To examine the potential effect that changes in fare would have on future travel volumes, Fehr & Peers ran sensitivity tests of varying price reductions to examine anticipated future change in demand for Alternative 1B. The fare reduction percentage was varied to test the sensitivity of the ridership demand in the forecasting model to changes in fare. The results from the ridership forecasting model show that each 10 percent reduction in fares would result in approximately 15 additional vehicles during an average summer day in 2050 (the JAI Project Draft SEIS design year).

As stated in the updated 2017 Appendix CC, *Development of Alternative 1B – Enhanced Service with Existing Alaska Marine Highway System (AMHS) Assets*, in Section 4.3.2 Reservation Enhancements, “Since the Draft SEIS was published, AMHS replaced the 15-year-old reservation system with a new automated system and enhanced their reservation website to make it easier to use.” “The number of calls the reservation call center is receiving is declining, in part due to the increased usage of AMHS’s enhanced reservation website. With declining call center usage, extending the call center hours of operation would do little to increase ridership or improve customer service; however, it would increase the cost of AMHS operations. As a result, DOT&PF has determined that **extending the call center hours for improved customer service is no longer considered**

reasonable for inclusion in Alternative 1B.”

Additionally, airlines have stopped providing free reservation service for many years and as a result the public books on-line, or pays additional fees for reservation services. AMHS costs for the call center are part of operating costs subsidized by the state. Instituting a user-pay charge for call center bookings would be a better way to address state AMHS subsidies than building a half-billion dollar road to nowhere.

The other “transportation system management” technique employed in 1B is to decrease fares by 20% in the hopes of enticing more ridership to increase revenues. Yet in real AMHS trials, price reductions of 10% and 30%, and driver goes free incentives resulted in small increases in ridership that “did not offset the loss in revenues” causing both programs to be discontinued.¹⁸⁸ In addition to the real world trial cited above, a ridership forecast model predicts a similar outcome.¹⁸⁹ Decreasing AMHS fares for Alternative 1B only serves to increase project costs.¹⁹⁰ More precisely, adding the Malaspina is predicted to increase Lynn Canal revenues by \$.5 million at an additional state cost of \$8.2 million.¹⁹¹ In short, this is a poor excuse for a TSM alternative and fails to address the purpose and need of reducing state costs.

RESPONSE: DOT&PF and FHWA considered fare reductions and enhancements in the call center because the plaintiffs in the 2006 lawsuit suggested those very kinds of improvements were needed to help maximize ridership. These considerations were evaluated and included only to the extent they made Alternative 1B more competitive.

The commenter incorrectly indicates Alternative 1B would not produce desirable results. What Appendix CC (at page 25) actually states is as follows: Project economists indicated that “fare elasticities are predictive at the margin, for modest changes in price (estimated by project economists as being up to 20% for this project).” The economists warned that “beyond marginal changes in prices, the uncertainty in the results increases.” The report goes on to indicate that a reduction in fares could potentially increase ridership, but the increases are not substantial and a fare reduction would be subject to the risk of lost revenue if not realized.” Based on these recommendations, “DOT&PF determined that a 20-percent reduction in fares in Lynn Canal would be reasonable to include as a component of Alternative 1B given the potential effect on ridership and revenue.”

Moreover, as described in the comment above, traffic modeling sensitivity runs determined that each 10 percent reduction in fares would result in approximately 15 additional vehicles during an average summer day in 2050. With a 20 percent reduction in fares, that equates to 30 vehicles. Given that the 2050 travel forecast for an average summer day was predicted to

¹⁸⁸ 2014 Appendix CC at 25

¹⁸⁹ Id.

¹⁹⁰ 2014 Appendix FF at 20

¹⁹¹ DSEIS at 4-30

be 50 vehicles greater under Alternative 1B as compared to Alternative 1 – No Action, the price reduction is roughly responsible for 60 percent of that difference.

A true TSM alternative would include options that maximize efficiency of the existing system with little or no new construction.¹⁹² A better TSM alternative would have been to use the Fairweather on a twice-daily Haines/Juneau route, to use one ACF for the Skagway/Juneau route, and build the optimum vessel for Haines/Skagway traffic, estimated to cost \$22.3 million.¹⁹³

RESPONSE: An SEIS prepared under NEPA is meant to analyze a range of reasonable alternatives representing the full spectrum of alternatives. Where there are virtually an infinite number of possibilities, it is not necessary to evaluate them all. The court ruling on the previous EIS required an alternative that used existing assets (without up-front capital costs, which plaintiffs argued had unfairly skewed the cost analysis of the ferry alternatives). Alternative 1B was created in response and was evaluated as a competing alternative to solve the problems expressed in the purpose and need statement in Chapter 1.

While NEPA requires that an EIS evaluate a full range of alternatives, it does not require an EIS to examine every possible variation in a theoretically infinite set of variations. That said, DOT&PF and FHWA have examined suggestions to "optimize" Alternative 1B, and discussion of the results are included in Appendix CC of the Draft and Final SEIS and Appendix II of the Final SEIS.

The alternative suggested here is not reasonable. The Day Boat ACF cannot make a round trip between Auke Bay and Skagway and comply with U.S. Coast Guard regulations. The reasons for not selecting the *FVF Fairweather* are explained in Appendix CC.

Unfortunately Alternative 1B was presented to the marine consultant Coastwise as-is. Coastwise therefore did not look for or evaluate a better option.¹⁹⁴ That is, if the state were to make a good faith effort to comply with the court order, it would have been reasonable for it to ask its selected marine expert how best to configure a true TSM alternative.

RESPONSE: Alternative 1B was developed by AMHS and other DOT&PF professionals with years of optimization experience. They were able to develop a system management alternative that makes improvements over and above Alternative 1 – No Action without jeopardizing service elsewhere. AMHS staff have considerably more experience with running and optimizing the existing AMHS service than Coastwise. Coastwise Corporation is a naval architecture and marine engineering firm offering primarily vessel design, marine structural and systems analysis, and port engineering services. Alternative 1B is a “good-

¹⁹² LCC 2005 DSEIS comments p10 referencing 2005 SDEIS at 2-7

¹⁹³ 2014 Appendix GG at 36

¹⁹⁴ 2014 Appendix GG at 5

faith effort.” It results in an increase in AMHS service in Lynn Canal that would not require a reduction in service outside Lynn Canal.

Environmental Consequences

Alternative 2B

Alternative 2B has the **most environmental impacts of any alternative**, as shown in Table ES-1. These impacts include the largest loss of old-growth forest habitat, largest loss of wetland habitat, largest loss of intertidal/subtidal areas, most area of essential fish habitat impacted, and most impacts to eagle nests. In 2005, the US Fish and Wildlife Service expressed concerns that all East Lynn Canal road options “would impact the **most productive and sensitive** habitats, such as the major estuaries and inland habitats at the head of Berners Bay. . . . These areas support **diverse and very high quality** fish and wildlife habitats.”¹⁹⁵ In 1997 the EPA noted that Berners Bay “is the area within the project corridor that has the **highest resource and recreational value**, and the area **most vulnerable** to impacts.”¹⁹⁶

Areas important to migrating waterfowl will also be adversely impacted by 2B. The Juneau Fish and Wildlife Field Office states: “Alternative 2B would impact the most productive and sensitive habitats, such as the major estuaries and inland habitats at the head of Berners Bay (confluence of the Antler, Lace and Berners rivers), and the Katzechin River delta.”¹⁹⁷ The Katzechin River delta has high habitat values, particularly an estuarine beach bar of 1.87 acres.¹⁹⁸ 85% of this area will be lost when the Katzechin ferry terminal is build.¹⁹⁹ While the 2006 FEIS states that 2B highway alignment has been adjusted to avoid salt marsh and open water to minimize disturbance to migrating waterfowl,²⁰⁰ nowhere is ease of human access to the Katzechin River delta evaluated for negative impacts to migrating waterfowl, as a result of selecting 2B.

RESPONSE: Per your comment, Section 4.3.15 of the Final SEIS includes an evaluation of the impacts from human access on the Katzechin River delta and associated wildlife, specifically waterfowl.

Purpose and Need

The DSEIS rewords the stated purpose and need in order to make Alternative 2B appear to be the best alternative. That is, instead of the stated purpose and need to “provide the capacity to meet transportation demand in the corridor” – which all alternatives meet as previously discussed - a rationalization for choosing Alternative 2B becomes to “generate and accommodate the greatest projected traffic demand.”²⁰¹ To “generate and accommodate” is *significantly different* from “provid[ing] the capacity” to meet

¹⁹⁵ 2005 SDEIS at 7-66, emphasis added

¹⁹⁶ 1997 EPA comments at 9, emphasis added

¹⁹⁷ 2006 FEIS at 7-133

¹⁹⁸ 2006 Appendix W at 250

¹⁹⁹ Id.

²⁰⁰ 2006 Appendix Y at 190

²⁰¹ DSEIS at 2-32

transportation demand. The purpose and need of providing flexibility and improving opportunity to travel – which all alternatives do – becomes providing “substantially greater” flexibility and opportunity. As previously discussed, this “substantially greater” does not apply to 45% of travelers. Reduce travel times becomes have the shortest travel time. Again, as previously discussed, while this may be true for ideal driving conditions and times when there is available ferry space, it is not true for many other reasonably foreseeable situations. Reduce state costs becomes have the lowest state cost per vehicle.²⁰² As the most costly to build and the 4th most costly of 8 alternatives to maintain, clearly Alternative 2B does not reduce state costs and does not meet this purpose and need. Therefore, in order to select 2B as the preferred alternative, the DSEIS has manipulated all five elements of purpose and need.

We repeat that the greatest shortcoming of purpose and need remains that it is narrowly defined to exclude safety and reliability. If these necessary purpose and need elements were included, 2B simply could not be the preferred alternative. There will likely be 600 crashes along 2B from 2020 through 2050.²⁰³ Additionally there will be mortality to “many terrestrial mammal species” that remains unquantified.²⁰⁴ Since many of the terrestrial mammal species are quite large (moose, goats, bear), vehicle/wildlife collisions could pose a serious threat to human safety as well.²⁰⁵ The importance of safety and reliability to the AMHS mission is very apparent. That is, in designing the ACF’s, AMHS standard mission requirements were #1 safety, and #2 reliability, to the extent that “vessel operation shall exceed 99% sailing frequency, or as good as existing AMHS service, whichever is greater.”²⁰⁶

RESPONSE: The elements of the purpose and need have not been manipulated to favor Alternative 2B. All alternatives are evaluated relative to the same purpose and need factors, and that analysis is presented in quantitative terms in the SEIS.

The purpose and need is to provide capacity to meet transportation demand in the corridor. Each of the reasonable alternatives satisfies the purpose and need to varying degrees in that they provide greater capacity than Alternative 1 – No Action and they have each been designed to accommodate the demand that would occur, given differences in attributes such as cost, travel time, and convenience. In other words, there is an underlying latent demand for travel in the corridor (unconstrained demand), and more or less of that demand will be realized with each alternative, depending on the attributes of that alternative. The Draft SEIS used the term "generate," which does not clearly communicate the situation. The phrasing "realize and accommodate" has been substituted in the Final SEIS for the phrasing "generate and accommodate" to try to clear up confusion.

²⁰⁶ Draft Design Concept for Day Boat ACF at 16

DOT&PF and FHWA want to select and build a transportation solution that maximizes the number of people who will use it, while also considering costs to the State and users and balancing environmental impacts. There is nothing manipulative about transportation providers wanting to identify, select, and build alternatives that maximize the usefulness of the investment in the transportation facility as measured by the number of people who will use it. Alternative 2B, the preferred alternative in the Draft SEIS, was found to best satisfy the overall corridor demand at the lowest cost per trip. In other words, it had the best return on investment.

As previously discussed, safety and reliability are included in a purpose and need statement for a project only if there is a demonstrable safety or reliability problem on the transportation link being considered. Safety and reliability are not a problem with the current system; therefore, neither safety nor reliability are part of the purpose and need for this project.

Under Alternative 2B, potential mortality to terrestrial mammals from vehicle collisions is disclosed in Section 4.3.15.3 of the Draft EIS. Information regarding traffic related accidents and fatalities was reported in Section 4.3.7 of the Draft SEIS and updated in the Final SEIS. While these impacts are not tied to the purpose and need for the project, they are part of the body of information provided to the decision maker.

Pro Road Bias

The systemic, biased presentation of pro-road information prejudices the analysis regarding all elements of purpose and need. This was stated in 2008 EPA comments: The “analysis tends to emphasize favorable facts that support the draft conclusions and overlook unfavorable facts that may lead to a different conclusion.”²⁰⁷ Travel time can be used to illustrate EPA’s point.²⁰⁸ Alternative 2B travel time analysis includes the DSEIS asserted favorable scenario followed by a reasonably foreseeable unfavorable scenario *in italics*:

- Times are computed for an average driving speed of 45 mph. *Yet, “the presence of ice, fog, wind, and rain would require travelers on the highway to reduce their speed.”*²⁰⁹ *Since ice and/or blowing snow are fairly common winter driving conditions six months a year, and wind, fog and rain are also fairly common local conditions any time of the year, a 45 mph average speed may only reasonably be assumed for optimum driving conditions. There is no accounting for many days of non-optimum driving conditions. There is no accounting for reduced speeds anticipated through extensive wildlife corridors.*²¹⁰
- All passengers “save” a 1 to 2 hour check-in time currently required for vehicles.

²⁰⁷ 2014 Appendix Z Attachment A at 34

²⁰⁸ We presented a more thorough analysis in our 2006 FEIS comments and we incorporate them into the record by reference.

²⁰⁹ 2006 Appendix Y at 33

²¹⁰ ADF&G Mountain Goat study at 18; Spacial Use, Habitat Selection, ad Population Ecology of Brown Bears Along the Proposed Juneau Access Improvements Road Corridor, Southeast Alaska, ADF&G, 2012 at 61 regarding speed bumps; ADF&G Moose study at 14

45% of AMHS passengers are walk-ons,²¹¹ who can easily walk on a ferry 15 minutes before departure. Yet all walk-ons are “charged” a time cost for a non-existent 1 to 2 hour check-in, which they are alleged to “save” if 2B is implemented.

- There will be no delays for road closures for clearing snow (not associated with avalanches), or for clearing rock, land and debris slides. There will be no glare ice conditions. *Reasonably foreseeable closures for common winter driving conditions will be discussed shortly.*
- No passengers will miss the ferry they hoped to catch. *Poor driving conditions, vehicle/wildlife collisions, getting stuck behind a slow moving vehicle, or arriving on time only to find out that the ferry is full, will necessitate a 1.5 to 2 hour wait for the next ferry, or driving back to Juneau if it was the last ferry of the day.*
- There will be no delays during peak travel times. *It is unrealistic to assume that demand will be evenly distributed amongst the hours of the day, the days of the week, and throughout each summer month.*

RESPONSE: DOT&PF and FHWA dispute the assertion that there is systematic bias in the development and evaluation of alternatives. Each point is taken one by one:

(1) As already discussed: The Draft SEIS acknowledges that adverse driving conditions would occur on the East Lynn Canal Highway in the winter, but anticipates that state maintenance crews would keep the highway open under all but the most severe conditions. Such severe weather conditions may call for road closure. DOT&PF and FHWA have disclosed the impacts of potential road closures and have mitigated those affects to the extent that travel delays and closures would be minimized. All alternatives are forecast based on an annual average basis, and all alternatives were treated equally. DOT&PF has committed to running ferries in Lynn Canal if the road were to be closed for extended periods. Therefore, even during road closures, the proposed road alternatives would be at least as good as the existing service.

Similar arguments as those made by the commenter could be made about the primarily ferry alternatives. There are times when sea conditions cause cancellations or delays, and there are times when the proposed ferries would be out of service for maintenance or overhauls. The analysis does not penalize the ferry alternatives for a decrease in flexibility under such circumstances. Again, all alternatives were evaluated equally and fairly.

A 45 mph average speed is a conservative estimate for the anticipated driving conditions for all but extreme weather conditions, and is representative of the conditions anticipated for most of the time.

(2) By AMHS policy, walk-on passengers have the same two hour check-in time as vehicles in Juneau and one hour in Haines and Skagway. Early check-in time for passengers is

²¹¹ McDowell 2000 *Marketing and Pricing Study* Vol. 1 at 65

necessary to avoid departure delays resulting from passengers checking in just before scheduled departure.

(3) The SEIS acknowledges and discloses that during weather events and other extreme events (like rockfall), there will be delays and closures. Travel times are based on averages, and are the travel times that would be experienced most of the time. As already mentioned, poor weather, mechanical problems, and other delays can also occur with ferry options. All alternatives have been treated equally, and are based on average operating conditions anticipated to be experienced in Lynn Canal.

(4) All alternatives include a ferry link; therefore, passengers could miss a ferry on any of the alternatives. For the road alternatives, because the ferries run as shuttle ferries, the time between ferry runs would not be nearly as long as if a passenger were to miss a ferry on the other alternatives. Nonetheless, as already mentioned, the alternatives are evaluated equally, based on average conditions, which are anticipated to cover the majority of trips. Guessing at how many people might miss a ferry 20 years from now, and penalizing one alternative over another, was not attempted, nor would it be defensible. However, the consequences of weather, missing ferries, etc. was disclosed in the impact discussion in the Draft SEIS.

(5) The Draft SEIS did not indicate that there will not be delays during peak times. Full ferries could happen on any of the alternatives during peak times. The impacts of such delays were disclosed in the Draft SEIS. Because the ferries on the road alternatives run as shuttle ferries, the time between ferry runs when ferries are full during peak times would not be nearly as long as if a passenger were to miss a ferry on the other alternatives. Also, it is easier for AMHS to extend the operating day (adding additional shuttle ferry runs or additional vessels) on peak days due to the relatively short distance. Adding runs on the ferry alternatives is more difficult due to the length of the runs. Nonetheless, as already mentioned, the alternatives are evaluated equally, based on average conditions, which are anticipated to cover the majority of trips.

The DSEIS simply ignores the fact that Haines-Skagway winter service will have increased travel times and user costs. Buried in an appendix, we find that winter travel cost increases from \$17.50 to \$30.23, and that travel time nearly doubles from 2.21 hours to 4 hours.²¹² These additional times and costs are not factored into the analysis.

RESPONSE: During winter, for Alternative 2B there would not be direct service between Haines and Skagway. Traveling between the two communities, the traveler would ride a ferry to the Katzehin Ferry Terminal and catch a second ferry to their destination, which will increase the cost and travel time to travel between Haines and Skagway. During winter, only two of the three vessels would be operating at one time. One vessel would service Skagway-

²¹² 2014 Appendix FF pdf page 140

Katzehin and the second vessel would service Haines-Katzehin. This is due to (1) reduced traffic demand and (2) the need to perform annual maintenance. Each winter, each of the three vessels would be serviced while the remaining two would continue to operate.

The purpose and need statement for the project is to improve surface transportation to and from Juneau. DOT&PF and FHWA have updated the data in Chapter 1 of the Draft SEIS since 2006 and have reconfirmed the project purpose and need. Because Juneau is a regional hub, with a substantial population and employment base, the demand for travel in and out of Juneau has been identified as driving the primary needs of the project.

If the DSEIS presented a fair analysis of alternatives as required by NEPA, and a similar explanation was used for Alternative 2B that was used for marine alternatives, it would be that 2B fails to meet purpose and need by 1) not being able to meet “unconstrained” traffic demand; by 2) improving flexibility and opportunity to travel only under certain limited conditions and not improving flexibility and opportunity under others; by 3) reducing travel times only for selected travelers under ideal conditions, and increasing travel times for others; by 4) increasing state costs because it is the most costly alternative to build and one of the more costly to maintain; and by 5) reducing user costs for some users while greatly increasing user cost for others, as discussed in previous sections.

According to CEQ regulation, the preferred alternative is the one “the agency believes would fulfill its statutory mission and responsibilities, giving consideration to economic, environmental, technical and other factors.”²¹³ The mission of the DOT is to “provide for the movement of people and goods and the delivery of state services.” Marine alternatives move people and goods; people with and without vehicles. Further, Alternative 2B is the most expensive to build, the most environmentally damaging, and the most technically challenging alternative. Logic and common sense dictate it should not be the preferred alternative.

RESPONSE: FHWA and DOT&PF have considered a range of alternatives to meet the purpose of and need for the project. Reasonable alternatives have been evaluated in the Draft SEIS for potential impacts to human and natural resources with considerable input from resource agencies and the public. FHWA and DOT&PF considered adverse and beneficial impacts that could result from each of the alternatives before identifying a preferred alternative in the Draft SEIS. Input from the agencies and public was also factored into the decision-making process. The reasons for identifying Alternative 2B as the preferred alternative was identified in Section 2.5 of the Draft SEIS.

Socio-economic

The additional costs to communities from adding 32 miles to the Juneau road system and 20 to the Haines Borough²¹⁴ are mentioned but not assessed. “Neither the state troopers nor the police in any of the three communities anticipate regular patrols of highway segments”

²¹³ 3/23/81 Federal Register, CEQ at 18027

²¹⁴ 2014 Appendix EE at 206

along 2B,²¹⁵ again raising legitimate concerns about safety. This is yet another reason why safety has been repeatedly requested to be included in purpose and need. While it is mentioned that there would be “increased demand for public safety services,”²¹⁶ there is no attempt to quantify these costs. The new highway would be “outside the fire service districts for both the Haines and Juneau boroughs.”²¹⁷ Further, it is anticipated there would be 15.4 accidents a year on 2B in an appendix²¹⁸, and a different figure of 22 yearly crashes in the DSEIS.²¹⁹ Which estimate is correct? A difference of 7 accidents per year means there will be 210 more accidents during the 30 year evaluation period. Further, vehicle/wildlife collisions, although anticipated, are not quantified and no costs are attributed. Long response times from the closest Juneau fire station are acknowledged,²²⁰ relegated to an appendix, remain unquantified, and have essentially been swept under the carpet. All these safety concerns become exacerbated because there is no cell phone service along the route.²²¹ A “hard look” at the true impacts and costs of Alternative 2B in the context of serious safety issues and increased costs to communities is missing.

RESPONSE: The Draft SEIS and the Socioeconomic Technical Report (Appendix EE) presented a public safety analysis for each project alternative. DOT&PF and FHWA acknowledge that project alternatives would have an impact on emergency service providers. There is no method to accurately predict the costs associated with providing public safety for the project alternatives. At this time, public safety agencies do not anticipate adding additional resources in response to the Juneau Access project and this may have an impact on service levels.

Regarding crash statistics reported in the Draft SEIS, DOT&PF and FHWA reviewed the calculations and found an error in the computation for the number of fatalities. The error in the Draft SEIS has been corrected in Sections 4.3.7.5 and 4.4.7.5 of the Final SEIS. In addition, the fatal crash rate and the crash rate used in the calculation of number of fatalities and crashes was changed from an Undivided Urban and Rural Interstate classification to Rural Other Principal Arterials to more accurately reflect conditions on the Alternative 2B and 3 roadways.

The published GCI cellular phone coverage map indicates there is talk and text coverage for approximately 80 percent of the Alternative 2B route. In addition, as a component of Alternative 2B, DOT&PF is proposing to construct a new maintenance station at Comet (MP 66) that will be staffed full time. Emergency services would be able to be contacted from the station.

The missing “hard look” is particularly evident in the manner in which the DSEIS characterizes benefits for health care access. Public comments to the contrary, the DSEIS

²¹⁵ 2014 Appendix EE at 207

²¹⁶ DSEIS at 4-44

²¹⁷ 2014 Appendix EE at 207

²¹⁸ Id.

²¹⁹ DSEIS at 4-63

²²⁰ 2014 Appendix EE at 207

²²¹ 2014 Appendix J at 37

continues to mistakenly characterize Alternative 2B as giving Haines and Skagway residents “better access to Juneau’s well-developed healthcare sector.”²²² Haines healthcare professionals submitted comments that indicate the opposite is true. Health care workers maintain that an East Lynn Canal road “would not be our choice based upon the healthcare needs of our community. **Any of the four marine alternatives would be much more beneficial to serving the medical needs of Haines residents.**”²²³ An unbiased document would have stated that marine alternatives better meet the healthcare needs of Haines and Skagway.

RESPONSE: All of the project alternatives improve access to and from Juneau relative to Alternative 1 – No Action. Presumably, improvements to access in general would improve the access to specific facilities and services. While ferry alternatives might be a preferred mode of access to some healthcare providers, others may prefer the highway alternatives. The healthcare providers cited in this comment did not comment on the Draft SEIS. FHWA and DOT&PF have initiated a supplemental NEPA process with this SEIS and are not required to revisit comments on the previous EIS. Furthermore, the preferred transportation mode for these healthcare workers to serve the medical needs of Haines residents may no longer be ferries.

Avalanches

“Lynn Canal is a dynamic, high-energy environment, subject to constant change.” During 15 years of study one new avalanche path was created and “others were substantially expanded. Changes will continue to occur.”²²⁴ Therefore, it is reasonably foreseeable that at some future time due to new avalanche path creation or substantial expansion of existing paths, the roadbed may no longer be safe, with implications for additional capital costs to address new safety concerns, and/or increases in annual maintenance and operational costs, and/or more predicted road closures than currently predicted. The “dynamic” nature of the East Lynn Canal terrain is evidenced by the fact that the 2006 analysis found only 36 avalanches and now there are 41.

RESPONSE: The potential for change is duly noted in the Juneau Access 2014 Update to Appendix J, Snow Avalanche Report, as quoted. Some additional paths were created by mass wasting processes, primarily landslides. Others were added due to alignment changes.

Avalanche paths on highways worldwide are dynamic, and their risk is mitigated to acceptable levels. There is nothing about Lynn Canal that would give reason to expect changes that could not be mitigated acceptably. It would be reasonably foreseeable to have changes that could be mitigated, rather than ones that could not.

The road would be closed when avalanche conditions are present and when mitigation

²²² DSEIS at 4-44

²²³ 2/18/05 SDEIS comments by doctors Hussain, Heinz, and Keirstead, physicians assistant Draper, and nurses Malone, Weaver, Miller, and Hodnik, emphasis added,

²²⁴ 2014 Appendix J at 13

cannot be accomplished due to weather conditions; hence, the amount of closure days, as noted in the *2014 Update to Appendix J - Snow Avalanche Report*, Section 2.5, Figure 1: Comparison of Selected Options and in the Draft SEIS at Section 4.3.8.2. Weather patterns are dynamic and it is speculative to state that events causing road closures will increase, decrease, or stay the same over time.

Damage from rockslides and avalanches do not put the road at risk. The likelihood of a slide event has been assessed and would be mitigated to the extent possible during highway design. DOT&PF would be responsible for these risks and would be staffed and equipped to repair damage from slides and maintain the highway in operable condition. DOT&PF would dedicate maintenance personnel and resources for routine maintenance, and would use State and/or federal highway funds to perform major repairs as needed. Clarifying language has been added to the Final SEIS in Sections 4.3.8.2, 4.3.8.3, and 4.4.8.1.

According to the DOT&PF highway maintenance priority system, a highway in Lynn Canal would be a high priority (likely a priority 2) because it would function as a road to connect communities. Crews of maintenance personnel and equipment would be assigned to maintain the Lynn Canal Highway at a high level, with an updated estimated cost \$2.4 million per year in the Final SEIS.

The Avalanche Hazard Index (AHI) “represents the probabilities of encounters between avalanches and vehicles on a highway and the resulting damage.”²²⁵ AHI “is most reliable when a long, detailed history of avalanche activity is available.” But only six years of observation are available for the East Lynn Canal,²²⁶ hardly the “long, detailed history” **required for reliability**. Six years is particularly short for “climate-related phenomena.”²²⁷ The data is further compromised by gaps because daily records were not kept.²²⁸ Further, observed data for three of six years did not conform to expectations and “it appears that some correction for the last three years’ data may be necessary.”²²⁹ The overall picture seems to be that even though the AHI is the best available tool to predict probabilities, it isn’t necessarily reliable when there is sparse data, which is admitted to be the case.

RESPONSE: The *2014 Update to Appendix J - Snow Avalanche Report*, Section 6 Avalanche Mitigation, includes using the Avalanche Hazard Index (AHI), the most widely accepted industry standard for comparison, with other highways and with AHI target values that are accepted within the industry. It also analyzes the effectiveness of avalanche programs, and compares Alaska highway avalanche risk with other common risks. These discussions cover worst cases as well as possible on a factual, data-driven basis, without speculation.

²²⁵ 2014 Appendix J at 13

²²⁶ Id

²²⁷ 2014 Appendix J at 199

²²⁸ 2014 Appendix J at 208

²²⁹ 2014 Appendix J at 204

Historical records older than a few years are usually not available for Alaska projects, so the best available data must be used. The period of study was prepared by professionals in the field of avalanche study and is adequate for EIS-level evaluation. For information on how representative the years studied were, and on corrections applied, please refer to the *2014 Update to Appendix J - Snow Avalanche Report*, Sections 12.2 Appendix 2: AHI Data Collection and Reliability and 12.3 Appendix 3: AHI Input Data Analysis, and the raw data and calculation spreadsheets available online in pdf format at www.juneauaccess.alaska.gov.

This is consistent with information presented in the 2005 analysis, which “is still valid.”²³⁰ 2005 Appendix J states: “The accuracy of avalanche forecasting programs **is largely dependent** on the accuracy of weather forecasts in the area. . . . Weather forecast **accuracy** in northern Southeast Alaska **is poor** due to the coastal weather pattern and its rapidly moving midwinter thaws, large variations in elevation, strong pressure gradient winds, long periods of darkness, lack of weather data to the west, and the difficulty of keeping weather stations operational.”²³¹ And again, “snowfall estimates along Lynn Canal are based on sparse data.”²³² In addition, historical avalanche data “is an incomplete record by people who were for the most part untrained in avalanche observation, but it is the most accurate long-term data set available.”²³³ This does not inspire confidence in the context of continuing unaddressed public concerns regarding safety and reliability. Again, if the DSEIS presented a “full and fair” analysis, safety and reliability would have been part of purpose and need.

RESPONSE: The Juneau Access *2014 Update to Appendix J - Snow Avalanche Report*, Section 5 Regional Snowfall, states that these are estimates based on limited data. As with all projects in Alaska, the available weather data is regional rather than project-specific, and period of record is variable and usually not very long, as climate records go. Different data sets over different periods inevitably yield a range of values, and quality of the data is variable.

This is why avalanche hazard evaluation and program design is based on actual observed and recorded avalanche activity; not on snowfall estimates or weather records. No greater level of accuracy is either available or necessary for avalanche evaluation at the EIS level. In addition, further weather data is not needed for the final design or construction.

Operational avalanche programs in coastal Alaska always face difficult forecasting conditions, but operate successfully on our highways, at the Alyeska and Eaglecrest ski areas, at Kensington Mine, at Alaska Electric Light and Power various locations, and at the

²³⁰ 2014 Appendix J at 2

²³¹ 2005 Appendix J at 41, emphasis added

²³² Id. at 29

²³³ Id. at 276

Alaska Railroad and the White Pass and Yukon Route. Forecasters use all available data including weather models to supplement National Weather Service products and produce custom forecasts.

The 2014 DSEIS does not discuss the actual consequences of a forecast mistake. Under the best-case scenario, an East Lynn Canal (ELC) road would be closed in advance of any avalanche event and no avalanche accidents or fatalities would occur. However, in a worst-case scenario, whether due to human error, malfunction of a weather station, or a fast-moving weather system – any of which can be presumed to happen at some point in time -- a person driving the ELC road could be subject to three types of avalanches:

- 1) Light snow avalanches that “could push a car off the highway but not bury it.”
- 2) Deep snow avalanches that “could bury or push vehicles off the highway and could severely damage a vehicle and injure or kill occupants.”
- 3) Plunging snow avalanches, high speed avalanches that could “tumble vehicles off the highway down a steep slope or into the water.” Many of the avalanche paths on 2B “must be considered plunging snow type.”²³⁴

Worst-case scenarios must be – but were not - included in the DSEIS due to the stated problems of accurately forecasting the weather in Southeast and sparse data.²³⁵ “If there are gaps in relevant information or scientific uncertainty pertaining to an agency’s evaluation of significant adverse impacts on the human environment, an agency must make clear that such information is lacking and that uncertainty exists. An agency must include a worst case analysis of the potential impacts of the proposal and an indication of the probability or improbability of their occurrence Thus, one of the federal governments most important obligations is to present to the **fullest extent possible** the spectrum of consequences that may result from agency decisions.”²³⁶ Again, the purpose of the worst-case scenario “is to carry out NEPA’s mandate for full disclosure to the public of the potential consequences of agency decisions, and to cause agencies to consider these potential consequences when acting on the basis of scientific uncertainties or gaps in available information.”²³⁷ This technical information can be part of an appendix but “a plain language summary of the analysis and conclusions of that technical discussion should go in the text of the EIS.”²³⁸ The public should have been – but was not informed that the preferred alternative would dismantle a safe, reliable ferry service and replace it with a road where human error, malfunctioning weather stations and/or rapidly changing weather conditions could cause human fatalities. These impacts are considered significant because they impact public health and safety.²³⁹

The above assessment is corroborated by the statement that AHI numbers “do not express the probability of death, damage, or injury.” AHI “is used for comparing the hazard rather

²³⁴ 2014 Appendix J at 195

²³⁵ 2005 Appendix J at 29, 41, and 276

²³⁶ Federal Register at 18032

²³⁷ Id.

²³⁸ Federal Register at 18033

²³⁹ 40 CFR 1508.27(b)(2)

than evaluating the level of risk.” There are no figures available to determine risk probability.²⁴⁰

RESPONSE: The *2014 Update to Appendix J - Snow Avalanche Report*, Section 6 Avalanche Mitigation, includes using the AHI, the most widely accepted industry standard for comparison, with other highways and with AHI target values that are accepted within the industry. It also analyzes the effectiveness of avalanche programs and compares Alaska highway avalanche risk with other common risks. These discussions cover worst cases, and the analyses can be done on a factual, data-driven basis, without speculation.

The 2014 Draft SEIS addresses Avalanches in Chapter 4 in the eighth section under each alternative (e.g., Section 4.3.8.2 for Alternative 2B). While avalanche risk and hazard are addressed in these sections, the text has been augmented to clarify that avalanche hazard includes the risks of property damage, injury, and death. However, the SEIS addresses how to mitigate these risks by such measures as forecasting, road closures, use of explosives, bridges, and snowsheds.

The existing AMHS system has had no fatalities since 1975, making the road alternatives appear to be less safe than the ferry alternatives. While the AMHS is safe, it does have the potential for catastrophic incidents due to the high number of people on a ferry and the hazards of ocean travel in Alaska’s environment. Ferry incidents tend to occur less frequently, but they can be severe, which makes it difficult to compare the safety of highway and ferry alternatives. While travel in private vehicles tends to be less safe than some other modes of travel, Americans routinely select that mode of travel because of the advantages of convenience, cost, and travel time.

Alternatives 2B and 3 would create a transportation system in Lynn Canal that provides these same advantages, but that also comes with a safety risk inherent in private automobile travel. Each mode of modern transportation is designed and operated to current standards to protect human health and safety to the extent possible. The avalanche sections of the 2014 Draft SEIS described how this would be accomplished for this project, including construction of snowsheds and berms, explosives, forecasting, and road closures. For Alternative 2B, the mitigated AHI score would be 28, down from an unmitigated score of 288. Achieving the North American standard residual AHI of less than or equal to 30 to 40. This is achieved through an Avalanche Management Program that allows for a safe traveling road system.

Worst-case scenarios are addressed throughout *2014 Update to Appendix J - Snow Avalanche Report* by using actual avalanche occurrence and weather data comparison with operating avalanche programs, and are further addressed in Section 4.1 Avalanche Event

²⁴⁰ 2014 Appendix J at 23

Variability. The AHI calculations included an increased risk factor for plunging avalanches, which was applied to vehicles that might be carried into the water, as detailed in the *2014 Update to Appendix J - Snow Avalanche Report*, Appendix 1: Avalanche Hazard Index (AHI) Calculation.

The raw data and calculation spreadsheets are available in pdf format online at www.juneauaccess.alaska.gov.

Geological Hazards

The 1997 DEIS identified three landslides on the 2B alignment²⁴¹ and this information was repeated in the 2006 FEIS. A geotechnical study released in December of 2006, after the April 2006 ROD, found 112 geological hazards, or **37 times more impact** than what was known in 2006. One would expect that this significant new information – updated in 2012 – would warrant some serious analysis in the 2014 DSEIS. But all we know from the DSEIS is 1) DOT shifted the 2B alignment “in several areas to avoid geological hazards;”²⁴² 2) instead of the 112 originally identified hazards, due to shifting the 2B alignment only 99 hazards would be “encountered;” and 3) the 2012 geotechnical update is characterized as follows: “38 [hazards] were determined to have a high probability of occurrence or likely to result in a more-severe event, 44 were determined to have a moderate probability of occurrence or likely to result in a moderately-severe event, and 17 were found to have a low probability of occurrence or likely to result in a less-severe event.”²⁴³ There is no further analysis of these hazards in the DSEIS, and therefore one has to go to both the 2006 and 2012 geotechnical reports for specific information that has significant implications for the human environment.

The 2006 study evaluated two hazard rating systems, including the Geological Hazard Rating System (GHRs).²⁴⁴ What is absent from the DSEIS analysis is that the 38 hazards that are described in the 2014 DSEIS as “hav[ing] a high probability of occurrence or likely to result in a more-severe event” are “A rated” hazards on the GHRs scale, which are described in the geotechnical report as having “**sufficient volume to close the highway for several days to weeks and could result in loss of the roadway prism.**”²⁴⁵ Given this prediction of highway closures for each of the 38 identified A-rated hazards, and given that the highway alignment shifted only in “several areas” to avoid geological hazards, **it is unreasonable to assume there will be no road closures due to geological hazard events.** This information and analysis is completely absent from the 2014 DSEIS and appendices.

Table 5 of the 2012 geotechnical update shows expected debris volumes, lengths of highway impacted by each hazard and the size of debris expected. Volumes of the more severe, A-rated hazards typically fall in the 50 to 1,000 cubic yard category with some predicted to exceed 1,000 cubic yards. Typical debris sizes are between 1 and 4 feet in diameter, with some areas having clast size exceeding 4 feet. These would presumably

²⁴¹ DSEIS at 3-38

²⁴² DSEIS at 3-38

²⁴³ DSEIS at 3-38

²⁴⁴ 2006 Golder Associates Lynn Canal Highway Phase 1 Zone 4 Geotechnical Investigation at 3.3.3.

²⁴⁵ 2006 Golder at 3.3.3, emphasis added

include some of the car and house-sized boulders too numerous to map.²⁴⁶ Highway exposure for each hazard often ranges between 50 and 200 feet, with some hazards impacting 200 to 500 feet of highway, some exceeding 500 feet, and others exceeding 1,000 feet of 2B highway alignment.²⁴⁷ Yet there is no further discussion about the dangers these hazards may pose to the traveling public, and no assessment of anticipated closures resulting from these hazards described as high probability, high volume events. The only assessment of closures in the DSEIS is for avalanches.

Also there is no discussion about additional man and equipment hours that would be required to remove debris, and no discussion of where it would be placed upon removal. These are all serious DSEIS failings because the human environment may be impacted, perhaps to the extent of human fatalities.

Given that many hazards were not affected by the 2012 alignment shifts, and given that they still are predicted to have “a high probability of occurrence,” and given the large volume of material predicted to be released and the large areas of highway affected, and given the definition for A-rated hazards as being “of sufficient volume to close the highway for several days to weeks”, it is unreasonable to assume that there will be no closures for these events, no extra time needed for clearing debris, and no delays in travel time on 2B as a result of numerous, identified, reasonably foreseeable hazard events.

It is also of interest that less severe B-rated hazards have sufficient volume “to close the highway for several hours to a few days.”²⁴⁸ In light of the above, it is a fallacious assertion that “this Draft SEIS provides an assessment of the effects of those [geological] hazards on alternative project facilities.”²⁴⁹ Rather, reasonably foreseeable effects of these hazards on the 2B alignment are essentially missing from the analysis.

While the DSEIS states mapping was completed at 117 locations “where rockfall hazard mitigation would be needed,”²⁵⁰ there is no discussion of how safety might be compromised, or how these specific challenges would increase both construction and maintenance costs. There is the observation that “extremely large boulders were noted, as these may present challenges in removal and compaction of fill for road grading”²⁵¹ but there is no meaningful analysis of the implications of this information to the traveling public.

RESPONSE: The *2017 Update to Appendix D - Technical Alignment Report* includes an updated discussion of the geologic hazards within Alternative 2B. Each identified hazard is tabulated to show the associated mitigation condition based on the current design. Based on the current design, inadvertent road closures may occur over the lifetime of the project. It is expected that these closures would require less than half a day to clean up. It is also expected

²⁵⁰ DSEIS at 4-7

²⁵¹ DSEIS at 4-7

that in the event of a full width road closure, single lane traffic would be restored within two hours and two-lane traffic would be restored within half a day. This is consistent with closures experienced on other Alaska highways with similar terrain.

It is impossible to precisely predict road closures. However, DOT&PF makes every attempt to mitigate hazards impacting Alaska highways. To protect against potential closures along the Lynn Canal Highway, DOT&PF conducted a hazard mapping program designed to identify the hazards and provide a preliminary assessment of their relative severity. As discussed in “Lynn Canal Highway Phase I Zone 4 Geotechnical Investigation,” hazard frequency values “... should be considered preliminary estimates.” These preliminary estimates were assigned to aid in identification of active hazards versus inactive hazards. The frequency categories presented in Section 3.3.2 of the report could just as effectively been labeled: unknown, frequent, less frequent, infrequent, and rare. The ultimate purpose for providing the estimates of hazard frequency, quantity, predictability, and all other parameters was to highlight areas of importance where additional design effort would be required. The preliminary hazard mapping conducted for this project was highly successful in doing that.

If a road alternative were selected, areas potentially affected by geological hazards that have not already been mitigated by preliminary design elements would be examined in additional detail during the final design phase of this project. With the goal of eliminating or minimizing road closures to the extent possible, detailed mitigation measures would be designed after more data and a refined understanding of each hazard can be obtained. There is, however, always the possibility of a large anomalous event. These rare events occur on highways through mountainous terrain common in states like Alaska, Washington, Oregon, Colorado, Montana, and Wyoming.

A new Maintenance and Operation (M&O) Station would be constructed near the original Comet mine camp (MP 66) for Alternative 2B. Equipment for snow removal and debris cleanup would be stored at this location. Equipment routinely used to clear debris from highways in Alaska includes pickups equipped with snow plows, loaders, excavators, and dump trucks. The Technical Alignment Report lists the anticipated M&O heavy equipment.

Debris cleanup is a routine activity for DOT&PF M&O. The time required to remove debris from the highway varies depending on type, size, and volume of material. M&O policy is to quickly open one lane of travel to allow traffic flow during remaining cleanup. Debris is typically disposed of along the downhill shoulder of the highway within the right-of-way. Here are three typical scenarios to help provide a more definitive estimate of the time required to clear debris from the road:

(1) In Ketchikan, rockslides of 10-30 cubic yards are not uncommon. These events typically

fill the rockfall catchment ditch and spill over onto the paved shoulder and part of one lane. In this case, traffic is routed around the debris using standard traffic control devices to redirect the traffic onto the unaffected lane and shoulder. Once M&O is notified of the road closure, traffic flow would be reestablished in this manner in approximately 30-60 minutes by personnel responding from the Lynn Canal M&O Station.

(2) In Ketchikan and parts of the Haines Highway, there are infrequently rockslide events of 50-100 cubic yards that fill the rockfall catchment ditch, shoulder, and one lane, and then spill over into the second lane and shoulder. In this case, M&O would respond with crew and equipment sufficient to provide traffic control and cleanup simultaneously. Once M&O is notified of the road closure single lane traffic flow would be reestablished in this manner in approximately 1-2 hours by personnel responding from the Lynn Canal M&O Station.

(3) Debris flows on the Haines Highway have covered the full width of the highway, taking a full day to open up a single lane of traffic.

Highway cleanup costs are tied to the M&O labor and equipment rates, and any additional rentals or contracted assistance. These costs are typical highway maintenance costs that have been accounted for in alternative cost estimates and are reflected in Attachment C to the *2017 Update to Appendix D - Technical Alignment Report*. Capital improvement costs for the geologic hazard mitigation strategies are included in the updated Engineer's Estimate in Attachment E to the *2017 Update to Appendix D - Technical Alignment Report*.

The section that is supposed to analyze Alternative 2B in terms of geology is extremely sparse. For example, the DSEIS still states that Avalanches are “the most common geological hazard,”²⁵² even though there are “only” 41 avalanches and 117 locations where rockfall hazard mitigation was necessary.²⁵³ The DSEIS concludes the geotechnical reports “have been incorporated into this Draft SEIS” and that the 2B alignment was changed “in several locations.”²⁵⁴ However, as previously discussed, there were far more locations where the alignment was not changed. For example, there are 30 rockfall areas in the new alignment. “Several” rockslides that could reach the alignment are within avalanche paths.²⁵⁵ But with 30 rockfall areas identified, and only “several” that are in avalanche paths, there would be 27 rockfall areas outside of avalanche paths. This does not agree with a prior assessment of 117 rockfall locations. Further, “most” of the debris flows are in avalanche paths,²⁵⁶ but what about those that are not?

RESPONSE: Section 4.3.8 of the Final SEIS and *2017 Update to Appendix D – Technical Alignment Report* have been updated with additional geological hazard information.

²⁵² DSEIS at 3-36

²⁵³ DSEIS at 4-7

²⁵⁴ DSEIS at 4-65

²⁵⁵ DSEIS at 4-67

²⁵⁶ DSEIS 4-67

With some minor additions, the rest of the section on Landslides and other Geological Hazards repeats material from the 2006 analysis, when the extent of geological hazards was unknown. It mentions “a raised roadway that would prevent rock and avalanche debris from flowing onto the road” with culverts that “would pass water and small debris.”²⁵⁷ This may have been true when only 3 landslides and no geological hazards were identified, but is likely not the case now. There is no current assessment (highlighted in gray) for the new information. That the 2014 DSEIS can still state the “conservative estimate of potential new rockslide activity” as being “approximately one per decade”²⁵⁸ indicates this section has not been updated to NEPA standards. One only need to look at Table 5 of 2012 geotechnical update to see how far off the mark this is. The unchanged assessment that road closures due to slides would be “infrequent”²⁵⁹ shows an utter lack of care given to significant new information that could change the practicability of Alternative 2B, construction and maintenance costs for 2B, closures for 2B, and resulting travel opportunity and time costs for users.

This sparse information regarding geological hazards is contrasted with detailed avalanche information including location, mitigation, extra capital and operating costs, and estimates for road closures.²⁶⁰ Since the DSEIS includes detailed information on how avalanches will either be mitigated, or how unmitigated hazard events will cause travel delays and road closures,²⁶¹ it also needs to include similar information about rock, debris, and landslide hazards on 2B. It is clear that the DSEIS has failed to take the required “hard look” and fully disclose the implications of this new information on the human environment, in violation of NEPA.

RESPONSE: All hazard types were defined in the Phase I Zone 4 Geotechnical Investigation (Golder Assoc., 2006) in Section 3.3.1 Definition of Hazards. While rockfall is used to define individual blocks of rock that detach from bedrock outcrops and fall, rockslides are comprised of multiple blocks. Both are natural processes that are present along most highways in Alaska. DOT&PF manages rockfall and other types of hazards along existing highway corridors with the Unstable Slope Management Program (USMP). If Alternative 2B were to be constructed, all the rock cuts and rock slopes that exist along the highway corridor would be inventoried, assessed, and ranked in accordance with DOT&PF’s USMP policies. There are two rockslide locations. Avalanche studies conducted as part of the *Update to Appendix J – Snow Avalanche Report* indicate that large rockslide paths may develop as avalanche paths in the future, although this is undemonstrated at either of the identified rockslide locations. The Draft SEIS contained alignment sheets (Attachment A of the *Technical Alignment Report*) that depicted the locations of the identified geological hazards and avalanche paths. Both are treated individually for design purposes and mitigated

²⁵⁷ Id.

²⁵⁹ Id. at 4-68

²⁶⁰ DSEIS at 4-67

²⁶¹ 2014 Appendix J, and DSEIS at 4-67

differently. Where avalanche paths and geological hazards are coincident, the *Technical Alignment Report* geological update reports the respective proposed mitigation measures.

Road Closures

There is no information given for delays when the Katzehin ferry will not be able to dock because “exposure to the west is still evident and some berthing losses can still be expected.”²⁶² These lost dockings will occur because the state decided not to invest an additional \$35 million in breakwaters.²⁶³ There is no information on the number of days or dockings likely missed per year due to strong wind conditions, which occur frequently in Lynn Canal during winter months.

RESPONSE: A review of the Glostien Associates, Inc., analysis (*Lynn Canal Wind and Wave Climatology – Multi-Year Extremes, Lynn Canal Wind and Wave Climatology Study for Vessel Operations*) indicates that, while the crossing for Alternative 2B is short and the vessels can safely handle wave conditions, it is possible that the sailing may be canceled. Based on a statistical evaluation of the data indicates weather conditions that could prevent sailings one to six days a year. The number of sailings that would be missed depends on the number of sailings per day and whether the inclement weather occurs during the scheduled sailing times.

The near-shore wave height prediction data suggests relatively low wave heights (under two feet) near the proposed Katzehin Ferry Terminal site regardless of magnitude of the wind event (northerly and southerly directions). The Katzehin Ferry Terminal is somewhat exposed to the west. There is no data for the westerly direction. However, the fetch distance is limited, and the waves should be relatively low. While winds may be strong, mooring of the ferry at the Katzehin Ferry Terminal would not likely be significantly affected by wave conditions from any direction.

No information is given in the DSEIS about why the 34.5 days of closure predicted in 2006 has decreased to 12 days. It is stated that “no avalanche debris should be cleared when visibility is poor due to darkness or conditions such as fog.”²⁶⁴ Darkness and fog are common winter conditions, yet no closures are estimated for these common and therefore reasonably foreseeable occurrences. It is of interest that the Klondike Highway, which is the closest proximity avalanche-prone road to the proposed East Lynn Canal road, is closed for avalanche danger, heavy snowfall, glare ice, blowing and drifting snow, rockslides, and poor visibility/white out conditions.²⁶⁵ About half of these reported road closures are for avalanches and about half for the other noted winter conditions,²⁶⁶ the point being that it is reasonably foreseeable that Alternative 2B will also be closed due to common winter driving conditions and road maintenance challenges.

²⁶⁴ 2014 Appendix J at 37

²⁶⁵ Personal communication from U.S. Customs and Border Protection Skagway Port of Entry

²⁶⁶ *Id.*

RESPONSE: In the 2006 Final EIS, Table 4-16, road closures for Alternative 2B were estimated to be approximately 33.9 days a year. The 2014 Draft SEIS, Table 4-27, estimated road closures to be approximately 12.1 days per year. This reduction in road closures is due to added avalanche mitigation measures, such as snowsheds.

DOT&PF and FHWA have disclosed the anticipated road closure effects due to weather and avalanches in the Draft SEIS. Section 4.3.7.2 "Travel Flexibility and Opportunity" describes the effects for the Alternative 2B. Service to and from Juneau during a road closure would be by one or more of the Day Boat ACFs that would be part of Alternative 2B.

There is no information on why 99 identified geological hazards, including debris flows, will not cause any road closures.

RESPONSE: It is impossible to precisely predict road closures. However, the Department makes every attempt to mitigate hazards impacting our highways. To protect against potential closures along the Lynn Canal Highway the Department conducted a hazard mapping program designed to identify the hazards and provide a preliminary assessment of their relative severity. As discussed in "Lynn Canal Highway Phase I Zone 4 Geotechnical Investigation", hazard frequency values "should be considered preliminary estimates." These preliminary estimates were assigned to aid in identification of active hazards versus inactive hazards. The frequency categories presented in section 3.3.2 of the report could just as effectively been labelled: unknown, frequent, less frequent, infrequent, and rare. The ultimate purpose for providing the estimates of hazard frequency, quantity, predictability, and all other parameters was to highlight areas of importance where additional design effort would be required. The preliminary hazard mapping conducted for this project was highly successful in doing that.

The *Update to Appendix D - Technical Alignment Report* includes a discussion of geologic hazards. Each identified hazard is tabulated to show the associated mitigation condition based on the current design. Based on the current design, inadvertent road closures may occur over the lifetime of the project. It is expected that these closures would require less than half a day to cleanup. It is also expected that in the event of a full width road closure, single lane traffic would be restored within two hours and two-lane traffic would be restored within half a day. This is consistent with closures experienced on other Alaska highways with similar terrain.

During the final design phase of this project areas impacted by hazards that have not already been mitigated by the current alignment and could potentially close the road will be looked at in additional detail. With the goal of eliminating or minimizing road closures to the extent possible, detailed mitigation measures will be designed after more data and a refined understanding of each hazard can be obtained. There is however, always the possibility of a

large anomalous event. These rare events occur on highways through mountainous terrain common in states like Alaska, Washington, Oregon, Colorado, Montana, and Wyoming.

On the Haines Highway, the other proximity Lynn Canal highway, a single debris flow frequently closes the road: “Between 2004 and 2012 the highway has been closed about ten times including a three to four-day closure during Thanksgiving of 2005. Most of these closures were for a day or so” with debris depths of 5 to 20 feet.²⁶⁷ There are 43 debris flows along the 2B alignment.²⁶⁸

“Staffing is not adequate to ensure trafficable roads at all times.”²⁶⁹ Yet there are no road closures planned for major snowstorms, which are common winter occurrences. This is particularly significant because it is anticipated that over the next fifteen years “average seasonal snowfall in northern Southeast Alaska will be significantly above average” due to a prevailing La Nina system.²⁷⁰

RESPONSE: Heavy snowfall and avalanches were accounted for in the estimated road closure time, and DOT&PF and FHWA are comfortable with the number of predicted closures. The road will be closed primarily when avalanche conditions are present and mitigation cannot be accomplished due to weather conditions. This is why there are so many closure days, as noted in *2014 Update to Appendix J – Snow Avalanche Report*, Section 2.5, Figure 1: Comparison of Selected Options. Weather patterns are dynamic, and it is speculative to state that events causing road closures will increase, decrease, or stay the same over time.

There is no accounting for high winds and poor visibility that will keep helicopters grounded and delay avalanche control. That is, helicopters would be used on avalanche paths that don't have blaster boxes.²⁷¹ Helicopters require “calm ridgetop winds and good visibility. The lack of good flying weather can result in substantial delays and missed opportunities.”²⁷² It has already been stated that “poor weather conditions can result in multi-day gaps in [air] service,”²⁷³ and also that Lynn Canal air travel “is often constrained by fog, high winds, or snow storms and can be delayed up to several days.”²⁷⁴ Given the above, it is unreasonable to assume only 12 days of closure due to avalanches, because there will be many days when avalanche bombing simply cannot occur due to weather conditions.

RESPONSE: The effects of bad weather on helicopter use were anticipated, which is why remote exploders are proposed to reduce reliance on helicopter flight limitations due to bad weather and darkness. Remote exploders can be loaded and serviced between storms during

²⁶⁷ Haines Highway Draft EA, 2013 at 15

²⁷⁴ DSEIS at 1-7

daylight hours.

Heavy snowfall and avalanches were accounted for in the estimated road closure time, and DOT&PF is comfortable with the number of predicted closures. The road will be primarily closed when avalanche conditions are present and mitigation cannot be accomplished due to weather conditions. This is why there are as many closure days, as noted in the Draft SEIS, *2014 Update to Appendix J – Snow Avalanche Report*, Section 2.5, Figure 1: Comparison of Selected Options.

Helicopters will also be used to survey for goats in avalanche chutes prior to detonation.²⁷⁵ Blaster box utility may be limited by ice build-up.²⁷⁶ Icing is known to be a problem at upper elevations and with an admitted “difficulty of keeping weather stations operational,”²⁷⁷ it seems logical that there would be a similar difficulty in keeping blaster boxes operational. Since this is untested technology for our maritime climate, worst-case scenarios should have been included.

RESPONSE: Rime ice buildup is common to all weather stations and avalanche mitigation systems used at altitude in coastal Alaska. All programs in the region operate successfully despite rime buildup affecting such high-elevation installations weather instruments and remote exploders. Rime ice buildup was factored into all risk, closure, and budget estimates.

An assumption is made that the “safety and reliability of this highway would be a high enough priority to merit adequate funding. Short funding would increase closure time.”²⁷⁸ Yet the winter maintenance allocations of 26.2 lane miles per operator “affords [only] a slightly better level of service than the regional average of 28.8 lane miles per operator.”²⁷⁹ In fact, the Klondike Highway uses two operators to maintain 14.8 centerlane miles²⁸⁰ indicating maintenance funding for Alternative 2B is indeed “short”.

RESPONSE: According to the DOT&PF highway maintenance priority system, the access highway for Alternative 2B would be a high priority, more than likely a priority 2. This classification is due primarily to the fact that its functioning class is as a road used to connect communities. Crews of maintenance personnel and equipment would be designated to maintain the access highway at a high level, with an updated estimated cost of \$2.4 million per year, equating to approximately \$17,000 per lane mile. The average cost for highway maintenance throughout Southeast Alaska is \$9,041 per lane mile.

Updated cost estimates for road maintenance and estimates for cost per lane mile are in the

²⁸⁰ Personal communication from Skagway DOT Station Foreman Malvenia Tyson

Road closure analysis is totally inadequate with closure predictions based on unrealistic, best-case scenarios. As discussed in a previous section, safety and road closures warrant a worst-case scenario so that decision-makers and the public fully understand the consequences associated with implementing the preferred, weather-dependent alternative.

RESPONSE: Worst cases were accounted for by using actual weather records, rather than theoretical estimates. The closure program is explained in Section 6.4.5 Highway Closure Program, and the calculations for closures are detailed in APPENDIX 4: Highway Closures as follows:

Closure periods were calculated using the weather logs and avalanche observations from the same six years of field studies as were used in the AHI calculations, with the same correction factors applied.

Each avalanche cycle was evaluated to determine how long the highway would have been closed, and what level of explosive work would have been conducted. Weather events that would have been forecast as avalanche cycles but turned out to be false alarms are also tallied, but given lower figures for closure time and explosive operations, as would have occurred once forecasters realized the expected activity was not materializing.

Highways with mitigated AHIs comparable to the East and West Lynn Canal route are left open at night at ‘low’ through ‘considerable’ hazard levels, unless natural avalanches are forecast to reach low elevations. If avalanches are likely to reach low elevations, and explosive work is not completed, the highway would be closed at night. Night closures were tallied for the major avalanche cycles.

Because howitzer use allows closure section by section as explosive work proceeds, the West Lynn Canal alternative uses spot closures in daytime for explosive work when the danger level is increasing but instability is limited. The highway would be closed when the instability is increasing more rapidly than explosive work can proceed. Prolonged closures were tallied under these conditions.

Limitations of darkness and storm conditions were factored into the initial tallies for all options. Corrections are added as follows:

- a. An additional 20 percent was taken from the explosive delivery mission tally for helicopter-based programs, because many days that appear suitable based only on the weather records would in fact be too windy, foggy, or stormy. The mission tally was simply reduced, as the window of opportunity would pass and the snowpack would either slide or stabilize on its own.

b. All blaster box figures were reduced 30 percent because the raw mission tally reflects only their capability for being fired in storm conditions. Operations using blaster boxes report that the high cost of ammunition and its delivery by helicopter necessitate using them conservatively.

c. Howitzer use figures for the West Lynn Canal WLC1 option were only reduced ten percent, as weather would not have much effect on transporting a trailered howitzer on the highway.

The tallies for missions and highway closure times under all options were further adjusted by 20 percent for crew limitations. It is often impossible to conduct explosive operations because the entire maintenance crew is tied up with other urgent work, or is working far enough away that they cannot get back in time, or because conditions develop too rapidly to respond, or because of budget and workforce limitations. Some other highway operations reported even greater limitations due to crew factors, but it is assumed here that safety and reliability of this highway would be a high enough priority to merit adequate funding. Short funding would increase closure time.”

Climate Change

Climate change models predict more extreme weather events, which are in fact occurring in the Lynn Canal area. For example, the summer of 2014 was the most rainfall on record. There was a record-breaking snowfall during the 2011-2012 winter and the second most snowfall on record occurred during the 2006-2007 winter. Additionally, December of 2013 broke all snowfall records for that month.²⁸¹ Extreme weather events such as these and others to come will have implications for 2B, a road that passes below 41 active avalanche paths and 99 debris, land, and rock slide areas. More moisture means more snow, more slides, more money for maintenance and more closures. It is admitted that landslides are triggered by “heavy precipitation or snowmelt,”²⁸² and the same is true for land, debris, and rock slides.

“There is general agreement that the Earth’s climate is currently changing at an accelerated rate and will continue to do so for the foreseeable future.”²⁸³ Threats posed include increased storm intensity and changing precipitation amounts and patterns.²⁸⁴ Weather events associated with climate change will have the most implications for Alternative 2B, because it has a marine component and because it is situated underneath 41 avalanches and 99 other geological hazard that can be triggered by wind loading, rain, and snow events, and also require helicopter use for routine maintenance.

The DSEIS fails to include the required “hard look” at the implications of climate change on its preferred alternative. Further, Alternative 2B will contribute the most to climate

²⁸¹ Personal communication from Paul Swift, Haines NOAA observer station #2

²⁸² DSEIS at 3-38

²⁸³ DSEIS at 3-45

²⁸⁴ DSEIS at 4-200

change because it increases the number of vehicle miles by “generating” or “inducing” travel.²⁸⁵

RESPONSE: The discussion on climate change in the Draft SEIS recognizes the potential for increased storm intensity as well as changes in precipitation and weather patterns. Taking a “hard look” at the effects of climate change on any alternative can only be as reliable as predictions for future conditions. As noted in Section 4.7.9 of the Draft SEIS, current design practices address the potential impacts to infrastructure resulting from climate change and increased storm intensity. The 2016 Update to Appendix D Technical Alignment Report provides new information regarding geologic hazard mitigation.

Mooring and Loading Operations (MLOPS)

In its analysis marine consultants Coastwise Corporation makes an *assumption* that MLOPS for the ACF will be efficient and *achievable*.²⁸⁶ Achievability is yet untested because ACF’s have yet to be built. Achievability is suspect because current AMHS MLOPS are substantially longer. The MLOPS times for 2B are admittedly “*short and were selected in order to ensure the maximum possible level of service.*”²⁸⁷ However, the possibility is admitted that if they are overly optimistic, night crew assistance and overtime pay would be necessary.²⁸⁸ This means that costs for the marine component of 2B may be underestimated and also that ferries may not be able to keep to schedule, with the implication that the number of round trips may need to be reduced, which would decrease the number of passengers that can be transported on Alternative 2B.

RESPONSE: The maneuvering and loading operations times (MLOPS) used in the Draft SEIS for alternatives employing a drive through loading and unloading approach are aggressive but achievable and realistic as demonstrated by actual measured times of existing public ferry systems. The MLOPS (as detailed in Appendix GG, *Marine Segments Technical Report*) was revised for the Final SEIS to reflect a more conservative timing, given the proposed terminal and vessel configurations. Ultimately, the final configuration of terminals and ferries would be determined by the operator, AMHS, as NEPA documents do not dictate operational decisions. For the SEIS, what is important is that all of the alternatives be designed for realistic efficiency so they can be compared on an equal basis.

According to Coastwise, currently AMHS loads 2 cars per minute. At this rate 53 vehicles would take 26.5 minutes to load. “Fast loading times require that vehicles be ticketed, checked for security, and staged prior to vessel arrival.”²⁸⁹ However, the Katzehin ferry terminal will be unmanned, so no tickets, no security and no guided staging can occur until after the vessel docks. Given that this will be the first unmanned AMHS terminal, the DSEIS should have – but did not - furnish details on how DOT anticipates the system will

²⁸⁵ DSEIS at 4-230

²⁸⁶ 2014 Appendix GG at 13, emphasis added

²⁸⁷ 2014 Appendix GG at 15, emphasis added

²⁸⁸ Id.

²⁸⁹ Draft Design Concept for Day Boat ACF, Coastwise, 2/25/13

even work at all, much less to the anticipated high level of efficiency. Additionally, the AMHS has installed security precautions at all other marine terminals, but discussion regarding how security will be provided at an unmanned Katzeihin terminal is absent.

RESPONSE: The purpose of the SEIS for the JAI Project is to evaluate the proposed project's environmental impacts to meet the requirements of NEPA, not to provide operational and logistical details for each alternative. To the extent operational details are known at this time, they are identified in the Final SEIS.

The operation of the proposed remote terminal does not require staffing. Homeland Security/U.S. Coast Guard do not require a separate security plan for unmanned terminals. The security for unmanned terminals is covered by the individual vessel security plans that are approved by the U.S. Coast Guard. Receiving approval for vessel security plans for vessels servicing Haines/Skagway/Katzeihin is not anticipated to be an issue. AMHS currently has several unmanned terminals in service.

Details of fare collection would be determined during the project design. However, it is possible fares would be collected on board and possible fares would be collected only in one direction.

There would be no staging required organizing vehicles by destination. With a single destination, it would be "first in line, first on." In addition, the Day Boat ACFs would use drive through loading and unloading operations, which allows vehicles to load faster than ferries that load from the side.

Coastwise characterizes a 15 minute ACF MLOPS as "more aggressive than existing AMHS," necessary only because "fast turn around times are critical to the success and cost effectiveness of high frequency ferry systems."²⁹⁰ For other ACF alternatives, a "most generous MLOPS time of 30 minutes" was used.²⁹¹ However, for the Haines/Katzeihin route, "reducing MLOPS from 30 minutes each to 15 minutes (for each load or unload interval) allow three additional round trips."²⁹² In this 15-minute time period a ferry needs to slow down and secure its moorage, unload 53 vehicles, ticket and load 53 vehicles for the return trip, and unmoor the vessel before getting underway. This untested best-case scenario seems highly improbable. For example, it is anticipated that the ACF could be loaded at 6 cars per minute and unloaded at 9 cars per minute.²⁹³ For a ferry that carries 53 vehicles, loading and unloading would take 15 minutes, leaving no time for mooring, unmooring, ticket-taking, security, etc.

RESPONSE: Please refer to the MLOPS table in Attachment E of the Appendix GG, *Marine*

²⁹⁰ 2014 Appendix GG at 38

²⁹¹ Draft Design Concept for Day Boat ACF, Coastwise, 2/25/13 at 11

²⁹² Id. at 13

²⁹³ Id, Appendix B at 4

Segments Technical Report of the Draft SEIS. For Alternative 2B, each load/unload operation MLOPS is 10 minutes, for a total of 20 minutes. Although aggressive, timing is achievable based on actual measured times of existing ferry systems. The MLOPS table has been updated for the Final SEIS.

There is some confusion in the DSEIS and Appendices regarding whether or not an even faster MLOPS is planned for Alternative 2B. That is, “to achieve desired number of round trips,” MLOPS for Alternative 2B were reduced to 10 minutes.²⁹⁴ (The sailings with 10 minute MLOPS are referred to as ACF-X sailings). The appendix clearly states that implementation is necessary to “verify the assumptions made.”²⁹⁵ Given that a 15- minute MLOPS is “aggressive”, and that MLOPS time are “critical” to success and cost effectiveness, a 10-minute MLOPS for Alternative 2B not only is untested, but also extremely unrealistic. In other words a MLOPS of 10 or 15-minute duration appears to be yet another best-case scenario for Alternative 2B. Obviously, with exceedingly short (and perhaps unrealistic) MLOPS, and the resulting extra ferry round trips, the capacity and frequency of 2B is likely overestimated, and time delays are likely underestimated. Manipulating MLOPS inflates both the capacity and the opportunity to travel for 2B, because these purpose and need elements are functions “of the frequency of [Katzehin] day boat ACF service.”²⁹⁶ If the number of sailings is inflated due to unrealistic MLOPS times, then the analysis is biased towards selecting 2B. This is particularly true when comparing Alternative 2B with Alternative 3.

RESPONSE: See the updated MLOPS table Attachment E of Appendix GG, *Marine Segments Technical Report*. The MLOPS for Katzehin to Haines/Skagway is extended from 10 minutes to 15 minutes.

Costs

As previously discussed, Alternative 2B is the most costly to build and the 4th most costly of 8 alternatives to maintain. If built, the government would provide a subsidy of \$52 per vehicle.²⁹⁷ Alternative 2B therefore seems to be a poor choice for the purpose and need element of reducing state costs. It is also a fact that Alternative 2B costs “are greater than the benefits provided,” to the tune of 309 million dollars.²⁹⁸ It makes no sense for FHWA to spend public money on a project with this huge level of negative economic benefit. Even with the incredibly skewed analysis as previously discussed, 2B is simply not worth building.

There are also energy costs involved, where 2B has the 3rd highest energy use of 8 alternatives,²⁹⁹ and the 3rd highest greenhouse gas emission costs.³⁰⁰ It also has the highest safety costs with the highest number of accidents, and human and animal fatalities. 2B also

²⁹⁴ 2014 Appendix GG, Attachment C at 2B-1 and Attachment E at 1

²⁹⁵ 2014 Appendix GG at 39

²⁹⁶ DSEIS at 2-16

²⁹⁷ DSEIS at 2-16

²⁹⁸ DSEIS at 4-62

²⁹⁹ DSEIS at 4-188

³⁰⁰ DSEIS at 4-202

has the highest environmental costs.

Costs for building and maintaining tunnels and snowsheds are likely low-balled. Safety features such as lighting, ventilation, and adequate shoulder width are not discussed in sufficient detail. All that is known is that the snowsheds are designed for “two lanes and no lighting, mechanical ventilation or real-time traffic monitoring.”

This can be problematic because they create “light/shadow vision problems, ice formation, and [are] something for cars to run into.”³⁰¹ The required “hard look” at safety issues posed by tunnels and snowsheds is missing from the DSEIS. Safety issues will be further compromised because there is no cell service along the route.³⁰²

RESPONSE: During the final design phase of this project, tunnels would be designed in accordance with FHWA and AASHTO guidance to ensure safe travel for the public. The tunnel cross sections would provide sufficient space for travel lanes, adjacent shoulders, and elevated walkways for inspection, maintenance, and emergency use. These structures would include lighting in the tunnel interior, entrance lighting, exit lighting, guardrail protection at approaches, traffic control to stop approaching traffic from entering following activation of a fire alarm, and standpipe systems for fire protection; however, mechanical ventilation is not proposed.

Snowsheds would be designed with an open side on the downhill side of the road, eliminating the need for features that are required for closed tunnel systems. Guardrail protection at approaches would be provided.

The costs to construct the tunnels and snowsheds are reflected in the updated Engineer’s Estimate in Attachment E to the *Update to Appendix D - Technical Alignment Report*. These costs include the anticipated features mentioned above.

The published GCI cellular phone coverage map indicates there is talk and text coverage for approximately 80 percent of the Alternative 2B route. In addition, as a component of Alternative 2B, DOT&PF is proposing to construct a new maintenance station at Comet (MP 66) that will be staffed full time. Emergency services would be able to be contacted from the station.

Funding

The realistic assessment from the state’s transportation plan is that if begun, an ELC road may not be completed.³⁰³ If construction begins and is not completed, NHS funds could not be used for the same reason that federal funding could not be used to improve a road to

³⁰¹ 2014 Appendix J at 30

³⁰² 2014 Appendix J at 37

³⁰³ Lets Get Moving, 2030 at 21

Cascade Point – that is, because it would not connect to another community.³⁰⁴ As of the DSEIS writing, “sufficient funding” is only available for construction to Independence Lake. The rest of the road would be constructed as “funds become available.”³⁰⁵ However, federal code requires that “full funding” needs to be reasonably anticipated “within the time period contemplated for completion.”³⁰⁶

The state transportation plan mandate is to “bring fiscal discipline” and shorten “the gap between needs and revenues.”³⁰⁷ The state plan understands and acknowledges the challenges posed by transportation in Southeast Alaska: “Extreme weather, rugged terrain, vast distances, low population density and scattered islands make road construction difficult and very costly compared to the number of users.”³⁰⁸ This is a very accurate description of reality and a very good rationale for why 2B should not be selected.

Given reality-based financial constraints admitted in the state transportation plan and the SATP, and given our previous discussion, it is hard to conclude anything but that complete funding for Alternative 2B will not materialize. In addition to not being completed, there are serious concerns about safety, durability and economy of maintenance.³⁰⁹ Building Alternative 2B would entail squandering public funds on a high-risk road.

RESPONSE: The current surface transportation system in northern Lynn Canal is eligible for National Highway Performance Program (NHPP) funding. New roads as proposed under Alternatives 2B and 3 can be designated as NHS intermodal connectors and are thus eligible to receive NHPP funds. Approval of a modification to the NHS system is independent of an FHWA Final EIS/ROD. An NHS modification would occur prior to a request for construction funding. Section 2.5 of the Draft SEIS described funding considerations and the plan to fund construction of the preferred alternative in its entirety

Currently, there are no funds shown in the STIP, since the preferred alternative has been changed to Alternative 1 – No Action; however, during the time period between the release of the 2014 Draft SEIS and prior to the change of the preferred alternative to Alternative 1 – No Action, the completion of the design phase was shown in the 2016-2019 STIP. The funding for construction was after FFY 2019.

A build alternative would have been constructed in stages, which is not segmentation. The initial construction stage would have occurred after the time frame presented in the current STIP (after 2019). Showing the intent to fully fund the project in the years beyond the current STIP shows intent by DOT&PF to fund the project in its entirety and is accepted by FHWA. (See <http://dot.alaska.gov/stwdplng/cip/stip/index.shtml> for full details on the STIP.)

³⁰⁷ 2030 Lets Get Moving at 30

³⁰⁸ Id. at 36 - 37

³⁰⁹ 23 USC 109(a)(1)

Had an alternative been selected with an estimated project cost greater than \$500 million, then according to 23 U.S. Code 106(h), it is a major project, and a project management plan and financial plan would have been produced for approval by the FHWA after the Final SEIS.

Invasive Species

The DSEIS admits that “invasive plant species could be introduced.”³¹⁰ Since the East Lynn Canal corridor is currently pristine regarding invasives, huge public expenditures to eradicate invasives could be required after-the-fact, adding new costs to 2B. NMFS expressed the following concerns: “Although the Draft Supplemental EIS responds to a comment concerning invasive plants by describing measures to minimize their spread, the general public transportation vector is not considered. Vehicles traveling the East Lynn Canal Highway may spread these plants along the road corridor and potentially into anadromous streams and coastal areas that are currently not infested. Eradication or control of these invasive plants, once established, can be expensive and difficult.

RESPONSE: Section 4.3.14 of the Draft SEIS acknowledged that Alternative 2B could have indirect effects on terrestrial vegetation from the general public transportation sector. Draft SEIS Sections 5.4 and 12.12.1 included measures to reduce the spread of invasive species during construction. Once the project is completed, road maintenance activities would be subject to the DOT&PF best practices for controlling the spread of invasive species.

Recognizing this, the Metlakatla Indian Community has established a vehicle wash down system for all vehicles entering Annette Island from the Alaska Marine Highway System (Winter 2012).

NMFS recommends that all alternatives in the Final Supplemental EIS examine the potential for aquatic invasive species to spread as a result of project activities and identify management measures to prevent the spread of invasive species.”³¹¹ Costs associated with controlling invasive species need to be addressed.

RESPONSE: Costs associated with controlling invasive species are included in M&O costs.

Segmentation

It has been suggested that the state of Alaska wants to build a road to the Katzeihin so that it can be extended to Skagway in the future. This was articulated during a 2008 legislative Transportation Hearing, where the following testimony was recorded: The Katzeihin will be the end of the current project “though DOT&PF plans a second project to ‘hard link’ to Skagway and the national highway system.”³¹² Evidence that this still may be the case is a USFS and DOT MOU for an easement through the Tongass National Forest beginning at Echo Cove and ending near Skagway, dated 9/22/06. This MOU occurred after the April 2006 ROD that selected a road that terminates at the Katzeihin as its preferred alternative.

³¹⁰ DSEIS at 4-81

³¹¹ NMFS comments 11/03/14 at 2

³¹² Alaska State Legislature House Transportation Standing Committee Hearing, 2/12/08, at 3

The easement is dated 11/22/06 and is on file at the CBJ recorders office.³¹³ There would be no need for an easement beyond the Katzehin, unless the intent is to continue building a road to Skagway. If this is the case, the project has been improperly segmented to avoid NEPA compliance.

RESPONSE: At this time, DOT&PF has no intent to pursue extension of a road from Katzehin to Skagway. It is true that the Forest Service has incorporated three transportation/utility corridors along Lynn Canal into the Tongass National Forest Plan: (1) from Echo Cove along the shore to Skagway, with a ferry terminal near the mouth of the Katzehin River, (2) from Skagway southward along Taiya Inlet then northwesterly along Lutak Inlet to Haines, and (3) from Haines across the Chilkat River/Inlet near Pyramid Island then south to William Henry Bay. Easements for these corridors and many others in Southeast Alaska were granted by Congress in Section 4407 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), as amended. The purpose of the referenced 11/22/06 Memorandum of Understanding (MOU) between the State of Alaska and Forest Service is to establish a framework and process for granting the reciprocal rights-of-way and easements described in Section 4407 of SAFETEA-LU.

Alternative 3

Least Environmentally Damaging Practicable Alternative (LEDPA)

The EPA assessed that Alternative 3 is the LEDPA because it would provide “significant transportation improvements over the No Action alternative” and also outperforms 2B on the Juneau/Haines route.³¹⁴ We have already detailed the numerous ways in which the DSEIS portrays Alternative 2B in a best-case scenario, and we question whether Alternative 3 has been intentionally diminished as an alternative by withholding sufficient detail and also unnecessarily inflating costs. We believe the DSEIS claim that “all alternatives have been evaluated to a comparable level of detail”³¹⁵ is false.

RESPONSE: As stated previously, all of the alternatives carried through the environmental analysis have been evaluated and presented to a comparable and appropriate level of detail for making an informed decision. The Draft SEIS reported the nature and magnitude of the environmental impacts of each project alternative without bias. More detail is available for Alternative 2B because it was the selected alternative in the 2006 ROD and was moved forward to permitting and design. To not include the relevant information obtained for that corridor in years following the 2006 ROD would be disingenuous; however, to bring all alternatives to the same level information (i.e., final design) is not reasonable or necessary.

Avalanches

In addition to Alternative 2B having more than twice the number of active avalanche paths

³¹³ 2014 Appendix Z at 6

³¹⁴ 2014 Appendix Z Attachment A at 34

³¹⁵ DSEIS at ES-13

than Alternative 3 (43 versus 19),³¹⁶ Alternative 2B has avalanche risk that is extensive along the corridor length, whereas Alternative 3 has discrete areas of high risk. Alternative 2B has nearly double the volume of anticipated avalanche debris (47,752 versus 29,775 cubic yards),³¹⁷ and 22.5% more snowfall.³¹⁸ One would assume that operating costs for avalanche control and debris removal, therefore, would be substantially higher for Alternative 2B. But annual operating costs are fairly similar.³¹⁹ Further, the DSEIS does not assess the relative merits of the avalanche program selected for Alternative 3. That is, an explosive delivery system was selected for Alternative 2B that was more expensive than other options, presumably because of a real benefit of lowering the avalanche closure time by half.³²⁰ For Alternative 3, a more expensive option was chosen with no apparent benefit. That is, capital costs were \$4.87 million more than a cheaper alternative with a resulting road closure decrease of only 4%.³²¹ There is the appearance that Alternative 3 costs have been inflated, making 2B appear to be more cost effective.

RESPONSE: The potential for avalanche effects to roadways has been fairly evaluated and appropriate mitigation has been proposed for Alternatives 2B and 3.

Please refer to the *Update to Appendix J - Snow Avalanche Report*, Section 13.6, Appendix 11, Operating Budget Spreadsheets, and Section 13.7, Appendix 12, Capital Budget Spreadsheets, for updated budget spreadsheets. Operating budgets for Alternative 2B are currently \$1,458,719 for Option D and for Alternative 3 are \$1,257,483 for Option H. Avalanche programs for all alternatives involve many of the same staffing, office, weather station, field equipment, and materials costs.

Alternative 3 options have been updated to avoid long howitzer shots, adding some blaster boxes or other fixed exploders. Current capital costs are \$11,185,325 for the preferred Alternative 2B option that minimizes closure time and maximizes risk reduction, and \$6,199,259 for the preferred Alternative 3 option. Capital costs include items such as blaster boxes, loaders, bulldozers, and signage to name a few of the items. Closure estimates are 12.1 days for Alternative 2B and 5.5 days for Alternative 3. The budget sheets, as updated in Appendix 11: Operating Budget Spreadsheets, contain all the details for how costs were calculated.

The key variables are explosive type and delivery method. The study presents the options; option selection is based on criteria for closure times, risk reduction, and other engineering and operational concerns.

Alternatives Evaluation

FHWA requires that alternatives be evaluated in a “fair and balanced manner” and that “each alternative must be explored at a sufficient level of detail to support a reasoned choice”.³²² The Safe, Accountable, Flexible, Efficient Transportation Equity Act included changes in the environmental review process that allows for a preferred alternative to be developed at a higher level of detail, but that higher level of detail must not prejudice the fair and balanced consideration of alternatives. In this DSEIS Alternative 3 is not evaluated in a comparable manner to Alternative 2B. As one example, we know that Alternative 2B will not be built to AASHTO standards (4 foot shoulders instead of 6). Figure 2-7b shows a roadway section for 2B, but there is no such drawing for a section of Alternative 3. Therefore it is not possible to determine whether the two road alternatives would be built to the same standards. If MLOPS for Alternative 2B are unrealistic in order to increase traffic volume, but cannot actually be met as previously discussed, then Alternative 3 will have a greater capacity than 2B. Again, a fair and balanced consideration of alternatives seems to be absent.

RESPONSE: The Draft SEIS is fair and balanced. More detail is available for Alternative 2B because it was the selected alternative in the 2006 ROD and was moved forward to permitting and design.

The roadway typical section schematic (Figure 2-7b, Final SEIS) applies to all alternatives with road construction. It is not specific to Alternative 2B.

As previously discussed, the MLOPS for Alternative 2B has been revised for the Final SEIS. See *Appendix GG, Marine Segments Technical Report*, for discussion. The increase in MLOPS is accounted for in the traffic study update.

Alternatives 4A and 4B

Having a fair treatment of fast vehicle ferries in the DSEIS analysis is very important because reducing travel time is a stated purpose and need and all alternatives are compared in this regard. A McDowell study prepared for the Municipality of Skagway states that the per-mile Lynn Canal costs for the Fairweather fast vehicle ferry were lower than any other Lynn Canal vessel.³²³ The McDowell Groups’ finding is very different from the DSEIS analysis, where fast ferry Alternatives 4A and B have the highest operating costs of any alternatives.³²⁴ Since DOT often contracts with the McDowell Group, this significant discrepancy should be explained.

RESPONSE: The 2014 McDowell study indicating a low cost per mile for the *FVF Fairweather* is in error due to faulty data. Specifically, the *FVF Fairweather* is credited with 2,728 nautical miles in 5.8 days, resulting in approximately 470 miles per day. This inflated mileage for 6 days of expenses results in an artificially low cost/mile.

³²² <http://www.fhwa.dot.gov/hep/section6002/1.htm#Toc148770599>

³²³ 2014 McDowell North Lynn Canal Ferry Service Analysis, page 7

³²⁴ DSEIS ES-16

Also the DSEIS assumes that ACF ferries are “sunk costs” that “will exist for all alternatives and can be factored out of the analysis,” and “there will be no difference between alternatives on their account.”³²⁵ Yet 4A and 4B do not deploy the ACF’s³²⁶ and are therefore unfairly penalized in the cost analysis, rendering the comparison of alternatives invalid. That is, resources have already been committed prejudicing a decision away from selecting either of these fast ferry alternatives.³²⁷

RESPONSE: Commissioning of the Day Boat ACFs was done under a separate decision-making process and must be dealt with as part of each of the alternatives as appropriate. They cannot be utilized as part of Alternatives 4A and 4B and new fast vehicle ferries would need to be purchased.

Alternative 4C

4C is our preferred alternative because it is safe and reliable, and is the most cost effective build alternative.³²⁸ It meets all of the purpose and need elements, as discussed in the purpose and need section. It is also the “environmentally preferred” alternative for the Army Corps of Engineers.³²⁹ Meeting all purpose and need elements, being the environmentally preferred alternative, and being practicable, also makes this alternative the LEDPA. We urge FHWA to reject the state of Alaska’s preferred alternative and instead support either Alternative 1 or 4C.

Other Reasonable Alternatives Not Considered

The Washington State ferry system and the Inter-Island Ferry Authority (IFA) are subsidized at a rate of 30% where the AMHS subsidy is twice that.³³⁰ Given that this information is available to DOT and was presented at the 2014 SATP public meetings, it would be reasonable for the DSEIS to have evaluated an IFA alternative for Lynn Canal in this EIS process as a way to improve service and reduce state costs.

RESPONSE: Due to the importance of the Lynn Canal link, it historically has been owned and operated by DOT&PF, instead of a non-State entity such as the Inter-Island Ferry Authority (IFA). AMHS operates under different conditions than the Washington State ferry system. Washington State Ferries has higher capacity/usage, short runs, and benefits from drive-on/drive-off in one direction, resulting in quick sailing turn-arounds. Washington State Ferries also benefits from a larger market size.

A reasonable alternative LCC previously suggested is a marine alternative that uses the same routing that the AMHS successfully used to provide Lynn Canal ferry service prior to 2004 and is still used for mainline and winter service: northbound ferries go from Juneau

³²⁵ 2014 Appendix FF at 52

³²⁶ DSEIS at ES-4

³²⁷ 40 CFR 1502.2(f)

³²⁸ DSEIS at ES-16

³²⁹ 2014 Appendix Z at 17

³³⁰ 2014 Appendix BB at 11 and 2014 SATP power point

to Haines to Skagway, and southbound ferries go from Skagway to Haines to Juneau, an efficient use of sailing time, fuel, and crew that connected all three Lynn Canal communities during the same sailing.

RESPONSE: The Juneau/Haines/Skagway/Haines/Juneau triangle route takes approximately 17 hours. When the route is run daily as a Lynn Canal shuttle, the vessel must have crew quarters and sufficient crew to run 24 hours. The Day Boat ACFs without crew quarters do not have the ability to run the triangle and return to their home port each day.

This routing is efficient only from the perspective of servicing all three ports with one vessel. It is inefficient with respect to travel time and capacity.

In 2004, AMHS routing separated summer Juneau sailings to Haines from summer Juneau sailings to Skagway, leaving no Haines/Skagway connection. This routing change involves the vessel sailing right past Haines on its way to Skagway without stopping. The 2004 routing has been adopted for all summer marine alternatives in the DSEIS (except mainline service) requiring a minimum of three day boat ferries with three separate crews, which “artificially inflates the cost of all marine alternatives.”³³¹ There has yet to be an evaluation of how this relatively new Lynn Canal configuration adds unnecessary costs to every marine alternative. This routing would be especially applicable to Alternatives 4A and B, ferries that have shorter turn-around times. Continuous routing that connects all three Lynn Canal communities currently occurs during winter.

RESPONSE: Primarily marine alternatives (4A-D) and road alternative (2B) involve a day boat connecting Juneau/Haines, a second connecting Juneau/Skagway, and a third providing the direct Skagway/Haines connection. The proposed level of service is necessary to optimize capacity.

The 2014 DSEIS continues to fail to consider legitimate reductions to capital costs for marine alternatives achieved by a vessel routing that significantly reduces fuel and crew costs. Adding a marine alternative that lowers both capital and operating costs, burns less fuel, and has no measurable adverse environmental impacts is a missed opportunity to comply with 40 CFR 1502.14 by “sharply defining the issues and providing a clear basis for choice among options.” Failure to identify and assess reasonable alternatives that avoid or minimize effects on the human environment is a clear violation of 40 CFR 1500.2(e).

RESPONSE: FHWA did not violate 40 CFR 1500.2(e). DOT&PF and FHWA examined a full range of reasonable alternatives, including Alternative 1B, which does not include up-front capital expenditures. The reasonable alternatives included avoidance and minimization measures to reduce impacts to the quality of the human environment. It is not possible to add a marine alternative that would lower capital and operating costs while reducing fuel and crew costs without adding new vessels or having a negative impact elsewhere in the AMHS system. DOT&PF examined various new vessels (e.g., fast ferries that would improve

³³¹ LCC 2005 SDEIS comments at 10

operating speeds), but those vessels cost more to operate.

Another option that could have been – but was not – explored is using two crews for the same vessel, to provide 24 hour operation. This could add capacity and reduce costs. For example, each ACF makes only one round trip per day for Alternative 4C, but using two crews would allow for 2 round trips using the same vessel,³³² freeing an ACF vessel for other AMHS routes.

RESPONSE: The Day Boat ACFs are not designed for continuous 24-hour service. The vessel requires time for service, such as fueling and maintenance in port.

Evaluating different routing options and different vessel choices should have been - but was not - part of the Coastwise marine consultant contract; i.e., all alternatives were already formulated by DOT and given to Coastwise for an as-is analysis.³³³ Given that Coastwise has marine vessel expertise sought out by DOT, discretion to design efficient marine alternatives should have been granted.

RESPONSE: Alternatives were developed in consultation with AMHS staff. AMHS staff have considerably more experience with the ins and outs of running and optimizing the existing AMHS service than Coastwise Corporation. Coastwise Corporation is a naval architecture and marine engineering firm offering primarily vessel design, marine structural and systems analysis, and port engineering services.

To conclude, the existence of viable but unexamined alternatives renders the EIS inadequate.

Executive Order (EO) 12898

EO 12898 addresses environmental justice for minority and low-income populations. Federal agencies must identify and address “disproportionately high and adverse human health or environmental effects” on these populations. This includes health, economic and social effects of federal actions.³³⁴ By not having a thorough – or even accurate - analysis of impacts to walk-on passengers from dismantling public transportation in the Lynn Canal, the DSEIS ignores very real impacts in the context of EO 12898. That is, if a road is built the costs will be borne by the elderly, students, and low-income families who do not have a suitable or available vehicle. Admission of this is buried in the appendices where it is stated that “cost is a key reason people choose to travel as walk-ons.”³³⁵ As previously discussed, walk-on passengers will be paying significantly more for Lynn Canal travel if Alternative 2B is implemented.

RESPONSE: The current surface transportation system in Lynn Canal operates like an expensive toll road, which has an impact on low-income travelers, in some cases precluding

³³² DSEIS at 2-27

³³³ 2014 Appendix GG at 5

³³⁴ DSEIS at 3-28

³³⁵ Appendix EE at 126

their ability to travel outside their hometown. As indicated in the Draft SEIS, vehicle travel on the AMHS costs roughly four to six times as much as travel over the same distance on a highway (see Section 1.4.5). One of the stated purpose and need elements of the project is to reduce user costs for transportation in the corridor. FHWA has determined, based on traditional measures of environmental justice, that none of the build alternatives would have a disproportionate high and adverse effect on low-income or minority communities (see Section 4.7.2).

9.5% of Juneau households, for example, do not own a vehicle. This is true for 7.8% of Haines households and 3.5% of Skagway households,³³⁶ but this number of potentially impacted households is not analyzed in the context of EO 12898. Additionally, Alternative 2B would also place a hardship on households that only have one vehicle, since it is likely that one or more household members would be home and need the vehicle to get to work, while other family members are traveling. Households that would face this situation include 35.2% of Juneau households, 45.9% of Haines households, and 34.1% of Skagway households.³³⁷ These are significant populations that could be seriously impacted if Alternative 2B is implemented, yet impacts remain unanalyzed.

The preferred alternative would put an unfair burden, in terms of cost, time, and ability to travel, on people living below poverty level, since it is reasonable to assume that household income is a major factor in vehicle ownership. While all the pieces of information are presented – and primarily in the appendices - the DSEIS fails to connect the dots and includes no meaningful analysis regarding EO 12898 mandates. Instead, the claim is made that the current “high cost of travel in Lynn Canal has an impact on low-income travelers and, in some cases precluding their ability to travel.”³³⁸ The DSEIS has wrongfully concluded that 2B would reduce these travel costs.³³⁹ However, low-income travelers are walk-on passengers because “cost is a key reason people choose to travel as walk-ons,”³⁴⁰ and these travelers would be precisely those most adversely impacted if Alternative 2B is implemented.

RESPONSE: FHWA did not identify a high and adverse disproportionate effect on low income or minority communities as a result of project alternatives. Reducing user costs was an element of the purpose and need statement. The alternatives evaluated in the Draft SEIS met the need for reduced user costs.

We have already discussed how costs to walk-ons increase significantly with Alternative 2B.

A meaningful analysis of EO 12898 would address equity issues concerning who benefits and who bears the costs for removing the public transportation option and building a road.

³³⁶ Appendix EE at 127

³³⁷ Appendix EE at 127

³³⁸ DSEIS at 4-186

³³⁹ Id.

³⁴⁰ Appendix EE at 126

Again, “cost is a key reason people choose to travel as walk-ons.”³⁴¹ Instead, contrary to logic, the FHWA has determined none of the build alternatives would disproportionately affect low-income or minority populations.³⁴²

RESPONSE: Per the comment, additional cost information and impacts to low-income and/or minority walk-on passengers have been supplemented in the Final EIS at Section 4.7.2.

AMHS Fare Structure

Despite the state’s pathetic attempt to create a TSM alternative as previously discussed, a true TSM alternative is still missing. A true TSM alternative would incorporate options that maximize efficiency of the existing system with little or no new construction.³⁴³ Maximizing efficiency in the absence of an AMHS rate structure analysis is an impossible task. That the Juneau Access EIS is going forward in advance of the completion of this analysis - due to be released next February³⁴⁴ - is absurd. A 2014 McDowell study shows huge disparities between AMHS fares in Southeast Alaska, which indicates arbitrary fares and system-wide inefficiencies. For example, adult Haines-Skagway per nautical mile fares are the highest in the system at \$2.38. Conversely, Petersburg-Sitka fares are only 29 cents per nautical mile. This is a difference of 1,000%. Haines-Skagway vehicle fares are also the highest at \$3.77 per nautical mile, with Petersburg-Sitka fares at 60 cents per nautical mile.³⁴⁵ For some unexplained and therefore mysterious reason, Haines-Skagway fares will be drastically reduced on Alternative 2B. Continuing to ignore an erratic and nonsensical AMHS rate structure while at the same time advocating that the AMHS is too costly to maintain and operate is arbitrary and capricious. One only needs to look at the fare comparison chart presented in the McDowell Report³⁴⁶ to ascertain the arbitrary nature of the fare schedule.

This is particularly egregious because the need for a “comprehensive analysis” for an equitable fare system to reduce AMHS costs was identified 15 years ago in the 1999 SATP.³⁴⁷

RESPONSE: Regarding the suggestion that Alternative 1B is not a true TSM alternative, the purpose and need for the project is not to maximize the efficiency of the AMHS operations system-wide. That said, the Draft SEIS did not fail to address the comparative needs and capabilities of the vessels across the AMHS system.

Appendix CC explains how Alternative 1B was developed and describes why certain vessels are needed on certain routes. DOT&PF established as a goal that the new alternative would

³⁴¹ Appendix EE at 126

³⁴² DSEIS at 4-186

³⁴⁵ 2014 McDowell North Lynn Canal Ferry Service Analysis, page 5

³⁴⁶ Id. at 6

³⁴⁷ 1999 SATP at 68

need to meet the purpose and need in Lynn Canal but not by diminishing service elsewhere in the system. As explained in Appendix CC, DOT&PF considered technical capabilities of the vessels, vessel size, operating conditions, and the effect on the AMHS mission (i.e., could a vessel be moved or shared with other routes such that it could provide Lynn Canal service while also maintaining the level of service committed to the other communities).

In part, vessels were rejected as being reasonable for Lynn Canal service because it was found that reassigning vessels to Lynn Canal would be at the expense of reduced service elsewhere. To this extent, DOT&PF did consider demand and capacity on the other routes in the system. As explained in Appendix CC of the Draft SEIS, seven of the 11 existing AMHS ferries are not suitable for use in Lynn Canal because relocating/diverting the ferry to Lynn Canal would jeopardize the AMHS mission, including impacts on demand, level of service, and schedule considerations.

DOT&PF evaluated every vessel in its fleet to try to identify those that could reasonably be relocated or share service within Lynn Canal. It is important to note AMHS other DOT&PF professionals regularly evaluate the demand, capacity, and efficiency of the overall system. Schedule changes are made, based on a system analysis of demand and community needs. In particular, because the operation and maintenance of the AMHS system is funded out of the State's general fund, there is great scrutiny and pressure to optimize the efficiency of the service and minimize the costs. The planning that is undertaken, as well as annual schedule and funding discussions, occurs with much involvement from the public and elected officials. DOT&PF contends that this regular planning process, operational funding scrutiny, and annual scheduling process results in a system that is already highly optimized. Despite this, DOT&PF took a hard look at each of the vessels in the fleet and identified and disclosed the reasons vessels were or were not reasonable to consider for Lynn Canal Service. DOT&PF then identified a reasonable "system management" alternative and fully evaluated it in the Draft SEIS.

DOT&PF and FHWA are not ignoring the AMHS rate structure study. The *AMHS Tariff Analysis* was completed in January 2015 and was made publicly available on the AMHS website. The fare study examined AMHS tariff rates and tariff rates for similar ferry systems. The study looked at changes in fares made since the previous rate study was completed in 2008. It also looked for anomalies on routes of similar length within the AMHS system. It considered the development and implementation of changes in tariff policy with the goal of creating a fair and equitable tariff structure. The study did not analyze demand or service to identify inefficiencies. DOT&PF and FHWA have determined that the results of this study do not have an impact on this project.

DOT&PF and FHWA did explain how fares were set and the reasons for reducing fares to Haines and Skagway under Alternative 2B. For the No Action Alternative and Alternatives

4A and 4C, the fares were based on 2012-2013 AMHS rates in the Draft SEIS. For new routes that were shortened versions of existing AMHS routes, the AMHS fares were prorated by distance traveled. For new routes less than 20 miles, fares were based on a flat fee to board the vessel and a cost per mile for the transit for both passengers and vehicles. These fares were lower than the existing AMHS fares due to the efficiencies generated from vessels designed and operated as drive through loading and unloading dayboats without reservations. Fares are commensurate with similar ferry systems in other locations operated in a similar fashion. The methodology for assigning fares is described in Appendix A of the *Revised Traffic Forecast Report* (Appendix AA of the Final SEIS).

Bald Eagles

According to United States Fish and Wildlife Service (USFWS) for Alternative 2B “almost every eagle nest tree buffer (37 out of 40) is likely to be impacted between Berners Bay and the Katzehin River. . . . Highway construction through most of the 330 foot buffer zones would result in long-term degradation of nesting habitat (permanent loss of nest areas) and productivity along Lynn Canal. For bald eagles, alternative nesting opportunities are very limited along Lynn Canal, due to the steep terrain and nearby glacial fields. Thus, eagles displaced by road construction will have limited opportunity to locate suitable nest trees.”³⁴⁸ The number of nests impacted has been updated for the 2014 DSEIS, with a large increase in the number of potentially affected nests since 2006.³⁴⁹

According to the USFWS, “FHWA would apply for eagle take permits” when constructing within 660 feet of nest trees and blasting within .5 mile. It is assumed that these takes are “permanent.”³⁵⁰ The impacts to bald eagles were more thoroughly discussed in our 2006 FEIS comments and we incorporate those into the record by reference.

RESPONSE: Thank you for pointing to the United States Fish and Wildlife Service (USFWS) record of comments on the JAI Project with respect to bald eagle impacts. Section 4.3.13 of the Final SEIS describes the effects of Alternative 2B on fish habitat and potential impacts to the commercial and sport fisheries.

Essential Fish Habitat (EFH)

The DSEIS determined the build alternatives may have a potential adverse effect on all five species of pacific salmon during all life phases.³⁵¹ If this does occur, there would be economic repercussions to commercial and sport fisheries, yet there is no analysis of potential impacts. In “40 Most Asked Questions,” when there is a potential for harm “the responsible agency must disclose and consider the possibility of the loss of the commercial or sport fishery.”³⁵²

³⁴⁸ 2006 FEIS at 7-64, emphasis added

³⁴⁹ 2014 DSEIS at ES - 17

³⁵⁰ 2/1/12 FWS scoping comments at 2

³⁵¹ DSEIS section 3.3.2.1.

³⁵² 46 Federal Register 18026 to 18032 (Mar. 23, 1981)

RESPONSE: Section 4.3.13 of the Final SEIS was updated to describe the potential effects of Alternative 2B on fish habitat and potential impacts to the commercial and sport fisheries. The five species of Pacific salmon were identified as potentially affected species during preliminary consultation with NMFS to determine the scope of field surveys in 2003 (Section 3.3.2.1 of the Draft SEIS). The impact analysis for marine and freshwater habitat and species, including EFH, under the build alternatives determined that there would be no measurable effect on regional populations of any fish species.

The analysis provided in the Draft SEIS indicated that no loss to the commercial or sport fishery would occur (Sections 4.3.13, 4.4.13, 4.5.13, and 4.6.13 of the Draft SEIS); therefore, no additional mitigation is proposed beyond the measures agreed to by the NMFS related to impacts to EFH.

Since our marine resources are economically and socially integral to the communities impacted by this proposed project, potential significant impacts need to be seriously addressed.

The environmental documents related to the DSEIS are extremely weak when considering the importance of nearshore marine rearing habitat for salmonids. A prime example of the failing to take a hard look at impacts is the DSEIS statement that the operation of the Katzehin ferry terminal “would not affect Pacific salmon, Pacific herring, or eulachon because of the spatial separation of the terminal from the Katzehin River and other areas of Lynn Canal important to these species.”³⁵³ The most informative statement found addressing the marine ecology of juvenile salmonids reads: “The young salmon feed and grow to maturity in saltwater.”³⁵⁴ It is as though the millions of juvenile salmon that leave the productive fresh water spawning and rearing habitat of Lynn Canal are instantly far at sea, never occupying the shorelines that this proposed project will impact.

RESPONSE: The importance of nearshore habitat is addressed in the Draft SEIS. Areas of nearshore habitat that are considered high value EFH areas were avoided as determined in coordination and consultation with the Alaska Department of Fish and Game (ADF&G), USFWS, and NMFS. The Draft SEIS described the presence of marine habitat and anadromous species in Sections 3.3.2 and 3.3.4 and the potential impacts to these resources for each alternative in Chapter 4. Section 3.3.2.1 of the Final SEIS has been updated to indicate that the Katzehin River also supports eulachon. Chapter 4 of the Final SEIS has also been updated to include potential effects on the larval stage of eulachon from Alternatives 2B, 3, 4B, and 4D.

The addition of fill proposed since issuance of the 2006 ROD in intertidal and subtidal areas was proposed to address concerns related to scour at the Katzehin River bridge abutment for Alternative 2B. This would result in placement of additional materials and an overall

³⁵³ DSEIS, Section 4.3.13

³⁵⁴ 2005 Appendix N at Section 4.4.1

increase of 0.64 acre of fill within the Katzehin River intertidal area, 0.55 acre of which would affect EFH. Construction and long-term effects to EFH from the ferry terminal north of the Katzehin River are evaluated in Sections 5.4.1.2, 5.4.2.3, and 5.4.2.4 of the *2004 Essential Fish Habitat Assessment* and Sections 2.1.1 and 2.1.2 of the *2005 Addendum to Appendix N - Essential Fish Habitat Assessment*. Per your comment, the site-specific effects of the increased fill on EFH in this area are described in Section 4.3.13 of the Final SEIS. The realignments of Alternative 2B since 2004 have reduced EFH impacts associated with highway fill and crossing structures for the Antler, Berners/Lace, and Katzehin Rivers. As stated in Section 4.2.2 of the *2014 Update to Appendix N – Essential Fish Habitat Assessment*, 25.5 acres of intertidal and subtidal fill is a small portion of the available habitat in Lynn Canal and would have minimal effects on the EFH available in Lynn Canal.

Studies conducted in Lynn Canal in the early 1980s specifically identified the east shoreline of Lynn Canal as critical habitat for juvenile salmon.³⁵⁵ This shoreline serves as the **essential migration and foraging habitat for all species of juvenile salmon emigrating from Lynn Canal**. The complex environment of the shoreline provides both refuge and a rich source of prey for the juvenile salmon. No study of the impacts of a road along the shoreline of Lynn Canal can be complete if it does not consider the juvenile salmonids' dependency on the health of this shoreline. The shoreline surveys described in the DSEIS did not include any attempt to determine if the impacted intertidal areas were critical to or utilized by juvenile salmonids. Extensive determination of the type of wetland was conducted for this project, yet the variation in habitat value for the equally critical intertidal areas was not determined at all. There is no way to determine if the areas proposed to be filled are critical feeding or refuge areas for migrating juvenile salmonids. This needs to be determined before it can be stated that the proposed loss of 36.45 acres of intertidal habitat will have no impact on salmonids.

RESPONSE: Nearshore habitat was evaluated for use by salmon species in Section 4.4.1 of the *2005 Appendix N - Essential Fish Habitat Assessment*. Salmon use nearshore migration corridors throughout Lynn Canal to migrate to spawning and rearing grounds in streams that feed into Lynn Canal. The loss of near shore habitat associated with and potential effects to juvenile salmon are presented in Section 4.2.2 of the *2014 Update to Appendix N – Essential Fish Habitat Assessment*, Section 2.1.2 of Attachment A – *2005 Addendum to Appendix N*, and 5.5.2 of the *2005 Appendix N - Essential Fish Habitat Assessment*. The placement of fill would eliminate existing EFH.

Recolonization by intertidal and subtidal species would be affected due to changes in the available substrate, thereby reducing its value as foraging habitat for EFH species. Therefore, depending on the individual area's use by EFH for spawning, rearing, and/or growth to maturity and its ability to recolonize, the direct effects on marine EFH of placing in-water fill in specific intertidal and subtidal zones would be realized in Lynn Canal,

³⁵⁵ Karns, 1981, 1982, and 1983. These studies were previously provided with our 2005 comments and we incorporate them by reference. If duplicate copies are needed, please let us know.

including for salmonid species using these areas. However, relative to the total available EFH in Lynn Canal, this fill would not affect regional populations of fish or invertebrate species or the overall quality of available EFH.

The 2005 SDEIS, surveys investigating the subtidal fill/sidecasting sites along the East Lynn Canal highway alignment found that “unidentified fish were observed at most every site.”³⁵⁶ The species composition of these observed fish was never determined, and the shoreline surveys conducted for the latest DSEIS also contained references to “unidentified fish.”

A thorough analysis would include an evaluation that determines which areas are most essential to these fish. The nearshore environment of Lynn Canal definitely provides habitat that is necessary for the feeding and growth to maturity of salmonids. This includes both the intertidal and subtidal zones.

RESPONSE: Although not all species were identified during the surveys, the assessment presented in Section 4.2.2 of the *2014 Update to Appendix N – Essential Fish Habitat Assessment*, Section 2.1.2 of Attachment A – *2005 Addendum to Appendix N*, and Section 4.3.13 and 4.4.13 of the Draft SEIS provided an evaluation of effects representative of fish species known to occur in Lynn Canal and its tributaries. FHWA regards the analysis contained in these documents to be sufficient for characterizing impacts to these resources and making an informed decision for the project. Consultation with NMFS, as part of the EFH assessment and Endangered Species Act (ESA) Section 7 consultation, led to agreement with the use of representative species to assess potential impacts to aquatic species.

The eulachon that spawn in the Chilkoot, Chilkat, Taiya and Skagway Rivers are of primary importance to the juvenile salmon foraging along the eastern shoreline of Lynn Canal. The larvae of these fish are likely dispersed along the eastern shoreline of Lynn Canal: “Surveys conducted in British Columbia show that larvae disperse from relatively small spawning areas to an area of 10 km² to 1000 km², but appear to be retained in inlets, with often higher densities observed on the seaward side of inlets.”³⁵⁷ The dispersal of the eulachon larvae coincides with the migration of juvenile salmonids through this area:

Little specific information exists on the larval and juvenile distribution and abundance of eulachon in Lynn Canal, although Haldorson et al. (1990) noted the seasonal abundance of larval eulachon in Auke Bay coincident with spring peaks in copepod abundance. Eulachon were the most abundant larval fish collected in Auke Bay by oblique Tucker trawls (0.505-mm mesh) from mid-March to mid-June during 1986 and 1987.³⁵⁸

³⁵⁶ 2005 Appendix N at Section 5.2.1

³⁵⁷ 2005 Appendix N, Attachment C “Foraging Fish Evaluation” at Section 3.2.1

³⁵⁸ 2005 Appendix N, Attachment C at Section 3.2.2

Since fish prey make up from 30 to 75 % of the diet of juvenile salmonids³⁵⁹ they are essential to the survival of all species of juvenile salmon. A reduction in the number of eulachon larvae available to the juvenile salmon would directly result in a decrease in the number of juvenile salmon that Lynn Canal is able to support.

As yet no studies have been conducted to determine the impact of the proposed road and ferry terminals on the larval stage of Lynn Canal eulachon. The consultants hired by DOT have clearly stated that eulachon are vulnerable to just the sort of habitat alterations the east side road will incur: “Both Pacific herring and eulachon have life history stages that make them vulnerable to a variety of environmental hazards, in particular to impacts along shorelines and in watersheds that affect nearshore physical processes and habitat structure.”³⁶⁰

At this time, there is too little information on the marine distribution of larval and juvenile eulachon distribution to allow for a determination of the extent of the impact to these fish. It is irresponsible to put this valuable and critical resource at risk.

RESPONSE: Sections 4.3.13, 4.4.13, and 4.6.13 of the Final SEIS have been revised to identify potential effects of Alternatives 2B, 3, 4B, and 4D on the larval stage of eulachon in Lynn Canal.

Nearshore impacts have also been inadequately discussed. According to the 2014 DSEIS, Alternative 2B would result in the loss of 36.45 acres of essential fish habitat (EFH) that will directly affect the ecology of the nearshore habitat of Lynn Canal. This includes 25.48 acres filled for the highway, 6.57 acres filled for the Katzehin Ferry Terminal and 4.40 acres dredged for the Katzehin ferry mooring basin. The DSEIS states that “Because of the small amount of intertidal and subtidal habitat that would be filled by Alternative 2B relative to the total available, this impact would not affect regional populations of any fish or invertebrate species.”³⁶¹ In presenting this acreage as the only area of impact resulting from the intertidal construction activities, the DSEIS failed to consider the information presented in the 2005 “Foraging Fish Evaluation”:

Indirect impacts can result from structural shoreline modifications that permanently alter physical processes. Chronic changes in regional hydrology alter wave energy and current patterns, obstruct littoral drift and longshore sediment transport, and cause fluctuations of temperature, salinity, and water levels. In turn, these changes can further alter substrate characteristics and beach morphology and affect biological resources and processes, such as changes in vegetation, primary production, food-web dynamics and predator-prey interactions.³⁶²

A table in the same section the document lists the following indirect and cumulative effects:

³⁵⁹ Landingham and Sturdevant, 1998, submitted with LCC’s 2005 comments

³⁶⁰ 2005 Appendix N, Attachment C, Section 5.2

³⁶¹ DSEIS at Section 4.3.13

³⁶² 2005 Appendix N, Attachment C “Foraging Fish Evaluation” at section 4.3

Indirect Permanent Effects

- Downtide Permanent Effects from Sediment Impoundment
- Modifications of Groundwater Regime
- Hydraulic Effects from Armoring
- Increased Energy Seaward of Armoring
- Reflected Wave Energy from Other Structures
- Dry Beach Narrowing/End Wall Effects
- Substrate Winnowing/Coarsening
- Beach Profile Lowering/Steepening
- Potential During Storm Effects
- Sediment Storage Capacity Changes
- Loss of Organic Debris
- Downtide Effects of the Above

Cumulative Effects

- Incremental Increases in All Effects
- Effects to Single Dredge Sectors
- Downtide Sediment Starvation
- Potential Threshold Effects

It is clear from this information that the DSEIS has still not determined the amount of EFH that this project will truly impact. In addition to the direct effects of the burial or excavation of intertidal and subtidal habitats, the structural modification along the Lynn Canal shoreline will alter important physical processes. The determination of the full impact of the effects of these structural modifications may well result in measurable impacts to the fish populations in Lynn Canal.

It is also stated that it will be necessary to build temporary barge ramps along the shores of Lynn Canal to allow for the “access of upland field camps.”³⁶³ No information is given for how long these ramps will remain in place, other than a statement that they will eventually be removed. What is the EFH impact of these facilities, including the indirect impacts noted above, where applicable? Where is a detailed plan, including a timeline, for the post-construction recovery of these sites?

The Magnuson-Stevens Conservation and Management Act defines essential fish habitat as “waters and substrate necessary for fish for spawning, breeding, feeding, or growth to maturity.” We contend that, given that the intertidal areas are necessary for the feeding and growth to maturity of eulachon and all five species of salmon, then all the area impacted by the barge ramps should be considered EFH.

RESPONSE: Section 4.3.13 of the Final SEIS has been updated to include potential indirect effects to fish from shoreline modifications due to placement of fill associated with the highway alternatives. The impacts to EFH from construction and operation of Alternative 2B are presented in Section 4.2.2 of the *2014 Update to Appendix N – Essential Fish Habitat Assessment* and Section 2.1.2 of Attachment A – *2005 Addendum to Appendix N*.

³⁶³ DSEIS, section 4.8.12.7

Information from these reports is incorporated into Sections 4.3.13 and 4.8.11 of the Draft SEIS. In addition, Section 4.8.11 of the Final SEIS includes an evaluation of the effects of the temporary barge ramps on eulachon. Mitigation planning and timing for post-construction recovery would be developed in conjunction with the agencies if this alternative were selected.

We restate for emphasis: The intertidal and subtidal areas along the shoreline of Lynn Canal are necessary for the feeding and growth to maturity of juvenile salmon and eulachon.

We disagree with the following dismissal of impacts to intertidal and subtidal habitat:

Placement of in-water fill in 25.5 acres for highway construction would bury all intertidal and subtidal organisms at the specific fill locations and alter the habitat. Intertidal and subtidal invertebrate species are opportunistic, and the slopes of fill areas would likely be colonized by similar intertidal and subtidal species over a few seasons. However, because the amount and character of the area available for recolonization would be different from the undisturbed intertidal and subtidal zone, recolonization would not restore the community to its original state, reducing its value as foraging habitat for commercial fish species. Because of the small amount of intertidal and subtidal habitat that would be filled by Alternative 2B relative to the total available, this impact would not affect regional populations of any fish or invertebrate species.³⁶⁴

It is simply not true that a “small amount” of intertidal and subtidal habitat will be filled by Alternative 2B. The true impact of the extensive fill proposed under this alternative would be measurable and would affect regional populations of fish and vertebrate species. Building 2B would conflict with the intent of the Magnuson-Stevens Fishery Conservation and Management Act, which “calls for direct action to stop or reverse the continued loss of fish habitats.”³⁶⁵

RESPONSE: Sections 4.3.13 and 4.4.13 of the Draft SEIS included analysis of the potential for recolonization in the intertidal and subtidal areas following construction of the road alternatives. Species that recolonize these areas would continue to provide foraging habitat for commercial fish species at a similar level and value as the original species. In addition, the loss of intertidal and subtidal habitat represents less than 1 percent of the overall habitat in Lynn Canal and would not affect regional populations of species that depend on these areas.

FHWA has coordinated with NMFS on the project since 1994, and continues to coordinate with the NMFS on the EFH assessment, ESA Section 7 consultation, and Marine Mammal Protection Act authorization (eulachon and herring are prey species for ESA listed species

³⁶⁴ DSEIS, section 4.3.13EO 11990

³⁶⁵ DSEIS at 3-56

and marine mammals). NMFS provided comments on the Draft SEIS EFH Assessment³⁶⁶ requesting minor clarifications. The EFH Assessment is updated by errata and included in the Final SEIS.

“Executive Order 11990, Protection of Wetlands, mandates that federally funded projects are to avoid construction in wetlands unless (1) there is no practicable alternative and (2) the proposed action includes all practicable measures to minimize harm to wetlands.”

Practicable alternatives are available and capable of being done after considering cost, existing technology and logistics.³⁶⁷ As previously discussed, all marine alternatives meet the purpose and need and would improve surface transportation in the Lynn Canal. Practicable alternatives include 1, and 4A, B, C, and D. Alternative 2B would compromise wetland values for groundwater recharge, wildlife habitat and nutrient transport. Fill “would reduce these wetland functions to zero.” Habitat value for wildlife might be regained, but not wetland functions. “The continued presence of humans and equipment would ensure that the project site was devoid of all habitat values, or ‘zero function’.” This “would be permanent.”³⁶⁸ Given the existence of many practicable alternatives with less impacts to wetlands, the selection of Alternative 2B violates EO 11990.

RESPONSE: FHWA and DOT&PF have identified Alternative 1 – No Action as the preferred alternative. It would not result in impacts to wetlands and is consistent with Executive Order 11990.

Conclusion

We support Alternatives 1 and 4C. The DSEIS, however, is so fatally flawed, that a new document should be prepared and be subject to public review and comment prior to a Record of Decision. Our reasons for a new environmental document include:

- Inadequate, faulty and biased comparison of alternatives
- Inadequate, faulty and biased methodologies and assumptions
- Failure to take the required “hard look.”
- Inadequate purpose and need statement
- Inadequate treatment of significant new information

RESPONSE: FHWA and DOT&PF have updated information in the Final SEIS to include newly available data, correct errors and omissions, or in other ways respond to comments on the Draft SEIS, as appropriate. The document is comprehensive and complete. No new studies or additional interpretations of project data are needed. There is no need to prepare a separate new document for public review. Per 23 USC 139(n)(2), FHWA developed and approved a combined Final SEIS and Record of Decision.

Thank you in advance for your careful consideration of our comments.

³⁶⁶

LCC 2006 Juneau Access FEIS comments

In addition to these exhibits that we are adding to the administrative record, we believe the DSEIS should have also included the following two documents in the DSEIS index for the administrative record:

- 1) The 2004 SATP is the official Southeast Alaska Transportation Plan until the 2014 draft SATP is revised and adopted. As such the 2004 SATP should have been referenced in the index and belongs in the administrative record.
- 2) Let’s Get Moving, 2030 is the state transportation plan and should also be part of this administrative record.

Re: Federal Project No. STP-000S(131) and ADOT&PF Project No. 71100

Dear Administrator Garcia-Aline and Commissioner Kemp:

Please accept the following timely comments from the Southeast Alaska Conservation Council (SEACC) on the draft supplemental Environmental Impact Statement (DSEIS) for the so-called "Juneau Access Improvements Project" prepared by the Alaska Department of Transportation (ADOT&PF) in cooperation with the Federal Highway Administration (FHWA). The ostensible purpose for the more aptly named "Katzehin Road Project" is to consider alternative means of improving surface transportation between Juneau and Haines/Skagway.

Over the past 20 years, SEACC has participated fully, and in good faith, in the three separate NEPA processes conducted jointly by the FHWA and ADOT&PF on this project. We submitted scoping comments, reviewed and commented on draft and final EISs, and obtained independent expert analysis relating to project costs, traffic demand forecasting, and user benefit analysis. By this reference we incorporate all previously submitted comments and exhibits into the planning record for the 2014 DSEIS.

The preferred alternative selected by the ADOT&PF calls for the construction of a two-lane, 48-mile road along the East Lynn Canal route that would desecrate the ancestral lands of the Auk Kwan,¹ the original settlers of Juneau, and unnecessarily degrade Berners Bay, the Congressionally-designated Legislated Land Use Designation II (LUD II) wildland. The proposed road would cross 41 avalanche chutes and over 100 identified geologic hazards before dead-ending at a new ferry terminal on the uninhabited Katzehin River delta across Lynn Canal from Haines, Alaska, about 1,000 miles from Anchorage. The \$574 million road extension is intended to replace existing community-to-community ferry service with an expensive, dangerous, and unreliable road-ferry hybrid.

¹ See Miller, Rosa *Letter to the Editor: Preserve traditional/and from development*, Juneau Empire (June 14, 2014).

This DSEIS represents the third attempt by your agencies over the last 20 years to disclose and evaluate the economic, social, and environmental effects of this proposal and demonstrate that its approval is consistent with fiscal constraint requirements for transportation decision making and is in the public's interest. This time, despite continued efforts to distort objectivity by inflating traffic demand estimates, misusing traffic forecast models to favor the Preferred Alternative,² and applying contingency cost factor that is too low at this preliminary planning stage,³ the numbers don't lie - Alternative 2B is a huge money loser and its economic costs vastly outweigh all its benefits. *See* Erickson, Gregg, *CON: Road makes no economic sense*, The Road, Juneau Empire (Nov. 25, 2014).

For the reasons described below, SEACC urges the FHWA to reject the State of Alaska's preferred alternative. The most practical and economically feasible way to facilitate safe and reliable transportation between Juneau, Haines and Skagway at a price that can be afforded, including improving the movement of freight, is to redeploy existing assets in the most productive way and expand ferry capacity at a price that can be afforded to match reasonably derived traffic demand. Alternatives 1B Optimized⁴ and 5,⁵ the All Alaska Class Ferry Alternative, were developed by the Skagway Marine Advisory Committee in response to the DSEIS. We believe both of these alternatives meet this project's purpose and need and deliver more practical and economically sustainable surface transportation improvements for the Lynn Canal corridor than Alternative 2B.⁶

I. THE PREFERRED ALTERNATIVE IS UNREASONABLE BECAUSE IT DOES NOT SATISFY THIS PROJECT'S PURPOSE AND NEED.

The purpose and need for this project "is to provide improved surface transportation to and from Juneau within the Lynn Canal corridor" DSEIS at 1-10. Unfortunately, Alternative 2B does not improve transportation opportunities for Lynn Canal residents.

RESPONSE: While Alternative 2B is not identified as the preferred alternative in the Final SEIS, Sections 2.3.3 and 4.3.7.2 of the Draft SEIS explain that Alternative 2B would provide improved transportation opportunities for Lynn Canal residents. Alternative 2B would provide 56 ferry round trips per week from Katzehin to Haines during the summer, while Alternative 1 – No Action would provide only 8 trips per week between Auke Bay and Haines. In the winter, Alternative 1 – No Action would provide only 6 ferry round trips per week between Auke Bay and Haines, while Alternative 2B would provide 42 ferry round trips per week. Similar increases for travel between Juneau and Skagway are also reported in the Draft and Final SEIS.

² *See generally* Marshall, Norman, Review of the Juneau Access Improvements Draft Supplemental Environmental Impact Statement, Smart Mobility (Nov. 2014)(hereinafter "Marshall"); Rogers, George W., The Alaska Marine Highway System at 16 (Univ. of Alaska, Institute of Social, Economic and Government Research)(Oct. 1970)(reflecting on "Numerous transportation studies ... under the sponsorship of agencies with built-in biases for particular modes of travel, generally pro-highway.").

³ *See* Herrera Environmental Consultants, Inc., Memorandum, Review of Draft Supplemental Environmental Impact Statement- Juneau Access Improvements Project at 2-3 (Nov. 21, 2014)(hereinafter "Herrera").

⁴ The Alternative 1B Optimized was prepared by the Skagway Marine Access Commission and submitted with its November 20, 2014 comments on the DSEIS. By this reference we incorporate this more efficient approach to enhanced ferry service in Lynn Canal into SEACC's comments on the DSEIS.

⁵ By this reference, SEACC incorporates the "All Alaska Class Ferry Alternative" into these comments.

⁶ For the record, SEACC has also joined the comments submitted by Earthjustice on behalf of a number of local, regional, state and national groups in opposition to the preferred alternative identified by FHWA and AKDOT&PF for this project.

The DSEIS does not identify any economic benefits from constructing the Katzehin road, like reduced freight costs or more industry.

RESPONSE: The Purpose and Need does not include the need to provide economic benefits like reduced freight costs or more industry; therefore, that is not factored into whether any of the alternatives are reasonable. The Purpose and Need does, however, identify the need to reduce State and user costs, and reports the results of that analysis in Table ES-1.

Furthermore, the Draft SEIS does discuss the implications of the build alternatives relative to economic impacts and benefits. The *Socioeconomic Effects Technical Report* (Appendix EE) and Socioeconomic sections (4.3.5, 4.4.5, 4.5.5, and 4.6.5) of the Draft SEIS explain the possible economic impacts of project alternatives.

The highway alternatives (2B and 3) were projected to have had a greater beneficial effect on the economies of Lynn Canal communities than marine alternatives. This would have resulted from a projected increase in tourist traffic, which would have increased spending and jobs in Lynn Canal communities. Highway alternatives would have also reduced transportation costs. Improved transportation resulting from the highway alternatives may have impacted some small businesses by providing access to competing businesses in other locations, but would have also provided more potential customers for new and existing businesses. It is likely that the higher frequency and low costs of the short shuttle links associated with these alternatives would have generated some truck shipping of fresh fish and other products. In addition to the temporary highway construction jobs that would have been created, both highway alternatives would have had a three-vessel shuttle system in Lynn Canal with permanent ferry crew jobs as well as permanent highway maintenance and seasonal avalanche control jobs.

The purposes of improving capacity and flexibility are ostensibly intended to mean better service of the travel needs and desires of residents living along the Lynn Canal (as the three hours in time savings will not make a significant difference for people driving for two days from Anchorage or three days from Seattle). This objective is clearly not met given that the communities have consistently and vocally opposed construction of a road along the Lynn Canal and repeatedly stated a preference for improved ferry service:

- The Haines Borough passed resolutions from 1997, 2004, and 2006, as well as sent letters to legislators and ADOT&PF in 2014.
- Skagway passed a resolution in 2003, voted against a road in 2004 vote and submitted comments to ADOT&PF in 2014.
- In 2000 Juneau narrowly voted to improve ferries over constructing the Juneau road and public opinion has remained heatedly divided ever since.

In addition to this overwhelming public opposition, we submit for the record a petition opposing construction of the proposed road signed by nearly 2,000 people opposing the Juneau road extension and a compilation of recent news articles outlining the local opposition to the project.⁷

If the primary goal of this project is to improve transportation for residents of the Lynn Canal,

⁷ See Change.org Petition, Southeast Alaska Conservation Council (2014) and Compilation of recent media from the Juneau Empire, Chilkat Valley News, and Skagway News (2014).

than considering the voluminous opposition, ADOT&PF has clearly missed its mark.

Since this project began in the early 1990's, ADOT&PF and the FHWA have tried to skew this process in favor of their Preferred Alternative by including cost components in the stated purpose and need for this project. Despite repeated objections from the public and reviewing agencies, ADOT&PF and FHWA stubbornly kept the reduction of State and user transportation costs as fundamental components of this project's purpose and need. This example of agency obstinacy has today become this project's Achilles heel. While an agency has considerable discretion to define the purpose of its proposed action, it would be unreasonable and impracticable to allow an agency to select an alternative that does not bring about the outcome intended. As revealed in the Executive Summary of the DSEIS, the Preferred Alternative will cost the State of Alaska \$5 million dollars more each and every year than needed to maintain the existing ferry service. *See* DSEIS, Table ES-1 at ES-16. The DSEIS further explains that "the net cost to the State of Alaska of Alternative 2B during the analysis period would be about \$193 million more than the No Action Alternative." DSEIS at 4-61. Clearly, the Preferred Alternative does not meet the purpose and need for tills project.

RESPONSE: DOT&PF and FHWA object to the characterization that they have tried to "skew" the process in favor of one alternative over another. DOT&PF and FHWA have been consistent in the needs described in the purpose and need for the project. Solving the transportation problems documented in the Purpose and Need chapter, and doing that in a way that reflects the operating and maintenance budgetary constraints of DOT&PF, remains an important part of project development.

The purpose and need for the project consists of five components (capacity, flexibility and opportunity to travel, reduced travel time, reduced State cost, and reduced user costs). Each alternative meets the five purpose and need components to a different degree. No alternative best meets all five components. The reasoning behind the identification of Alternative 2B as the preferred alternative in the Draft SEIS was provided in the Executive Summary and in Chapter 2 of the Draft SEIS under the heading "Identification of the Preferred Alternative" (Sections ES-7 and 2.5, respectively).

While DOT&PF and FHWA consider all input, NEPA decisions are not based on a vote but rather an objective evaluation of the facts. The decision is strongly based on how well an alternative satisfies the Purpose and Need for the project (see Chapter 1).

As presented in Table ES-1 of the Draft SEIS, Alternative 2B accommodated the highest demand, provided the greatest capacity, had the shortest travel times, provided the greatest frequency of service, had the lowest cost per vehicle transported, and had the second lowest operations and maintenance costs of any of the build alternatives. It was identified in the Draft SEIS as preferred, taking into consideration these benefits as well as the impacts described throughout the document and appendices.

Due to declining State finances, the preferred alternative has been changed to Alternative 1 – No Action in the Final SEIS. This decision was based in part on the challenging economic conditions as well as the controversy mentioned by the commenter. The rationale for the change in preferred alternative is discussed in Section 2.5 of the Final SEIS.

Incredibly, the DSEIS doesn't adequately address user costs, even though it is a purpose of the project. Rather, the DSEIS focuses entirely on vehicle costs, ignoring almost entirely the critical function the current community-to-community ferry system serves as a transit system for walk- on passengers. A 2000 study prepared for the AMHS and & ADOT&PF by the McDowell Group found

that walk-on travelers *account for 45% of travel on the ferry system.*⁸ Remarkably, we could not find any reference to tills relevant study in the 2005 supplemental DEIS, 2006 final EIS, or the 2014 DSEIS and its supporting appendices.

Consequently, for nearly half of the today's travelers, the user costs associated with Preferred Alternative will increase significantly. ADOT&PF estimates that with Alt. 2B, the Katzehin road and shuttle ferry, total user costs will be \$82 to get to Haines and \$101 to get to Skagway. *See* DSEIS, Table ES-1 at ES-16. Today a ferry ticket from Juneau to Haines costs \$37 and to Skagway it costs \$50 for a walk-on passenger. Under the Katzehin Road scenario an individual traveler will pay roughly \$33 more to travel from Juneau to Haines or Skagway, assuming they have a vehicle at their disposal. At today's taxi rates set by the City and Borough of Juneau of \$3.40 plus \$2.20 per mile, the ride from Juneau to the Katzehin terminal will cost on average \$200 - that's more than four times what it would cost walk-on passengers to reach Haines or Skagway using the existing ferry system.

RESPONSE: The Draft SEIS does describe the user costs for walk-on passengers and does not ignore the use of the ferry as a transit system. The road alternatives (2B and 3) represented a shift in the way transportation would have been provided in the corridor—away from a primarily public transportation mode that operated more like a public transit service, to a highway system where private vehicles provided most of the transportation (publicly-owned shuttle ferries would have provided shorter links connecting the roadways).

DOT&PF and FHWA recognize that this shift would have affected walk-on passengers. Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS described impacts to “Pedestrians and Bicyclists” for Alternatives 2B and 3, including walk-on passengers. The information included estimates of how many walk-on passengers might have been affected and discussed how they would have been affected, including the anticipated changes in fares. Walk-on passengers are currently able to ride on a subsidized ferry for a long portion of the trip, and under Alternative 2B or 3 they would have needed to drive or take a cab, which would have increased their total out of pocket cost. The actual ferry ticket itself for walking on would have been less than the current system because it would have been a relatively short ride. The \$82 fare quoted in the comment is not the cost for a walk-on passenger; rather, it represents an estimated fare for a family of four in a 19-foot vehicle. To help clarify, additional information about the anticipated fares for the various travel markets (walk-ons, single drivers with a vehicle, etc.) has been added to the Final SEIS.

The primary reason stated for why ADOT&PF and FHWA chose Alternative 2B to be the "preferred alternative" was because it would "generate and accommodate the *greatest* projected traffic demand." DSEIS at p.2-32 (emphasis added). This reasoning is arbitrary for at least two reasons. First, the traffic demand estimates underlying these projections are specious, improper use of models to estimate "some hypothetical larger market," and biased assumptions that prejudice the results for ferry alternatives. *See* Marshall, *supra* note 2, at 2, 5, and 12.

RESPONSE: The traffic demand model is not “specious” and it did not use “improper” methodology. All traffic demand models attempt to predict future demand based on assumptions and data available in the present. To the extent that they are predicting a future unknown condition, all demand models are “hypothetical.”

⁸ *See* McDowell Group (2000), AMHS Marketing and Pricing Study, Volume 1: Summary Report of Key Findings and Recommendations at 65).

The demand model used for this project was developed based on empirical data derived from actual travel conditions observed in Alaska, British Columbia, and Yukon from communities with similar geographic characteristics as Juneau. The model starts by defining a condition that the modelers called “unconstrained demand.” This level of demand predicts how many people would want to travel between Juneau and Haines/Skagway if there were a road the entire distance. This predictive condition was based on the assumption that people in Juneau, Haines, and Skagway would exhibit similar travel patterns given the opportunity to travel by road as other similarly situated communities.

Based on the project team’s research, there are no indicators that travel behavior in Juneau, Skagway, and Haines would differ substantially from that of other Alaskan and Canadian communities if full highway access is available. Based on the data collected, the project team is confident that Juneau residents would travel in a similar manner to other Alaskan residents. Even today, Juneau residents travel only slightly less on a per household basis than the average Alaskan household, even though they do not have full road access. Vehicle ownership per capita in Juneau, Haines, and Skagway is also comparable to other Alaska areas.

The forecast only used the unconstrained demand as an upper bound to bracket the overall demand in the corridor. Each forecast, for each of the alternatives, scales down from the unconstrained demand based on factors of cost, travel time, schedule convenience, etc. Using such factors to predict traveler’s choices and behavior among competing alternatives is a common modeling practice and is used in nearly every traffic model. By factoring the demand down from the unconstrained demand based on costs, travel time, and convenience, the model predicts reasonable estimates of travel behavior based on the relative merits of the alternatives.

Moreover, more than one approach to predicting future travel behavior was used by the project team. These approaches were developed by travel modelers at Fehr & Peers. This firm was specifically identified and hired for its expertise in travel modeling, and its approach and results were peer reviewed by an independent university professor with expertise in travel modeling and travel behavior prior to the results being accepted for use in the Draft SEIS. Two models/approaches were selected as being most representative of likely conditions along Lynn Canal. Each of these models was developed independently and resulted in similar estimates of travel volume along Lynn Canal. The methodology and results of both approaches are fully disclosed in Appendix AA and summarized in the Draft and Final SEIS.

Second, the agencies misinterpret the demand component for this project-it is not to "generate and accommodate the greatest projected traffic demand" but "provide capacity to meet transportation demand in the corridor." DSEIS at 1-10 (emphasis added).

RESPONSE: DOT&PF and FHWA are not misinterpreting their own purpose and need statement. Data have demonstrated that there is considerably higher demand for travel than is currently met by the existing transportation system. However, due to high costs, slow travel times, and other inconveniences, the system does a poor job at serving corridor demand. These problems are documented in Chapter 1 of the Draft SEIS.

Each of the reasonable alternatives satisfies the project’s purpose and need to varying degrees in that each provides greater capacity than Alternative 1 – No Action and has been designed to accommodate the demand that would occur given differences in attributes such as cost, travel time, and convenience. There is an underlying latent demand for travel in the corridor (unconstrained demand) and more or less of that demand would be realized with each alternative, depending on the attributes of that alternative. Building a system that satisfies the greatest projected demand in consideration of the costs

is not an arbitrary goal for transportation service providers, and the information provided to make this decision was prepared by specialists in travel forecasting, engineering, and economics.

The agencies' arbitrary reasoning also undermines their argument that Alternative 2B is the "most practicable:" alternative for purposes of justifying the most extensive and permanent loss of aquatic resources from any of the alternatives considered. If the purpose of the project is to accomplish one thing- meet transportation demand - then it is unreasonable to consider an alternative "practicable" if it accomplishes another - increases transportation demand, particularly when such numbers are based on "useless" estimates "relative to some hypothetical larger market." See *Angoon v. Hodel*, 803 F.2d 1016, 1021 (9th Cir. 1986); see also *Smart Mobility on 2014 DSEIS*, supra note 2, at 5 (DOT&PF's unconstrained demand concept is "meaningless").

RESPONSE: DOT&PF and FHWA believe the currently low volume of vehicles transported, the high cost to the State and users, and the low frequency and long travel time of the current ferry service justifies the needs for improvement, and Alternative 2B meets these needs the best. The analysis documenting these needs and the selection of the preferred alternative for the Draft SEIS was not arbitrary. The demand for travel in the corridor already exists. Alternatives that better serve that demand (i.e., satisfy more of it) are superior in meeting the Purpose and Need for the project.

In identifying a preferred alternative for the Draft SEIS, DOT&PF and FHWA weighed the relative merits of the alternatives against the purpose of and needs for the project and the relative impacts to the environment, including impacts to aquatic resources. The documentation of the reasons for identifying Alternative 2B as the preferred alternative in the Draft SEIS are laid out in Section 2.5 of that document.

Moreover, in reference to whether Alternative 2B is "practicable," the Draft 404(b)(1) evaluation provided in Appendix Z (Update to Appendix X) of the Draft SEIS is for the U.S. Army Corps of Engineers evaluation and consideration.

II. DOT&PF'S PREFERRED ALTERNATIVE IS NOT ECONOMICALLY EFFICIENT OR COST EFFECTIVE.

Soon after statehood, Alaskans faced the formidable challenge of connecting our far-flung coastal communities with the rest of the state and each other. In November of 1960, to provide for our basic transportation needs, Alaskans passed the Ferry and Road Bond Issue No.2, and began development of:

... a fast, modern ferry system operation which will serve as a marine highway to connect the various communities of the State together where it is not practical nor economically feasible to construct highways.

See Alaska Department of Public Works, Study and Report on the Alaska Ferry System at B-1 (Feb. 1961) (emphasis added). The preferred alternative for Juneau Access Improvements is neither practical nor economically feasible.

At the very moment that Alaska is looking for ways to cut the State's operating budget, DOT&PF's dead-end road will cost the State of Alaska \$5 Million more every year than the No Action [ferry] alternative. See DSEIS, Table ES-1 at ES-16; 4-61. Inexplicably, DOT&PF chose to plow ahead and release the DSEIS for this Katzeihin Road Project after it was informed by its own experts:

RESPONSE: In the Draft SEIS, the estimated \$5 million difference between Alternative 2B and Alternative 1 – No Action maintenance and operations costs considers expenses only. Factoring in AMHS revenue generated, Alternative 2B was estimated to be \$2.3 million more expensive than Alternative 1 – No Action. Table ES-1 and Table 4-29 in the Final SEIS have been revised/updated. Alternative 2B is now comparable to the no Action for maintenance and operations estimated annual costs.

None of the "action" alternatives are worth more than they cost, considering all resources (State and federal) required to build and operate the project."

See DSEIS, Appendix FF, User Benefit Analysis at v (April 2014). According to Appendix FF, the cost-benefit analysis "generally followed the methodology set out by the American Association of State Transportation Officials for evaluation of highway transportation." *Id.* at 3. Under that methodology:

When choosing between alternative highway projects the standard is to dismiss projects with benefit-to-cost ratios less than 1.0, because it doesn't make sense to invest in projects when the costs outweigh the benefits. According to ... calculations [in Appendix FF], the proposed Juneau road doesn't even come close, with a benefit- to-cost ratio of 0.28.

See Erickson, Gregg, *CON: Road makes no economic sense*, The Road, Juneau Empire (Nov. 25, 2014); see also DSEIS, Appendix FF, Table A-1 - Utility Values (March 27, 2014). Although the authors of Appendix FF note that "the AASHTO has shortcomings when it comes to evaluate project that involve modes of travel other than roads and highways," they don't specifically identify the benefit-to-cost ratio as one of those shortcomings. Unfortunately, neither do they explain why it makes sense to proceed with the Alternative 2B in the face of this lopsided ratio and ignore this general rule of thumb.

RESPONSE: Benefit cost ratios described in the Draft SEIS are not intended to represent a full measure of all benefits and costs associated with project alternatives. In fact, benefit cost ratios described in Appendix FF of the Draft SEIS are narrowly based on user (traveler) benefits alone and do not consider a wide range of other potential household, commercial, industrial, and community benefits associated with improved Lynn Canal access.

The purpose of the economic efficiency and cost-effectiveness analysis conducted as part of the Draft SEIS was to determine which alternatives serve the largest number of users/travelers at the lowest possible cost. A number of measurements are important in the selection of a preferred alternative. For example, the total number of travelers served and the cost to serve each traveler are important measurements.

That all benefit cost ratios calculated in Appendix FF are less than 1 does not mean investment in better infrastructure is imprudent; it primarily shows that transportation infrastructure costs are very high in Alaska, where populations are generally small, distances long, terrain often challenging, and sea conditions often difficult.

In addition, although the User Benefit Analysis claims "to provide a more comprehensive picture

of the alternatives,"⁹ the analysis fails to consider impacts on the Alaska Marine Highway System's (AMHS) capital or operating costs outside northern Lynn Canal or:

external costs including public safety and emergency response-related service costs, pollution and global warming costs, and loss of wildlife or [roadless and] wilderness values . . . or impacts on AMHS capital or operating costs outside northern Lynn Canal . . . For that reason, this analysis does not evaluate the net benefit comprehensively as it states it tries to.

See Herrera, *supra* note 3, at 5.

RESPONSE: The quoted sentence states in full “The tables break out the present values of user benefits and project costs to provide a more comprehensive picture of the alternatives.”

Regarding the costs outside of Lynn Canal, the benefit cost ratios described in the Draft SEIS are not intended to represent a full measure of all benefits and costs associated with project alternatives. In fact, benefit cost ratios described in Appendix FF of the Draft SEIS are narrowly based on user (traveler) benefits alone and do not consider a wide range of other potential household, commercial, industrial, and community benefits associated with improved Lynn Canal access. The analysis clearly articulates this in the Executive Summary as well as Scope of Study sections of Appendix FF. The purpose of the economic efficiency and cost-effectiveness analysis conducted as part of the Draft SEIS was to determine which alternatives serve the largest number of users/travelers and the lowest possible cost in support of the purpose and need statement.

A. The Cost Estimate to Construct Alternative 2B is Still Too Low.

ADOT&PF's latest price tag for the dead-end Katzehin Road Project is \$574 Million, up from the \$258 Million predicted back in 2006. See DSEIS at 2-16. Some of the changes in the project since 2006 include the addition of three snow sheds and two tunnels to mitigate avalanche danger and presumably rock-fall hazards. Bridges have also been lengthened to reduce impacts on salmon, hooligan, and other fish. The effect of these changes has been to increase the total cost, however we submit that even this estimate is not high enough to reflect the true cost of constructing the Katzehin Road Project. The price tag for this project will rise because DOT&PF used a relatively low cost contingency factor for technologically complex changes that have a high risk of cost increases once the supplemental geotechnical analysis needed is completed. *See* Herrera, *supra* note 3, at 3.

RESPONSE: The construction contingency for Alternative 2B is appropriate given the level of design development. The segment from Echo Cove to Sweeny Creek was developed through final design in 2006 after the 2006 Record of Decision, which justifies the 5 percent contingency amount.

A 2006 geotechnical investigation that identified all geologic hazards for Alternative 2B within the segment from Independence Creek to the south bank of the Katzehin River was updated in 2012 in support of the Draft SEIS. Preliminary geotechnical recommendations were developed to address all identified geologic hazards in response to comments and are reflected in the updated cost estimate in Attachment E of the *2017 Update to Appendix D - Technical Alignment Report* in Appendix Z of the Final SEIS. Although additional costs due to geotechnical hazard mitigation have been included in the cost estimate, the final design has not been completed, so a 10 percent contingency is appropriate.

⁹ DSEIS, Appendix FF at 65.

From the south bank of the Katzeihin River to the proposed Katzeihin Ferry Terminal, the contingency amount of 5 percent is appropriate because this section of roadway is located on relatively flat terrain and the potential for unforeseen circumstances is low. The greatest portion of the cost for this segment is the Katzeihin Bridge. The bridge amounts to over 70 percent of the cost estimate for this segment. Bridge super-structures are well defined, with a low potential for unforeseen conditions that would impact cost. The bridge piling size and length estimates are based upon preliminary geotechnical results in the corridor. In addition, there are substantial historic cost data from throughout the State that were used to estimate bridge construction costs. This further justifies the 5 percent contingency amount.

The original survey data collection for Alternative 2B was completed in 2002. The DOT&PF elected to collect updated survey data for the entire Alternative 2B alignment in 2013 and 2014. Since 2002, there has been substantial improvements to LiDAR sensors and collection/processing techniques that improve the bare earth surface modeling for design. This updated data collection effort further validated the estimated quantities contained within the construction cost estimate for Alternative 2B. For this reason, the contingency amounts for the Final SEIS estimate were left unchanged from the Draft SEIS.

Consider that the length of each of the three bridges will be four times longer than the Douglas Island bridge. In fact, at 2,900, 2,800, and 2,600 feet, the three bridges will be the second, third, and fourth largest bridges in the Alaska if built. *See* Friedman, Sam, *Tanana River Crossing: Alaska's Longest Bridge Opens*, Fairbanks Newsmine.com (posted Aug.6, 2014). Until the agency conducts drilling to determine the actual substrate, the cost estimates for the bridges as well as the Katzeihin ferry terminal will remain highly suspect. The bridges will cross five glacial rivers, which can be particularly challenging because of silty and shifting outwash and the occurrence of Jökulhlaups, or glacial outburst floods and ice flows.¹⁰ The recent washout of the mile 36 bridge along the Copper River Highway is an example of the extreme power and unpredictable nature of glacial river systems.¹¹ Given the level of uncertainty associated with designing bridges with sufficient clearance to account for isostatic rebound, glacial outbursts, and unknown subsurface conditions at bridge locations, the 8% contingency cost relied on by ADOT&PF for the DSEIS is too low. *See* Herrera, *supra* note 3, at 2-3.

RESPONSE: Contingency costs are addressed in the preceding response. Isostatic rebound and glacial outburst floods result in the raising or lowering of the riverbed. The bridge piles were designed to accommodate long-term scour and other factors associated with isostatic rebound and glacial outburst floods that alter the riverbed elevation.

B. Constructing Alternative 2B would Consume a Disproportionate Share of the State's Transportation Funding.

The \$574 million price tag is in addition to the \$120 million the State is already spending on the Alaska Class Day Boat Shuttle Ferries now being constructed at the Ketchikan shipyard. In sum,

¹⁰ Miller, Emily Russo, Jökulhlaup erupts from Glacier, Juneau Empire (July 10, 2014).

¹¹ *See* Press Release, USDA, Forest Service, Chugach National Forest, *Copper River Highway closed indefinitely at mile 36 due to safety concerns* (released Nov. 22, 2011). An interesting time lapse video of what happened at this bridge crossing can be seen at <https://www.youtube.com/watch?v=7HIVGvv5v8I> (viewed on Nov. 23, 2014).

the investment in new construction for the Lynn Canal corridor will be \$694 million over approximately the next seven years. That is assuming no cost overruns, which as described above, are most probable. The 2014 draft Southeast Alaska Transportation Plan (SATP) notes that the annual new construction budget for the entire Southeast region is \$61 million per year for a total of \$366 million in new construction the next 6 years.¹² Somehow, the State is planning to spend nearly twice what is budgeted for the entire Southeast Alaska region on the Lynn Canal road alone. Will the additional money come from repairs and refurbishments needed across the region? Will it be taken from other regions of the State?

RESPONSE: Prioritizing the use of National Highway System (NHS) transportation funds is the responsibility of the DOT&PF. DOT&PF is continually reconsidering where to spend available transportation funds. That prioritization is done through the Statewide Transportation Improvement Program (STIP), which is published in draft form for public review and comment before approval. The STIP is frequently modified each year to account for first, project schedule changes and second, shifting priorities around the State. The STIP is approved by the DOT&PF Commissioner, FHWA, and Federal Transit Administration (FTA).

The Legislature provides DOT&PF with authority to spend money on a project by project basis, and allocates funding for the State's match through the capital budget. This process is responsive to funding availability; on-going assessment of the condition of roads, bridges, ferries, and terminals; assessment of traffic and needs; and shifting federal and State legislation.

Will the road stop short of the proposed ferry terminal?

RESPONSE: Alternative 2B would have been constructed from the terminus of the existing road to the Katzehin Ferry Terminal. There would have been multiple construction projects comprising the overall project development. There would have been no intent to end the road short of the proposed ferry terminal.

1. If segmented, this project would lose its eligibility for Federal funds.

It is common practice to divide up mega-projects, like the proposed Katzehin Road Project, into segments. Unlike other road improvements that may leave a portion of the road in poor, but still passable condition, people will be unable to travel the East Lynn Canal corridor between Juneau and Haines or Skagway until the entire route is built. We are concerned that if the State only has enough funding to construct the first phase of the project through Berners Bay to the Kensington Mine, the State of Alaska will not be eligible for reimbursement from the Federal Highway Administration. Funding from the National Highway Performance Program (NHPP) is designated for transportation projects that are part of the National Highway System. A road ending at a mine, which provides no way for people to travel between communities, can in no way be interpreted as part of the National Highway System. In this scenario, the NHS route designation and funding that accompanies that title would remain with the Lynn Canal's community-to-community ferry route.

RESPONSE: The suggestion that FHWA or DOT&PF intended to build a road to Kensington Mine is unfounded and not supported by any information in the Draft or Final SEIS. Section 2.5 of the Draft SEIS described funding considerations and the plan to fund construction of Alternative 2B in its

¹² See ADOT&PF, 2014 Draft SATP at 14.

entirety. Were Alternative 2B to proceed, DOT&PF would have developed a financial plan detailing the funding, after FHWA issued a Record of Decision, and FHWA would have approved the plan prior to authorizing construction funding. Because Alternative 1 – No Action is now identified as the preferred alternative, no financial plan would be prepared.

The same reasoning precludes the use of Shakwak funds on a segmented road project because this funding source is also designed to connect Southeast Alaska with the Yukon Territory and the rest of Alaska. If this occurred, the State of Alaska would be on the hook to pay back federal dollars spent to build a road to the Kensington Mine.

RESPONSE: Section 2.5 of the Draft SEIS described funding considerations and the plan to fund construction of Alternative 2B. The Draft SEIS did not identify Shakwak funds as a potential source of funding for the project. Because Alternative 1 – No Action is now identified as the preferred alternative, no financial plan would be prepared.

We saw the Federal Highway Administration threaten to demand that State of Alaska pay back funding for two unused ferry terminals earlier this year. *See* Forgey, Pat, *New ferry 'pit stops' in Southeast Alaska aimed at satisfying feds*, Alaska Dispatch News (Sept. 14, 2014). The Federal Transit Authority has made a similar request to the Mat-Su Borough to return federal funds expended on the Knik Arm Ferry, which was never used for its intended purpose. *See* Brehmer, Elwood, *Feds ask Mat-Su for ferry grants back*, Alaska Journal of Commerce (Aug. 7, 2014).

2. If selected, Alternative 2B may be ineligible for NHPP funds.

We also question Alt. 2B's eligibility for reimbursement through the NHPP even if the project does provide a complete connection between Juneau and the northern Lynn Canal communities. Congress designed the NHPP to "ensure that investments of Federal-aid funds in highway construction are directed to support progress toward the achievement of performance targets established in a State's asset management plan for the NHS."¹³ The State's Long Range Transportation Plan stakeholders group recently began setting these goals. Specifically, the goal for new infrastructure is to "develop new capacity and connections based on the return on investment in improving accessibility, connectivity, safety, efficiency and reliability of the Alaska Transportation System."¹⁴ ADOT&PF's preferred alternative fails to meet any of these goals.

RESPONSE: DOT&PF plans to submit an asset management plan to FHWA 2018.

DOT&PF and FHWA disagree with the suggestion that the project is not consistent with the goals of the State's Long Range Transportation Plan. The Southeast Alaska Transportation Plan is an element of the Statewide Plan and includes the Juneau Access Improvements Project. The goal language cited by the commenter is still "preliminary" and has not been adopted. Nonetheless, it is consistent with the purpose and need for the project.

Like the goal language, the alternatives under consideration do seek to develop new capacity to meet demand. Similarly, consideration of State costs and return on investment are defined in Chapter 2 of

¹³ ADOT&PF, 2013-2015 Statewide Transportation Improvement Program with Amendment 11 at Need ID: 19214 (Sept. 16, 2014).

¹⁴ ADOT&PF, Preliminary Policies, Strategies, and Actions, Long Range Transportation Plan at 2 (Oct. 2014)

the Draft SEIS. In the Draft SEIS, Alternative 2B was found to best satisfy the overall corridor demand at the lowest cost per trip.

Efficiency is an important consideration and need for the project. As documented in Chapter 2 of the Draft SEIS, the current system is not efficient, and is characterized by long travel times and high user costs. Alternative 2B performs best in terms of efficiency, making the most improvement over current travel times and trip costs.

3. *Alternative 2B is not eligible for Federal transit funds*

The Alaska Marine Highway serves a wide array of purposes and a variety of travelers, which open the system to a wider array of Federal funding options. For example, mainline ferries which connect with the continental road system are considered part of the National Highway System and are thus eligible for NHPP funds. Because of the important role the ferry system plays in connecting the continental U.S., British Columbia, Southeast Alaska, and South Central Alaska, the AMHS is also eligible for what is called "Shakwak" funds. Because Marine Highway vessels also carry people from community to community without the need of a vehicle, the AMHS is also eligible for Federal transit funding.

We submit that the Lynn Canal portion of the AMHS will no longer be eligible for Federal Transit funds because ADOT&PF's Preferred Alternative 2B removes the mass transit function of the Marine Highway System, forcing 45% of travelers who would otherwise "walk-on" to the ferry system¹⁵ to drive a vehicle or take a taxi.

RESPONSE: Section 2.5 of the Draft SEIS described funding considerations and the plan to fund construction of Alternative 2B. DOT&PF did not identify Federal Transit or Shakwak funds as a potential source of funding for the project.

The FTA Section 5309 New Starts program was an annual allocation to the State of Alaska for the AMHS under the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) and was discontinued under the Moving Ahead for Progress in the 21st Century Act (MAP-21).

Under MAP-21, and continuing under the Fixing America's Surface Transportation (FAST) Act, FTA made available Section 5307 Urbanized Area Formula Grant program funds in support of the Discretionary (competitive selection) Passenger Ferry Grant program. The AMHS does not qualify for urbanized area funds.

AMHS is potentially eligible for 5311 Rural Transit Formula funds for non-urbanized areas. This is a small program, approximately \$8 million annually, and AMHS's participation in this program would generate minimal funding for the AMHS program and divert federal funds away from rural community transit systems that depend on these funds for continued operation. As such, AMHS has not competed for 5311 funding due to the limited amount of funds available to the State of Alaska.

There will be no "walk-on" travelers aboard the Katzeihin shuttle ferry with the exception of the occasional hunter, angler, or adventurer setting out from Haines. The Katzeihin River, part of the largest Inventoried Roadless Area on the Tongass National Forest, is currently managed to provide generally unmodified natural appearing settings environments; the 1997 Tongass Plan

¹⁵ McDowell Group (2000), *supra* note 8.

recommended the upper 10 miles of this river for Wild designation under the federal Wild and Scenic Rivers Act. Even if the land were zoned for development, the sheer 6,000 foot mountain cliffs that make the road so difficult to construct would quickly curtail any dreams of development. ADOT&PF is not planning for anyone to drive their car 90 miles from Juneau only to leave it at the Katzeihin ferry terminal; the layout of the parking area is barely large enough to stage the traffic ADOT&PF predicts. In short, proceeding with Alternative 2B is akin to tearing up a light rail and replacing it with asphalt.

RESPONSE: DOT&PF and FHWA do not anticipate walk-on passengers would use the new ferry like they currently use the system because of the driving distance under Alternatives 2B and 3. The fare structure would have been such that it would have been approximately the same or less costly to take a car across Lynn Canal at Katzeihin on the shuttle ferry than it would have been to walk on as a ferry passenger under the No Action Alternative. There would not have been the same kind of financial incentive to leave one's car at the terminal and the terminal would have been remote and unmanned, meaning vandalism would have been a possibility. Therefore, overnight and multi-day parking is not part of the design for the new shuttle ferry terminals.

The road alternatives (2B and 3) represent a shift in the way transportation would have been provided in the corridor—away from a primarily public transportation mode that operates more like a public transit service, to a highway system where private vehicles provide most of the transportation (publicly-owned shuttle ferries would provide shorter links connecting the roadways). The Draft SEIS described the consequences of such changes to walk-on passengers in Sections 4.3.7.5 and 4.4.7.5 under the headings, “Pedestrians and Bicyclists.” The information included estimates of how many walk-on passengers might have been affected and how they would have been affected. Additional information regarding walk-on passengers has been added to these sections in the Final SEIS.

III. DSEIS FAILS TO REASONABLY DEMONSTRATE THAT THE PROPOSED "KATZEIHIN ROAD PROJECT" IS SAFE.

Both federal and state law make safety a top priority. The agencies' selection of a substandard road along the deepest and steepest fiord-like inlet in the North America¹⁶ and under 43 avalanche chutes and over 100 geologic hazards is completely inconsistent with achieving the national highway system's top priority.

Federal law requires an EIS prepared for a federal highway project to be sufficiently detailed for the FHWA to ensure that the project is safe. *See* 23 U.S.C. 109. Under Alaska law, when ADOT&PF designs new highways, they "must be conducive to safety, durability, and economy of maintenance" *See* AS 19.10.160(b). The DSEIS fails to provide a reasonable basis for meeting either standard.

RESPONSE: Alaska Statute (AS) 19.10.160(b), applies to “major upgrade and new construction projects for highways in **federally recognized metropolitan planning areas**” [emphasis added]. The only two metropolitan planning areas in Alaska are Anchorage and Fairbanks; therefore, the citation does not apply to this project. Nonetheless, all roads constructed under State and federal authority must follow State and federal design procedures that have been adopted/established to support safe travel.

A. The Secretary of Transportation Should Reject the DSEIS Because It Fails to Reasonably Assess Safety Issues.

¹⁶ *See* DSEIS at 3-40

The EIS must be sufficiently detailed for the Secretary to ensure that the project is safe. The Secretary must reject the EIS if these issues aren't fully assessed. *See* 23 U.S.C. 109. The Secretary must ascertain the safety of the project before approving it.¹⁷ Given the predicted risks associated with avalanches, landslides, and glacial outburst floods (Jökulhlaup), exacerbated the impracticality of stabilizing all potential rockslide areas, Alternative 2B is far more dangerous than a road of similar dimensions and traffic volume built in a far more forgiving landscape.

See DSEIS at 3-36 to 38, 4-67; 2013 Update to Appendix J, Snow Avalanche Report (hereinafter "Snow Avalanche Report").

In addition, the Secretary of Transportation shall consider the needs for effectiveness and safety in transportation systems, including recognition and preservation of "the inherent advantage of each mode of transportation" and promoting "safe, adequate, economical, and efficient transportation." *See* 49 USC 302 (c)(1); 49 USC 13101 (a)(1)(A), (B). Given the nearly perfect safety record for the Alaska Marine Highway System, and the unreasonable risks presented by the proposed substandard road, approval of DOT's preferred alternative would be arbitrary.

RESPONSE: All roads constructed under State and federal authority must follow State and federal design procedures that have been adopted/established to support safe travel. FHWA may grant an exception to a specific design criterion on a case-by-case basis with justification. FHWA requires any alternative selected for construction to fulfill the standards identified in 23 United States Code (USC) § 109. DOT&PF and FHWA have disclosed the anticipated implications to safety of travel in Lynn Canal under each of the alternatives, including No Action, in the SEIS. While it is true that highway travel tends to have more crashes, there is no reason to believe that accident frequency under Alternative 2B or 3 would have been statistically different than on similar highways in Alaska.

If FHWA were to select a build alternative, it would not be arbitrary. FHWA's Record of Decisions are based on review of technical data developed in support of a Final SEIS and each alternative's ability to meet the Purpose and Need for the project. FHWA also takes into consideration all comments received in the development of a Final SEIS.

B. The DSEIS does not Disclose Enough Information to Fully Evaluate the Avalanche Hazards Posed by the Preferred Alternative.

As noted at the beginning of Appendix 2 to the Snow Avalanche Report, "[t]he results of the analysis are only as reliable as the data used." It is difficult to determine how reasonable the calculated mitigated Avalanche Hazard Index (AHI) is because important factors are not disclosed, including the criteria used for estimating avalanche frequency and the correction factor applied because of changing weather patterns associated with climate trends in the region. *Id.* at 198-99. Without understanding the precise factors plugged into the formulas, this numerical expression of hazard risk remains "dimensionless" and the public has no way of

¹⁷ *See D.C. Federation of Civic Associations v. Volpe*, 459 F.2d 1231, D.C. Cir 1972) (upholding District Court's finding that planning had not "proceeded to a sufficient degree for the responsible officials to determine that the planned facility is structurally feasible" and finding that "§ 109(a) requires not only that the bridge be safe, but also—and no less important—that its safety be ascertained before the Secretary approves the project. That requirement minimizes the safety hazards and at the same time insures that public funds will not be squandered on a demonstrably unsafe proposal").

evaluating the results.

RESPONSE: All the factors, raw data, and mitigation calculation spreadsheets used to calculate the mitigated AHI (risk reduction) are available in pdf format online at www.juneauaccess.alaska.gov (http://dot.alaska.gov/sereg/projects/juneau_access/documents.shtml).

The discussion in the *2014 Update to Appendix J - Snow Avalanche Report*, at Section 6.1, Mitigated AHI Target Calculations, provided analysis of how well the goals were achieved, rather than the calculation of the risk reduction. The risk reduction factors for each path and for the overall avalanche program are listed in Section 6.3, Lynn Canal Avalanche Hazard Reduction Methods.

The level of specificity of the *2014 Update to Appendix J - Snow Avalanche Report*, is more than adequate for an EIS-level evaluation. The experience of the authors and peer reviewers has been updated with resumes in Appendix J in Appendix Z of the Final SEIS.

In response to our specific request on October 30th for information on how these calculations were made, ADOT&PF responded on November 20th with a copy of the "AHI Data Sheets" and a 1989 study on methodology for AHI calculations. While we appreciate ADOT&PF providing us with this information, the agency's response is not in compliance with AS 44.62.213(b) which requires the agency to respond to such requests within 10 days and, if it answers the question, to make sure the question and answer are made available to the public. Other than the email to SEACC, we are unaware of any steps taken by ADOT&PF to inform the public that this important information was available as required.

RESPONSE: The statute cited is incorrectly applied. Article 4 of the Alaska Administrative Procedure Act (AS 44.62.180-290) provides the procedures for the adoption of regulations by a State agency. The statutory provisions referenced in the comment, AS 44.62.213(b), is only applicable when a State agency is adopting, amending, or repealing a regulation. The statutory provision and its requirements are not part of the Alaska Public Records Act and are not applicable to requests for public records referenced in the comment. DOT&PF's response to the records request referenced in the comment was done in accordance with the Alaska Public Records Act.

The geotechnical and design uncertainties associated with avalanche mitigation structures like snowsheds and bridges, exacerbates the difficulties faced by the public and agency decision-makers to understand the precise basis for dropping the avalanche hazard index from 300 to 28. See Herrera, *supra* note 3, at 4. Given the errors discovered in the DSEIS regarding loss of life from traffic accidents under the Preferred Alternative,¹⁸ we respectfully request the agencies "show us the numbers."

RESPONSE: All the factors, raw data, and mitigation calculation spreadsheets used to calculate the mitigated AHI (risk reduction) are available in pdf format online at www.juneauaccess.alaska.gov (http://dot.alaska.gov/sereg/projects/juneau_access/documents.shtml).

The discussion in the *2014 Update to Appendix J - Snow Avalanche Report*, at Section 6.1 Mitigated AHI Target Calculations, is an analysis of how well the goals were achieved, rather than the calculation of the

¹⁸ Furbish, Elaine, *Letter to Editor The Road is deadlier than forecast*, Juneau Empire (Nov. 3, 2014)((the projection of 5 deaths due to traffic accidents under over 30 years in the DSEIS for the Preferred Alternative is incorrect-the correct calculation is three times higher).

risk reduction. The risk reduction factors for each path and for the overall avalanche program are listed in Section 6.3, Lynn Canal Avalanche Hazard Reduction Methods.

The level of specificity of the *2014 Update to Appendix J - Snow Avalanche Report*, is more than adequate for an EIS-level evaluation. The experience of the authors and peer reviewers has been updated with resumes in Appendix J in Appendix Z of the Final SEIS.

The risk reduction factors are consistent with those routinely achieved by modern avalanche programs worldwide. The program proposed for Lynn Canal follows current best practices, with multiple full-time forecasters for daily field presence.

There are no “geotechnical and design uncertainties” associated with snowsheds or their mitigation capabilities; they are in common use around the world, and their effectiveness is well-proven. All other mitigation factors applied are consistent with best engineering practices worldwide.

Please refer to the *2014 Update to Appendix J - Snow Avalanche Report*, Section 3.1, Figure 2, for methods used on various highways worldwide, and to the remainder of Section 3, and to Section 6, Avalanche Mitigation, where the reduction factors are discussed specifically and in detail, especially Figure 4a, where mitigation factors achieved in other locations are listed.

1. The DSEIS fails to fully account for the societal costs of avalanches.

In standard practice the Avalanche Hazard Index calculation includes the probability that vehicles, equipment, infrastructure, and people will be struck while either moving or waiting. By assigning values to these categories ADOT&PF could estimate not just the number of people who while likely die as the result of avalanche related fatalities, or the number of vehicles likely to be tossed to the bottom of Lynn Canal, but also how much those losses will cost the State of Alaska.

The structurally mitigated AHI for Alt. 2B is a relatively low 27.7. See Figure 10, Snow Avalanche Report at 29. It is unclear how the risk to operators who are working to mitigate or clear slides is accounted for. See Glassett & Techel (2014).¹⁹ With a higher AHI, which may very well be appropriate given the variables explained below, the Preferred Alternative becomes even more dangerous. In addition to adjusting the AHI, the number of expected avalanche fatalities of both drivers and operators should be added to the anticipated fatalities reported in the DSEIS.

RESPONSE: While it is possible to calculate societal cost values for economic losses, injury, and death as suggested, these numbers would be of questionable accuracy. There is an international group working on the problem of assigning risk of death, but there is no accepted, accurate method for calculating probability of avalanche death on transportation corridors or the number of vehicles impacted.

The encounter probability term, as calculated for the AHI, is an oversimplified calculation. Using it as a basis for calculation of potential deaths does not result in numbers that agree with actual highway avalanche death records, as noted in Hendrikx and Owens (Hendrikx, J. and Owens, I. 2008. *Modified*

¹⁹ Glassett, Timothy and Frank Techel. *Avalanche accidents involving people along transportation corridors and the implications/or avalanche operations*, Proceedings, Internal Snow Science Workshop, Banff, 2014, available at http://arc.lib.montana.edu/snow-science/objects/ISSW14_paper_014.02.pdf

Avalanche Risk Equations to Account for Waiting Traffic on Avalanche-Prone Roads, in *Cold regions Science and Technology* 51, February 2008, pages 214-218). It quotes Peter Scherer, the originator of the AHI method: “Furthermore, while the individual and collective risk enumerated in deaths year⁻¹ may still seem high, Schaerer (1989) noted that the theoretical frequency of encounters has been found to be far greater than the observed number, providing the example of Rogers Pass, where the expected encounter frequency was calculated at 0.3 vehicles year⁻¹ for a 25 year period, but no encounters actually occurred during this period.”

The one method of assessing risk on transportation corridors that has a historical record of being a useful working basis for comparison of one route to another is the AHI, without the addition of socioeconomic factors. It is the most widely used and most accepted method, and thus has the greatest comparative value of all methods.

The *2014 Update to Appendix J - Snow Avalanche Report*, 6.2.1 Risk Management Analysis of Three Very High AHI Highways, provides a detailed comparison of death rates on highways with similar AHIs. It also, accounts for the deaths in Alaska for both traveling public and highway workers due to avalanches and highway with high AHI.

The 2014 Draft SEIS addresses avalanche hazards associated with Alternatives 2B and 3 in Sections 4.3.8.2 and 4.4.8.1, respectively, and addresses how to mitigate these risks through forecasting, road closures, use of explosives, bridges, snow sheds, etc. While avalanche risk and hazards are addressed in the Draft SEIS, the text has been augmented in the Final SEIS to clarify that avalanche hazard includes the risks of property damage, injury, and death.

The *2014 Update to Appendix J - Snow Avalanche Report*, Section 6.4, Operational Avalanche Risk Management Program, outlines the considerations for developing worker risk reduction programs for construction and operations. Section 12.4 Appendix 4: Highway Closures, Section 13 Appendix 5: Transportation Avalanche Danger Scale, and Section 13.1 Appendix 6: Highway Closure and Operation Criteria, outline the need for operational worker risk reduction programs and contain examples of the material in such operational plans. Appendix 6 states that "These guidelines are a sample of the kind of material that is part of a project-specific operational avalanche plan and are not a substitute for such a detailed plan. A project-specific plan is required under Alaska case law for worker safety before construction or operation of an avalanche-exposed facility may proceed." Should a build alternative be chosen as the preferred alternative, a project-specific operational avalanche plan would be developed during final design.

Section 6.2, AHI Values and Risk to Travelers and Workers, compares public and worker deaths on high-AHI highways and notes that “The higher risk to highway workers underscores the need for strict adherence to the avalanche program and risk management protocols presented in this study, particularly when reopening the highway after avalanches have occurred.” While development of an operations plan is required during final design phase, key concerns and typical risk mitigation measures detailed in Section 6.4, Operational Avalanche Risk Management Program, include forecasting, closures, allowing debris removal only with the approval of the avalanche forecaster, and specific provisions for clearing debris. Sample protocols with specifics for risk reduction at various avalanche danger levels are provided in Appendix 6: Highway Closure and Operation Criteria.

Risk management for maintenance crews is part of an operations plan, which is not done until the design and pre-operations stage, but the program outlined in Section 6.4.6, Highway Operations Procedures, states that “No avalanche debris should be cleared without approval from the on-duty avalanche specialist. The specialist should consider visibility, presence of residual snow in avalanche starting zones, terrain hazards,

availability of spotters and equipment and other risk factors. No avalanche debris should be cleared when visibility is poor due to darkness or conditions such as fog.”

Annual maintenance and operation costs for Alt. 2B are estimated at \$2.8 million annually with \$1.6 million of that dedicated to the avalanche control program. *See* DSEIS at 2-16; Table 4-27 at 4-67. We submit that it will be much higher, particularly when the annual loss factor is taken into account.

RESPONSE: The maintenance would have been funded by State general funds and administered by DOT&PF Southcoast Region. The funding is subject to the Alaska Legislature, who annually identifies, allocates, and authorizes these funds.

The maintenance cost for the highway under Alternative 2B was estimated using actual costs incurred by DOT&PF for highway maintenance. Additional personnel, equipment, and materials were included in the estimate to provide for responses to avalanches. Because of the addition of extra resources to address conditions expected on the Juneau Access highway, the estimate shows the cost per mile to maintain the highway to be approximately 190 percent higher than DOT&PF's current average maintenance cost per mile in Southeast Alaska.

2. The operational avalanche risk management program should be reviewed by experienced operators

Although the reputable authors of the Snow Avalanche Report possess experience in avalanche forecasting and engineering, they do not have direct experience operating an avalanche control program. It is also not apparent whether the engineers who provided the peer review of the Snow Avalanche Report have such experience. Given the extremely complex nature of this type of operation, it is prudent to have at least one author who has real-life experience with avalanche control programs. You would not consent to heart surgery by a doctor who had only read about it in a textbook, nor should the State rely on an avalanche mitigation program designed by people without direct experience in the field. At the minimum, the avalanche mitigation and control program should be independently audited or peer reviewed by any number of experts in Alaska (including ADOT&PF employees) who run actual mitigation programs along highways and railways.

RESPONSE: The *2014 Update to Appendix J - Snow Avalanche Report* was peer reviewed. Please refer to Appendix J, Section 13.11, Appendix 16: Peer Review for details.

Resumes for those who worked on and reviewed the study have been added to the *2017 Update to Appendix J - Snow Avalanche Report*, Section 13.12, Appendix 17: Resumes. These resumes demonstrate that the authors and peer reviewers have extensive experience with avalanche control programs, including in Alaska. One reviewer, Doug Fesler, is based in Alaska and has over 30 years of avalanche forecasting and hazard management experience in Alaska.

3. Southeast ADOT&PF's current forecasting and mitigation strategies are woefully inadequate.

A 1990 study prepared for ADOT&PF, evaluated the avalanche program run by the Southeast region of DOT on Thane Road just south of downtown Juneau. The authors found that "the

existing program does not reflect the state-of-the-art in avalanche forecasting/control procedures."²⁰ Specifically the report found that ADOT&PF lacked in-house professional avalanche forecasting/hazard evaluation capability. The authors also questioned the soundness of relying on the National Weather Service to provide hazard warnings because meteorologists have little or no avalanche training, conduct no field evaluations, and have no network of avalanche observers. The authors found that ADOT&PF avalanche control was often poorly timed, virtually no records were kept, training was incomplete and inconsistent, and the timing of explosive control was not optimal. Twenty-four years later a Site Visit and Review by an Avalanche Specialist found that nothing has significantly changed in the department's practices. *See* Murphy, Matt *Site Visit and Review, ADOT&PF Avalanche Forecasting and Control on Thane Road Juneau, Alaska* at 7 (Mar. 2014).

It is also instructive to compare how many forecasters ADOT&PF proposes for the Katzeihin Road Project with the State of Utah on the dangerous, less than the 14-mile Little Cottonwood Canyon Road, which is threatened by 35 major avalanche paths. The State of Utah employs a seasonal staff of four full-time avalanche forecasters stationed in the canyon. *See* Fehr & Peers, Report No. UT-09.01 at I (Feb. 2009). According to the Snow Avalanche Report (at 34), the core staff anticipated for an avalanche program that will cover 43 avalanche chutes and over 100 geologic hazards along a 48 mile road will be one full time avalanche specialist, one half-time avalanche specialist and one part-time intern. Clearly the State of Alaska needs to do much more to avoid liability for implementing a policy decision to select the Preferred Alternative in a negligent manner.

RESPONSE: DOT&PF is well aware of the deficiencies in past avalanche programs, and added their first avalanche program staffer for the region in the 2014-15 season as part of an ongoing effort to upgrade avalanche operations.

Staffing for the program includes two full-time avalanche specialists plus one seasonal avalanche specialist, or three people, during avalanche season. Staffing at this level is comparable to other transportation and industrial avalanche programs, with two people on duty daily, and the capability to operate 24/7 in shifts when conditions dictate. Please refer to *2017 Update to Appendix J - Snow Avalanche Report*, Section 13.6, Appendix 11, Operating Budget Spreadsheets, for updated details on staffing.

4. Proposed avalanche mitigation options are unrealistic.

Under Alaska law, ADOT&PF has a duty to "develop and implement an avalanche control plan to protect persons who use public highways." AS 19.05.030(7). We could not find any regulations or agency policy implementing this duty. Instead, DOT&PF apparently tries shovels responsibility for managing avalanche risks on to the general public. *See* ADOT&PF Kicks off Alaska's Avalanche Awareness Month (Nov. 10, 2014). Despite recognizing that Alaska law requires development of project-specific operational avalanche plan, the Snow Avalanche Report does not provide one because "[p]lanning at that level is beyond the scope of this report." Snow Avalanche Report at 211. Because ADOT&PF chose not to develop and disclose such a plan for the Preferred Alternative in this DSEIS, or establish any regulatory standards for doing so, we question what basis the FHWA can reasonably rely upon to conclude that the Preferred

²⁰ *See* Fesler, D., et al., 1990. Avalanche Hazard Analysis & Mitigation Recommendations for Thane Road Juneau, Alaska Phase I. Prepared for ADOT&PF Project No. 70134/FM-0963)(cited in Snow Avalanche Report at 255).

Alternative is safe.

RESPONSE: The *2014 Update to Appendix J - Snow Avalanche Report*, Section 6.4 Operational Avalanche Risk Management Program, outlines the considerations for developing risk reduction programs for construction and operations. Section 12.4 Appendix 4: Highway Closures, Section 13 Appendix 5: Transportation Avalanche Danger Scale, and Section 13.1 Appendix 6: Highway Closure and Operation Criteria outline the need for operational risk reduction programs and contain examples of the material in such operational plans. Section 13.1 Appendix 6 states that “These guidelines are a sample of the kind of material that is part of a project-specific operational avalanche plan and are not a substitute for such a detailed plan. A project-specific plan is required under Alaska case law for worker safety before construction or operation of an avalanche-exposed facility may proceed. Planning at that level is beyond the scope of this report.” DOT&PF and FHWA believe that the analysis presented is sufficient for decision making.

As stated in Section 6.4.6 of the *2014 Update to Appendix J - Snow Avalanche Report*, “Avalanche season highway operations should be conducted following a project-specific, fully detailed avalanche risk management plan, as required under Alaska case law on worker safety. Crews should be trained in avalanche procedures and equipped with avalanche emergency kits.”

According to the 2013 Update to Appendix J, mitigation options include adjusting Alternative 2B and 3 routes to reduce avalanche hazard and application of some unspecified "industry standard program of risk management using a combination of forecasting, explosives, and preventative highway closures." 2013 Update to Appendix J at 7-8.

Using helicopters to service the blaster boxes and directly bomb 25 different chutes with an untold number of start paths is an unreliable strategy. First, avalanche danger is often highest when it is most difficult to mitigate the danger. Snow builds up during stormy weather precisely when low ceilings and high winds can make it difficult to fly helicopters. Second, avalanche mitigation efforts that rely on using howitzers to trigger avalanches have a success rate of just over 50 percent. "This means just more than half of significant avalanches-those with a snow depth of 10 feet or more-are triggered and few then half occur naturally." See Coffey, M. and Hess, E., *The Valdez "Damalanche"*, "APWA Reporter at 44 (Nov. 2014). Pre-emptively closing the road when the danger is high but cannot be mitigated is not a realistic strategy as the State of Alaska never pre-emptively closed a road to date.

RESPONSE: The details of the operational avalanche program are unspecified because detailed operational programs are developed at the design, pre-construction, and pre-operations stages; not at the EIS stage. The *2014 and 2017 Update to Appendix J, Snow Avalanche Report*, Section 6.4 Operational Avalanche Risk Management Program, outline the considerations for developing risk reduction programs for construction and operations. Sections 12.4 Appendix 4: Highway Closures; 13 Appendix 5: Transportation Avalanche Danger Scale; and 13.1 Appendix 6: Highway Closure and Operation Criteria outline the need for operational risk reduction programs and contain examples of the material in such operational plans. Section 13.1 Appendix 6 states that “These guidelines are a sample of the kind of material that is part of a project-specific operational avalanche plan and are not a substitute for such a detailed plan. A project-specific plan is required under Alaska case law for worker safety before construction or operation of an avalanche-exposed facility may proceed. Planning at that level is beyond the scope of this report.”

The reason remote exploders are proposed is to reduce reliance on helicopters flying in bad weather and during the night. Remote exploders can be loaded and serviced between storms.

Effectiveness of all avalanche mitigation programs is calculated based on the proven and documented records of other highway avalanche programs. No explosive works on deep instability. A program that involves waiting until ten feet (3.0 m) of snow accumulates before blasting would not be effective; blasting must be frequent if it is to be effective.

Pre-emptive avalanche closures have been used on Alaska highways, for instance in Skagway in the winter of 2015-2016. In Lynn Canal, DOT&PF would have the ability to use the shuttle ferries during closures, encouraging the use of preventive closures of a Lynn Canal highway.

It is also not clear how the AHI accounts for risks associated with paths that have multiple starting zones. For example, the Eldred Rock path appears to have 15 or 16 different starting zones making it an extremely dangerous path. *See* Snow Avalanche Report at 65. If ADOT&PF succeeds in mitigating the danger at one of the starting zones, there are still over a dozen more that could trigger a slide. If a slide does occur and a crew is sent out to clear it, they could be exposed to risk for a prolonged period of time. Clearly this is a far more dangerous and problematic path than a path with a single start zone.

RESPONSE: All paths with multiple starting zones or in groups where they are close to other paths were assigned increased probabilities of secondary avalanches. Please refer to the *2017 Update to Appendix J - Snow Avalanche Report*, Section 12 Appendix 1: Avalanche Hazard Index (AHI) Calculation for details of the AHI calculation.

For further details, please refer to the raw data and calculation spreadsheets available online in pdf format at www.juneauaccess.alaska.gov (http://dot.alaska.gov/sereg/projects/juneau_access/documents.shtml).

The standard practice for avalanche mitigation work is that all multiple starting zones are dealt with before anyone is allowed into their runout zones; therefore, multiple starting zones do not represent an increased risk to workers or the traveling public. Risk management for maintenance crews is part of an operations plan, which is not done until the design and pre-operations stage, but the program outlined in Section 6.4.6 Highway Operations Procedures nonetheless states that “No avalanche debris should be cleared without approval from the on-duty avalanche specialist. The specialist should consider visibility, presence of residual snow in avalanche starting zones, terrain hazards, availability of spotters and equipment and other risk factors. No avalanche debris should be cleared when visibility is poor due to darkness or conditions such as fog.”

It is hard to evaluate the efficacy of the snow sheds proposed for the Yeldagalga Creek paths (ELC019, 020, and 021). All we can determine for certain is the length of the sheds are 1500 feet. *See* 2014 Update to Appendix D at 24 and Table 3-1 at 25 (hereinafter "Technical Alignment Report"). If a tunnel is over 800 feet long, the FHWA requires including ventilation and fire protection systems into the design.

RESPONSE: Snowshed effectiveness is well documented from the design and implementation of snowsheds around the world. Through proper design, snowsheds have proven effective and provide protection for all of the width of the path that they cover. Specifics of detailed design are not typically available at the EIS stage; rather, they would be determined further in the design stage.

The requirements for ventilation have been accounted for in the design (snowsheds are open on the

downhill side, which provides ventilation) . The *2017 Update to Appendix D - Technical Alignment Report*, lists three proposed snowsheds ranging in length from 300 to 800 feet.

This is true for both avalanche sheds and the two traditional tunnels that are planned for the route. It is important to note that Washington DOT is currently dismantling a snow shed along I-90 and replacing it with a bridge. Constructing new tunnels were rejected "due to the tunnels causing greater engineering risks, maintenance cost, operational difficulties, and environmental consequences."²¹ A recent study from Italy concluded that "severe accident rates in tunnels are higher than those of the corresponding motorways in about two-thirds of the tunnels studied, and lower in the remaining one-third. These results appear to be affected, apart from driver behavior and poor visibility in tunnels, also by the geometric and traffic characteristics of each tunnel when compared to those of the open road sections."²²

RESPONSE: Snowshed issues on Snoqualmie Pass and elsewhere are known and are similar to challenges for overpasses, bridge abutments, and other similar structures along highways. For Alternative 2B, the snowsheds appear to be the best design solution. In addition, the two proposed tunnels are the preferred design solution for the terrain encountered. The tunnels are less than 800 feet in length.

For the record, we attach to a 2006 paper by Alaskan avalanche control expert David Hamre, *Advanced Technologies in Avalanche Programs*. This report is not cited in the references for the Snow Avalanche Report but should be considered because of its extensive discussion of avalanche mitigation technologies that have worked well in the Alaskan landscape. Additionally, we incorporate Hamre (1996) into our comments.²³

RESPONSE: There are no "geotechnical and design uncertainties" associated with snowsheds or their mitigation capabilities; they are in common use all over the world, and their effectiveness is well-proven. All other mitigation factors applied are consistent with best engineering practices worldwide.

The mitigation measures in the Draft SEIS were properly investigated by professionals in the field of avalanche study and deemed sufficient. The authors of the 2014 and 2017 *Update to Appendix J, Snow Avalanche Report*, are quite familiar with Mr. Hamre's work and its results. It has been added to the *2017 Update to Appendix J, Snow Avalanche Report*, Section 13.10, Appendix 15 References.

The frequency-magnitude studies, while useful in some cases, are more theoretical and less accurate than the actual avalanche observations used for this study, and it should be noted such data are not available for the Coast Range of Southeast Alaska.

5. The risk reduction estimate is unrealistic.

According to Figure 4B of the Snow Avalanche Report, the consultants estimate that the proposed avalanche mitigation program will reduce the AHI risk by over 90%. This figure appears to be

²¹ See Washington DOT, Draft Supplemental Environmental Impact Statement. I-90 Snoqualmie Pass East Project p. 2-1 (available at <http://www.wsdot.wa.gov/Projects/I90/SnoqualmiePassEast.draftSEIS>)(cited pages attached).

²² See Caliendo & De Guglielmo at 176 (2012)

²³ See David, Doug McCarty, *Frequency/magnitude relationship of avalanches in the Chugach Range, Alaska, International Snow Science Workshop (1996)*.

extremely high, particularly given Southeast ADOT&PF's poor record on avalanche mitigation thus far, as well as the lack of specificity and experience with which the report was written. Along the Seward highway/Alaska Railroad where there are multiple full time avalanche forecasters and 25 years of experience running a mitigation program the risk has only been reduced to 50%. See Hamre, David. "Evolution of Avalanche Risk Reduction on the Alaska Railroad", International Snow Science Workshop Proceedings, 2009, p. 535; see also The Valdez Damalanche at 44 (ADOT&PF's avalanche mitigation efforts "[have] a success rate of just over 50 percent.").

RESPONSE: The risk reduction factors are consistent with those routinely achieved by modern avalanche programs worldwide. The program proposed for Lynn Canal follows current best practices, with multiple full-time forecasters for daily field presence.

Please refer to the *2017 Update to Appendix J - Snow Avalanche Report*, Section 3.1, Figure 2, for methods used on various highways worldwide, and the remainder of Section 2. as Also see Section 5, Avalanche Mitigation, for a discussion of reduction factors, especially Figure 4A, which lists mitigation factors achieved in other locations.

DOT&PF avalanche programs have been upgraded within the past few years. For example, preventive blasting has recently replaced waiting for slides to hit the road along such routes as the Richardson Highway to Valdez, and in the 2014-2015 season an avalanche specialist was added in the Southeast Alaska region. DOT&PF recognizes the seriousness of the need for adequate funding of avalanche programs.

Alaska Railroad programs have also been upgraded within the past 20 years. The Alaska Railroad faces problems unique to railroad operations in extremely difficult terrain and snow conditions that do not apply to highway operations in the very different terrain, snowpack, and weather conditions along Lynn Canal.

All the factors, raw data, and mitigation calculation spreadsheets used to calculate the mitigated Avalanche Hazard Index (risk reduction) are available in pdf format online at www.juneauaccess.alaska.gov (http://dot.alaska.gov/sereg/projects/juneau_access/documents.shtml).

The discussion in the *2014 Update to Appendix J - Snow Avalanche Report*, Section 6.1 Mitigated AHI Target Calculations, is an analysis of how well the goals were achieved, rather than the calculation of the risk reduction. The risk reduction factors for each path and for the overall avalanche program are listed in Section 6.3, Lynn Canal Avalanche Hazard Reduction Methods.

The level of specificity of the 2014 and 2017 *Update to Appendix J, Snow Avalanche Report*, is more than adequate for EIS-level evaluation. The experience of the authors and peer reviewers has been updated with resumes in the Final SEIS.

IV. DSEIS INADEQUATELY ASSESSES THE IMPACTS OF PREFERRED ALTERNATIVE ON MOVEMENT OF FREIGHT IN LYNN CANAL.

MAP-21 establishes national performance goals for Federal highway programs. One of those goals is to improve the national freight network and improve regional economic development. The DSEIS cannot cite to any specific evidence that this taxpayer boondoggle will actually improve the transport of freight up and down Lynn Canal. The failure to address this important issue in a thorough manner also fails to foster informed decision-making and informed public participation as required by NEPA.

RESPONSE: Citing National Performance Goals from MAP-21 relative to this project suggests a misunderstanding of those performance goals. MAP-21 is not project specific, but rather establishes broad goals to be achieved by the overall transportation system. In other words, not every project in the nation is expected to have as part of its purpose and need the improvement of the national freight network. The purpose and need for the Juneau Access Improvements project is not intended to promote freight shipment or “improve the transport of freight up and down Lynn Canal.” Contrary to the assertion, the Draft SEIS does evaluate the effects of the alternatives on freight movement. The Draft SEIS and the *Socioeconomic Effects Technical Report* (Appendix EE) explain that most freight would continue to move by barge under these alternatives. Barge transport has the advantage of being relatively low cost but has the disadvantage of being slow. Alternatively, air shipment is faster but has a higher cost. Highway transport offers a third option with faster delivery times than a barge to Seattle or other locations in the Lower 48 states at lower cost than air freight. Neither of the highway alternatives evaluated in the SEIS (Alternatives 2B and 3) would provide a direct highway connection to the continental highway system. However, it is anticipated that the higher frequency and low costs of the short shuttle links associated with these alternatives would be advantageous to trucking some freight and would generate truck shipping of fresh fish and other products.

According to the DSEIS, "Alternative 2B would affect freight movement to and through Haines." DSEIS at 4-51. Construction of a highway in the East Lynn Canal corridor would not affect existing barge service to Haines, but "[f]reight that is now shipped to Haines on the AMHS ferries ... would be off-loaded at Auke Bay, and trucked to Haines via the Katzeihin ferry." *Id.* The DSEIS does not estimate what the costs would be delivery freight to Haines along the highway, but according to AML, "[t]he cost of off-loading vans in Juneau and trucking to Haines would not be competitive with continued barge service to Haines." DSEIS at 4-51. ADOT&PF states that it costs 5 cents per pound to move freight by barge versus 25 cents per pound to move it by truck. *See* DSEIS at 4-62. The DSEIS does not disclose existing rates for shipping goods via the Alaska Marine Highway System. Without this key information, decisionmakers and the public cannot make an informed comparison of the alternatives.

RESPONSE: AMHS vehicle rates are based on the length of vehicle and origin/destination. Rate information is publicly available on the AMHS website. As the AMHS rates are not based on weight, a direct comparison of shipping costs is not feasible. The Draft SEIS does, however, qualitatively discuss anticipated changes in freight shipping. Section 4.3.7.5 of the Draft SEIS noted that Alternative 2B would not have substantially altered freight traffic between Seattle and Juneau or barge service to Haines and Skagway. Shippers would have been expected to continue using the most cost-effective method of shipping freight in Lynn Canal. However, it is anticipated that the higher frequency and low costs of the short shuttle links associated with the highway alternatives would have been found advantageous to trucking some freight and would have generated truck shipping of fresh fish and other products. Additional information has been added to the Final SEIS (Section 4.3.7.5 and 4.4.7.5 and Appendix EE) to discuss the cost differences concerning the current practice of shipping containers via AMHS vessels in Lynn Canal and the change proposed under Alternative 2B and 3 (whereby vans would need to be driven over the road and accompanied by a driver on the shuttle ferries). Note that even under Alternative 1 – No Action, which uses the Day Boat ACFs, unaccompanied vans will typically no longer be allowed, so these changes would only affect the discontinuation of mainline ferry service in Lynn Canal.

With regard to Skagway, again without disclosing specific rates for comparison ferry freight delivery, the DSEIS asserts:

Skagway would see reduced costs for freight shipped to/from Juneau.... The cost of transporting these vans [from Juneau] over Alternative 2B's highway and then by shuttle ferry from Katzehin [to Skagway] would be lower than the cost of all-ferry transport.

With the exception of freight currently moved from Juneau to Skagway on the ferry, Skagway is not expected to see any change in waterborne freight service with alternative 2B. The cost of off-loading vans or fuel in Juneau, trucking to Katzehin, and then shuttling to Skagway is more than the cost associated with barge transportation.
DSEIS at 4-55.

The assumption, that hauling freight by truck for 91 miles to the Katzehin, and then transferring the freight to a day-boat for final delivery to Skagway is cheaper than utilizing the current Alaska Marine Highway System configuration appears implausible, particularly without disclosing cost data to support it.

RESPONSE: The freight shipments questioned by the commenter consist of container vans that are currently driven to Auke Bay, loaded on a ferry, transported to Skagway, and then driven to their final destination. The existing system allows vans to be unaccompanied between Auke Bay and Haines/Skagway, while freight would have to be accompanied (i.e. have a tractor and driver) the entire trip under Alternatives 2B and 3. Additional information has been added to the Final SEIS (Section 4.3.7.5 and 4.4.7.5 and Appendix EE) to discuss the cost differences concerning the current practice of shipping containers via AMHS vessels in Lynn Canal and the change proposed under Alternative 2B and 3 (whereby vans would need to be driven over the road and accompanied by a driver on the shuttle ferries).

The fallacy in ADOT&PF's claim can be seen by looking at history. Back in 1975, quite a stir was caused when AMHS proposed moving the ferry dock in Juneau from downtown 12.5 miles out to Auke Bay. According to Hank Noble, Foss Alaska Line's Juneau manager:

I can understand why the ferry system people would want to move out to Auke Bay, from their operational standpoint. ... but it's a question of how much fuel the ferries will save versus the extra fuel and time the people and trucking companies in Juneau will have to spend to get out to Auke Bay.

He said Foss drivers can load their cargoes of 24-foot vans in an average of one hour when the ferries dock downtown, but that it would take at least eight hours to do the same job if drivers had to pull the vans to Auke Bay. He said the biggest cost increases would be paid by residents of Haines and Skagway who receive about 16 vanloads per week by ferry.

See Ruhl, John, *State to Close Downtown Terminal*, SE Alaska Empire (April 29, 1975). The DSEIS fails to disclose and evaluate the fuel and time costs associated with loading and trucking freight from Juneau to the Katzehin for transfer to a ferry for delivery to Skagway as required by NEPA.

RESPONSE: Additional information has been added to Section 4.3.7.5 of the Final SEIS regarding

freight.

V. ADOT&PF AND FHWA FAILED TO DISCHARGE THEIR AFFIRMATIVE RESPONSIBILITY TO CONSULT WITH AWK KWAN ABOUT IMPACTS TO CULTURAL AND HISTORIC PROPERTIES WHICH MAY BE IMPACTED BY THE PROPOSED ACTION.

According to the DSEIS, ADOT&PF sent letters inviting formal tribal consultation to 11 area tribes and Native organizations back in 2003, "with follow-up phone calls and face-to-face meetings when conducted." DSEIS, section 3.1.3 at 3-18. It does not appear that the agencies conducted any consultations with all the parties having consultative roles in the process mandated by section 106 of the National Historic Preservation Act.

Despite clear evidence over the past 17 years of Rosa Miller's demonstrated interest in the potential adverse effects of the proposed undertaking on Awk Kwan's ancestral lands in Berners Bay, and the fact we raised this need at both the draft and final stages of the last NEPA process, neither agency made any effort to consult with the Awk Kwan, Juneau's original settlers during this planning effort. This failure to follow the rules and consider the relevant factors not only violates standards promulgated by the Advisory Council on Historic Preservation but disrespects the Awk Kwan's time-honored connections to Berners Bay. *See* 36 C.P.R. 800.2(c)(5); *see also* Letter from Miller to FHWA Administrator Garcia-Aline and DOT Commissioner Kemp (November 24, 2014)(incorporated herein by reference).

RESPONSE: Consistent with requirements of Section 106 of the National Historic Preservation Act, Auk Kwan was not specifically consulted because it is not a Federally Recognized Tribe. However, as a part of the NEPA process, the Auk Kwan has been given multiple opportunities to provide input on the project. Comments from Auk Kwan members on the Draft SEIS have been considered and are addressed in Appendix JJ of the Final SEIS. FHWA and DOT&PF have followed State and federal regulations as well as FHWA guidelines regarding consultation with Federally Recognized Tribes.

The procedural short cut taken by the agencies makes the choice to limit your efforts to identify and evaluate historic properties during this supplemental NEPA process to conducting a "follow-up literature review" arbitrary. This failure to consult fully with all interested parties also prevented DOT&PF from considering impacts to historic and cultural resources in a thorough manner and did not foster informed decision-making and public participation as required by NEPA.

RESPONSE: As discussed in Sections 3.1.3 and Chapter 7 of the Draft SEIS, DOT&PF sent letters in September 2003 to eleven tribal organizations (Chilkoot Indian Association of Haines, Klukwan Inc, Golbelt Inc., Chilkat Village of Klukwan, Sealaska Corporation, Douglas Indian Association, Tlingit and Haida Central Council, Skagway Traditional Council, Auk Kwan Traditional Council, Sealaska Heritage Institute, Hoonah Indian Association), six of which are Federally Recognized Tribes; the State Historic Preservation Officer (SHPO); U.S. Forest Service (USFS); and National Park Service (NPS). The letters invited these entities to participate in the process of identifying cultural properties (prehistoric and historic) and determining the effects of the alternatives on such properties for the 2005 Supplemental Draft EIS. DOT&PF conducted follow-up phone calls and face-to-face meetings when requested by the Tribes and Native organizations. In August 2004, FHWA sent letters to these same entities, inviting them to comment on FHWA's determination of eligibility on historic properties for the National Register of Historic Places and determination of potential effects on any historic properties in the area of potential effect (APE).

In 2012, SHPO was consulted and concurred with the APE for the project and field methodology. In addition, SHPO concurred with FHWA's determinations of eligibility for all historic properties within the APE of Alternative 2B (with minor changes to the site boundaries) as discussed in Section 4.3.4. The Tribes and Tribal organizations were additionally notified regarding opportunities for input through scoping outreach, the notice of availability, and the public hearing process as part of the Draft SEIS. FHWA and DOT&PF did not receive scoping comments from Tribes or Tribal organizations but did receive comments on the Draft SEIS from Douglas Indian Association, Sealaska, and Auk Kwan. FHWA and DOT&PF have responded to Draft SEIS comments in this Final SEIS. These responses are included in Appendix JJ of the Final SEIS. The APEs have not changed between SHPO's concurrence and the Final SEIS. Following the additional consultation described below, FHWA and the DOT&PF have reviewed the existing analysis and determined that additional field investigations are not necessary (see paragraph below).

The investigations (research and field studies) of cultural resources presented in the Draft and Final SEIS are a synthesis of several technical reports and memoranda regarding historic and archaeological sites prepared for this project between 1994 and 2005. A follow-up literature review was conducted in 2012 to determine if any new information regarding cultural resources in the APE had become available since 2005. No new cultural resources were identified within the APE. Together, these documents comprise the cultural resources record for the project. In part, they include:

- Archaeological Inventory of the East Lynn Canal Alternative, Juneau Access Road Improvement Project. Gary Wessen, Elena Nilsson, Michael S. Kelly, and Sandra Flint. Dames and Moore, Inc., Chico, California. 1994.
- Archaeological Survey on the West Coast of Lynn Canal: William Henry Bay to Pyramid Island. Amy F. Steffian, Owen K. Mason, and Stacie J. McIntosh. Northern Land Use Research, Fairbanks. 1994.
- Inventory and Evaluation of Historic Properties For Lands Within the Area of Potential Effect from Addendum No. 1 to the Plan of Operation for the Kensington Gold Project Submitted by Coeur Alaska in April 2002. Brenden Raymond-Yakoubian. Integrated Concepts and Research Corporation, Anchorage. 2004.
- Juneau Access Road 2003 Cultural Resource Studies: West Lynn Canal Alternative Update and Skagway Approach Survey Results. Catherine M. Williams, Peter M. Bowers, and Lisa J. Slayton. Northern Land Use Research, Inc., Fairbanks. 2004.
- Determination of Eligibility for the Dalton Trail (SKG-052). Northern Land Use Research, Inc., Fairbanks. 2004.
- Determination of Eligibility for the Skagway Hydroelectric Complex District (SKG-189). Northern Land Use Research, Inc., Fairbanks. 2004.
- Determination of Eligibility for the Lower Dewey Lake Trail (SKG-203). Northern Land Use Research, Inc., Fairbanks. 2004.
- Juneau Access Road 2004 Cultural Resource Studies, East Lynn Canal Alternative Update. Michael R. Yarborough and Catherine M. Pendleton. Cultural Resource Consultants LLC, Anchorage. 2004.
- Juneau Access Road 2005 Cultural Resource Study, East Lynn Canal Alternative Update. Michael R. Yarborough and Catherine M. Pendleton. Cultural Resource Consultants LLC, Anchorage. 2005.
- Alaska Heritage Resources Survey database, State of Alaska Office of History and Archaeology, 2012

To protect sensitive site information, the data and analyses contained in these documents are only

summarized in the Draft and Final SEIS, although all the information therein was used in making determinations of eligibility and findings of effect. For example, the locations of sensitive archaeological and burial sites are not disclosed in the Draft and Final SEIS. It is understandable that a review of the Draft and Final SEIS could lead to confusion regarding the summary of this site information, since it does not include all site locations.

On February 25, 2016, meetings with Sealaska Corporation, Sealaska Heritage, Douglas Indian Association, Goldbelt Corporation, and SHPO verified that no previously unidentified sites of cultural or historic importance were missed in the analysis.

According to the DSEIS, the protocols developed for guiding archaeological inventories resulted in the surveying on the ground in "[a]reas with a high potential for past human occupancy (e.g., river and stream mouths, shoreline benches below 100 feet in elevation, and areas) of less than 25 percent slope)" DSEIS at 3-18. The DSEIS contains no discussion, however, about the effect of subsequent isostatic rebound on the physical location of cultural resources. As a result, surveys of lower elevations are unlikely to find evidence of habitation sites from this period or adequately evaluate the impacts of this proposal's alternatives on cultural resources.²⁴ Since this new science came out after the surveys done in 1994 and 2003, and the agencies didn't conduct additional surveys for this supplemental NEPA review, the agencies failed to consider all the relevant information and an important aspect of the problem.

RESPONSE: The effects of isostatic rebound (referred to as uplift in the SEIS) were considered as a part of the archaeological analysis. Section 3.2.1.1 of the Draft SEIS reported that after deglaciation, the gradual rebound of land that had sunk below its original level due to weight of glacial ice resulted in the emergence of marine deposits and uplifted rock faces. Clarifications and additional information have been added to Section 3.1.3 of the Final SEIS regarding survey methodology and considerations in the APE.

VI. DSEIS DOES NOT COMPLY WITH NEPA.

As already noted above regarding the misleading, faulty, and incomplete consideration of traffic demand forecast modeling, costs, and safety, *supra* at 8-12, the content and preparation of this DSEIS fails to foster informed decision-making and informed public participation as required by NEPA. Additional inadequacies with the DSEIS are identified below.

A. The Alternative Analysis Is Arbitrary.

The alternatives disclosed and evaluated in the DSEIS are not reasonable because the DSEIS fails to provide decisionmakers and the public with sufficient information to "make an informed comparison of the alternatives." *SEACC v. FHWA*, 649 F.3d, 1050, 1058 (9th Cir. 2011). (citations omitted). First, the No Action alternative violates NEPA because it does not reflect the status quo or actually serve as a benchmark for analyzing the action alternatives. Instead the DSEIS relies on assets "that have not yet been constructed" and what is essentially a hypothetical "current plan" that reflects "most likely AMHS operations" once, and if, construction of the new Alaska Class Ferry is completed on time. *See* DSEIS at 2-10,2-12.

²⁴ See Baichtal, J.F., and R.J. Carlson 2010. "Development of a Model to Predict the Location of Early-Holocene Habitation Along the West Coast of Prince of Wales Island and the Outer Islands. *Current Research in the Pleistocene* Volume 27: 64-67.

RESPONSE: The No Action Alternative for the project consists of the existing highway and ferry system (as of 2014) plus improvements programmed by DOT&PF. Programmed improvements were described in Section 2.3.1 of the Draft SEIS. Including programmed improvements as part of the No Action Alternative does not violate NEPA and is consistent with FHWA practice and guidance. A contract to construct the ferries was signed in fall 2014. The ferries are currently under construction at the time of this Final SEIS. It would be irresponsible to ignore improvements that are programmed and designed, and would be constructed prior to implementation of any build alternative.

We are also frustrated with Alternative 1B, proposed by ADOT&PF in response to the above ruling. *SEACC v. FHWA* at 1059. Alternative 1B mismatches capacity and demand by providing greater capacity than needed to serve the smaller demand port of Skagway. Alternative 1B also calls for a reduction in fares and increases in extending business hours at the reservation call center; measures that ADOT&PF considers of "no net benefit" in increasing ridership. *See* DSEIS, Appendix CC at 21. Until it completes a system-wide analysis of traffic, fares, and capacity, DOT&PF cannot meaningfully evaluate reasonable options for more efficient use of existing ferry system assets.

RESPONSE: DOT&PF and AMHS staff developed a new alternative based on direction from the District Court (and upheld by the U.S. Court of Appeals for the Ninth Circuit), shared a draft of that alternative with the public during a new scoping effort for the Draft SEIS, took input on the new alternative, and revised that alternative based on the scoping comments received. The new alternative took into account changes that had occurred to the "existing assets" in the AMHS fleet since the 2006 Final EIS, the capabilities of the vessels in the fleet, and the needs and mission of the fleet to the numerous communities served by AMHS. DOT&PF and FHWA fully disclosed the thought process and evaluation in the Draft SEIS. Appendix CC of the Draft SEIS described the efforts undertaken to develop Alternative 1B and documented the data and analysis relied upon to create as reasonable an alternative as possible toward solving the transportation problems in the corridor using only existing assets. Alternative 1B incorporated the following considerations:

- Existing AMHS assets reasonably available and feasible for use in Lynn Canal
- Programmed AMHS assets (decisions by AMHS independent of this project that made new Day Boats available in the fleet)
- Enhancements that could be employed that do not involve substantial initial capital investments

The resulting alternative, Alternative 1B, was rigorously analyzed in context of the project's Purpose and Need and as part of NEPA requirements for the consideration of alternatives.

Regarding the suggestion of a mismatch in capacity and demand, the Day Boat ACF cannot make a daily Auke Bay-Skagway round trip and comply with U.S. Coast Guard (USCG) work/rest requirements. USCG regulations dictate that a typical sailing schedule be completed in 12 hours, crew members have 70 hours of rest within a 7-day period, and the crew not be scheduled to work more than 12 hours in a 24-hour work day. Without modification of the vessel or the loading and unloading facility at the Skagway Ferry Terminal to decrease the Day Boat ACF's operating day, a daily Auke Bay-Skagway run would not be compliant with USCG requirements. The *M/V Malaspina* is able to make this run, even though it takes longer than 12 hours, because it has crew quarters onboard (the Day Boat ACFs do not) and sufficient crews to run 24 hours. This was one of the reasons the *M/V Malaspina* was assigned to the Auke Bay-Skagway run instead of the Auke Bay-Haines run for Alternative 1B as evaluated in the Draft SEIS.

To enable the Day Boat ACF to make the Auke Bay-Skagway run and be consistent with USCG

regulations would require capital improvements to the ferry terminals to convert them to drive through loading and unloading procedures (thereby speeding up the loading and unloading processes). Such capital improvements would be counter to the Court's directive to develop an alternative without up-front capital costs.

Based on the comment, DOT&PF and FHWA did modify Alternative 1B for the Final SEIS to better balance capacity and demand: during summer, the *M/V Malaspina* would make one round trip per day 5 days per week on a Skagway-Auke Bay-Skagway route. On the sixth day, the *M/V Malaspina* would sail on the Skagway-Auke Bay-Haines-Skagway route; on the seventh day, it would sail that route in reverse (Skagway-Haines-Auke Bay-Skagway).

Contrary to the comment, Appendix CC does not conclude there would be "no net benefit" to a reduction in fares and extended call center hours. In fact, Appendix CC of the Draft SEIS indicated that the reduction in fares increases ridership (p. 23-25) and reservations enhancement would have "little benefit in improving ridership but would improve customer service." (p. 19). For the Draft SEIS, DOT&PF and FHWA considered fare reductions and efficiencies in the call center because the plaintiffs in the 2006 lawsuit suggested those very kinds of improvements to maximize ridership and efficiency. Note, with improvements to the AMHS website resulting in an increase in website use for reservations, extended call center hours were dropped from Alternative 1B in the Final SEIS.

The Draft SEIS did not fail to address system-wide analysis. Appendix CC explained how Alternative 1B was developed and described why certain vessels are needed on certain routes. As explained in Appendix CC, DOT&PF considered technical capabilities of the vessels, vessel size, operating conditions, and the effect on the AMHS mission (i.e., could a vessel be moved or shared with other routes such that it could provide Lynn Canal service while also maintaining the level of service committed to the other communities). An examination of each vessel was disclosed in Appendix CC. In part, vessels were rejected as being reasonable for Lynn Canal service because it was found that reassigning vessels to Lynn Canal would be at the expense of reduced service elsewhere.

Alternative 1B was developed by AMHS and other DOT&PF professionals with years of optimization experience. They were able to develop a system management alternative that manages to make improvements over and above Alternative 1 – No Action. DOT&PF identified and evaluated Alternative 1B as a competing NEPA alternative. Alternative 1B addresses the Court's requirement to evaluate an alternative using existing assets. Alternative 1B uses existing assets, which results in an increase in AMHS service in Lynn Canal that would not require a reduction in service outside Lynn Canal.

We also recommend using variable pricing strategies like those used in the airline industry to fill seats on flights with excess capacity by reducing fares to help fill boats and increase revenues for the AMHS. Updating to a modern reservations and ticketing system offered by companies like PDMS (<http://www.ferrysoftware.co.uk/>) could allow for this strategy and benefit the entire AMHS.

RESPONSE: The reservation system used for the last 15 years was not capable of variable pricing. AMHS is renovating the reservation system and enhancing its capabilities and functionality. However, AMHS demand-based pricing must be justified on the basis of balancing service and cost.

AMHS will not be implementing a variable pricing system for the near term. However, in May 2016, as a result of the 2015 AMHS Rate Study, AMHS implemented a variable leveling tariff increase on all routes. The tariff increase would vary by route and would be divided out over a five-year implementation period. The purpose of this action is to level the AMHS tariff structure. Once the tariff

structure has been leveled, AMHS may consider further modifying the tariff structure consistent with recommendations from the 2015 AMHS Rate Study.

Using readily available information, however, the Skagway Marine Access Commission modified proposed Alternative 1B, which it dubbed, Alternative 1B Optimized. *See* 2014 Skagway Marine Access Commission DSEIS Comments. The Commission's Alternative 1B Optimized, incorporated here by reference, utilizes existing resources to increase service among the northern communities in Southeast Alaska, provides passengers with more travel options and flexibility, and costs less than Alternative 1B proposed by ADOT&PF.

The Commission also proposed an improved marine alternative in its comments on the DSEIS, which they refer to as Alternative 5, the All Alaska Class Ferry Alternative. *See, id.* Unlike either Alternative 1B or 1B Optimized, Alternative 5 calls for constructing a third ACF and retiring one aging mainline ferry. The cost of this alternative would be offset by the savings from the elimination of expensive mainliners in Lynn Canal. *Id.* Alternative 5 would provide a highly flexible transportation system that increases service in the Northern Panhandle without the huge capital investments and direct adverse impacts to Berners Bay from Alternatives 2B, and 4A-4D.²⁵ With this reference, SEACC encourages the agencies to take a hard look at this practical and economically feasible approach to meeting the basic transportation needs the public is entitled to in Lynn Canal.

RESPONSE: DOT&PF and FHWA have analyzed Alternative 1B Optimized and Alternative 5 proposed by the Skagway Marine Access Commission (SMAC) and have included the updated analysis and information Appendix II of the Final SEIS. The two new alternatives were labeled by SMAC as “Alternative 1B Optimized” and “Alternative 5.” DOT&PF has retained this labeling for convenience, but use of these labels should not be interpreted as conferring stature or reasonableness.

As noted in the Alaska Marine Highway System 2013 Financial Report, fuel costs make up roughly 21% of ferry operational costs. A recent announcement from British Columbia noted that BC Ferries is planning to substantially reduce fuel costs by converting the propulsion to dual-fuel capability, allowing the ships to operate on both diesel and liquefied natural gas.²⁶

RESPONSE: Currently, natural gas is not a viable option in Southeast Alaska because no source is available. The new ACFs, which would be used in some of the alternatives, will use Tier III engines that operate at the highest efficiency. These engines can be converted to use natural gas in the future, should a natural gas supply be available; however, natural gas storage tanks would be required to be above deck, thus reducing passenger capacity.

Both the 2008 Tongass Plan and 2001 Roadless Area Conservation Rule require ADOT&PF and the FHWA to evaluate whether there are feasible alternatives to road construction through lands designated as Old Growth Reserves and whether the proposed road is in the public interest and no other reasonable and prudent alternative exists. *See* 2008 Tongass Plan at 3-61; 36 C.F.R. 294.12(b)(6)(2001). The DSEIS does not contain this evaluation. As the project applicant, it is the responsibility of the ADOT&PF and FHWA, not the Forest Service, to prepare this evaluation. Finally, the claim by ADOT&PF that section 4407 of SAFETEA-LU somehow exempts them

²⁵ *See generally* Rogers (1970) at 2-3.

²⁶ *See* Canadian Press, *The BC Ferries files application to convert two biggest ferries to diesel, LNG operation* (Sept. 22, 2014).

from complying with these laws is complete balderdash.

RESPONSE: The State of Alaska believes it currently holds an easement interest in each transportation and utility corridor established by Congress in SAFETEA-LU, Section 4407, as amended. Once the State of Alaska determines the precise location of the highway facility within the Section 4407 corridor, USFS must issue recordable documentation of the Congressionally established easement. Congress stated its intent that “the Secretary of Agriculture will not withhold or deny the issuance of an easement for a proposed transportation or utility project that otherwise has all necessary construction permits and authorizations from other State and Federal agencies.” (Senate Report 114-80:23-24; July 15, 2015). Thus, the USFS’s issuance of recordable documentation of the easement is a non-discretionary and ministerial act. The Secretary of Agriculture and USFS may be required to make a finding under the Roadless Rule and may need to complete a NEPA decision for a plan amendment related to adjusting Old Growth Habitat LUD boundaries to recognize the highway easement; however, these processes and decisions would be internal to the USFS and could occur after the completion of the Final SEIS.

The Roadless Rule excepts classes of road projects from its general prohibition on roads, including an exception when the Secretary of Agriculture determines that a road is provided for by statute or treaty (36 CFR 294.12(b)(3)). Transportation and utility rights-of-way and easements along the east and west sides of Lynn Canal were granted to the State of Alaska by Congress in SAFETEA-LU, Section 4407, as amended. Thus, the Secretary of Agriculture need only make an affirmative finding that Congress provided a highway easement by statute to fulfill the requirements of the Roadless Rule.

B. DSEIS Misleads Public by Inflating Traffic Demand, Invalidly Using Models and Bogus Assumptions.

The travel forecast and estimates of user benefits made by ADOT&PF for this DSEIS fails to provide a reasonable thorough discussion of the issues raised by SEACC and others on this important issue. Although the FHWA's *Interim Guidance on the Application of Travel and Land Use Forecasting in NEPA* is voluntary, the serious problems that continue to plague ADOT&PF traffic forecasting over the past 10 years for the Katzehin Road Project indicate that much more needs to be done for the agency to come up with defensible forecasts.²⁷

RESPONSE: Because there is no road linking communities in Lynn Canal, a forecast of surface transportation demand cannot be conducted in a conventional manner. The previous forecast was partially based on the results of two household surveys. The household surveys indicate people’s perceived behavior but may not reflect actual travel behavior. The project team is aware of FHWA's *Interim Guidance on the Application of Travel and Land Use Forecasting in NEPA*. The team followed a process consistent with the recommendations from that guidance and implemented many of the recommendations, including conducting a conceptual review of the analysis, identifying analysis years and geographic scope of the analysis, considering the suitability of modeling methods and appropriate tools, reviewing previous forecasts, and calibrating and validating the forecast and checking it for reasonableness. As recommended in the guidance, the modeling was peer reviewed.

The Traffic Forecast Model for the SEIS was developed based on empirical data derived from actual travel conditions observed in Alaska and Western Canada, from communities with similar geographic characteristics as Juneau. It was validated against existing travel demand by ferry within Lynn Canal.

²⁷ See, Moniak, Rich, *My Turn: How ADOT&PF ignored best practices for Juneau Access* (sic), Juneau Empire (Nov. 7, 2014).

To forecast traffic demand for each of the alternatives, the model considered various factors relating to travel time, cost, and convenience of travel.

In developing the model, the project team looked at changes in travel options in Lynn Canal during the periods noted above. Ferry ridership demand changes occur for various reasons. The travel choice model is sensitive to several variables, including travel time, travel cost, and frequency of travel. The model was calibrated to match empirical evidence from 1997-1998 and 2004-2007 as well as possible. The evidence suggests that cost and convenience of travel are more likely to affect travel behavior than ferry travel time when compared with existing service levels. In response, the project team modified one of the model variables (i.e., the service index) from its initial formulation to reflect the reduced effect of travel times on the forecasted demand. While the alternatives under considerations include more substantial changes in service than have been experienced previously in Lynn Canal, it is possible that the demand forecasts are conservatively high for some of the marine alternatives. However, the fact that the model did a good job of matching existing Lynn Canal ridership means that the travel choice model was reasonably validated and applied.

The user benefits did not rely on a traditional cost-benefit analysis where all costs and benefits are described quantitatively, if possible, and qualitatively otherwise. That type of cost-benefit analysis is not required by NEPA and has not been conducted as part of this SEIS. Analysis of the economic efficiency and cost-effectiveness of project alternatives has been limited to User Benefit Analysis, Life Cycle Cost Analysis, and Total Project Life Cost Analyses. Conducted in accordance with standards set by the American Association of State Highway and Transportation Officials (AASHTO), these analyses do not, and are not intended to, consider the full spectrum of costs and benefits. Project economic efficiency and cost-effectiveness analyses did not include economic benefits associated with each alternative (e.g., from commercial or industrial development) or effects on environmental values or amenities.

Benefit/cost ratios described in the Draft SEIS were not intended to represent a full measure of all benefits and costs associated with project alternatives. In fact, benefit cost ratios described in Appendix FF of the Draft SEIS were narrowly based on user (traveler) benefits alone and did not consider a wide range of other potential household, commercial, industrial, and community benefits associated with improved Lynn Canal access. The purpose of the economic efficiency and cost-effectiveness analysis conducted as part of the Draft SEIS was to determine which alternatives serve the largest number of users/travelers and have the lowest possible cost.

C. The DSEIS does not Accurately Describe the Impacts of Alternative 2B on the Alaska Marine Highway System.

In the press release announcing the release of the DSEIS, Commissioner Kemp claimed that constructing the Katzeihin road would have huge benefits to the rest of the ferry system.²⁸ We believe the opposite is true; Alternative 2B will be a tremendous detriment to the rest of the ferry system because it will steal capital construction dollars from replacement ferries and it will increase the operating cost for AMHS while jeopardizing revenue.

As we noted, *supra* at 6-7, the Katzeihin road would consume double the new construction budget for the region leaving no money to purchase new mainline ferries in the foreseeable future, even though ADOT&PF acknowledged in its 2014 draft SATP that the aging vessels should be retired in the next 10 years.

²⁸ ADOT&PF, Press Release: *Juneau Access Draft SEIS Available for Public Review* (Sept. 18, 2014).

RESPONSE: Selecting an action alternative with capital cost would have resulted in other transportation needs being deferred. It is unknown which future projects would have been deferred. Prioritizing the use of NHS transportation funds is DOT&PF's responsibility. DOT&PF is continually reconsidering where to spend available transportation funds. That prioritization is done through the STIP, which is published in draft form for public review and comment before approval. The STIP is frequently modified each year to account for shifting priorities around the State. The STIP is approved by the DOT&PF Commissioner and FHWA. The Legislature provides DOT&PF with authority to spend money on a project-by-project basis, and allocates funding for the State's match through the capital budget. This process is responsive to funding availability; to ongoing assessment of the condition of roads, bridges, ferries, and terminals; to assessment of traffic and needs; and to shifting federal and State legislation.

Commissioner Kemp states that cutting off 100 miles off of mainline ferry service allows the vessels to get to more communities more quickly. However, if there are no mainline ferries because they have broken down his department predicts they will and no steps have been made to replace them, then all other coastal community outside the Lynn Canal will experience a tremendous reduction in ferry service.

The DSEIS finds that the Katzehin road and shuttle ferry will increase the burden on the ferry system without increasing the revenue. The maintenance and operating costs for Alternative 2B is \$20.4 million annually, \$17.6 million of which is for operating the Katzehin shuttle ferry and terminal. See DSEIS at 2-16. In comparison, the No Action Alternative has an operating cost of \$15.4 million annually, with \$7 million coming back in revenues. *Id.* at ES-16. In other words, under Alternative 2B the burden on the Alaska Marine Highway System would go up \$2.2 million annually, with revenue staying flat at \$7 million.

To make matters worse, we believe that the revenue projections for Alternative 2B are wildly optimistic. Unlike the proven high-cost low-volume scenario represented by the No Action Alternative, Alternative 2B depends on the opposite and more risky high-volume low-cost scheme. The ten-fold increase in traffic traveling in the Lynn Canal corridor predicted for Alternative 2B is simple fantasy. See DSEIS at 4-58; see also Marshall, *supra* note 2. The State will end up further subsidizing the AMHS when revenues plummet because the predicted traffic volumes failed to materialize, as occurred with DOT's Whittier Tunnel Project a decade earlier.²⁹

The DSEIS and associated documents should be changed to accurately describe the deleterious impact Alt. 2B will have on the Alaska Marine Highway System.

RESPONSE: For clarification, the Draft SEIS estimated AMHS revenues for Alternative 1 – No Action and Alternative 2B as \$7.7 million and \$10.4 million, resulting in an estimated net annual General fund cost (expenses minus revenues) of \$7.7 million for Alternative 1 – No Action and \$7.2 million for Alternative 2B (see page 4-63).

In the event traffic does not materialize as projected, AMHS has flexibility to adjust fares, reduce hours of operation, and/or reduce the number of vessels with the intent of scaling the AMHS assets/effort

²⁹ See Forgey, Pat, *Will proposed Knik Arm Crossing follow lead of Alaska's other toll road, the money-losing Whittier tunnel?*, Alaska Dispatch News (August 16, 2014) available at <http://www.adn.com/article/20140816/will-proposed-knik-arm-crossing-follow-lead-alaskas-other-toll-road-money-losing>

with demand.

D. DSEIS Ignores Adverse Effects on Independent Travelers.

Back in the mid-1970s, an Alaskan author opined:³⁰

The Alaska Marine Highway sells or offers for sale a "Product", in addition to a service. What is this product? Why, the Ferry System itself (and) the resplendent maritime scenery through which it travels. . . . This product ... is reflected in the ships, the crewmembers, the convenience and efficiency of operation, the concept of purpose. . . . A ship staffed be (sic) a pleasant, attentive and proud crew offering that fine food and courteous service. This is the Product! This is the experience that people will pay for and should always come to expect."

A 2009 report done by the Alaska University Transportation Center for the AMHS and ADOT&PF noted the "unique mode of independent travel" offered by the AMHS, "a flexible and 'off-the-beaten path' style of travel. . . . Independent traveler research shows they consider the AMHS a pleasant alternative to the rigid travel schedules imposed on Alaska's package tour visitor."³¹ We found no evidence in the DSEIS and supporting appendices that the agencies or their consultants considered this key document.

As noted in Marshall, *supra* note 2, at 12:

The enormous growth of the cruise ship industry has shown that there is a huge market for vacation travel without the encumbrance of personal vehicles. Many tourism industry groups throughout the U.S. are working towards making offerings that more attractive to such travelers including improving intermodal connections, services within walkable areas, and providing good traveler information. Alternative 2B probably would largely kill this market off. Even if good bus service were provided to the new terminal, most travelers to coastal Alaska are not doing so to ride buses. This market and the effects of the alternatives on it should have been analyzed in the DSEIS.

If these passengers without vehicles continue to travel using Alternative 2B, they will incur significant increased out-of-pocket costs that are not considered in the DEIS. If they choose not to travel, the Alaska economy will suffer.

RESPONSE: The Draft SEIS did not ignore impacts to independent travelers. As discussed in the Draft SEIS, all of the project alternatives were projected to increase independent tourist visits to Lynn Canal communities; however, Alternatives 4A and 4C were anticipated to have the least effect on independent visitor traffic (Section 4.5.5). Alternatives 2B and 3 were projected to result in the largest increase in independent tourist visits (Section 4.3.5 and 4.4.5).

Independent travelers who rent cars or get rides from others in cars are accounted for in the vehicle

³⁰ See MeVaugh, William F., *Thoughts, Answers, Management Suggestions - A personalized look at the ALASKA MARINE HIGHWAY* (197?)(excerpts attached).

³¹ Alaska University Transportation Center, AMHS Analysis, Phase I: Establishment of System Baseline at 32 (Feb. 2, 2009).

estimates. The road alternatives (2B and 3) represent a shift in the way transportation would have been provided in the corridor for independent travelers who wanted to walk onto the ferries—away from a primarily public transportation mode that operates more like a public transit service, to a highway system in which private vehicles provide most of the transportation (shuttle ferries on short routes would provide links connecting the roadways). The SEIS acknowledges the impact to travelers wishing not to take a vehicle. As explained in Section 1.4.1.1 of the Draft SEIS, the State’s primary responsibility is to provide a transportation facility for vehicles, not the transportation itself. The impacts to walk-on passengers for Alternatives 2B and 3, including costs, are addressed in Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS under the subheadings “Pedestrians and Bicyclists.” Based on the comment, additional information about the anticipated cost for the various travel markets (walk-ons, single drivers with a vehicle, etc.) have been added to these sections in the Final SEIS.

Without any backup at all, the agencies respond to scoping comments by claiming that:

Improved access to Juneau [via Alternative 2B, of course] would redistribute within the state some of the economic benefits received from one of Alaska's primary industries, the visitor industry. Independent visitors (i.e., non-cruise ship visitors) could shift their travel patterns, perhaps spending more time and money in Southeast Alaska, particularly in Juneau."

DSEIS at 7-7. In the effects analysis, again without citation to any supporting evidence, the agencies assert that "[t]ravelers without vehicles would be forced to rent vehicles, take a commuter flight, or travel on private carriers (if they develop) to accommodate this demand."

The failure to consider effects of project alternatives on the "out-of-state non-vehicle" market, and the adverse economic effects on local communities and industry if this segment of the visitor industry choose to go elsewhere instead, violates NEPA. The agencies' failure to consider an important aspect of the issue, and consider readily available records, is arbitrary.

RESPONSE: The Draft SEIS does evaluate the economic effects of changes in travel patterns on the tourism economy. The Draft SEIS stated that Alternatives 2B and 3 would have increased mobility for both Alaskans and visitors traveling through Southeast Alaska by shifting the limitations of long-distance ferry service to a network of surface transportation connections, which would have consisted of road links and short-distance ferries.

As documented in Sections 4.3.5.1 and 4.4.5.1 of the Draft SEIS and Sections 3.1.4.4 and 3.1.5.3 of Appendix EE, *Socioeconomic Effects Technical Report*, Alternatives 2B and 3 would have been expected to increase the number of independent visitors to Lynn Canal communities and would not have impacted the cruise ship industry.

E. The DSEIS fails to adequately evaluate safety

The general safety statistics cited by ADOT&PF fail to satisfy NEPA's information and public awareness goals and ignore an important aspect of the problem. According to the DSEIS, the crash rate on roads similar in size to Alternative 2 averages 600 accidents and 5 fatalities over the course of 30 years. See DSEIS at 4-63. The 50-plus miles of new pavement to the Katzechin can, in no way, be considered an average road. First of all, there is the setting. The sheer cliffs dropping off into North America's deepest fjord equate to a constant rock fall threat on one side and sheer cliffs

on the other. The route will go through 5 different tunnels. Because of the change in lighting and temperature, tunnels have a higher accident rate than stretches of non-covered road.³² The freeze-thaw cycle that is the hallmark of this northern coastal temperate rainforest for 6 months of the year makes icing a threat to begin with. According to the DSEIS, portions of the road will also dip below mean-high tide, DSEIS at 4-91, further exposing the road surface to sea-spray and mist kicked up by the heavy winds that characterize the Lynn Canal.

RESPONSE: The *2017 Update to Appendix D - Technical Alignment Report* has been updated to include a discussion of the geologic hazards and the proposed mitigation measures to address those hazards. Avalanche mitigation is discussed in the *2017 Update to Appendix J - Snow Avalanche Report*. The Final SEIS at Sections 4.3.7.5, 4.4.7.5, and 4.6.7.5 has been updated to explain the hazards of icing, high tides, freezing rain, icing on bridge decks, and wind conditions with respect to the road segments included in Alternatives 2B, 3, 4B, and 4D. These impacts and freeze-thaw conditions are no different than for any other road in Southeast Alaska. These conditions are difficult to predict and evaluate; however, the proposed measures to reduce these hazards would mitigate the risks of geological and meteorological events on highway safety. The road alternatives would be maintained by DOT&PF when these hazardous conditions are encountered.

The study cited states that “literature shows that different results have been obtained with regard to accident rates in tunnels when compared to those of open roads” (page 168). It also states that “in general it cannot be concluded that safety in tunnels is always lower than that of motorways. Apart from driver behavior and visibility, tunnel safety is affected by the geometric and traffic characteristics of the specific tunnel” (page 178). As this study is focused on severe accidents that occur in Italy in unidirectional tunnels, the results may not be applicable to tunnels proposed as part of Alternative 2B. The crash rate used to calculate the crashes in the Draft SEIS was based on Statewide crash information for Rural Other Principal Arterials in Alaska between 2002 and 2012.

High tides are not a concern because the driving surface elevation for the road alternatives has been designed to account for extreme high tides and storm events. The road would not “dip below mean-high tide.” The text referenced on page 4-91 of the Draft SEIS identified necessary permits. It indicated that fill would be necessary below mean high water, requiring a permit from the U.S. Army Corps of Engineers. The fill would be placed to bring the road grade up to a level that meets acceptable engineering standards, to ensure it would not be compromised by coastal flooding.

Lastly, the remote nature of this road will surely increase the death rate. The closest emergency services will be at the Lynn Canal fire station in Tea Harbor, roughly 70 miles from the Katzeihin, and is currently staffed part time by volunteers. What could have been a bad accident in town will undoubtedly be a fatality out the road given the slow response times.

RESPONSE: The Draft SEIS disclosed the effects of remote travel with respect to public safety in Section 4.3.5.1 and the effect to emergency response agencies in Sections 4.3.5.3 and 4.3.5.4. The changes in crash rates and estimated fatalities based on Statewide crash information for Rural Other Principal Arterials between 2002 and 2012 are described in Sections 4.3.7.5 and 4.3.7.5 of the Final SEIS. Many Rural Other Principal Arterials are remote in nature and are not in close proximity to emergency service providers.

As outlined in the section of our comments on avalanches, the DSEIS does not appear to account for operator deaths due to avalanches. See, *supra* at 8-12. This is an important figure, especially

³² See Caliendo, C. & De Guglielmo (2012)

considering that more operators than travelers have been killed in avalanche-related deaths along Alaska's roads and railways.

RESPONSE: The *2014 Update to Appendix J - Snow Avalanche Report*, 6.2.1 Risk Management Analysis of Three Very High AHI Highways, provides a detailed comparison of death rates on highways with similar AHIs. It also accounts for the deaths in Alaska for both traveling public and highway workers due to avalanches and highway with a high AHI.

The material in the *2017 Update to Appendix J - Snow Avalanche Report*, Section 6.2 AHI Values and Risk to Travelers and Workers compares public and worker deaths on high-AHI highways and now states that “The higher risk to highway workers underscores the need for strict adherence to the avalanche program and risk management protocols presented in this study, particularly when reopening the highway after avalanches have occurred. Workers are at risk both during the construction and operations of all highways through avalanche terrain, and such work must be conducted only under the provisions of an operational safety plan and with an active avalanche forecasting, training, and mitigation program.” While development of an operations plan is required during the final design phase, key concerns and typical risk mitigation measures detailed in the *2017 Update to Appendix J - Snow Avalanche Report*, Section 6.4 Operational Avalanche Risk Management Program, include forecasting, closures, allowing debris removal only with the approval of the avalanche forecaster, and specific provisions for clearing debris. Sample protocols with specifics for risk reduction at various avalanche danger levels are provided in Section 13.1 Appendix 6: Highway Closure and Operation Criteria.

Sections 12.4 Appendix 4: Highway Closures, 13 Appendix 5: Transportation Avalanche Danger Scale, and 13.1 Appendix 6: Highway Closure and Operation Criteria outline the need for operational worker risk reduction programs and contain examples of the material in such operational plans. Appendix 6 states that “These guidelines are a sample of the kind of material that is part of a project-specific operational avalanche plan and are not a substitute for such a detailed plan. A project-specific plan is required under Alaska case law for worker safety before construction or operation of an avalanche-exposed facility may proceed. Planning at that level is beyond the scope of this report.”

Members of the public also discovered that the base calculation for the number of deaths expected on a road of this size for travel between Auke Bay and the Katzehin should be 15 people over the course of 30 years, not 5 as originally reported in the DSEIS. *See supra* note 18. We concur with SMACs conclusion and ask that the base number be changed to accurately calculate projected fatalities over the life of this project between Auke Bay and the Katzehin.

ADOT&PF must revise the accident and fatality estimates to reflect the known safety risks associated with Alternative 2B.

RESPONSE: Regarding crash statistics reported in the Draft SEIS, DOT&PF and FHWA reviewed the calculations and found an error in the computation for the number of fatalities. The error in the Draft SEIS has been corrected in Sections 4.3.7.5 and 4.4.7.5 of the Final SEIS. In addition, the fatal crash rate and the crash rate used in the calculation of number of fatalities and crashes was changed from an Undivided Urban and Rural Interstate classification to Rural Other Principal Arterials to more accurately reflect conditions on the Alternative 2B and 3 roadways.

Road proponents have often referred to Highway 1 in California as proof that a highway can be built along a steep and sliding landscape, however in our preliminary research, it does not appear to

be a successful example. Frequent rock and landslides have wreaked havoc on the road and prompted frequent closures.³³

We have observed that the section of the Seward Highway between Anchorage and Portage Glacier is slated for Intelligent Transportation System (or ITS) improvements including an automated anti-icing/de-icing system.³⁴ Given that the Juneau road extension is similar too, if not more dangerous than this stretch of the Seward Highway, we request that fixed automated anti-icing technology (FAST) is used throughout the system. Additionally, we urge the department to use the most effective, least toxic de-icing agent. On preliminary reviews, these seem to be liquid potassium acetate³⁵ or magnesium chloride.³⁶

RESPONSE: The use of automated de-icing systems on bridges would be considered during the design phase based upon the technical and economic feasibility. However, fixed de-icing systems are not common in Alaska and there is no crash data in Alaska that suggests icing on bridges causes a higher crash rate than other portions of the roadway. Through an experimental project, de-icing systems were installed on two of the Knik River bridges in Southcentral Alaska. These systems were expensive to install and even more so to maintain. To date, an automated de-icing system has not been installed on the Seward Highway and there is no intention to do so now.

F. The Superficial Evaluation of the Risks from Exposing Rock with Acid-Generating Potential is Inadequate in the DSEIS Violates NEPA.

In evaluating the potential that blasting activities associated with road construction in the Alternative 2B corridor, ADOT&PF asserts that "[b]ased on available information related to geologic features ... DOT&PF anticipates no development of acid-generating waste rock or rock with high total metals content." DSEIS at 4.3.8.4, p. 4-68. This information is inconsistent with information available to SEACC, as well as the Forest Service and Alaska Departments of Environmental Conservation and Natural Resources. ADOT&PF failed to take a hard look at this issue and satisfy NEPA's information and public awareness goals.

According to a Forest Service inspection report dated June 5, 2013, "Acid rock drainage (ARD) ... is coming from [graphitic phyllite] rock that was excavated during the phase 2 construction of the dam [during the summer of 2012]." Agency reports describe unsuccessful efforts taken by Coeur to contain and remediate the seepage, including removal of 14,000 tons of graphitic phyllite,³⁷ and limiting infiltration and exfiltration of oxygen and water into the exposed graphitic phyllite with shotcrete.³⁸ For the record, every inspection report from July 2012 until September 2013 acknowledged this issue and is available at the Kensington DEC Inspection Report Archive on DNR's Large Mine Permitting website.³⁹

³⁹ See http://dnr.alaska.gov/mlw/rnining/largemine/kensingtonlarchive_inspections.cfm. No inspection reports have been posted on DNR's website in 2014.

Similarly, based on available information, the ADOT&PF "anticipates no development of acid-generating waste rock or rock with high metals content" in the West Lynn Canal corridor for Alternative 3. DSEIS, part 4.4.8.3 at 4-119. In violation of NEPA, ADOT&PF apparently didn't take a hard look at the Special Publication of the federal Bureau of Mines' Mineral Investigations from 1984-1988 in the West Lynn Canal Subarea.⁴⁰ "The results of this effort show the West Lynn Canal subarea to have significant potential for containing volcanogenic and sediment hosted massive sulfide deposits." *Id.* at C-31. Known stratiform sulfides occur dominantly in volcanic rocks in the northern third of the area, but stratiform occurrences also are present in sedimentary units in the southern portion. *Id.* at C-5. Minerals in these occurrences include pyrite (iron sulfate), chalcopyrite, sphalerite (zinc sulfate), pyrrhotite (iron sulfide), galena (lead sulfite), and arsenopyrite (iron-arsenic sulfate). All of these minerals are known to cause acid rock drainage when exposed to air and water.

The harmful and costly consequences that can result from road construction on Southeast Alaska's heavily mineralized landforms was demonstrated during the upgrade to the Coffman Cove Road on Prince of Wales Island. There, about 80,000 cubic meters of B-5 fill pulled from a roadway cut and used on more than 3 miles of road oxidized into sulfuric acid and damaged high value remote ecological and recreational stream and wetland resources. As reported on the Department of Environmental Conservation's Contaminated Sites Database, "Observed iron (III) hydroxide, 'yellowboy' inundated streams exhibit no aquatic life; anadromous fish habitat is directly affected."

RESPONSE: Based on recent experience in Southeast Alaska and available information related to geologic features in the Alternative 2B and 3 corridors (see *2017 Update to Appendix D – Technical Alignment Report* in Appendix Z), DOT&PF believes there is a potential for encountering acid-generating rock during construction of Alternative 2B or 3. On-site investigations to date have not identified acid-generating rock within the limits of the Alternative 2B and 3 alignments. The rock type responsible for acid generating rock would be identified in final design level geotechnical investigations. Once the presence of this rock type is identified, it would either be avoided or a plan would be established for the appropriate use or disposal of the material.

G. DSEIS' Evaluation of Costs is Incomplete.

There are a number of costs that are not included in the DSEIS. As mentioned in earlier, the DSEIS does not attempt to address what the cost for providing public safety will be for both the State and municipalities, nor does it disclose the financial burden of lives and goods lost to avalanches, landslides and other known geological hazards, also outlined earlier.

RESPONSE: The Draft SEIS and Section 3.3.1.3 of the *Socioeconomic Technical Report* (Appendix EE) included a public safety analysis for each project alternative. DOT&PF and FHWA acknowledge that project alternatives would have had an impact on emergency service providers. DOT&PF and FHWA have disclosed the environmental consequences of the proposed alternatives in the Draft and Final SEISs, including the indirect effects described in the comment. Cost-benefit analyses can include a wide array of inputs, many of which are very difficult to monetize and can make the cost-benefit analysis controversial and difficult to understand. DOT&PF and FHWA believe the cost-benefit analysis presented in the SEIS is a reasonable approach for comparing the economics of the

⁴⁰ See Clough & Redman at C30 (1991)(cited pages from Special Publication).

alternatives, but it is just one consideration among many others that are addressed qualitatively and quantitatively in the SEIS. A cost-benefit analysis that attempts to compute a dollar figure for the types of impacts identified in the comment would be highly speculative and not a wise use of public funds. Consistent with NEPA regulations, the indirect impacts analysis provided in Chapter 4 of the SEIS discloses the potential impacts quantitatively when possible, and qualitatively when not.

The DSEIS also does not address the cost to provide for homeland security at the Katzehin ferry terminal. With ever-more stringent protocols how will this issue be dealt with at an unmanned ferry terminal?

RESPONSE: No additional costs associated with security at the Katzehin Ferry Terminal are anticipated because security would have been provided by the ferry crew. Under Alternative 2B, all passengers and vehicles would have been required to off load from the ferry at its destination. After the off-loading procedure had been completed, AMHS vessel staff would have conducted a security inspection of the vessel prior to the boarding of passengers and vessels for the return trip. This is consistent with U.S. Department of Homeland Security guidelines. Many existing AMHS ferries undergo a different process because the routes have intermediate stops (i.e., passengers and vehicles remain on the ferry at each stop), preventing AMHS from doing a security sweep of an empty vessel before continuing its route.

Perhaps most concerning to us is the failure to account for the cost to the environment and managing, mitigating, or avoiding those damages.

RESPONSE: The “costs” to the physical, natural, and social environment are the main topic of the entire SEIS. The SEIS discloses all known impacts, both beneficial and adverse, as required by NEPA. Where possible, impacts are quantified, and elsewhere qualitative analysis is provided. Commitments to manage, mitigate, or avoid environmental damage are part of the project and its costs, as disclosed in the SEIS.

The AASHTO sets the standards and guidelines for transportation projects across the nation. An October 2008 report found that environmental costs are often underestimated. The report recommends an approach for accounting for these costs which we encourage DOT&PF to utilize.⁴¹

RESPONSE: DOT&PF and FHWA have disclosed the environmental consequences of the proposed alternatives in the Draft and Final SEIS, including the indirect effects described in the comment. Transportation EIS documents are not required to, and typically do not, present impacts to the environment in financial terms. The “costs” to the physical, natural, economic, and social environment are the main topic of the entire SEIS. The SEIS discloses all known impacts, both beneficial and adverse, as required by NEPA. A cost-benefit analysis that attempts to compute a dollar figure for the types of impacts identified above would be highly speculative and subjective, and not a wise use of public funds. Because the indirect impacts have been disclosed quantitatively where possible, and qualitatively elsewhere, FHWA has met its requirements under NEPA. Commitments to manage, mitigate, or avoid environmental damage are part of the project and its costs, as disclosed in the SEIS.

The DSEIS fails to consider the costs that will be imposed on the Alaska Department of Fish and Game (ADF&G) for fish and game management if access to Berners Bay is expanded by Alternatives 2B and 4A through 4D. On the one hand, DOT&PF places a positive spin on the amount of hunting and fishing opportunities that will now be open to residents and tourists. *See*

⁴¹ See ICF et al., (2008)(excerpts attached)

DSEIS at 4-36. On the other, although it acknowledges that road access under Alternative 2B or 3 will increase hunting pressure, *id.* at 4-37, the DSEIS makes no effort to analyze the costs to ADF&G to manage these new harvest opportunities. ADF&G is required by law to manage fish and game populations in a sustainable manner. This requires research to estimate populations and monitor the harvests. Obviously additional ADF&G biologist in both the research and management sections will be required. The DSEIS does not address these additional costs to ADF&G. Will additional wildlife protection officers also be required?

RESPONSE: A positive spin has not been placed on the amount of hunting and fishing opportunities that would now be open to residents and tourists. Section 4.3.15 of the Draft SEIS acknowledged that trappers, hunters, and fishermen could benefit from improved access but this improved access would result in the consideration of management actions by the ADF&G to manage wildlife populations. Section 4.3.15 of the Final SEIS has been updated to state that ADF&G confirmed in January 2016 that no additional staff is anticipated to manage additional harvests that may occur as a result of Alternative 2B.

More specifically, ADOT&PF funded a study by the ADF&G of brown bear abundance, space use, and habitat use in Berners Bay, yet used little of the information for siting the road. The Berners Bay brown bear population is of particular concern because it is fairly insular, showing little gene flow with other mainland populations (e.g., in the Stikine-Bradfield Canal - Unuk River areas) or with island populations (e.g., Admiralty Island). One reason this population remains viable is because it is difficult to access the area and thus to hunt these bears. As a result, human-caused mortality is pretty low in the population. Putting this road through the Berners Bay grass flats area may drastically change this. The road, and associated pull-outs will make hunting these bears much easier. "Non-intentional" killing of bears (mostly due to defense of life and property kills) will likely increase significantly. The road alignment for Alt. 2B will cross both the Berners Bay and Katzechin grass flats.

The ADF&G study showed more than 32% of all bear locations were within 0.6 mi of the proposed route, especially during spring and summer. Mid-June to mid-July is the brown bear mating season. In this population (as opposed to island populations elsewhere in Southeast Alaska), breeding takes place at the low-elevation grass flats. Thus, during late June, bears will be attempting to breed right in the area where this road will be constructed. The increased access from the road will lead to human - bear interactions during a time of year when bears do not always follow the "classic" behavior patterns. For example, during mating season, male bears will follow female bears to the point of harassment. This often causes female bears to have a short temper when disturbed (e.g., surprised at close distance) and often causes males to be extra curious of any and everything in the area. This could lead to increased negative interactions between bears and humans. There is also extensive literature showing that bears will avoid roads or not cross roads.

While ADOT&PF has proposed extending bridges over the rivers of the flats to allow for bear routes, these routes are based on a study conducted to document bear trails, not on the actual movement of marked bears described in ADF&G's movement study. The problem here is that the bears will be forced to either cross the road or use several small travel corridors under the road, which will likely affect their behavior and movement in the area during an important time (mating season). The Alt. 2B road alignment also crosses several salmon streams (Sawmill Creek, Johnson Creek, Slate Creek), which are used extensively by bears during salmon season. While the roads won't necessarily stop bears from visiting, they will allow increased human

access and thus lead to increased bear disturbance and potential negative interactions.

The proposed road would also open up the area for increased wolverine trapping. ADF&G did not estimate wolverine numbers in the Berners Bay area, instead marking animals to look at movement patterns and space use. Trapping in Berners Bay now relies on use of a skiff to access the outer parts of the bay or an air-boat to get up into the bay; there are only a handful of trappers that ever get up in the bay this way and only 1 or 2 that currently trap there. This road will likely make it much easier to access the area; allowing people to hike or use snow machines on the river flats to get well up the valleys (e.g., the Lace River valley) to set traps. This could increase trapping mortality in this population. How increased mortality like this will affect the population is not known but it would likely lower it in some way. DOT stated that the funds provided for the ADFG study were to allow ADFG to better manage this population if a road was built. But, now that this study is complete, there are no additional funds to allow for additional study to evaluate the population as a road is built. Thus, the burden to manage the increased wolverine harvest is on ADFG with no additional funds.

There is no mention of disturbance to wolverines during avalanche control (via explosives from helicopter). Based on ADFG's study, wolverines use these habitats extensively and could be disturbed during this activity. The DSEIS does acknowledge that mountain goats do use this same avalanche habitat, and while DOT has said it will look for goats before blasting, we are dubious that this measure will be effective, implemented, or at all meaningful.

Many of the concerns about the impact of increased access on bear and wolverine populations are similar for both the Berners Bay moose population and East Lynn Canal mountain goat populations. And while defense of life and property kills are not likely a significant issue for mountain goats, being killed by a vehicle is. The proposed road corridor slices through the heart of mountain goat winter habitat. Crashing into a moose, meanwhile, may kill both the moose and the driver, an issue that Juneau drivers have not had to deal with before.

RESPONSE: The studies conducted by ADF&G were funded by DOT&PF as mitigation to determine population densities and aid ADF&G in harvest analysis, not to determine the road alignment. Section 4.3.13 of the Draft SEIS included Figure 3-21, which illustrated these potential high use areas by brown bears as they relate to project alternatives based on information from the studies. Alternative 2B was modified in several locations to avoid sensitive resources. Between the Lace and Antler Rivers, the alignment was determined by resource agencies input and wetland permitting requirements to avoid wetlands. Wildlife undercrossings are incorporated into the design as discussed in Section 4.3.13 of the Draft SEIS.

Section 4.3.15 of the Final SEIS has been revised to include the pertinent information from the 2004, 2005, and 2014 wildlife technical reports and incorporates recent information on the effects of increased hunting and trapping pressures on wolverines as well as wolverine habitat use and loss as a result of Alternative 2B. As described in Section 4.3.1.3 of the Draft SEIS, hunting and fishing pressure has increased along every highway in Alaska that has opened formerly remote areas. Increases in hunting and fishing would occur along the alignment.

As in other readily accessible regions of the State, ADF&G would monitor the resources along Lynn Canal and adjust fish and game regulations, as necessary, to protect these resources from over utilization. ADF&G would consider management actions to ensure sustainable harvests, including more active monitoring and enforcement duties by State and federal agencies. Furthermore, the effects

of increased hunting and trapping pressure could be controlled by ADF&G and the Board of Game through season duration, take limits, lottery drawings, etc. Description of hunting and trapping pressures relative to brown bear and wolverines are incorporated in Section 4.3.15 of the Final SEIS. In addition, ADF&G confirmed in January 2016 that no additional staff is required to manage additional harvests that may occur as a result of Alternative 2B. The Final SEIS updates Section 4.3.15 to address ADF&G management of several wildlife species due to a new road.

Section 4.3.4.5 of the *2014 Update to Appendix Q – Wildlife Technical Report* addressed the potential impacts to wolverines as result of avalanche maintenance activities. Avalanche control could result in mortality to wolverines because avalanche chutes are preferred habitat for foraging; however, the probability of mortality related to avalanche control for Alternative 2B is likely low due to low wolverine densities in the area. The information has been incorporated into Section 4.3.15.3 of the Final SEIS.

Section 4.3.15.3 of the Draft SEIS included a description of the impacts of vehicular collisions on moose and mountain goat. Due to poor visibility in winter, the proposed highway could create the potential for vehicle collisions. Wildlife crossing signage in areas of high brown bear, moose, and mountain goat use as identified by ADF&G would be incorporated into the road design. Quantitative estimates of collisions were not completed; however, given the population levels and anticipated traffic volumes, mortality from vehicular collisions is not expected to have population level effects.

We acknowledge that ADOT&PF made an effort to site the road so to avoid eagle nests as much as possible. We remain concerns that this population of eagles is more sensitive to disturbance and thus may abandon nests during construction or nesting territories due to increased human use in the area.

RESPONSE: Section 4.8 of the Final SEIS has been revised to incorporate the evaluation of effects to bald eagles during operation and construction from the *2004 Appendix R – Bald Eagle Technical Report* and *2014 Update to Appendix R – Bald Eagle Technical Report*. The evaluation includes an assessment of the potential for bald eagle nest abandonment during construction as well as other potential effects on bald eagle populations from disturbance activities.

Overall, the cost to wildlife will be high both through direct mortality (via hunting and defense of life and property kills) and through disturbance (and thus changing of habits). It is clear, however, that this issue will take increased attention and resources from ADF&G to manage properly.

In addition to the straight up fiscal costs associated with environmental issues, there are also the less tangible but equally important impacts to the quality of life. We also posit that the loss of plentiful fish and game populations, including bear, mountain goat, moose, wolverine, and salmon has a significant impact on the quality of life. While reaching Haines three hours faster may improve the quality of life for some, the loss of a uniquely wild but accessible landscape like Berners Bay will decrease the quality of life for others.

RESPONSE: DOT&PF and FHWA have disclosed the environmental consequences of the proposed alternatives in the Draft and Final SEIS, both beneficial and adverse, including the indirect effects of improved access on wildlife populations. The Draft SEIS did not identify a “loss of plentiful fish and game populations” as a potential impact of Alternative 2B. The Draft SEIS (Section 4.3.15.4) did acknowledge that some wildlife would have been lost to vehicle collisions and some would have been

lost to hunters and trappers because of improved access, and some animals would avoid the area as a result of human presence. Section 4.3.15.4 also states that ADF&G would consider management action to support sustainable harvests.

Loss of wildlife in the area as a result of vehicle collisions, hunting and trapping, or displacement and avoidance, may or may not have been perceived by travelers in the corridor. Making a correlation between wildlife presence and quality and life for highway travelers would be arbitrary. Improved access for hunters and trappers would be perceived as improved quality of life for people with those interests.

While some individuals may currently access Berners Bay by water for its “uniquely wild” landscape, many more may enjoy highway access through this same landscape, if it were provided. The SEIS cannot assess quality of life impacts for differing values placed on access to wildlife. Because the indirect impacts have been disclosed, quantitatively where possible and qualitatively elsewhere, FHWA has met its requirements under NEPA. Commitments to manage, mitigate, or avoid environmental damage are part of the project and its costs, as disclosed in the SEIS.

H. Cumulative Effects Analysis Inadequate.

The summary of cumulative impacts at part 4.9.3.2 of the DSEIS is pretty general. *See* DSEIS at 4-237 to 238. Although the DSEIS notes a road on either the east or west side would result in "improved access," no effort is made to evaluate the effects from the potential mineral development of the numerous state and federal mining claims that such improved access may allow.

RESPONSE: The Draft SEIS fully disclosed the effects of reasonably foreseeable mineral development (Section 4.9.1.1). The cumulative effects analysis is based on potential cumulative impacts identified in scoping and on reasonably foreseeable actions that may contribute to cumulative impacts. The Draft SEIS (Section 4.3.1.3) acknowledges that a highway would have provided easier and less expensive access to mineral resources, but access alone does not determine whether a mineral deposit would be developed. FHWA and DOT&PF are not aware of specific mining prospects that would go into development if a road were built, hence the statement “It is unlikely that any mineral deposits within the region would be developed solely because of this improved access.” In this case, anticipating mineral development as a result of highway access would be speculative.

Information related to mining in the project area has been updated in the Final SEIS.

The DSEIS acknowledges that improved access along the West Lynn Canal corridor would increase the likelihood of future exploration but does not disclose how many existing claims there already are along the route or how improved access might affect their development. DSEIS at 4-102.

Interestingly, other than the assertion that Alternative 2B would not have any effect on the operation of the Kensington Gold Mine, *see* DSEIS at 4-47, the DSEIS contains no evaluation of the effect of improved access on development of other mining claims in the Berners Bay area. No effort is taken to evaluate whether improved access might result in development of other, perhaps more marginal claims, existing along the east side of Lynn Canal. Given the numerous state and federal mining claims along both the East and West Lynn corridors, the DSEIS should have taken a harder look at the potential the improved access might result in the development of these mining claims.

RESPONSE: The Draft SEIS did include a figure showing active mining claims in the project area (Figure 3-2) and discussion about reasonably foreseeable future exploration associated with existing claims along the proposed highway corridors (Section 4.9.1.1). As previously stated, anticipating mineral development as a result of highway access would be speculative considering the numerous factors involved in determining economic viability. The roadway alternatives are expected to result in negligible impacts to mine development in the area. Improved access may increase exploration in the area; however, DOT&PF and FHWA cannot speculate how that exploration might lead to development of an active mine. Information related to mining in the project area has been updated in the Final SEIS.

Thank you for your careful attention and response to the serious issues we have raised.

Best Regards,

Buck Lindekugel

Juneau Access Improvements Project DSEIS

Attn: Deborah Holman
DOT&PF Southeast Region
P.O. Box 112506
Juneau Alaska 99811-2506
juneauaccess@alaska.gov

Thank you for the opportunity to provide further testimony with regard to the Juneau Access Project. The following are the Skagway Marine Access Commission's comments on the 2014 Juneau Access Improvements Project Draft Supplemental Environmental Impact Statement (DSEIS.) We are submitting our comments via email and the U.S. Postal Service. A copy of a CD with our source documents will be mailed with the hard copy.

The Commission is a non-profit corporation dedicated to improving business conditions in Northern Lynn Canal, promoting safe, reliable and efficient transportation networks and supporting fiscally responsible government projects. We incorporate by reference and ask that Alaska Department of Transportation (AKDOT) review our past testimony as it pertains to this issue which was submitted during the Final Environmental Impact Statement (FEIS) process of 2006 and our Scoping Comments submitted in 2012.

The previous Environmental Impact Statement failed to apply uniform, consistent standardized formulas to the transportation and engineering data used in its cost/benefit analysis of the various alternatives. Despite requests from the public for clarification, many assumptions were made but never substantiated. The Skagway Marine Access Commission believes that the court's decision mandated not only more comprehensive analysis but more accurate and precise application of established principles of economic analysis, transportation planning and engineering assessment.

The National Environmental Policy Act (NEPA) requires that to reach a reasonable decision, an agency must show it considered the right information, and then articulated a satisfactory explanation that rationally connects the facts found and the choices made. An agency violates NEPA if it fails to furnish high quality data to the public that supports its conclusion, fails to adequately evaluate reasonable alternatives or fails to describe and assess the direct, indirect, and cumulative impacts of a proposed

alternative. The Skagway Marine Access Commission submits the following in depth analysis of areas where the DSEIS fails to meet NEPA standards:

- User Cost Skewed Due to Omission of Foot Passenger Data: An analysis of the Juneau Access DSEIS and its failure to consider ferry passengers traveling without vehicles.
- How the Juneau Road Fails to Meet State and Federal Highway Safety Goals: An analysis of safety issues in the Juneau Access DSEIS.
- Inconsistent Methodology For Assigning Ferry Fares: An analysis of selective application of fare structures in the Juneau Access DSEIS.
- Alternative 1B Optimized: A more efficient proposal for enhanced ferry service than Alternative 1B in the Juneau Access DSEIS.
- Alternative 5: The All Alaska Class Ferry Alternative, an improvement on Alternatives 4A-4C in the Juneau Access DSEIS.

The DSEIS contains an abundance of analysis. Unfortunately flawed data and unsubstantiated assumptions render much of it meaningless. Some key components of the project are given only passing consideration or are left out of the study altogether, others are selectively applied. The following are examples of the ways in which the DSEIS appears to attempt to engineer a favorable outcome for the preferred alternative 2B.

RESPONSE: The Alaska Department of Transportation and Public Facilities (DOT&PF) and Federal Highway Administration (FHWA) dispute the assertion that the Draft SEIS relied on flawed data or unsubstantiated assumptions. The analysis contained in the Draft SEIS is based on accepted methodologies and the latest available data, and is in compliance with applicable laws and regulations. All analysis was performed by highly qualified professionals within their respective disciplines. For example, the Draft SEIS adheres to NEPA requirements and guidance governing an SEIS. Additionally, DOT&PF specifically addressed each of the previously raised plaintiff legal challenges, including those not ruled upon by the Courts. Finally, comments herein relating to transportation planning requirements and goals have been addressed in the responses. In general, the commenter incorrectly cites requirements placed on Metropolitan Planning Organizations under the Moving Ahead for Progress in the 21st Century Act (MAP-21) as being directly applicable to this project. Nonetheless, DOT&PF and FHWA meet safety requirements, and have disclosed safety consequences of the project, in the Draft SEIS. DOT&PF and FHWA object to the characterization that the Draft SEIS attempts to “engineer a favorable outcome for the preferred alternative 2B.” Each of the commenter’s points is answered in turn, below.

SAFETY

Over a decade in the different towns where hearings have been held, the chorus of public testimony on the safety issue has been deafening. Yet sadly, safety still has not been included in the purpose and need statement for the project.* Because safety is not included in purpose and need, it is not one of the criteria considered in the choice of a preferred alternative, which is a major oversight given the numerous hazards along the proposed road routes.

*The Skagway Marine Access Commission requested that safety and reliability be included in the statement of purpose and need in comments on the FEIS in 2006 and again in scoping comments in 2012.

RESPONSE: Safety is included in the purpose and need statement for a project only if there is a demonstrable safety problem on the transportation link being considered. An example would be a link in which the number of accidents is higher than the state average for similar transportation links. Safety is not a problem with the current system; therefore, safety is not a stated purpose and need factor for the proposed project. Nonetheless, all roads constructed under State and federal authority must follow State and federal design procedures that have been adopted/established to support safe travel. Therefore, all evaluated project alternatives will be developed to be safe and reliable in accordance with standards.

FOOT PASSENGERS

Nearly 45% of passengers on the Alaska Marine Highway System (AMHS) travel without a vehicle yet the document ignores their existence as an element in both traffic forecasts and user cost analysis.

RESPONSE: The document does not ignore passengers traveling without a vehicle; all people wanting to travel from Juneau to Haines and from Juneau to Skagway are included in the traffic forecasts. What the commenter is misunderstanding (or objecting to) is that there is a fundamental difference in how people will travel in the primarily road alternatives (Alternatives 2B and 3) as compared to the primarily ferry alternatives (Alternatives 1, 1B, 4A, 4B, 4C, and 4D).

The primarily ferry alternatives operate more like a public transit system, such that the ferry leg is long, and comprises a large proportion of the trip. For those alternatives, the public transportation mode (ferry) transports people and vehicles, dropping them off relatively close to their destination. This makes it more conducive to walk onto the ferry, as does the fact that the ferry trip is highly subsidized and is seen as a good deal. Of note, however, is that even for the primarily ferry alternatives, the trip typically includes a short vehicle component at each end (Skagway has the only ferry terminal in Lynn Canal that is within reasonable walking distance from residential areas for most residents. All other existing terminals must be reached by private vehicle or private carrier; therefore, a vehicle is typically used for at least part of the trip).

For the primarily road alternatives, a greater proportion of the trip would be made in a vehicle than on public transportation (shuttle ferry). Because of the distances to reach the ferry terminals, particularly at Katzechin, these alternatives would be less conducive to passengers walking onto the ferry (e.g., friends or a cab would be needed to drive someone to Katzechin to catch the shuttle ferry). This would be a change in travel patterns and would also be an impact. For some travelers, this is an adverse impact, and for others it is considered a beneficial impact. Both the beneficial and adverse impacts to walk-on passengers are identified and disclosed in the SEIS. The total amount of demand in the corridor (both walk-on passengers and vehicles) is captured and represented in the forecasts. As is discussed in the SEIS, DOT&PF and FHWA anticipate that with the primarily road alternatives, most of the travel will be via vehicle (i.e., not walk-on), and those travelers who were accustomed to making their trip as walk-on passengers will use a

vehicle. The implications of this change are fully disclosed in the SEIS. Of note is that DOT&PF and FHWA have updated the calculation of current walk-on traffic; it is closer to 30 percent. Additional information on the forecast of walk-on traffic has been included in the *Traffic Forecast Report* (Revised Appendix AA), and the impact analysis has been updated in the Final SEIS and *Socioeconomic Effects Technical Report* (Revised Appendix EE) to reflect more current estimates under the impacts analysis associated with each alternative.

TICKET PRICES

Favorable fares are selectively applied to benefit the preferred alternative thereby skewing the analyses of user benefit, demand and subsidy identification. The methodology for assigning fares is never explained. A study of AMHS fare inequities has been ongoing concurrent with development of DSEIS alternatives and is scheduled for release shortly after the close of the comment period. Upon its release (presumably with its legislatively mandated fare increases) the study immediately will render the traffic demand and cost-benefit analysis out of date. Despite requests to include the AMHS study in the DSEIS the AKDOT has not made the study public. **
