RESPONSE: “Favorable fares” were not applied to Alternative 2B, nor was the analysis “skewed” in its favor. Again, the commenter ignores that the differences between the alternatives that are primarily ferry options, and those that are primarily road options, include substantive changes in the operating costs of the vessels and therefore in the fare structure. For the primarily road alternatives, the ferry service would operate as a shuttle ferry and would have reduced operating costs. The fares are lower due to the efficiencies generated from day boat vessels operating without the need for a supporting reservation system, operating with drive through loading and unloading, as well as higher traffic volumes generated by frequent, regularly scheduled service. Per your comment, a memo describing the methodology for developing the fares has been added to Revised Appendix AA of the Final SEIS.

The AMHS Tariff Analysis was not completed until January 2015, after the Draft SEIS was published. It was made publicly available on the AMHS website at that time. The study examined AMHS tariff rates and tariff rates for similar ferry systems, as well as changes in fares made since the previous rate study was completed in 2008. It also looked for anomalies on routes of similar length within the AMHS system. The study did not identify any fare anomalies on the Juneau-Skagway or Juneau-Haines routes. The study also considered the development and implementation of a change in tariff policy with the goal of creating a fair and equitable tariff structure. As of January 2018, DOT&PF has not acted on the study recommendations regarding revising the fair structure methodology. As a study, the tariff analysis results did not render the Draft SEIS results out-of-date. DOT&PF and FHWA have reviewed the study and concluded that the analysis and recommendations do not impact the methodology used for the SEIS.

MARINE MODELING

The court mandated a more efficient “no build alternative” but the model put forth as the “enhanced” marine alternative 1B is burdened unnecessarily by assigning the largest, most expensive ship to operate on the route with the least demand.

RESPONSE: A review of the AMHS fleet indicates that the vessel best positioned (availability, functionality) to enhance service in Lynn Canal is the motor vessel (*M/V Malaspina*). The *M/V Malaspina*'s primary service link is Auke Bay to Skagway due to the Skagway Ferry Terminal configuration. The existing Skagway Ferry Terminal configuration cannot accommodate bow loading and unloading. Without the ability for vehicles to drive onto the ACF at one end and drive straight off the other end, it is not reasonable to schedule a 12 hours per day, 7 days per week Day Boat ACF on the Auke Bay to Skagway link. Without taking advantage of the drive through loading and unloading vessel capability, there is insufficient time to make the round trip within 12 hours. In addition, there is flexibility in the scheduling of the *M/V Malaspina*. The Alternative 1B presented in the Final SEIS demonstrates the potential of flexibility.

Many of the technical reports are plagued with inconsistent methodologies with regard to fare structure, route cost modeling and route segment distance.

RESPONSE: Cost calculations for mainliner operations and day boat operations require separate methods because they are two different types of systems. The day boats are dedicated to Juneau Access Improvements (JAI) Project alternatives and can be thought of as stand-alone systems. The mainline vessels (operating part time in Lynn Canal) are tied to a much larger system, and operate on schedules not necessarily optimized for Lynn Canal traffic. To calculate the dedicated day boat operating costs, cost estimate models were created that estimated annual vessel cost components, including crew cost, fuel cost, maintenance cost, vessel lay-up cost, and administrative overhead costs (see Chapter 5 of the *Marine Segments Technical Report*, Revised Appendix GG). For the mainliner cost analysis, the cost component categories are non-fuel operating expenditures, fuel expenditures, shoreside costs, and overhaul costs. AMHS provided the annual total cost (see Chapter 6 of Revised Appendix GG).

See the previous response regarding fare structure.

COST-BENEFIT ANALYSIS

Appendix FF presents a thorough and credible analysis which concludes that building the road makes no economic sense. But the results of the study are ignored (much like the foot passengers) in the choice of a preferred alternative and buried in the nearly 1500 pages of document and technical reports.

RESPONSE: The results of Appendix FF, *User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses*, have not been “ignored.” The purpose of the economic efficiency and cost-effectiveness analysis conducted as part of the Draft SEIS was to determine which alternatives serve the largest number of travelers at the lowest possible cost. Many measurements are important in the identification of a preferred alternative. For example, the total number of travelers served is important. Alternative 2B would serve substantially more travelers than any other alternative (9.6

million vehicles versus 1.4 to 3.4 million vehicles for the marine alternatives). The cost to serve each traveler is another important measurement (Alternative 2B is lowest in terms of per user cost).

SPECULATIVE DEMAND

Alternative 2B poses significant financial risk based on a model of theoretical demand. Appendix AA, the Traffic Forecast Report uses an “unconstrained demand” model. It predicts greatly inflated numbers in an “if we build it they will come” strategy, a risky game plan for gambling with more than a half a billion of the state’s dwindling transportation dollars.

RESPONSE: All traffic demand models attempt to predict future demand based on assumptions and data available in the present. To the extent that they are predicting a future, unknown condition, all demand models are “theoretical.” The total demand model used for this project was developed based on empirical data derived from actual travel conditions observed in Alaska and Western Canada from communities with geographic characteristics similar to those in Juneau. The model begins by defining a condition that the modelers call “unconstrained demand.” This level of demand predicts how many people would want to travel between Juneau and Haines/Skagway if there were a road the entire way. This predictive condition was based on the assumption that, if given the opportunity to travel by road, people in Juneau, Haines, and Skagway would exhibit travel patterns similar to the patterns of people in similarly situated communities. Based on the project team’s research, there are no indicators that travel behavior in Juneau, Skagway, and Haines would differ substantially from that of behavior in other Alaskan and Canadian communities if full highway access were available. Based on the data collected, the project team is confident that Juneau residents would travel in a manner similar to that of other Alaska residents. Even today, Juneau residents travel only slightly less on a per-household basis than the average Alaskan household, even though they do not have full road access. Vehicle ownership per capita in Juneau, Haines, and Skagway is also comparable to vehicle ownership per capita in other Alaska areas.

The predictive methodology used in this project’s forecast is not “risky” or based on a strategy of “build it and they will come,” and does not result in “greatly inflated numbers.” The forecast used the unconstrained demand only as an upper boundary to bracket the overall demand in the corridor. Each forecast, for each of the alternatives, scales down from the unconstrained demand based on factors such as cost, travel time, and schedule convenience. Using such factors to predict travelers’ choices and behavior among alternatives is a common modeling practice and is used in nearly every traffic model. By factoring the demand down from the unconstrained demand based on costs, travel time, and convenience, the model predicts reasonable estimates of travel behavior based on the relative merits of the alternatives.

Moreover, more than one approach to predicting future travel behavior was used by the study team. Two methods were selected as being most representative of likely conditions along Lynn Canal. Each of these two different models was developed independently and resulted in similar estimates of travel volume along Lynn Canal. These approaches were developed by travel modelers at Fehr & Peers, a firm specifically identified and hired for its expertise in the travel modeling field. The Fehr & Peers approach and results were evaluated by an independent

university professor with expertise in travel modeling and travel behavior, prior to the results being accepted for use in the SEIS. The methodology and results of both approaches are fully disclosed in the associated technical report and summarized in the SEIS.

JUNEAU-CENTRIC

The plan is named Juneau Access Improvements Project (JAIP) and in this sense it is Juneau-centric in its conception and its execution. It is all about Juneau all the time. The emphasis is on improving access from Juneau to Haines and Juneau to Skagway. There is very little written in the document about the vital transportation links that exist between Haines and Skagway or between Juneau and points south. The DSEIS treats the rest of the region as an afterthought and gives no consideration to effects on the remainder of the Alaska Marine Highway System.

RESPONSE: Based on the information in Chapter 1 describing the problems to be solved, the purpose of the project is to provide improved surface transportation to and from Juneau within the Lynn Canal corridor. In that sense, the commenter is correct—the project is about access to and from Juneau. This SEIS is a project-level evaluation focused on solving identified problems of access to and from Juneau in the Lynn Canal corridor; the intent is not to plan for and evaluate the overall needs of the AMHS. Overall transportation needs are evaluated in the Southeast Alaska Transportation Plan.

Nevertheless the project considers effects on the remainder of the Alaska Marine Highway System. To the extent that there are impacts that extend beyond the Lynn Canal project area, those impacts are discussed as indirect or cumulative impacts in the SEIS. Moreover, DOT&PF does include and evaluate access between Haines and Skagway in the SEIS. In each of the project alternatives (see Chapter 2), access between Haines and Skagway is maintained, and that planned connection is integral to each of the project alternatives evaluated in the SEIS.

STATE SUBSIDY

In their 2012 scoping comments the Skagway Marine Access Commission raised the issue of state subsidy. “Traffic studies to date demonstrate that a preponderance of AMHS traffic occurs in Lynn Canal. With its inflated pricing and its large traffic volume, Lynn Canal makes a disproportionately large financial contribution to the overall AMHS system as compared to the rest of the region. An issue of concern with regard to the goal of reducing State costs (reference purpose and need) would be possible impacts that the loss of Lynn Canal revenues would have on the rest of the system, either in the form of increased tariffs for users in other communities in Southeast or increased level of required government subsidy.” This issue was raised in the lawsuit over the previous FEIS. It is not addressed in the current DSEIS.

RESPONSE: There is a misconception in the region that the Lynn Canal Service covers its costs and generates excess revenue that helps subsidize other less-profitable runs in the system. While traffic and revenue studies indicate higher demand in Lynn Canal, and therefore higher revenues, the current ferry system in Lynn Canal still requires a State subsidy. For the time period 2001 through 2015, providing Lynn Canal service was 12.6 percent of AMHS total cost generating 12.7

percent of AMHS total revenue. More recently (2013-2015) Lynn Canal service was 13 percent of AMHS total cost generating 10.3 percent of AMHS total revenue.

It is not true that this issue is not addressed in the SEIS. Section 1.4.4 of the Final SEIS describes the costs, revenues, and subsidies necessary to run the AMHS system in general, and Lynn Canal service in particular. Over fiscal years 2001 through 2015, the cost to operate AMHS in Lynn Canal averaged \$16.6 million per year. Revenues from fiscal years 2001 through 2015 from passenger and vehicle tickets and on-ship services averaged \$6.1 million. As a result, the State general fund contribution has averaged \$10.5 million to provide surface transportation in Lynn Canal. The estimated revenues, costs, and AMHS/State costs are reported for each for the alternatives. See, in particular, tables in Chapter 4 of the Draft and Final SEISs. Also, see text under the "Transportation" headings for each alternative, under subheadings "Other Transportation Impacts," and AMHS. Finally, in addition to the above-mentioned information, an update (2005-2015) to the *Lynn Canal Corridor Revenues and Expenditures* reports for 2001-2002 and 2003-2004 is included in Appendix BB of the Final SEIS. This report has great detail on revenues, costs, and subsidies.

The *2015 Alaska Marine Highway Tariff Analysis* identified rate anomalies on comparable routes within the AMHS system. AMHS is on a 5-year schedule, following through with the recommendation to bring outlying tariffs to within 25 percent of the average tariff per nautical mile for the route distance. The Tariff study identified the link between Haines and Skagway as too high relative to other links of similar distance and is addressing this as part of the 5 year plan.

Under Federal law, the burden rests with the Federal Highway Administration (FHWA) to ensure that state transportation agencies adhere to federal law and regulations. It is the responsibility of FHWA to require that AKDOT furnish high quality data that supports its conclusions. The omissions and faulty analyses in this document should be corrected and the public should be given an opportunity to comment on the corrected version. Over the past decade there has been a tendency on the part of the Alaska Division of FHWA to rubber stamp any and all decisions made by the AKDOT with regard to Juneau Access. For the Federal Agency to sign off on another substandard environmental impact statement would be highly suspect and raise the question as to whether the closeness of the two agencies bounds on a form of government failure known as regulatory capture.

RESPONSE: The Draft and Final SEIS conclusions are based on up-to-date high-quality data and analyses. Corrections, where necessary, have been made in the Final SEIS. The procedures followed by FHWA and DOT&PF are completely within the regulatory framework of NEPA and the Administrative Procedure Act.

The Skagway Marine Access Commission requests that AKDOT address the inadequacies of the DSEIS and provide the public an opportunity to comment on the corrected document. The Commission concurs with the comments of the Municipality of Skagway.

Sincerely,

Janice C. Wrentmore, President Skagway Marine Access Commission

Dr. Lindsey Doctorman's Comments in Regards to Appendix EE: Socioeconomic Effects Technical Report from July 2014.

This appendix is an update from the 2004 Appendix H: Socioeconomic Effects Technical Report. I would like to reiterate my concerns with the previous document here as they did not do an updated survey or if they did it was not reported here:

- The socioeconomic impacts are out of date and not fully captured. The household survey data that is the basis for the socioeconomic effects in Appendices H and I are from nearly 20 years ago. For example, Appendix H, page 52 states “The 1994 Juneau Access Household Survey found that Skagway households spent an average of \$1,600 in retail purchases, including \$1,100 in groceries, the previous year.” These results are archaic as the internet was not a major economic force as it is today. The high frequency of use of online shopping is not taken into account in this survey nor in the survey conducted 10 years later, but the impacts still claim shopping trips as one of the main uses by residents. In addition, the survey conducted in 2003 asks the residents about their preferences of three potential access options, one of which is no longer viable under this project, and it does not ask about the preferred alternative. Lastly, recreation and summer travel are other stated uses for Juneau Access, however, the survey does not ask the tourists nor the non- car travelers their patterns or preferences on travel under these scenarios. These groups are a major portion of travelers, especially in the summer. You are doing a disservice to the citizens of this State by making decisions on such partial and outdated information.

RESPONSE: The results of the 2003 household survey were provided as background information. These results were not used in developing the travel model for the Draft and Final SEISs, nor was the household survey used as the basis for determining the socioeconomic effects. As part of the preparation of the Draft SEIS, all socioeconomic baseline data and impacts were reviewed and updated where appropriate. As evidence, Appendix EE of the Draft SEIS, *Socioeconomic Effects Technical Report*, is a revised assessment of the 2004 *Socioeconomic Effects Technical Report*, which documented the potential socioeconomic effects of improved access to Juneau. It includes detailed socioeconomic baseline data for Juneau, Haines, and Skagway. This report was updated for the SEIS based on the latest census information, comprehensive plans, and other relevant socioeconomic information.

The updated appendix, Appendix EE, does not provide updated survey data in this way. In fact the methodology used is very vague. It states that they interviewed the public, business owners and government officials. It does not point out what questions were asked and in what platform they were asked. The lack of description of the methodology used in this report does not make this report reliable in any form. They did use Northern Economics for some of their data collection. The majority of this appendix was information gleaned from the Census Bureau.

RESPONSE: The commenter seems to be objecting to the use of survey data that were relied upon in the 2006 Final EIS. At that time, a household survey was used to provide information for the traffic forecast. In the 2014 Draft SEIS, a different methodology was used to forecast traffic. As a result, no new surveys were conducted for the Draft and Final SEISs, because they were not needed.

That is not to say that socioeconomic baseline data and effects were not updated. As mentioned above, all socioeconomic baseline data and impacts were reviewed and updated where appropriate in preparation of the Draft SEIS and its Appendix EE, *Socioeconomic Effects Technical Report*. Appendix EE of the Draft SEIS is a revised assessment of the 2004 *Socioeconomic Effects Technical Report* documenting the potential socioeconomic effects of improved access to Juneau. It includes detailed socioeconomic baseline data for Juneau, Haines, and Skagway. This report was updated based on the latest census information, comprehensive plans, and other relevant socioeconomic information.

The commenter seems to be confusing the interviews conducted for the purpose of updating socioeconomic data, with the more formal household survey method undertaken in 2004. It is true that in 2004 the formal survey had a more detailed methodology. Nonetheless, Section 1.2 of the 2014 *Socioeconomics Effects Technical Report* (Appendix EE of the Draft SEIS) describes the methodology used to conduct the interviews. It states that “Primary research includes interviews with Juneau, Haines, and Skagway businesses, government, and other community representatives. In addition, executive interviews were conducted with State and local government agencies throughout the research process in order to gather data and assess the effects of the various transportation alternatives.” Moreover, in sections in which direct interviews are cited, additional information is presented regarding what type of information was requested and gleaned from the interviews. Interview materials are cited in the reference list and are a part of the administrative record for the project.

I did examine their *ES 1 Effects Common to All Alternatives*, where they broke out the overall effects on different aspects of the communities which I will summarize here. But first, it should be noted that they estimate between 90 annual average daily traffic (ADT) in the no action alternative and 835 ADT for the other alternatives. I fail to believe that this road would increase traffic 10-fold, especially with the claims that they back below:

RESPONSE: The traffic forecast methodology and results are fully disclosed in Appendix AA, *Traffic Forecast Report*, and are summarized in the SEIS. The study team selected two forecasting methods as being most representative of likely conditions along Lynn Canal. Each of these two different models was developed independently and resulted in similar estimates of travel volume along Lynn Canal. These approaches were developed by travel modelers at Fehr & Peers, a firm specifically identified and hired for its expertise in the travel modeling field. The Fehr & Peers approach and results were evaluated by an independent university professor with expertise in travel modeling and travel behavior, prior to the results being accepted for use in the SEIS.

The ten-fold increase in traffic from the No Action Alternative to Alternative 2B would be the result of lower-cost, more convenient travel opportunities for a much larger segment of the region's population.

Transportation: The report claims to improve access in the Lynn Canal by creating closer links among the economies, more retail / service access for Haines and Skagway residents and more access to recreation for Juneau residents.

Air taxi operations: The report claims that improved access to the Lynn Canal is likely to have a negative impact on air taxi operators. This contradicts the previous claim in transportation that this improved access will create a closer link to the communities. A 45 minute plane ride is as close as you can be connected to a community in Southeast Alaska.

RESPONSE: A statement that improved surface transportation in Lynn Canal would reduce business for air taxi operators does not contradict a statement that improved surface transportation would improve linkages for the affected communities. An important aspect of the SEIS is to describe both beneficial impacts and adverse impacts. As in the analysis cited above by the commenter, it is possible to have an overall benefit to travelers in general, while also having an adverse effect to one transportation industry—in this case air taxi operators. As is explained in Section 4.4.7.5 of the Draft SEIS, construction of any of the build alternatives would divert some traffic from air taxis to the improved Lynn Canal surface transportation. The improved access in Lynn Canal would facilitate the movement of goods and people through and to the northern Southeast Alaska region. This would create closer social, cultural, and economic links among the communities of Juneau, Haines, Skagway, and Whitehorse. However, air taxi operators could see reduced activity and business.

Economic development: The report continues to claim this is improved access. The access will benefit Haines community for retirement opportunities. I thought the claim for this Juneau Access project was to increase jobs? It is just expanding retirement opportunities, so where are the jobs?

RESPONSE: The purpose of the JAI Project is not to “increase jobs” (see Chapter 1 for a full description of the project purpose and need). However, as presented in Section 4.8.4 of the Draft SEIS, all of the project alternatives would create construction jobs, and Alternatives 2B and 3 would create the most jobs. All of the project alternatives except Alternatives 4A and 4C are projected to increase employment in Juneau (Section 4.8.4.3 of the Draft SEIS), and, depending on the alternative, Haines and/or Skagway, primarily as a result of increased visitors (see Sections 4.3.5, 4.4.5, and 4.5.5 of the Draft SEIS). This increased employment would result in increased population.

Local government expenditure: The report claims with this improved access that there will be an increased demand for public services (i.e. a great cost to local governments), but it will be offset by higher property tax revenues (i.e. a greater cost to the local residents). Not sure where this is benefiting anyone.

RESPONSE: The Draft SEIS discloses impacts on local government. It does not claim that this is a benefit. Benefits are derived by travelers who would use the project alternatives; those benefits would come in the form of lower costs, increased flexibility and opportunities to travel, and shorter travel times. See Appendix EE, *Socioeconomic Technical Report*, for more detailed information on impacts to local government expenditures. Appendix EE estimates the amount of additional sales tax revenue that could be generated by each alternative, but other expenditures are not quantified (they are described qualitatively).

Healthcare: The report claims that this ‘improved access’ would make it “somewhat easier and faster to transport patients” In emergency situations, helicopters or planes are utilized, so a road would provide no additional benefit in those situations.

RESPONSE: Implementation of any of the project’s build alternatives would improve access to the communities in Lynn Canal; therefore, all the alternatives would improve access to health care facilities. The Draft SEIS acknowledges that air transport for medical emergencies would remain the method of choice.

Education: This report claims that improved access by ferry or highway benefits educational programs. If it states that it does not matter which mode of transportation is used, then there is no need to build a road.

RESPONSE: The purpose and need for the project is not directly tied to education. Implementation of any of build alternatives would improve access to the communities in Lynn Canal, and therefore would improve access to and from Lynn Canal’s educational facilities (among other destinations and users who would benefit).

Public Safety: The report directly quotes *“As with any rural Alaska road system, emergency situations occurring far from downtown areas would create response challenges for fire, emergency medical service, and police departments. Personnel and equipment would be pulled away from normal duties, possibly for extended periods. The agencies with the most resources available – State Troopers, Juneau Police Department, and Juneau Fire Department – say they are already operating at minimal staffing levels given the extent of their current responsibilities and service areas.”*

This road alternative is NOT SAFE and the safety officers are NOT available for unsafe situations. This report states this fact!

RESPONSE: The quote pulled from the Draft SEIS does not indicate that the road alternative is not safe. The Draft SEIS discloses effects on local communities, and in this particular instance it describes the effects to local emergency service providers. The Draft SEIS and the *Socioeconomic Effects Technical Report* (Appendix EE) include a public safety analysis for each project alternative.

Statewide, the Alaska State Troopers are responsible for general policing, patrols, and emergency response along rural roads, particularly outside the areas associated with individual local governments. Alternative 2B falls partially in the City and Borough of Juneau (about 30 road

miles north of Echo Cove to Eldred Rock) and partially in the Haines Borough (from Eldred Rock northward). The Alaska State Troopers were contacted and indicated that, under Alternative 2B, the primary response would come from State Troopers based in Juneau. The Alternative 3 road on the west side of Lynn Canal lies within the Haines Borough. Under Alternative 3, the primary response would come from State Troopers based in Haines¹.

The SEIS indicates that it is likely that emergency medical response would come from these communities. Section 3.1.4 and sections in Chapter 4 corresponding to the socioeconomic impacts for each alternative provide basic information about services provided at each community and disclose the potential impacts to the service providers of having more road miles and more traffic within their areas of responsibility (see also Appendix EE, Section 3.3). Fire protection outside local fire service areas (i.e., along these road routes) is provided by the Alaska Division of Forestry and Tongass National Forest. Haines, Skagway, and Juneau all have search and rescue capabilities, either through separate organizations or through their fire/rescue departments, or both. Overall, staffing of public safety is anticipated to remain the same as it is today under all alternatives.

All roads constructed under State and federal authority must follow State and federal design procedures that have been adopted/established to support safe travel. Therefore, all of the evaluated project alternatives would be developed to be safe and reliable in accordance with standards.

Quality of Life: The report claims that how this access affects quality of life is a personal perspective. The report references a survey conducted in 2003, and claims that residents in all three communities would, at some level, prefer improved access or find it important. The survey results stated did not define whether that improved access be in the form of a road or more ferry access.

In the second chapter of this report, the baseline conditions are set out. On page 11, in regards to section **2.1.1.3 Population Forecast**. The highly subjective statement eludes to the report writers preference as to how revenue should be raised in the State of Alaska. The direct quote is:

“There is considerable uncertainty in forecasting Juneau’s population because it is not possible to predict when or how State government will choose to deal with continuing revenue shortfalls. The opening of the Arctic National Wildlife Reserve to oil drilling or the construction of an Alaskan route for a natural gas pipeline could temporarily mitigate some of the budget deficit. Implementation of some new tax structure could also ensure that State programs will continue uninterrupted.”

This statement alone shows that they are not approaching the Juneau Access objective and unbiased. The report directly claims that they are not able to properly provide for the safety of the public in remote areas and there are clear preferences as to how the politics in this State should

¹ As of January 2018, the Alaska State Trooper position in Haines is vacant.

be directed. These are two important reasons why this study is not objective and why these alternatives are not safe for the citizens of Southeast Alaska. The main goal for improved access or a change in the current transportation system is to improve safety and that is not what would occur if a road were to be built.

RESPONSE: FHWA and DOT&PF have undertaken the SEIS for the JAI Project in an objective and unbiased manner. The quote pulled from Appendix EE, *Socioeconomic Technical Report* (Section 2.1.1.3), of the Draft SEIS does not describe a “bias” or “elude [*sic*] to the report writers preference as to how revenue should be raised...” The sentence merely describes the challenge in forecasting Juneau’s population, given the current difficult budget situation. The sentence quoted is not stating a preference, but rather reporting the kinds of remedies that have been discussed to stem the budget shortfall for funding State government. In Alaska, there is a strong connection between economic activity and population. Because Juneau’s economic activity is heavily tied to State government, the Draft SEIS acknowledged the potential for certain issues to result in substantial changes to the city’s population. The population forecast used in the Draft SEIS for the project was founded on a base case population developed by the Alaska Department of Labor and Workforce Development. It was completed by Northern Economics, a firm that is eminently qualified in Alaska for conducting such a forecast. The forecast showed flat to declining population in Southeast Alaska. If the project were trying to bias the results, it would not make sense to identify a flat to declining population. The forecast was updated in the Final SEIS based on a 2016 population projection also done by the Department of Labor and Workforce Development (see Appendix B of Appendix AA, *Traffic Forecast Report*).

The report does not claim we will “not able to properly provide for the safety of the public in remote areas.” As mentioned previously, the Draft SEIS discloses effects on local communities and describes the effects to local emergency service providers. DOT&PF and FHWA acknowledge that project alternatives would have an impact on emergency service providers; however, as has occurred across the state on other stretches of rural highway, emergency service providers respond and provide proper assistance. The Draft SEIS discloses that this would come with a financial cost to the providers.

All roads constructed under State and federal authority must follow State and federal design procedures that have been adopted/established to support safe travel. Therefore, all of the project alternatives are safe and reliable.

Inconsistent Methodology for Assigning Ferry Fares: An analysis of skewed ticket prices selectively applied in the Juneau Access DSEIS

November 20, 2014

*Skagway Marine Access Commission
Box 1076
Skagway, Alaska 99840*

Inconsistent methodology identified

Early on in the Juneau Access environmental impact statement process, the Alaska Department of Transportation and Public Facilities (AKDOT) identified the lack of a consistent methodology for calculating the fares under the present Alaska Marine Highway System (AMHS) fare structure. The lack of a consistent fare formula has been documented not only in earlier drafts of the EIS and supporting documents, but in official governmental reports, correspondence and public testimony by AMHS and AKDOT officials. ⁽¹⁻⁵⁾

In an August 2005 update to the March 2004 Proposed Marine Segments Fare Structures Report,⁽⁶⁾ the AKDOT proposed a cost per mile fare formula that has been applied to some but not all route alternatives presented in the 2014 DSEIS. We are concerned that the algorithm proposed in the report has been selectively applied to the advantage of the preferred alternative, 2B.

An August 30, 2012 memo from consultant Laura Cummings of HDR references the 2005 fare memo. It also documents HDR's methodology for developing the 2014 pricing for DSEIS marine alternatives as being "revised" based on comments provided by Reuben Yost on August 17 and 24, 2012. ^(7&8) The memo summarizes Yost's instructions on how to structure the ferry fares on a variety of alternatives. Although this HDR Ferry Fares Memo is referenced on the cover page for Appendix A of the Traffic Forecast Report (Appendix AA) of the 2014 DSEIS, it has not been included in the Traffic Forecast Report either on the DSEIS website or on paper. Upon a specific request I was told by Gary Hogins that the index page was a mistake and the Ferry Fares Memo did not exist. A few days later I received an email from him saying that the Ferry Fares Memo did in fact exist and he provided me with a copy. ^(9&10)

This memo is the only supporting documentation for the methodology used to establish the AMHS fares for ferry links proposed in the 2014 DSEIS.

RESPONSE: As you report, Appendix AA cited an "HDR Ferry Fares Memo" as an attachment. The cover page indicating that this memo was to be an attachment was in error. The memo in question was not intended to be published. Rather, it is an internal HDR record of a telephone meeting between the DOT&PF project manager and HDR staff. The intention of the memo, written by a junior HDR staff member, was to provide internal communication to other project team members on the direction provided. Thus, when the commenter called to request it, at first neither HDR nor DOT&PF were aware to what memo the commenter was referring – and hence the original response that such a memo "did not exist." When the internal HDR telephone record was identified as the memo of reference, it was transmitted – to provide full disclosure.

The memo documents the approach used to update the fares to 2012 values. The recommendation by Mr. Yost was, in brief, to keep the same (2004) methodology for the fares but to update them to reflect actual 2012 AMHS fares. As such, the fares calculated for the Draft SEIS were prepared based on the 2004 report.

The algorithm used in the report was not selectively applied to the advantage of Alternative 2B. Rather, the fares are calculated differently for long-haul ferry runs relative to the shuttle ferry runs. The Alternative 2B and 3 fares are lower due to the efficiencies generated from vessels designed and operated as day boats; the ability of the day boats to operate with drive through

loading and unloading; and the higher traffic volumes generated by frequent, regularly scheduled service and no costs for reservations. These cost efficiencies in day boat operations are transferred to the fares. Per the comment, additional information describing the development of the fares has been added to Appendix A of Revised Appendix AA, *Traffic Forecast Report*, in the Final SEIS.

In accordance with Yost's instructions, the formula developed in the 2005 report is applied ONLY to pricing of marine segments for the East Side Road and the West Side Road alternatives. ALL other alternatives are burdened with existing AMHS rates which are considerably higher when analyzed on a cost per mile formula. (The exception to this rule in the DSEIS is Alternative 1B which arbitrarily reduces fares by 20%)

The fare is an important coefficient in any meaningful analysis of the EIS. An inequitable and arbitrary fare structure reverberates through the development of all alternatives, and the resulting analyses of user benefit, demand and subsidy identification. Without knowing the formula by which AKDOT set fares on different routes, it is impossible to review and evaluate the wide variety of alternatives presented in the 2014 DSEIS. NEPA requires that agencies furnish high quality data to the public that supports its conclusion. AKDOT has failed to do this.

RESPONSE: Alternative 1B does not arbitrarily reduce fares by 20 percent. The lawsuit by plaintiffs regarding the 2006 FEIS suggested that reducing fares should be a part of the consideration for an alternative using only existing assets. It was argued that reducing fares would increase ridership and provide Alternative 1B a better chance at satisfying the purpose and need. Appendix CC, *Development of Alternative 1B – Enhanced Service with Existing Alaska Marine Highway System (AMHS) Assets*, describes the methodology and results of a fare sensitivity analysis used to determine that a 20 percent reduction in fares would be reasonable given the potential effect on ridership and revenue. The analysis and decision to reduce fares was not arbitrary.

Favorable ticket pricing applied to Alternative 2B

The DSEIS includes two approaches for fare pricing and mixes and matches between those two approaches to create a favorable outcome for Alternative 2B. Both approaches are discussed in the 2012 Ferry Fares Memo which in turn references the 2005 update to the 2004 Marine Segments Fare Structures Report.

Approach 1: Per mile algorithms for Shuttles (routes less than 20 miles runs) and for Dayboats (routes greater than 20 miles).

Approach 2: Existing AMHS pricing used as a basis for prorating a per mile cost.

In the development of the 2014 DSEIS, Approach 1 was selectively implemented to exclusively benefit the short runs included in Alternative 2B (East Lynn Canal Road) and Alternative 3 (West Lynn Canal Road.) Approach 2 was applied to all other alternatives.

In the Cummings memo, at Yost's direction, the favorable per mile pricing algorithm created in 2005 was applied only to shuttle routes under 20 miles which benefited Alternative 2B with its short runs from

Skagway to Katzehin, Haines to Katzehin, and Skagway to Haines. ALL other routes in ALL other alternatives (with the exception of the West Lynn Canal Road) are burdened with existing AMHS rates.

Routes less than 20 miles (Shuttles)	2014 DSEIS Pricing (algorithm applied)	2005 Dayboat algorithm adjusted for price increases	2014 AMHS fare structure	
Skagway/Haines 15 miles	\$22.00/vehicle 7.50 pax	\$22.00/vehicle \$7.50/pax	\$49.00/vehicle \$31.00/pax	
Skagway/Katzehin 16 miles	\$24.00/vehicle 8.00/pax	\$24.00/vehicle 8.00/pax	\$52.00/vehicle \$33.00/pa	
Routes greater than 20 miles (Dayboats)	(algorithm not applied)			
Skagway/Berners Bay 60 miles	\$72.00/vehicle \$32.00/pax	\$52.00/vehicle \$23.00/pax	\$72.00/vehicle \$32.00/pa	
Skagway/Auke Bay 93 miles	\$111.00/vehicle \$50.00/pax	\$77.00/vehicle \$35.00/pax	\$111.00/vehicle \$50.00/pax	

Assumptions: Using mileage provided in Table 1 of the HDR Ferry Fares memo referenced in Appendix A of the Traffic Forecast Report (2014 DSEIS.) Yellow highlights indicate fares prorated for distance (there is lack of consistency with regard to route distances throughout the source documents.)

The pricing table compares the modified Shuttle and Dayboat algorithms with existing AMHS fare structures. The large swing in cost to the end user is apparent from this table. Due to the fact that AMHS fares are arbitrary (see documentation) any inclusion or extrapolation using these fares is suspect. Particularly so, because they provided a reasonable methodology and then discarded half of it and applied the other half to produce a favorable outcome on their preferred alternative which uses exclusively short ferry links under 20 miles.

The following table looks only at rates relevant to marine segments in the Preferred Alternative (2B):

Routes less than 20 miles (Shuttles)	2014 DSEIS Pricing (algorithm applied)	2014 AMHS fare structure
Skagway/Haines 15 miles	\$22.00/vehicle 7.50 pax	\$49.00/vehicle \$31.00/pax
Skagway/Katzehin 16 miles	\$24.00/vehicle 8.00/pax	\$52.00/vehicle \$33.00/pax

Assumptions: Using mileage provided in Table 1 of the HDR Ferry Fares memo referenced in Appendix A of the Traffic Forecast Report (2014 DSEIS.) Yellow highlights indicate fares prorated for distance (there is lack of consistency with regard to route distances throughout the source documents.)

Recalculating ticket prices proposed in Alternative 2B to reflect current AMHS fares (which are quite high on the Skagway/Haines route) makes a dramatic illustration of how drastically the price of ticket from Skagway to Katzehin would change: The price balloons from \$24/vehicle and \$8/passenger to \$52/vehicle and \$33/passenger. For the proverbial family of four, the price goes from \$52 to \$168.

Following the same line of reasoning, applying the algorithm fairly across the board to runs longer than 20 miles, would produce a savings for the end user of roughly 30%. Conversely, applying current AMHS rate pricing structure to Skagway/Katzehin route would create a revenue increase for AMHS of 217% for vehicles and 413% for passengers.

RESPONSE: For existing AMHS routes, published AMHS fares were used. For new routes that were shortened versions of existing AMHS routes, AMHS fares prorated by distance were used. For new routes less than 20 miles in length, a fare based on a flat fee to board the ferry and a cost per mile were used. This methodology was used for Alternatives 2B and 3 because it is more suitable for the shorter shuttle ferry operations that are included in these alternatives. These fares are somewhat lower than the existing AMHS fares due to the efficiencies generated from using ferries designed as day boats with drive through loading and unloading and no reservation system expense, as well from the higher traffic volumes generated by frequent regularly scheduled service.

In comments on the 2006 Final Draft EIS, the Skagway Marine Access Commission raised serious objections about how AKDOT established fares for project alternatives and requested that the AKDOT reveal its methodology for setting the favorable ticket prices associated with Alternative 2B.⁽¹¹⁾ Our scoping comments in 2012 reiterated the same concerns.^(11&12) “The principals of sound economic analysis and transportation planning require that these discrepancies be addressed in any future planning documents produced by the AKDOT.” The agency has failed to do this. Not only is there no discussion of fare methodology in the document, the only supporting marine highway fare document referenced in the Traffic Forecast Report (Appendix AA) is missing. NEPA requires agencies to disclose the information upon which it relied to support its decision and then articulate a satisfactory explanation that rationally connects the facts found and the choices made.

RESPONSE: Per your comment, documentation of how the fares were developed has been added to the Final SEIS at Revised Appendix AA, *Traffic Forecast Report*.

The arbitrary and capricious assignment of favorable ticket prices to some alternatives and not to others skews the entire project analysis with regard to demand, user cost, revenue generation and costs to the state.

RESPONSE: As documented in the addition to Revised Appendix AA, assigned ticket fares were not arbitrary or capricious. Documentation of how the fares were derived is provided in Revised Appendix AA of the Final SEIS.

AMHS Fare Equalization Study

In 2013 AMHS announced that it would contract with a consultant for a Fare Equalization Study. Subsequently, Northern Economics was awarded the contract to perform an “AMHS Ferry Tariff Policy and Fare Structure Development.”⁽¹³⁾ The contract beginning and end dates were December 06, 2013 and April 30, 2014. The contract states that “AMHS would like to look at the next steps in implementing change with the goal of creating a ‘fair and equitable’ tariff structure while also examining tariff policy for a more efficient approach to managing tariffs into the future.... The structure is difficult to manage, difficult for the traveling public to understand and has many inconsistencies resulting from various internal and external factors.” The contract has been extended beyond those dates and despite

numerous requests to have the results of that study included in the DSEIS the department has steadfastly refused to release the information contained in the report. ⁽¹⁴⁻¹⁶⁾ Sources within the department and the Governor's office have stated, off the record, that the study would not be released until after the election which is coincidentally within a few days of the end of the comment period.

In correspondence with the FHWA over the past year, the Municipality of Skagway has requested that the agency make the fare equalization study public and incorporate its results into the 2014 DSEIS. In their response the Federal Highway Administration has taken the position: "As a system-wide proposal, it (the study) is entirely separate from the JAI project in timing and in scope." In their letter of October 3, 2014, the Municipality stated that "Ticket prices on the ferry system will be significantly impacted by the fare adjustments which will result from the AMHS fare equalization study. This analysis is an invaluable tool for evaluating end user costs associated with the various alternatives and should be integrated into the EIS."

The fact that a study of AMHS fare structure has been underway concurrently with the development of alternatives with variable (and questionable) ticket pricing methodology in the DSEIS and is planned to be released shortly after the close of the public comment period should be carefully scrutinized by the FHWA and other reviewing agencies.

RESPONSE: The AMHS Tariff Analysis was not publicly released until January 2015, after the Draft SEIS was published. DOT&PF project staff and FHWA have reviewed the study and, after consultation with AMHS, have determined that no information from the study changes any of the assumptions for determining fares used to analyze alternatives. (See previous response regarding Ticket Prices on page 4).

The National Environmental Policy Act (NEPA) requires that to reach a reasonable decision, an agency must show it considered the right information, and then articulated a satisfactory explanation that rationally connects the facts found and the choices made. An agency violates NEPA if it fails to furnish high quality data to the public that supports its conclusion, fails to adequately evaluate reasonable alternatives or fails to describe and assess the direct, indirect, and cumulative impacts of a proposed alternative. The DSEIS violates NEPA because the methodology for assigning fares is never explained.

RESPONSE: Per the comment, documentation of how the fares were developed is included in the Final SEIS at Revised Appendix AA, *Traffic Forecast Report*.

Favorable fares are selectively applied to benefit the preferred alternative thereby skewing the analyses of user benefit, demand and subsidy identification which are in turn used to justify the choice of Alternative 2B as the preferred alternative.

RESPONSE: The fare assignment was not skewed. Please refer to the documentation added to Revised Appendix AA, *Traffic Forecast Report*.

**How the Juneau Road Fails to Meet State and Federal Highway Safety
Goals: An Analysis of Safety Issues in the Juneau Access Project DSEIS**

Prepared by the Skagway Marine Access Commission

November, 2014

*Skagway Marine Access Commission
Box 1076
Skagway, Alaska 99840*

The DSEIS ignores national and state plans and mandates for highway safety

Safety on America's highways is a top priority for our country and for the State of Alaska. Over decades, Federal transportation law has created a framework of policy that embraces safety over other considerations. The most recent iteration of this federal law, Moving Ahead for Progress in the 21st Century (MAP-21), promotes an aggressive safety agenda including the National Strategy on Highway Safety *Toward Zero Deaths*. "With over 33,000 fatalities occurring on the Nation's highways each year road safety remains one of the most challenging issues facing America." [39]

The Alaska Department of Transportation and Public Facilities' (AKDOT&PF) mission statement also lists as its number one priority providing "for the safe and efficient movement of people and goods." [39] The State's Long Range Transportation Plan (LRTP) aligns statewide needs with these goals. The recent draft of the Southeast Alaska Transportation Plan (SATP) also lists "Maintain or Improve Modal Safety" as one of its goals. "Our mission is to reduce the accident and injury rates to zero," Governor Parnell said in a recent press release on highway safety. "This initiative is a step toward making Alaska's highway system safer." [40]

Sadly, the AKDOT&PF's track record would indicate that it is only paying lip service to the national mandate for highway safety. In its recently released Draft Supplemental Impact Statement (DSEIS) for the Juneau Access Improvements Project, AKDOT&PF gives only passing consideration to safety. In direct conflict with the goals of MAP 21 and State and Federal transportation plans, safety is not included as a factor in the "Statement of Purpose and Need." [1]p.1-10] The DSEIS acknowledges on page 7-16 that many comments were received during the scoping process requesting that safety and reliability be included in the Purpose and Need. Specifically the Skagway Marine Access Commission recommended in its February 20, 2012 scoping comments that "safety, reliability and predictability" be included in the Statement of Purpose and Need. [50]

RESPONSE: Safety is included in the purpose and need statement for a project only if there is a demonstrable safety problem on the transportation link being considered. An example would be a link in which the number of accidents is higher than the state average for similar transportation links. Safety is not a problem with the current system; therefore, safety is not a stated purpose and need for the proposed project. The Draft SEIS does address accident potential associated with the primarily highway project alternatives, Alternatives 2B and 3 (see Sections 4.3.7.5 and 4.4.7.5).

Approximately 66% of all fatalities in motor vehicle crashes in Alaska occur in rural areas, [41] yet the AKDOT has chosen as its preferred alternative (2B) a substandard road through a remote dangerous coastal corridor. Forty-three avalanche chutes and about one hundred geologic hazards including rock slides, landslides and rock falls have been identified along the proposed route. [1]p.3-37,38.] The document makes no mention of freeze/thaw weather phenomenon such as icing, and freezing rain which may be an even bigger concern in this coastal corridor. There are no studies of the high winds and large swells which historically have been experienced by fishermen at the ferry terminal which is the planned terminus of the road.

RESPONSE: All roads constructed under State and federal authority must follow State and federal design procedures and standards that have been adopted/established to support safe travel. Avalanche mitigation is presented in the *2014 Update to Appendix J – Snow Avalanche Report*, and the geological hazard mitigation is presented in the *2014 Update to Appendix D – Technical Alignment Report*.

Two studies (Lynn Canal Wind and Wave Climatology – Multi-Year Extremes and Lynn Canal Wind and Wave Climatology Study for Vessel Operations) were prepared to study winds and waves in the project area. These studies are available at www.juneauaccess.alaska.gov.

Current data for the north and south wind directions suggest relatively low wave height (less than 2 feet) near the Katzehin Ferry Terminal site regardless of the magnitude of the wind event. The Katzehin Ferry Terminal would be somewhat exposed to the westerly direction. There are no current data presented for the westerly direction; however, the fetch distance is short, and wave heights should be relatively low.

By the Department’s own admission the DSEIS grossly under estimates highway crashes on this road by a factor of three. The DSEIS projects 5 deaths due to traffic accidents will occur on the preferred alternative East Lynn Canal road over 30 years. However, if you redo their calculation of this number,^{[1]p.4-63} you will come up with 14-15 deaths in 30 years.^[42] The AKDOT&PF rejects the option of continuing service in the Lynn Canal corridor by the Alaska Marine Highway System which has a perfect safety record. In the past 40 years of service, there have been no safety-related fatalities to travelers aboard the Alaska Marine Highway.^{[1]p.4-63}

RESPONSE: DOT&PF and FHWA reviewed the calculation and found an error. The error in the Draft SEIS is corrected in the Final SEIS. See Sections 4.3.7.5 and 4.4.7.5.

Federal oversight is required by law

Clearly, the AKDOT&PF’s bias toward their preferred alternative moves the state away from the objectives outlined in Map 21. By choosing the most dangerous alternative over the safest, the state fails to meet the performance goals set forth in MAP-21. In fact the state’s proposal marks a significant regression from the exceptional safety record of the Alaska Marine Highway System ferries that currently ply the Inside Passage Waters.

The U.S. Secretary of Transportation has an independent duty to ensure the Juneau Access Project and its EIS comply with federal law. The Secretary must furnish guidance in the preparation of the EIS and must “independently evaluate” the EIS.^[43] Also, federal courts have determined that the U.S. Department of Transportation has an independent duty to ensure compliance federal metropolitan transportation planning goals and guidance,^[44] and must ascertain that the state highway departments have adhered to federal law and regulations.^[45]

The burden rests with the Federal Highway Administration (FHWA) to ensure that state transportation agencies have adhered to federal law and regulations. For the FHWA to ignore or deliberately overlook the omissions in the state’s EIS with regard to safety would constitute a classic case of regulatory capture. **Regulatory capture** is a form of political corruption that occurs when a regulatory agency, created to act in the public interest, instead advances the commercial or special concerns of interest

groups that dominate the industry or sector it is charged with regulating. Regulatory capture is a form of government failure. It creates an opening for firms to behave in ways injurious to the public (e.g., producing negative externalities). The agencies are called "captured agencies". In this case FHWA is charged with oversight of the AKDOT&PF for a project which will consume the nearly a half billion dollars of federal funds. To ignore or overlook the safety concerns with the Juneau Access Improvements Project would make the FHWA complicit in a project which safety statistics indicate would be injurious to the public.

Other provisions of federal Law require the U.S. Secretary of Transportation to ascertain the safety of the project before approving it and that the EIS must be sufficiently detailed for the Secretary to ensure that the project is safe.^[44] In addition, the Secretary of Transportation shall consider the needs for effectiveness and safety in transportation systems,^[46] which includes recognizing and preserving "the inherent advantage of each mode of transportation" and promoting "safe, adequate, economical, and efficient transportation."^[47]

RESPONSE: The commenter's characterization of the application of MAP-21 to the NEPA decision-making for this project is inaccurate. MAP-21 and its successor, the Fixing America's Surface Transportation Act, do not require that every project fully implement every broad policy goal in the legislation. The citation that FHWA has a "duty to ensure compliance federal metropolitan transportation planning goals and guidance" is not applicable to this project. In short, the project is not within the boundaries of a Metropolitan Planning Organization (MPO). The only MPOs in Alaska are in Anchorage and Fairbanks. That said, any alternative selected would meet engineering design standards and practices and be safe and reliable, and would therefore meet the safety policy goals of MAP-21.

The suggestions that FHWA has ignored or deliberately overlooked safety or engaged in "regulatory capture" are patently false and exhibit a misunderstanding of the relationship between FHWA and DOT&PF in the NEPA process. FHWA takes its oversight role to ensure that the project's process and documentation comply with federal law seriously. In fact, although the SEIS is prepared by the DOT&PF, it is the FHWA's document. It is not a case of FHWA "regulating" DOT&PF. FHWA reviews analyses prepared for the SEIS and does not sign off on the SEIS until it satisfies applicable laws and regulations. For this reason, the SEIS development and NEPA process are overseen by FHWA environmental specialists, and the document, the process to develop it, and the technical analyses undergo legal review prior to publication. For this project's SEIS publication, that review has been particularly rigorous, given the legal history of the project.

As previously mentioned, because there is not a documented safety problem in Lynn Canal, safety is not an element of the purpose and need. The safety record of AMHS and anticipated safety of the primarily roadway alternatives are disclosed in the SEIS in Sections 4.3.7.5 and 4.4.7.5. While it is true that highway travel tends to have more accidents, there is no reason to believe that accident frequency under Alternative 2B or 3 would be statistically different than on similar highways in Alaska.

Sound engineering principals and intelligent transportation systems technology not applied

The Juneau Access project must be in compliance with MAP 21 and the State's Long Range Transportation Plan (LRTP) and the Southeast Alaska Transportation Plan (SATP). The U.S. Secretary of

Transportation cannot approve it otherwise. Ironically, the SATP under its goal of maintaining and improving modal safety makes the claim that it will accomplish this goal through the application of “sound engineering principles, including intelligent transportation systems technology...”^[49] In direct opposition to that strategy, the AKDOT&PF has proposed a road that neglects to include important safety features that would improve Alternative 2B. Some of these include road lane width, road shoulder width and provisions for pedestrians, hikers and bicyclists.

RESPONSE: The Juneau Access Project is in compliance with MAP-21 and the State’s Long Range Transportation Plan. The highway segments of any build alternative selected would be constructed according to the typical section identified in Section 2.3.3 of the Draft SEIS and illustrated in Figure 2.7b. This typical section has 11-foot-wide travel lanes, 4-foot-wide paved shoulders, and a minimum of 8 feet of traversable side slope (4:1 or flatter) on either side, except in guardrail areas. The lane width would conform to the appropriate American Association of State Highway and Transportation Officials (AASHTO) standard.

For Alternatives 2B and 3, the shoulder width would be an exception to the AASHTO-recommended standard of 6 feet. A 4-foot shoulder was determined to be best suited for the rugged terrain that the highway would cross. Cost was a consideration, as well as the amount of use the shoulder would likely receive. The typical section also shows that widened shoulders would be created with excess material in upland areas. These widened areas, turnouts, and no parking signs in particular areas would minimize parking on the paved shoulders. The typical section for highway alternatives would match the width to be constructed on Glacier Highway from Amalga Road to Echo Cove. A 4-foot-wide paved shoulder would be adequate to accommodate bicyclists and pedestrians.

The Seward Highway provides a dramatic comparison to an existing road with a similar geography and safety hazards. Many lives have been lost on the Seward Highway. Since 2006, planners and residents at numerous public meetings have been calling for a divided highway as the best and most effective engineering enhancement on the Seward Highway. Yet, the DSEIS fails to analyze the cost/benefits of making the road to Katzehin a divided highway. As demonstrated in the following analysis, safety upgrades to the Seward Highway will be necessary in the future with a projected price tag of approximately half a billion dollars. The cost of safety upgrades to the Juneau Access road is not disclosed in the DSEIS. The federal mandates for safety and good fiscal planning would dictate that safety features should be incorporated in the Juneau Access Road sooner than later.

RESPONSE: Highway design takes into account a number of factors, not least of which is the amount of traffic the facility needs to accommodate. The traffic on the Seward Highway outside of Anchorage is more than 10 times greater (7,000 to 10,000 ADT) than the traffic forecast for the JAI Project alternatives (835 ADT reported in the Draft SEIS). Based on the traffic forecast for the JAI Project, a two-lane highway is sufficient to safely accommodate the traffic. Consequently, a cost benefit analysis for a divided highway has not been done for the Final SEIS.

Moreover, all roads constructed under State and federal authority must follow State and federal design procedures and standards that have been adopted/established to support safe travel. The highway design includes safety measures such as widened embankments, guardrail, recessed pavement markers, paint, and signage. The roadway design geometrics that would be used on the

project are appropriate for a rural arterial highway with an ADT of less than 2,000. Extensive future safety upgrades for alternative highway links are not anticipated.

2nd slide from DOT&PF presentation at the 2009 Girdwood Traffic Safety Corridor meeting ^[35]

Failure to include key safety features in the Alternative 2B road

The DSEIS fails to include important features that would improve the safety of Alternative 2B (Alt2B), such as increased road lane width and road shoulder width, and best design provisions for pedestrians, hikers and bicyclists.

Road lane width

AASHTO standards for rural arterial roads include a lane width of 12 feet for any speed and ADT of over 2000. ^{[32]p.1} The estimated summer ADT for the Alt2B road is 1,345. ^{[1]Apdx.AA-p.26} The nature of the traffic will not be distributed evenly, but will tend to bunch up in pulses associated with the ferry schedules. In addition, enforcement presence will be low and inconsistent (Table A), which will encourage aggressive driving such as dangerous passing and speeding. No slow-vehicle turnouts or passing lanes are included in the new construction for Alt2B. (Table A) Combining the higher summer ADT and the potential for aggressive driving, the level of travel danger on the Alt2B road could easily approach that of a rural arterial road with 2000 ADT.

During winter, the estimated ADT for the Alt2B road is 460, ^{[1]Apdx.AA-p.26} well below the AASHTO standard for 12 foot lanes. However, the potential for snow, slush, and icy road conditions, again combined with low enforcement presence, increases the likelihood of drivers losing control of their vehicle. The long response times for emergency services (Table A) will increase the chance that serious injuries could

result. The 2 feet added travel width of 12 foot lanes over 11 foot lanes would give drivers a better chance of regaining control before having an accident.

RESPONSE: The highway segments of any build alternative selected would be constructed according to the typical section identified in Section 2.3.2 of the Draft SEIS and illustrated in Figure 2.7b. This typical section has 11-foot-wide travel lanes, 4-foot-wide paved shoulders, and a minimum of 8 feet of traversable side slope (4:1 or flatter) on either side, except in guardrail areas. The lane width conforms to the appropriate AASHTO standard.

As stated in Section 4.3 of the Draft SEIS, there are 11 pullouts along the Alternative 2B corridor. DOT&PF anticipates that approximately 25 percent of the road for Alternative 2B would be striped to allow for safe passing. These passing zones, as well as pullouts, would be available to slower moving traffic to allow following vehicles to pass.

Adverse weather conditions make driving challenging on any road. The project's road alternatives would be no different during adverse weather conditions than any other road in Southeast Alaska. Alternative 2B would include a new maintenance station that would be staffed full time, which would improve maintenance response times to address adverse weather conditions. Alternative 3 would include a maintenance staging site. Details are discussed in Attachment C to the 2014 and 2017 Updates to *Appendix D - Technical Alignment Report*.

Road shoulder width

The DSEIS presents AASHTO standards for rural arterial roads as:

“Shoulder Widths: AASHTO Standards indicate that a 4-foot-wide usable shoulder should be considered for rural arterials with average daily traffic (ADT) less than 400 that have travel lanes 11 feet wide and Design Speeds from 40 to 55 mph. For ADTs between 400 and 1,500 a 6-foot-wide usable shoulder should be considered.” ^[1]Apdx.D-p.5]

The DSEIS proceeds to justify using 4 foot paved shoulders “to minimize construction impacts while still providing for bicyclists and pedestrians.” ^[1]Apdx.D-p.5] There is no discussion in the DSEIS of the AASHTO guidance based on 400 to 1,500 ADT as described above. All projected ADTs for Alt2B are above 400, and the summer ADT of 1,345 approaches the upper limit of adequacy for a 6 foot shoulder.

Both in summer and in winter, crashes are likely whenever a driver leaves his/her lane of travel. Having 6 foot shoulders gives drivers more opportunity to recover before impacting a fixed object (such as a guardrail or retaining wall), rolling over in a ditch, etc.

Road shoulders also provide important areas for disabled vehicles and enforcement stops. A 4 foot shoulder prevents vehicles from pulling well out of the travel lane, increasing the chance of additional accidents.

RESPONSE: The shoulder width for Alternatives 2B and 3 would be an exception to the AASHTO recommended standard of 6 feet. For all other alternatives, the proposed 4-foot-wide shoulders meet AASHTO standards for the projected ADT. A 4-foot-wide shoulder was

determined to be best suited for the rugged terrain that the highway would cross. Cost was a consideration as well as the amount of use the shoulder would likely receive. The typical section also shows that widened shoulders would be created with excess material in upland areas, which would provide sufficient room for emergency parking and allow vehicles that errantly stray from the travel lane to safely recover. These widened areas, turnouts, and no parking signs in particular areas would minimize parking on the paved shoulders. The typical section for highway alternatives would match the width to be constructed on Glacier Highway from Amalga Road to Echo Cove. A 4-foot-wide paved shoulder would be adequate to accommodate bicyclists and pedestrians.

Bicyclists and Hikers

The potential for bicycle use of the Alt 2B road is high. Summer recreational cycling and touring is well established on the Klondike Highway, Haines Highway and Alaska Highway. Scenic values of Berner's Bay and Lynn Canal will entice cyclists to make day trips from one of the 11 pullouts, or touring trips along the length of the road. Commercial bicycling tours may develop.

AKDOT&PF encourages bicyclists:

“We are excited to be able to promote bicycle tourism in the state of Alaska,” said Bob Laurie, a transportation planner and the bicycle and pedestrian coordinator for the Alaska Department of Transportation and Public Facilities. “We have fabulous vistas and low-traffic highways that beg exploration. Connecting to Washington State via the ferry system and collaborating with Canada is next on our list.”^[33]

The 4 foot paved shoulder designed for Alt2B provides only minimal room for bicycle travel along the road. Any vehicles pulled over into the shoulder will block bicyclists, forcing them far into travel lanes. Conversely, bicyclists occupying the shoulder will increase the likelihood of vehicle-bicycle collisions. Wider lanes and shoulders would decrease the potential for accidents involving bicycles.

Hikers will be attracted to trail heads and scenic overlooks, they are less likely to trek along the road shoulders for long distances. However, the narrow lane and shoulders near the trail head pullouts and scenic overlooks could lead to wandering pedestrians in the shoulder areas nearby. Once again, wider lanes and shoulders give everybody a better chance to avoid collisions.

RESPONSE: As stated above, the shoulder width for Alternatives 2B and 3 is an exception to the AASHTO recommended standard of 6 feet. For all other alternatives, the proposed 4-foot-wide shoulders meet AASHTO standards for the projected ADT. A 4-foot-wide shoulder was determined to be best suited for the rugged terrain that the highway would cross. Cost was a consideration, as well as the amount of use the shoulder would likely receive. The typical section also shows that widened shoulders would be created with excess material in upland areas, which would provide sufficient room for emergency parking and allow vehicles that errantly stray from the travel lane to safely recover. These widened areas, turnouts, and no parking signs in particular areas would minimize parking on the paved shoulders. The typical section for highway alternatives would match the width to be constructed on Glacier Highway from Amalga Road to Echo Cove. Moreover, Glacier Highway north of Tee Harbor has comparable shoulders, substantial bike use, and higher ADTs than anticipated for Alternative 2B. Given that there are no

documented accidents over the 5 year period between 2011 and 2015 involving bicyclist and pedestrians on this stretch of Glacier Highway supports DOT&PF’s assessment that a 4-foot-wide paved shoulder would be adequate to safely accommodate bicyclists and pedestrians on Alternative 2B and 3.

Flawed and incomplete analysis of accidents and other hazards

The DSEIS’s estimate of fatal accidents runs counter to the evidence, the DSEIS fails to consider other major accidents, and the DSEIS ignores obvious hazards. These deficiencies render the DSEIS’s conclusion regarding accidents and hazards arbitrary.

Alternative 2B Traffic Crashes

The state of Alaska monitors 5 types of traffic crashes: total, fatal, major injury, minor injury, and property damage only. Crashes are defined as vehicle accidents, except those due to natural causes, weapons, or pre-existing medical conditions, or under \$2000 of damages. ^{[31]p.10}

The DSEIS presents two crash type estimates for the Alt2B road, total crashes (annual and project lifetime of 30 years) and fatal crashes (project lifetime). ^{[1]p.4-63} Estimates for major injury, minor injury and property damage only crashes are not given.

As a first step toward estimating the missing crash information, the crash numbers presented in the DSEIS were recalculated with the information provided in the DSEIS. The annual total crash number was verified, but the project lifetime numbers for total crashes and fatal crashes were different. (See Table C in the Appendix)

The missing crash estimates were generated using the DSEIS given number for total crashes, the different, recalculated number for fatal crashes, and statewide averages for 2001-2011.

Table B. Alt2B Road Crashes Estimates

crash type	number of crashes		
	Alt2B annual crash estimates, printed / recalculated *	missing Alt2B annual crash estimates, using total annual crashes = 22 and statewide crashes breakdown 2001-	project lifetime crashes (annual x 30 years), printed /
TOTAL	22		600 / 660
fatal	not given / 0.475		5 / 14.25
major injury		.71	16
minor injury		5.8	174
property damage only		15.4	462

* Table C. DSEIS Crash Data Recalculation (in the attached Appendix)

** Table D. Alt2B road missing crashes (in the attached Appendix)

When evaluating safety programs, AKDOT&PF often uses numbers for “serious” crashes: fatal + major injury crashes combined. ^[2]p.2] For the Alt2B road, over the project lifetime of 30 years, the serious crash estimate is 30 (14+16). This means that the expectation for Alt2B is to experience about 1 fatal or major injury crash per year.

Traffic crashes for alternative 2B road compared to AMHS

The projected fatalities and other crashes for the Alt2B road are small compared to high traffic volume roads, but unlike Seward Highway, there is an alternate road: the Alaska Marine Highway System.

	<u>Alt2B road *</u>	<u>AMHS ferries **</u>
TOTAL crashes:	660	near 0
fatal crashes:	14	0
major injury crashes:	16	0
minor injury crashes:	174	0
property damage only crashes:	462	near 0

* Table B

** ^[1]p.4-63]

The rare low-speed bumps at terminal staging areas and when loading ferry car decks are unlikely to even qualify for the property-damage-only crash category which excludes accidents of less than \$2000 damage. Crashes would not occur while vehicles are safe on board a ferry in transit.

RESPONSE: Information on traffic related accidents and fatalities has been updated in Section 4.3.7.5 and 4.4.7.5 of the Final SEIS. Based on Statewide crash rate information and 2025 traffic projections, it is anticipated that there would be approximately 39 crashes per year on the East Lynn Canal Highway. In the 30-year operation period (2025 through 2055), it is estimated there would be approximately 1,156 crashes. It is anticipated that there would be approximately 30 crashes per year on the West Lynn Canal Highway and, in the 30-year operation period (2025 through 2055), it is estimated there will be approximately 886 crashes.

Other Hazards - Long Bridges

Alt2B's three long bridges over Berner's Bay and Katzehin river deltas would be 2nd, 3rd, and 4th longest bridges in the state. ^{[51][1]Apdx.D-p.25]} The DSEIS does not address the potential hazard posed by ice forming on extremely long bridges. Icing on bridge deck surfaces and other poor winter driving conditions will be worst during times of least traffic volume. Poor road conditions will often occur at the same time that high velocity winds roar down the river valleys. Emergency response times will be high, especially at Katzehin. These factors combine to make winter driving conditions on the Alt2B bridges more dangerous than the norm.

RESPONSE: The use of automated de-icing systems on bridges would be considered based upon the technical and economic feasibility. However, fixed de-icing systems are not common in Alaska and there is no crash data in Alaska that suggests icing on bridges causes a higher crash rate than other portions of the roadway. Through an experimental project, de-icing systems were

installed on two of the Knik River bridges in Southcentral Alaska. These systems were expensive to install and even more so to maintain.

The project roadway and bridges would be treated similar to other roads throughout Alaska. This treatment includes applying salt for de-icing and sand for traction. Adverse weather conditions makes driving any road challenging. The project road alternatives would be no different during adverse weather conditions than any other road in Southeast Alaska. Alternative 2B includes a new maintenance station facility that would be staffed full time, which would improve maintenance response times during adverse weather conditions. Further details are discussed in Attachment C to the *2017 Update to Appendix D - Technical Alignment Report*.

The need for and cost of necessary safety upgrades is not included in the DSEIS

The Alternative 2B route shares similar geography and safety hazards with the Seward Highway, and AKDOT&PF should use its experience with the Seward Highway to inform its expectations and predictions for an East Lynn Canal road. As demonstrated by AKDOT&PF's experience with the Seward Highway safety upgrades will eventually be necessary. The cost of safety upgrades is not disclosed in DSEIS.

RESPONSE: Safety comparisons to the Seward Highway outside of Anchorage are not applicable. While the Seward Highway traverses the coast and has several avalanche zones, the comparison ends there. The Seward Highway has considerably higher traffic volumes (7,000-10,000 ADT) as compared to Alternative 2B (835 ADT reported in the Draft SEIS). This high level of traffic, coupled with limited passing opportunities, contributes to heavy congestion and causes travelers to make unsafe maneuvers. With 10 times or less traffic, the JAI Project is not anticipated to experience similar driving behavior. The forecast does not anticipate reaching anywhere near the traffic levels experienced on the Seward Highway; therefore, it is incorrect to predict that upgrades would be necessary within the forecast period. Alternative 2B would be designed to meet appropriate safety standards.

The Seward Highway from Mile Post 37 to 117 is similar in length, terrain, waterways, climate, and avalanche hazards to the proposed East Lynn Canal, Juneau Access road described under Alternative 2B. However, there are important differences in traffic volume and safety features. This section compares the two roads, reviews crash estimates, and discusses safety improvement issues, costs, and funding.

The proposed East Lynn Canal road under Alternative 2B (Alt2B) includes existing Glacier Highway from Auke Bay to Echo Cove (27 miles), widening the existing road from Echo Cove to Cascade Point (3 miles),

new construction from Echo Cove around Berner's Bay (~18 miles), and new construction along the east shore of Lynn Canal to a ferry terminal north of Katzehin River (~30 miles). [1]Fig.2-7a)

A similar length of Seward Highway (Hwy 1) runs along Turnagain Arm from MP117 to MP75 (42 miles), then inland through river valleys and saddle passes to the intersection with Highway 9 (37 miles).

The thirty mile stretch of Seward Highway from MP117 to MP87 was designated a Traffic Safety Corridor in 2006,^[2] leading to enhanced safety measures and much available information. Therefore, most comparisons will use the Seward Highway Traffic Safety Corridor (SwdTSC), but other Seward Highway areas will be included when information is available.

The following table compares the Alternative 2B route to Seward Highway in detail. It demonstrates the similarities in the environment (terrain, waters, and climate), physical hazards (such as avalanche chutes), and design features (bridges, pullouts) for both routes, and contrasts the differences in the amount of traffic, road characteristics (such as lane and shoulder width), and safety features (such as reflectors, rumble strips, and emergency services). This comparison shows that the Seward Highway has more safety features than Alternative 2B despite similar geography and hazards.

TABLE A. ALT2B Road Compared To Seward Highway MP37 to MP117

		Alt2B - Katzehin to Auke Bay	Seward Highway MP37 to MP117
terrain	fjord shoreline terrain	~30 miles of roadway sandwiched in narrow band between adjacent downslope saltwater fjord, and adjacent upslope steep mountainsides ^[1]	~35 miles of roadway next to railroad (downslope) sandwiched in narrow band between adjacent downslope saltwater fjord, and adjacent upslope steep mountainsides ^[3]p.3+15-17]
	bay/river delta terrain	~20 miles along Berner's Bay shores and through river deltas, also river delta at Katzehin ^[1]	~8 miles of roadway next to railroad (upslope) along terminus of fjord and through river deltas ^[3]p.3+18]
	other terrain	~ 27 miles of existing Glacier Hwy from Auke Bay to Echo Cove ^[1]	~37 miles through valleys and saddle passes to intersection with Highway 9 ^[4]

waters	waterway currents	tidal range of 13-16 feet, ^[5] weak tidal currents in fjord (1-2 knots) ^[6]	mean tidal range of 31 feet, ^[7] very strong tidal currents (22 knots), 6-10 foot tidal bore wave can develop ^[8]p.12]
	water depth and freezing	deep fjord, does not freeze in winter, blowing spray freezes on hard exposed surfaces ^[9]	shallow fjord, with areas of deep mudflats ^[3]p.8] water surface freezes in winter but is broken up daily by tides ^[10]

climate	temperatures	coastal – temperatures moderated by ocean water, frequent winter freeze-thaw cycles near sea level ^{[11][12][13]}	coastal – temperatures moderated by ocean water, frequent winter freeze-thaw cycles near sea level ^[3]p.9]
	winds	funneled winds can reach high velocities (60-80mph or more) ^[9]	funneled winds can reach high velocities (60-80mph or more) ^[14]
	avg. precipitation (inches/year)	at Haines = 48 ^[11] at Eldred Rock = 46 ^[13] at Auke Bay = 62 ^[12]	at Anchorage = 15 at Girdwood = 41 at Portage = 78 (all above) ^[3]p.9]

	road section	new construction: two 11-foot lanes, with 4 foot paved shoulders, or 4 feet to guardrail or retaining wall [1]Apdx.D-p.9-19 Echo Cove to Cascade Point: 26 feet to be widened to 30 feet [1]p.4-33 Glacier Highway: two 12 foot lanes with 2-5 foot shoulders, or two 11 foot lanes with 6 foot shoulders [16][17][18]	MP105-107: two 12-foot lanes, 8 foot paved shoulders, centerline and shoulder rumble strips [19]
	bridges	~19 smaller bridges over creeks, etc. typical length = 140 ft. 3 larger bridges over river deltas, ~ 2590-2880 feet [1]Apdx.D-p.25	~10 smaller bridges over creeks, etc. typical length = 80 ft. 5 larger bridges over river deltas, ~160-490 feet [20][21]

TABLE A – continued. ALT2B Road Compared To Seward Highway MP37 to MP117

		Alt2B - Katzeihin to Auke Bay	Seward Highway MP37 to MP117
engineered safety	road width	new construction: does not meet AASHTO standards for <i>rural arterial</i> shoulder width. ^{[1]Apdx. D-p.5} Echo Cove to Cascade Point to be widened from 26 feet to 30 feet ^[1]p.4- 33] Glacier Hwy recently upgraded (see above “road section description”)	SwdTSC: MP105-107 meets AASHTO standards for <i>rural principal arterial</i> . ^[19]p.3]
	scenic/trail head pullouts	new construction: 11 pullouts, most with trail heads or scenic overlooks ^[1]p.4- 33,34]	SwdTSC: at least 14 ^[22] MP 37-87: at least 12 ^[22]
	high intensity reflectors	new construction: none	SwdTSC: high intensity reflectors installed on guardrails ^[23]
	rumble strips	new construction: none	SwdTSC: center and shoulder rumble strips ^[24]
	passing lanes	new construction: none	SwdTSC: 3 ^{[22][25]} plus 2 planned ^{[26][27]} MP37 to 87: at least 6 ^[22] plus 1 planned ^[28]
	slow vehicle turnouts	new construction: none	SwdTSC: at least 2 ^[22] plus 5 planned ^{[29][30]} MP37 to 87: at least 12 ^[22]
	separate pedestrian/bike trail	new construction: none	SwdTSC: 3 miles Bird to Girdwood ^[22]
	divided highway	new construction: none Glacier Hwy: none	SwdTSC: 2 miles planned MP105-107 ^[19] MP67: 1.5 miles divided highway ^[22]
	emergency call boxes/phones	new construction: none Glacier Hwy: none	SwdTSC: additional call boxes planned ^{[20][29]} MP47: 1 ^[22]
	structurally deficient bridges	n/a	SwdTSC: 2 replacements planned ^{[20][21]} MP77-83: 6 replacements planned ^{[20][21]}

TABLE A – continued. ALT2B Road Compared To Seward Highway MP37 to MP117

		Alt2B - Katzehin to Auke Bay	Seward Highway MP37 to MP117
other safety	avalanche program	full, active program	full, active program
	enforcement safety dedicated trooper presence	0 (zero) - state troopers will be responsible north of Eldred Rock; Juneau CBJ south, ^[1]p.4-48] regular patrols of highway segments between Echo Cove and Haines not anticipated by State Troopers, Juneau PD, Haines PD ^[1]Apdx.EE-p.207]	SwdTSC: 4 (before TSC) 7 (beginning 2010) ^[2]p.8] plus special programs coordinated between Bureau of Highway Patrol and communities of Anchorage and Girdwood ^[2]p.18]
	emergency services	outside current service districts for both Haines and Juneau ^[1]Apdx.EE-p.207] up to 50 miles away at Auke Bay, Juneau, or from Haines via boat then up to 20 miles away – response times likely to be long. ^[1]p.4-48]	SwdTSC: from Anchorage (adjacent) or Girdwood (adjacent), response times quick.

RESPONSE: As already mentioned, a safety comparison with the Seward Highway is not valid, given the tremendous difference in anticipated traffic (835 ADT reported in the Draft SEIS for the Juneau road alternatives versus 7,000-10,000 on the Seward Highway).

Project characteristics do not meet warrants for the installation of rumble strips.

Improvements to the Seward Highway to enhance safety

Due to the similarities between the roads, Seward Highway may be used as a case study to discuss costs and results of safety enhancements. The Seward Highway from MP 87 (near Girdwood) to MP 117 was designated Traffic Safety Corridor (TSC) in 2006. ^[2] Traffic Safety Corridors target improved safety through Engineering, Enforcement, Education (the “three Es”) and Emergency Response (the “4th E”). Implementation Plans are developed for the three Es, while emergency responders are encouraged increase daily alert readiness. ^[34]p.6]

Engineering improvements focus on bringing degraded infrastructure up to standards, then improving roadway features to increase safety. Enforcement includes actions such as hiring new troopers, increased patrols, double fines, and coordinating with local community police departments. Education includes measures such as media campaigns, roadside message boards and “this is your speed” signs, and encouraging citizen participation through REDDI (Report Every Dangerous Driver Immediately). ^{[2][34]}

Traffic Safety Corridors assess progress through monitoring fatal crashes and major injury crashes, ^[2]p.2+8] but the AK Department of Public Safety also monitors total crashes. ^[29] The list below shows crash rates

for SwdTSC pre- and post-designation, using AKDOT&PF rates for fatal and major injury crashes, with other rates estimated from statewide averages for 2001-2011. (see Appendix, Table E)

	<u>crash rates per 1 million miles</u>	
	SwdTSC after designation <u>(1996-2006)</u>	SwdTSC after designation <u>(2006-2013)</u>
estimated TOTAL crash rate:	2.490	1.648
actual fatal crash rate:	0.021	0.025
actual major injury crash rate:	0.073	0.038
estimated minor injury crash rate:	0.655	0.434
estimated property damage only crash rate:	1.741	1.152

The Seward Highway TSC has been remarkably successful. All crash rates, except fatal, have been reduced since TSC designation. Major injury rates have decreased by half. Estimated minor injury crash rates are down by a third. At a February 2013 public meeting, a Department of Public Safety official stated that the past five years have been the highway's lowest for total crashes.^[29]

The fatal crash rate, however, remains stubbornly unchanged. This is despite the considerable resources applied to the Seward Highway TSC over the years. Enforcement presence within the TSC was increased to 7 Troopers in 2010.^{[2]p.8} Special enforcement and educational programs targeted dangerous driver behavior based on annual audits and data analysis.^{[34]p.8} Engineering improvements worth \$35 million have been accomplished, with \$410 million additional engineering improvements scheduled through 2018, pending available funds. When these projects are accomplished, sections of the TSC may be decommissioned.^{[2]p.13} Whether these improvements will reduce the fatal crash rate is unknown.

Safety improvements costs and funding for the Alt2B road

The Alt2B road will not have the enhanced safety engineering features that brought about the lower SwdTSC crash rates. Rather, the Alt2B road as planned is below normal AASHTO standards^{[1]Apdx.D-p.5} Experience tells us that Seward Highway has needed several safety upgrades, and Juneau Access, as currently planned, will probably also need safety improvements.

RESPONSE: Per 23 CFR 625.3, highways on the National Highway System (NHS) are required to meet AASHTO standards. The highway design for the alternatives meets AASHTO standards for rural arterials for the traffic volumes projected for the proposed project, with the exception of shoulder width for Alternatives 2B and 3. For all other alternatives, the proposed 4-foot shoulder meets AASHTO standards for the projected ADT. An adequate recoverable slope is also included in the road design to allow vehicles that errantly stray from the travel lane to safely recover.

As already mentioned, a safety comparison with the Seward Highway is not valid, given the tremendous difference in anticipated traffic (835 ADT reported in the Draft SEIS for the Juneau Access road alternatives versus 7,000-10,000 on the Seward Highway). Based on the anticipated

traffic forecast, and design features planned (e.g. avalanche and geological hazard mitigation), DOT&PF does not anticipate Alternative 2B would need substantial additional safety improvements during the 2025 to 2055 timeframe. Adequate safety features and mitigation have already been incorporated into the preliminary design of Alternative 2B.

Additionally, if the accident rate for fatalities and incapacitating injuries on the Alt2B road exceeds the statewide average, the State of Alaska must identify it as a High Risk Rural Road and obligate funds to improve safety on the road. ^[49] As improvements at Seward Highway show, these upgrades are very costly. These costs should be disclosed in the DSEIS.

RESPONSE: The road cannot be defined as a High Risk Rural Road (HRRR) per the FHWA definition. FHWA defines HRRR as "any roadway functionally classified as a rural major or minor collector or rural local road:

A) on which the accident rate for fatalities and incapacitating injuries exceeds the statewide average for those functional classifications or roadway; or

B) that will likely have increases in traffic volumes that are likely to create an accident rate for fatalities and incapacitating injuries that exceeds the statewide average for those functional classifications of roadway."

The road is not classified as a collector or local road; therefore, the HRRR program does not apply.

The accident rate on Alternative 2B is anticipated to be comparable to other similar rural highways. Based on the anticipated traffic forecast, and design features planned (e.g. avalanche and geological mitigation), DOT&PF does not anticipate Alternative 2B would need to be designated as a safety corridor. Adequate safety features and mitigation have been incorporated into the preliminary design of Alternative 2B.

In fact, the Seward Highway was planned to be much safer in the past, but these safety features were very expensive and were taken out of the design. As early as 2009, AKDOT&PF acknowledged that a divided highway would be the safest design for the Seward Highway, but the estimated \$600 million price tag seemed out of reach. ^{[35][36]} In 2012, STIP Budgeting estimated the cost of upgrading the entire Seward Highway TSC to a divided highway would be \$750 million. ^[2]p.12] The \$410 million partially funded Seward Highway TSC improvement projects will include additional passing lanes and slow vehicle turnouts, but only 2 miles of divided highway. ^{[19][2]p.13]}

The Juneau Access Improvement DSEIS must propose a road that the Secretary of Transportation has deemed to be safe, and the costs of making this road safe must be included in the DSEIS. The Secretary cannot approve a substandard road.

RESPONSE: All roads constructed under State and federal authority must follow State and federal design procedures and standards established to support safe travel. The costs associated with construction, maintenance, and operation of the alternative road components are disclosed in the Draft and Final SEIS.

TABLE C. SDEIS CRASH DATA Recalculation

TOTAL CRASHES	units	Source
Alt2B road AADT = 835	vehicles/day	average annual daily traffic, from DSEIS ^[1]Apdx.AA-p.26]
total crash rate = 0.925	crashes per 1 million vehicle- miles	DSEIS ^[1]p. 4-63] , taken from 2009 Alaska Traffic Crashes ^[31]p. 62] , average of 2008 + 2009 crash rate for AK undivided rural & urban interstates. Rate does not include crashes from natural causes, weapons, or pre-existing medical conditions, or under \$2000 of damages. ^[31]p.10]
DSEIS number = 22	total crashes per year	from DSEIS ^[1]p.4-63]
Recalculated total crashes = 22	total crashes per year	redoing calculation with DSEIS figures VERIFIES result: 22 total crashes per year (see Calculation C-1 below)
SDEIS project lifetime total crashes = 600	total crashes per project lifetime (30 years)	from DSEIS ^[1]p.4-63]
recalculated project lifetime total crashes = 660	total crashes per project lifetime (30 years)	redoing calculation with DSEIS figures DOES NOT verify result: 22 x 30 = 660

FATAL CRASHES		
fatal crash rate = 2	fatal crashes per 100 million vehicle miles	DSEIS ^[1]p.4-63] , based on AK statewide rate of 2 per 100 million vehicle miles
project lifetime fatalities = 5	fatal crashes per project lifetime (30 years)	from DSEIS ^[1]p.4-63]
recalculated project lifetime fatalities = 14.25	fatal crashes per project lifetime (30 years)	redoing calculation with DSEIS figures DOES NOT verify result (see Calculation C-2 below)

Calculation C-1 total crashes

	units	Source
835	average vehicles per day	DSEIS ^[1]Apdx.AA-p.26] (annual average daily traffic)
x 365	days per year	
= 304,775	vehicles per year	
x 78	miles	Alt2B road - Auke Bay to Katzehin
= 23,772,450	vehicle-miles per year	
x 0.925 ÷ 1,000,000	total crashes per 1 million vehicle-miles	DSEIS ^[1]p. 4-63] , average of 2008 and 2009 total crash rates for AK undivided rural & urban interstates.
= 21.99	total crashes per year	

Calculation C-2 fatal crashes

23,772,450	Alt2B road vehicle-miles per year	see calculation A-1
x 2 ÷ 100,000,000	fatalities per 100 million vehicle-miles	DSEIS ^[1]p. 4-63] statewide average fatalities on all roads
= 0.475	fatalities per year	
x 30	project lifespan of 30 years	DSEIS ^[1]p. 4-63]
= 14.25	fatalities per project lifespan	

Table D. Alt2B road missing crashes, with missing crash types estimated using total crash rate of 22 and statewide crashes breakdown, 2001-2010.

crash type	SDEIS number per year	(A) statewide breakdown proportion of total crashes for all types of roads, 2001-2010 (Calculation D-1)	(B) estimated number per year 22 x (A)	(C) project lifespan crashes (B) x 30 years	(D) crash rate per 1 million vehicle-miles 1 million x (B) ÷ 23,772,450 (Calculation C-1)
TOTAL	22	SDEIS number used		660	SDEIS rate = 0.925
fatal	0.475	SDEIS number used		14.25	SDEIS rate = 0.020
major injury		.0321	0.71	16	0.030
minor injury		.2631	5.8	174	0.244
property damage only		.6992	15.4	462	0.648

Calculation D-1 Statewide averages, calculated using statewide crash data for 2001-2010 ^[31]p.12]

User Cost Skewed Due to Omission of Foot Passenger Data

An analysis of the Juneau Access Draft SEIS and its failure to consider ferry passengers traveling without vehicles.

November 18, 2014

*Skagway Marine Access Commission
Box 1076
Skagway, Alaska 99840*

FOOT PASSENGERS

The Juneau Access Improvement Project Draft Supplemental Environmental Impact Statement (DSEIS) entirely fails to consider foot passenger traffic, which is an important aspect of travel within Lynn Canal. The omission of data on passengers traveling without vehicles seriously flaws the analysis of user costs and traffic forecasts. The document offers an assumption concerning vehicle occupancy that runs counter to the evidence. As a result, the DSEIS's calculations of user costs are arbitrary and capricious and violate the National Environmental Policy Act.

The DSEIS uses approximations of vehicle occupancy to calculate user costs, community economic benefit, system efficiency, etc. AMHS ferry foot passengers (walk-on passengers) are up to 45% of the current ferry ridership between Juneau-Haines-Skagway. The DSEIS ignores foot passengers, both as an element in developing calculated estimates within the DSEIS, and as a substantial part of the current traffic among the communities - users who will be affected by the Juneau Improved Access project.

RESPONSE: DOT&PF and FHWA disclosed the effects to walk-on passengers under Alternatives 2B and 3 in Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS, respectively. Additional information about walk-on passengers has been added to the Final SEIS for all alternatives. The document does not ignore passengers traveling without a vehicle and all people wanting to travel Juneau-Haines and Juneau-Skagway are included in the traffic forecasts. What the commenter is misunderstanding (or objecting to) is that there is a fundamental difference in the how people would travel in the primarily road alternatives (Alternatives 2B and 3) as compared to primarily ferry alternatives (Alternatives 1, 1B, 4A, 4B, 4C, and 4D).

Under Alternative 2B, a substantial segment of current walk-on traffic would be expected to convert to personal vehicle travel. Cost is currently the principal deterrent for ferry travel with a vehicle. As described in the Draft SEIS User Benefit Analysis, under the No Action and Enhanced Service alternatives, the roundtrip cost for a driver and standard vehicle is \$242. Under Alternative 2B, round-trip ferry costs for a driver and vehicle would be \$39 (Table A-13). Adding vehicle operating costs to the comparison results in \$244 for No Action and Enhanced Service and \$80 for Alternative 2B. This substantial decrease in the cost of travel would prompt many more travelers to take their own vehicles. Further, the substantial increase in overall traffic associated with Alternative 2B would represent many more opportunities for walk-ons to travel with family, friends, and acquaintances.

The primarily ferry alternatives operate more like a public transit system, whereby the ferry leg is long, and comprises a large proportion of the trip. For those alternatives, the public transportation mode (ferry) transports people and vehicles, dropping them off relatively close to their destination. This makes it more conducive to walk onto the ferry, and because the ferry trip is highly subsidized, is seen as good deal. Of note, however, is that even for the primarily ferry alternatives there is typically a short vehicle component of the trip at each end (Skagway has the only ferry terminal in Lynn Canal that is within reasonable walking distance from residential

areas for most residents. All other existing terminals must be reached by private vehicle or private carrier; therefore, a vehicle is used for at least part of the trip).

For the primarily road alternatives, a greater proportion of the trip would be made in a vehicle than on public transportation (shuttle ferry). Because of the distances to reach the ferry terminals, particularly at Katzehin, these alternatives would be less conducive to passengers walking onto the ferry – e.g., friends, cab, bus or other form of transportation would be needed to drive someone to Katzehin to catch the shuttle ferry. This would be a change in travel patterns and would also be an impact. For some travelers, this is an adverse impact and for others it is considered a beneficial impact. Both the beneficial and adverse impacts to walk-on passengers are identified and disclosed in the SEIS. The total amount of demand in the corridor (both walk-ons and vehicles) is captured and represented in the forecasts. As is discussed in the SEIS, DOT&PF and FHWA anticipate that with the primarily road alternatives, most of the travel will be via vehicle (i.e. not walk on) and those that were used to making their trip as a walk-on passenger will use a vehicle. The implications of this change are fully disclosed in the SEIS.

To compare user costs, the DSEIS uses a hypothetical family of 4 in an SUV as the approximated vehicle occupancy [p.ES-7 and ES-16]. User costs for any other travelers, with or without a vehicle are completely absent. Analysis of AMHS data shows that a vehicle occupancy of 4 cannot account for more than ¼ of ferry vehicles and still leave at least 1 occupant for each remaining vehicle. (Table X).

Therefore, of the people now traveling between Juneau-Haines-Skagway, the maximum that could possibly be represented by the user costs based on 4 occupants/per vehicle is only 23% of all users. (Table X) No information on changes to user costs among the alternatives is provided for the minimum of 77% of all other users.

The costs to current AMHS foot passengers under Alternative 2B are shown in Table Y. **All possible scenarios result in increased costs to these users.** Costs for a one-way trip are quite high for current foot passengers that do not own or always have access to a vehicle for travel, from \$100 to \$200 with existing services, and from \$70 to \$80 if a commercial bus/van business develops.

TABLE X. VEHICLE OCCUPANCY AND FOOT PASSENGER ESTIMATES

The DSEIS vehicle occupancy and foot passenger estimates are based on AMHS 2011 data for Juneau-Haines-Skagway of 82,186 total passengers and 26,061 total vehicles.

DSEIS vehicle occupancy estimates:

- (A) 3.2 = total passengers divided by total vehicles [$82,186 \div 26,061 = 3.16$]
- (B) 3.3 = total passengers divided by total vehicles [numbers not given]
- (C) 2.3 = National Household Travel Survey 2009 dataset, filtered for trip distance, rural states and city size Other estimates:
- (D) foot passengers = 45% of total passengers [$82,186 \times 45\% = 36,984$] McDowell, 2000

	passengers with vehicles (PwV)		resulting total foot passengers
	calculated with vehicle occupancy estimates	calculated with % foot passenger estimate	
DSEIS (A)	83,395		< 0
DSEIS (B)	86,001		< 0
NHTS (C)	59,940		22,246
McDowell (D)		45,202	36,984

The only calculation of foot passengers based on an estimate of actual AMHS foot passenger numbers is (D).

How many vehicles could possibly carry 4 occupants while still allowing at least 1 person in each remaining vehicle? From row (D) column PwV above: 45,202 = the number of passengers with vehicles. From the DSEIS, vehicles with 4 occupants are used to present costs to travelers.

If one quarter of vehicles carry 4 occupants, then 26,061 passengers will be in vehicles with 4 occupants:

$$\begin{array}{ccccccc}
 26,061 & \div & 4 & = & 6,515 & \times & 4 & = & 26,061 \\
 \text{(total vehicles)} & & \text{(one quarter)} & & \text{(\frac{1}{4} of vehicles)} & & \text{(occupants)} & & \text{(passengers in vehicles with 4 occupants)}
 \end{array}$$

how many passengers remain?	how many vehicles remain?
45,202 total passengers with vehicles	26,061 total vehicles
<u>- 26,061</u> passengers in vehicles with 4 occupants	<u>- 6,505</u> vehicles with 4 occupants
19,141 passengers left	19,546 vehicles left

19,141 (passengers left) ÷ 19,546 (vehicles left) = 0.97 occupants per vehicle, or about 1 person per vehicle.

82,186	36,984 (45%)	26,061 (32%)	19,414 (23%)
total passengers	foot passengers	maximum possible passengers in vehicles with 4 occupants	passengers in vehicles with occupancy of 1 per vehicle

Only ¼ of vehicles could possibly carry 4 occupants while still allowing for at least 1 passenger in each remaining vehicle.

	Alt1	Alt 2B-a personal vehicle	Alt 2B-b rental vehicle	Alt 2B-c bus/van business	Alt 2B-d taxi	data source

Total cost to Skagway- Juneau foot passenger	\$50.00	\$82.20	\$140.93	\$81.00	\$211.00	

* includes fuel, oil, tires, maintenance, insurance, license, registration, depreciation, financing

** not extant, no guarantee will develop, based on unlikely traffic estimates and inflated demand forecast

*** one-way miles, unlikely to be only charge for such a long distance

note: rental car (2B-b) and taxi (2B-d) are only existing options for residents that don't own a vehicle, or who belong to households with only one vehicle, which may be needed by family member for work commute, etc. --households with 0 or 1 vehicle: Juneau 44.7%, Haines 53.7%, Skagway 37.6% (DSEIS Apdx EE p.127)

note: with rental car option (2B-b) – individuals that cannot drive would need to pay ferry fare for added person, and other trip added expenses, such as lodging, meals, etc. for driver

note: 80 miles from Auke Bay to Katzehein used throughout

RESPONSE: The source document of the 45 percent walk-on rate is dated 2000. A review of the 2000 and 2015 AMHS *Annual Traffic Volume Report* (travel within Lynn Canal) indicates a 14 percent reduction in vehicle travel and a 26 percent reduction in pedestrian travel. The 2015 walk-on percentage within Lynn Canal is estimated to be 34 percent summer only and 30 percent for the year. Additional information regarding the forecast of walk-on passengers has been added to Appendix AA of the Final SEIS.

A family of four was used in the Draft SEIS to illustrate the relative costs of alternatives because it represents a common family unit. It was not the basis of calculating all user costs as assumed in the tables above. The Final SEIS has been updated to show costs for other travelers and to more thoroughly explain the derivation of user costs.

(walk-on passenger = foot passenger)

page	alternative	statement in document	problem
xxiii	all alternatives	ADT – described as “average daily traffic”	Defined on page 1-8 as “...the number of vehicles passing a given point in either direction”, therefore should be described as “average daily vehicle traffic”
ES-5	all alternatives	2 traffic models, both based only on vehicles per day	doesn't include existing users that travel without a vehicle
ES-7	all alternatives	user costs compared among alternatives based on users described as “a family of four in a 19-foot vehicle”	existing users that travel without a vehicle are not included in user cost estimates, and thus are excluded from user cost comparisons
ES-16	alternatives comparison	Summary Table, all demand and capacity figures based on “vehicles per day”	foot passengers ignored
ES-16	alternatives comparison	Summary Table, user costs based on 19 ft. vehicle with family of 4	ferry foot passengers ignored, actual avg vehicle occupants not used,
ES-16	alternatives comparison	Summary Table, travel time estimates based on vehicle travel only	ferry foot passengers ignored
1-9	all alternatives	Table 1-1: AMHS traffic volume history gives round trips, but not one-way trips	many one-way passengers, foot and vehicle, not represented
1-9	all alternatives	Table 1-1: AMHS traffic volume given for total vehicles and total passengers only	does not present breakdown of passengers traveling with vehicle vs. foot passengers
1-13	all alternatives	Table 1-3: only ADT (vehicle) information presented	AMHS foot passengers excluded
1-13	all alternatives	“Note” justifies exclusion of walk-on passengers from DSEIS because “primary responsibility of State is to provide transportation facility and not the transport itself.”	foot passengers are large portion of existing users. EIS supposed to evaluate all impacts. Therefore, effects upon users (costs, travel time, etc) should include ALL users
1-17	all alternatives	state costs for road/highway and AMHS all converted to vehicle miles	costs should be given in absolute and comparable units (eg. per mile, per trip) AND in reference to traffic variables (vehicles and people)

1-18	all alternatives	user costs all based on “family of four in a 19-foot vehicle”	AMHS costs inflated because: smaller vehicle=lower cost, less that 4 people in vehicle=lower cost, foot passenger=lower cost
2-10	1-no action	traffic capacity based on ferry vehicles only (footnote 10)	capacity of ferry foot traffic ignored
2-11	1-no action	travel times based on vehicles only, with check-in, load and unload times	long check-in times, load and unload times don't apply to foot passengers.
2-12	1-no action	user costs calculated only as “cost per vehicle” presumably for the 19-foot vehicle and family of 4	doesn't include smaller vehicles, vehicles with fewer passengers, all foot passengers
2-12	2-enhanced AMHS	traffic capacity based on ferry vehicles only (footnote 13)	capacity of ferry foot traffic ignored
2-13	2-enhanced AMHS	travel times based on vehicles only, with check-in, load and unload times	long check-in times, load and unload times don't apply to foot passengers.
2-14	2-enhanced AMHS	user costs calculated only as “cost per vehicle” presumably for the 19-foot vehicle and family of 4 mentioned earlier	doesn't include smaller vehicles, vehicles with fewer passengers, all foot passengers
2-15	3-Juneau road	travel capacity only for vehicles	current foot passenger users eliminated
2-15	3-Juneau road	travel time only for vehicles	current foot passenger users eliminated
2-15	3-Juneau road	user costs calculated only as “cost per vehicle” presumably for the 19-foot vehicle and family of 4 mentioned earlier	doesn't include smaller vehicles, vehicles with fewer passengers, all foot passengers
2-19	3-West Side road	travel capacity only for vehicles	current foot passenger users eliminated
2-19	3-West Side road	travel time only for vehicles	current foot passenger users eliminated
2-20	3-West Side road	user costs calculated only as “cost per vehicle” presumably for the 19-foot vehicle and family of 4 mentioned earlier	doesn't include smaller vehicles, vehicles with fewer passengers, all foot passengers
– same applies to alternatives 4A, 4B, 4C and 4D not included here –			
2-32	alternatives comparison	Table 2-26, capacity in vehicles per day	doesn't include existing users that travel without a vehicle
2-32	alternatives comparison	Table 2-26, travel times for vehicles only	doesn't include foot passenger travel time
2-33	alternatives comparison	Table 2-26, user costs based only on vehicle travel	doesn't include effect upon foot passenger costs
2-33	alternatives comparison	Table 2-26, footnote 3 says user costs based on family of 4 in standard pickup, but figures match other calculation? (see ES-16 above)	doesn't include effect upon foot passenger costs

3-32	social/economic environment-transportation	AMHS 2011 passenger-to-vehicle ratio in Lynn Canal calculated as 3.2 passengers/vehicle	calculated by dividing total passengers into total vehicles, foot passengers lumped in with vehicle passengers
3-32	social/economic environment-transportation	assumes actual number of passengers traveling with cars on AMHS in 2011 was closer to the highway average of 2.3 passengers/vehicle, so may have been approx. 22,300 walk-on passengers	foot passengers estimated indirectly by using national highway vehicle occupancy ratio, actual estimate available from AMHS data not used. Also, though acknowledges 2.3 is more reasonable estimate than above, continues to use 3.2 in rest of DSEIS – especially pertinent when used to estimate economic benefits for all alternatives
4-4	methods-transportation	total demand model based on vehicular travel only	eliminates foot passengers
4-5	methods-transportation	user benefits and costs based on vehicle travel	doesn't include effects upon foot passengers
4-64	3-Juneau road-transportation	using year 2011, estimated that 22,100 passengers were walk-on, out of 82,000 total passengers	works out to 27% - percentage figure not given in document, no technical reference given for estimate, McDowell 2000 study estimated 45% foot passengers, what does analysis of most recent AMHS data show?
4-64	3-Juneau road-transportation	20-50% of walk-on passengers used to estimate demand for private bus/van service from Katzehin, resulting in 70% (26-52 per day) in summer and 30% (8-15 per day) in winter	also states that 90% of households have vehicles, so more realistic estimate would be 10-20% of residents plus proportion of walk-on passengers that are non-resident – total presumably less than 20-50%
4-64	3-Juneau road-transportation	above used to solicit service estimates from private businesses. Result = bus coach service from Haines-Juneau and Skagway-Juneau, daily in summer, every 2 days in winter, at \$40 to \$60 one way	private businesses estimated service based on inflated demand (above), if demand is less and/or spotty, private service reduced in frequency, increased in cost, or unlikely to develop
----- rest of section 4 – all based on vehicle traffic only, effects upon foot passengers ignored -----			

RESPONSE: A family of four was used in the Draft SEIS to illustrate the relative costs of alternatives because it represents a common family unit. It was not the basis of calculating all user cost as assumed in the tables above. The Final SEIS has been updated to show costs for other types of travelers and to more thoroughly explain the derivation of user costs.

ALTERNATIVE 1B OPTIMIZED

A more efficient proposal for enhanced ferry
service than Alternative 1B in the Juneau Access
Draft SEIS

November 18, 2014

*Skagway Marine Access Commission
Box 1076
Skagway, Alaska 99840*

Review of Alternative 1B of the Juneau Access Improvements Draft Supplemental Environmental Impact Statement by the Skagway Marine Access Commission.

Evaluation of Alternative 1B

Based on the brief description and undeveloped discussion of Alternative 1 in the DEIS, the court cannot conclude that an alternative aimed at providing improved and more efficient ferry service was “rigorously explored” by the agencies. Judge Sedwick 105 Order and Opinion Granting SJM

The Alaska Department of Transportation and Public Facilities (AKDOT) proposed Alternative 1B in the Juneau Access Improvements Draft Supplemental Environmental Impact Statement (DSEIS) as a response to the Alaska District Court’s 2008 decision that the state did not adequately consider improving ferry service in Lynn Canal using existing assets. In other words, the state failed to provide an apples-to-apples comparison for the purpose of evaluating the costs and benefits of the various proposed Juneau Access improvements.

The state’s new proposal is called “Alternative 1B – Enhanced Service with Existing AMHS Assets,” described on the DSEIS website as follows:

“Alternative 1B includes all of the components of Alternative 1, No Action, but focuses on enhancing service using existing AMHS [Alaska Marine Highway System] assets without major initial capital expenditures. Similar to Alternative 1, Alternative 1B includes: a continuation of mainline ferry service in Lynn Canal; the AMHS would continue to be the NHS [National Highway System] route from Juneau to Haines and Skagway; no new roads or ferry terminals would be built; and in addition to the Day Boat ACFs [Alaska Class Ferries], programmed improvements include improved vehicle and passenger staging areas at the Auke Bay and Haines ferry terminals to optimize traffic flow on and off the Day Boat ACFs as well as expansion of the Haines Ferry Terminal to include a new double bow berth to accommodate the Day Boat ACFs. Service to other communities would remain the same as the No Action Alternative. Alternative 1B keeps the *M/V Malaspina* in service after the second Day Boat ACF is brought online to provide additional capacity in Lynn Canal. Enhanced services included as part of Alternative 1B are a 20 percent reduction in fares for trips in Lynn Canal and extended hours of operations for the reservation call center.

“Mainline service would include two round trips per week in the summer and one per week in the winter with Auke Bay-Haines-Skagway-Haines-Auke Bay routing. During the summer, the *M/V Malaspina* would make one round-trip per day seven days per week on a Skagway-Auke Bay-Skagway route, while one Day Boat ACF would make one round trip between Auke Bay and Haines six days per week, and one would make two round-trips per day between Haines and Skagway six days per week. The Day Boat ACFs would not sail on the seventh day because the mainliner would be on a similar schedule. In the winter, ferry service in Lynn Canal would be provided primarily by the Day Boat ACFs three times per week.”

The Skagway Marine Access Commission has reviewed Alternative 1B to determine whether AKDOT has met the judge’s mandate of “rigorously” exploring an alternative aimed at

providing improved and more efficient ferry service. It is our opinion that while alternative 1B provides certain “enhancements” to the No-Build Alternative 1, it falls short of providing an optimized model that deploys existing assets in the most efficient way. Given the state’s choice of vessels, their proposal fails to match capacity to demand. The planners focused on adding capacity but neglected to consider the efficiencies that can be gained by optimum routing configurations.

RESPONSE: DOT&PF and AMHS staff developed a new alternative based on direction from the Court, shared a draft of that alternative with the public during a new scoping effort, took input on the new alternative, and revised that alternative based on the scoping comments received. Alternative 1B complies with NEPA and the Court’s order. The new alternative took into account changes that had occurred to the “existing assets” in the AMHS fleet since the 2006 Record of Decision, the capabilities of the vessels in the fleet, and the needs and mission of the fleet to the numerous communities served by AMHS. DOT&PF and FHWA fully disclosed the thought process and evaluation in the Draft SEIS. Appendix CC, *Development of Alternative 1B – Enhanced Service with Existing Alaska Marine Highway System (AMHS) Assets*, of the Draft SEIS described the efforts undertaken to develop Alternative 1B and documented the data and analysis relied on to create as reasonable an alternative as possible toward solving the transportation problems in the corridor using only existing assets. Alternative 1B incorporated the following considerations:

- Existing AMHS assets reasonably available and feasible for use in Lynn Canal
- Programmed AMHS assets (decisions by AMHS independent of the project that made new Day Boat ACFs available in the fleet)
- Enhancements that could be employed, as suggested by the Plaintiffs, that do not involve substantial initial capital investments

The resulting alternative, Alternative 1B, was developed to the same level as all other build alternatives in the Draft SEIS and was rigorously analyzed to the same degree as other project alternatives.

Throughout the following analysis we rely on AKDOT’s figures in Appendix GG of the DSEIS: Marine Segments Technical Report.

Alternative 1B fails to match capacity to demand

A key weakness of Alternative 1B is the deployment of the M/V Malaspina to the Auke Bay-Skagway route. Historically, this route experiences less traffic than the Auke Bay-Haines route. Yet Alternative 1B proposes to use the Malaspina, with its large vehicle capacity and high labor costs to service this less-traveled route, creating excess capacity between Auke Bay and Skagway at significant cost to the system. This scenario also fails to take advantage of the Malaspina’s ability to run longer than 12 hours per day. The vessel’s 24/7 crewing requirements allow it to follow its traditional Auke Bay-Haines-Skagway-Haines-Auke Bay route, thereby

avoiding the 12 hour rule that limits the length of route segments that the ACF Day boat can service.

At the same time, 1B proposes to use the smaller ACF day boat, with its lower vehicle capacity, on the more popular Auke Bay-Haines, leaving little excess capacity.

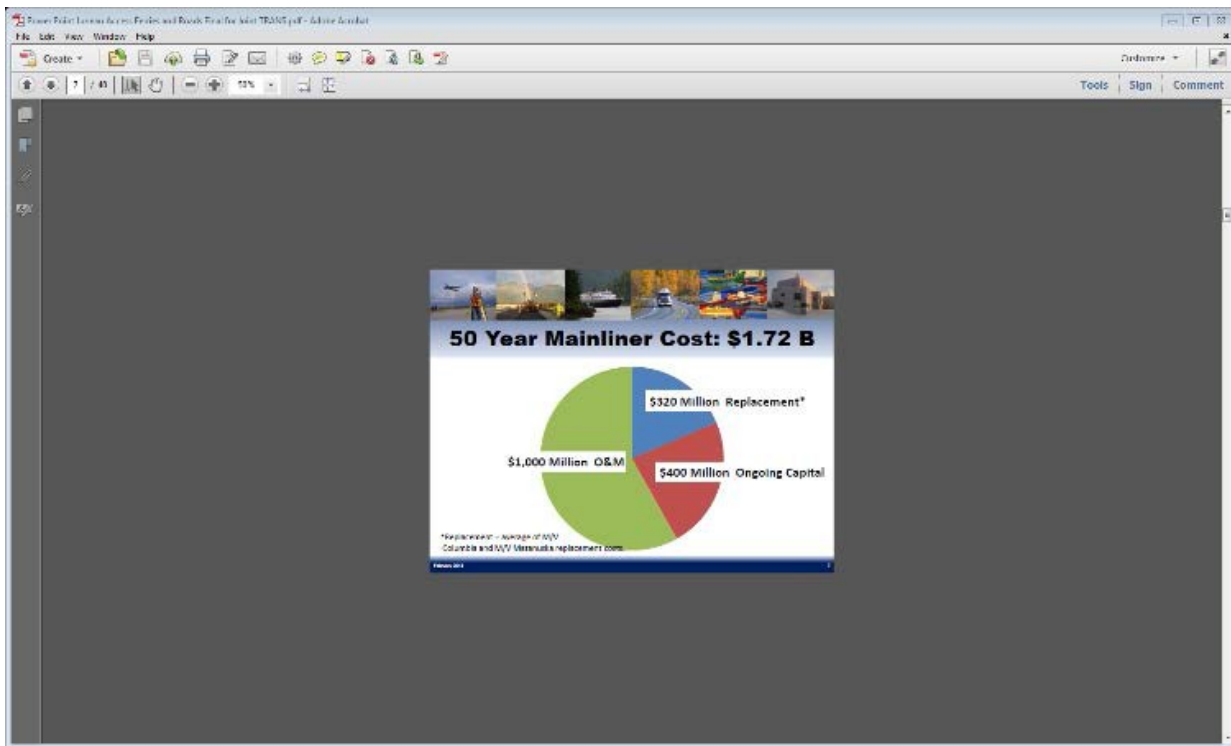

RESPONSE: Given the current ferry terminal configurations, the Day Boat ACF cannot make the Auke Bay-Skagway daily round trip within 12 hours, which precludes reasonably scheduling the Day Boat ACF for the link. The Day Boat ACF, coupled with mainliners, provide sufficient capacity for the Auke Bay-Haines link. However, as demonstrated by Alternative 1B, as presented in the Final SEIS, there is flexibility in routing the *M/V Malispina* through Haines as traffic demand warrants.

Alternative 1B never considers the option of removing mainliners from Lynn Canal

A second weakness of Alternative 1B is the failure to consider eliminating “through” mainliners carrying traffic from points south of Auke Bay. Whether calculated by hour or miles, mainliners with their large crews and 24/7 crewing requirements, are very expensive to operate. The Southeast Alaska Transportation Plan (SATP) calls for retiring one or more of the aging mainline vessels in the next few years. By comparison, the new ACF day boats, which are included in Alternative 1B, present a more efficient transportation model for Lynn Canal, requiring one-fifth the crew of the larger ships.

RESPONSE: Absent a highway in Lynn Canal, AMHS intends to continue mainline service in Lynn Canal. The rationale includes scheduling concerns and inconvenience to the travelers passing through Juneau. In addition, the mainliner inclusion in Alternative 1B increases access (number of trips per week) and provides additional capacity in Lynn Canal, in keeping with the project’s purpose and need. With the assets provided, there is typically insufficient capacity in Lynn Canal to handle traffic on the days mainliners would turn around at Auke Bay.

In recent years at many public presentations, AKDOT officials have referenced the high cost of maintaining and replacing mainliners as a justification for the Juneau Access road project. For example, on March 6, 2014 Jeff Ottesen, Director of Program Development for AKDOT, gave a presentation to the Joint Transportation Committees of the Alaska Legislature entitled “Why Extending Roads and Shortening Ferry Links is a Sound Policy Choice.” The pie chart below is from his presentation and shows the excess cost to the state of maintaining and replacing mainliners.

Given this concern on the part of AKDOT, it is curious to us that only the two road alternatives [Alternatives 2B and 3] have not been burdened with the costly mainliner through-service from Bellingham and Prince Rupert. In those alternatives, traffic arriving in Auke Bay from points south must offload in Auke Bay and transfer to the road system in order to drive to a ferry terminal located at either Berners Bay or Katzechin.

RESPONSE: AMHS mainline service would terminate at Auke Bay with construction of a highway alternative. Mainline service is not needed to meet demand, or to increase access/frequency. The mainliner was included in the primary ferry options because it provided necessary capacity, thereby attempting to better satisfy the project's purpose and need. Travelers who were already on the mainliner would be required to transfer to a separate ferry, increasing their travel time and inconvenience.

None of the all-marine options considers offloading passengers and vehicles in Auke Bay and transferring them to a more efficient marine transportation system to reach Haines or Skagway. This scenario provides the best apples-to-apples comparison to a road link with regard to isolating the costs of providing efficient and enhanced service in Lynn Canal.

RESPONSE: The continued mainline service in Lynn Canal for the ferry alternatives is necessary to provide capacity. Analyses of the proposed Alternatives 1B Optimized and 5 in the Final SEIS at Appendix II, *Alternative 1B Optimized and Alternative 5 Evaluation*, discuss this issue.

Our proposal: Alternative 1B Optimized

The optimization of 1B involves two key changes to AKDOT's Alternative 1B:

- Reconfiguration of route segments and homeporting the *Malaspina* in Haines
- Elimination of “through” mainline service north of Juneau

Homeporting the *M/V Malaspina* in Haines allows that vessel to be deployed on a Haines-Skagway-Haines-Auke Bay-Haines route. This routing accomplishes the following:

- Uses the large vehicle capacity of the *Malaspina* on the route with the most demand;
- Takes advantage of the *Malaspina*'s ability to run longer than 12 hours a day;
- Allows the *Malaspina* to shuttle traffic between Haines and Skagway, freeing up an ACF day boat to run between Haines and Auke Bay;
- Matches the capacity of the smaller ACF vessel to the demand of the less frequently traveled route between Skagway and Auke Bay;
- Eliminates the need for the “through” mainliners and frees up a mainliner to be retired or deployed to other parts of the region such as Sitka; and
- Saves the AMHS more than \$1 million in annual operating costs. (We believe the savings may be significantly higher. Please see page 8 for discussion of possible errors in the DSEIS' mainline data.)

Assumptions

Alternative 1B Optimized assumes the same vessel and terminal improvements as are proposed for Alternative 1B, and requires no new construction of ships or berths. Our analysis does not address the AMHS reservation system or reduction of fares. Our analysis also assumes an elimination of through-mainliner service north of Juneau. (AKDOT would have the option to use mainliners in case of schedule disruptions, on alternative routes such as those servicing Sitka, or left idle to save system costs.)

The purpose of this analysis is to demonstrate that service and capacity can be increased at reduced cost through better use of three vessels: two ACFs and the *Malaspina*. This scenario also allows for a more accurate apples-to-apples comparison with the two road alternatives.

Please note the following abbreviations: HNS = Haines; SGY = Skagway; ABY = Auke Bay

Route Configuration – Summer Schedule

- ACF 1 homeports in Auke Bay and runs ABY-HNS-ABY once a day, seven days a week
- ACF 2 homeports in Skagway and runs SGY-ABY-SGY once a day, seven days a week
- The *Malaspina* homeports in Haines and runs HNS-SGY-HNS once a day and HNS-ABY- HNS once a day, seven days a week

All departures are in the morning with the Skagway ACF departing early enough to free up the Skagway Terminal for the arrival of the *Malaspina*.

This proposed route configuration better matches capacity to demand. It increases the number of sailings per week and provides more departure time options.

Route Configuration – Winter Schedule

- ACF 1 homeports in Auke Bay and runs ABY-HNS-ABY once a day, five days a week
- ACF 2 homeports in Haines and runs HNS-SGY-HNS twice a day, five days a week
- The *Malaspina* is not used on this route and is available for use as AMHS sees fit

This provides slightly more capacity and more sailings per week than AKDOT's Alternative 1B. When not in use on its Haines route, the ACF in Auke Bay would be available should AKDOT wish to provide additional sailings in Lynn Canal or surrounding communities such as Hoonah, Gustavus, Angoon, etc.

Alternative 1B Optimized Schedules

We have developed proposed schedules to verify number of round trips and determine crew times. Schedule start times are arbitrary. The schedules are notional and are not intended to show route connections or homeport locations. Final schedules and homeport locations will be based on system implementation.

Transit times are based on AKDOT's estimated transit times in Alternative 4C (Conventional Monohull out of Auke Bay), found in the JAI Marine Segments Technical Report (DSEIS Attachment C). See Exhibit B.

Capacity-Demand Comparison of Alternatives 1B and 1B Optimized (Summer Schedule)¹

Purpose and Need Factors	1B	1B Optimized
Auke Bay-Skagway		
Forecasted demand (vehicles per day)	90	90
Capacity (vehicles per day)	176	106

Round-trip sailings per week	9 ²	7 ³
Auke Bay-Haines		
Forecasted demand (vehicles per day)	100	100
Capacity (vehicles per day)	154	282
Round-trip sailings per week	8	14
Haines-Skagway		
Forecasted demand (vehicles per day)	53	53
Capacity (vehicles per day)	260	176
Round-trip sailings per week	15	7

¹Data are derived from Appendix GG, Juneau Access DSEIS, Marine Segments Technical Report.

²An additional six trips per week could be made by taking the Day Boat ACF between Auke Bay and Haines and transferring ferries.

³An additional seven trips per week could be made from Skagway to Auke Bay by taking the *Malaspina* southbound or transferring in Haines to the ACF.

Cost Comparison

The table below compares estimated yearly fuel and crew costs under AKDOT's Alternative 1B and our proposal, Alternative 1B Optimized. As the table shows, Alternative 1B Optimized generates an estimated annual savings of more than \$1 million.

Cost comparison, Alternative 1B and Alternative 1B Optimized

(total annual costs in millions)

	Alternative 1B	Alt. 1B Optimized	Savings with 1B Opt.
Fuel costs	\$5.7	\$7.5	(\$1.8)
Crew costs	\$13.9	\$10.9	\$3.0
Total	\$19.6	\$18.4	\$1.2

Figures for Alternative 1B are from JAI DSEIS Appendix GG. Calculations for Alternative 1B Optimized can be found in Exhibit A.

We believe annual savings associated with Alternative 1B Optimized may be significantly more than this analysis indicates. On page 1 of Attachment A in the DSEIS, “AMHS Mainline Operating Costs,” the methodology and results for the Comparison of Vessel Operating Days Chart appear to be incorrect. The chart lists a total of 40.9 Mainline Days for the number of days the mainliners operate in North Lynn Canal. It is difficult to see how this value was derived considering that under alternatives that use mainline ferries as a transportation component, the document states that two mainliners will run in summer and one in winter.

Summer is defined as approximately 22 weeks (44 mainline sailings) and winter is approximately 30 weeks (30 mainline sailings). These combine for a total of 74 mainline sailings a year. Even if you discount the running time in North Lynn Canal as not a full day (24 hours) and assume a run time of 18 hours (75 percent of a day), calculations render an operating days total of 55.5 days: 74 sailings x 0.75 days = 55.5 days. This is significantly higher than the 40.9 days listed in the DSEIS. This is important, as this number is used to calculate crew and fuel costs for the mainline component of a majority of the alternatives. This problem was brought to the attention of Gary Hogins, Project Manager. In an email exchange on November 3, 2014 he acknowledged that the document is in error and corrections would need to be made.

SUMMARY

Advantages of Alternative 1B Optimized compared to Alternative 1B

The cost analysis for Alternative 1B Optimized is contained in Exhibit A. Our preliminary work indicates that this proposal could save the state more than \$1million in annual operating costs while increasing capacity and travel options. We believe the savings could be significantly greater (see note on preceding page). Eliminating “through” mainliners from Lynn Canal allows the AMHS to redeploy those ships to increase service to other northern panhandle communities, provide back-up in case of service disruptions, or to retire an aging vessel.

Unlike Alternative 1B, our proposal scales capacity to demand, with room for growth. Our proposal increases capacity on the popular Auke Bay-Haines route while more closely matching capacity to demand on the Auke Bay-Skagway and Skagway-Haines routes. Other benefits include:

- Multiple deployment options, especially in the winter;
- More flexibility and travel options for passengers;
- Use of the *M/V Malaspina* in her traditional role of day boat in Lynn Canal. While this increases fuel costs slightly (owing to a longer route than the *Malaspina* route proposed under 1B), those costs are more than offset by more efficient use of labor (*Malaspina* crew is paid 24/7 whether it is tied up at the dock or sailing on a route); and
- Direct access from Skagway to Juneau seven days a week in the summer.

Our proposal is just one alternative. There may be even more optimal deployments of the ferry system’s existing vessels and crew. We believe our analysis demonstrates, at a minimum, that the state failed to do a rigorous analysis of the most efficient and effective use of existing assets to enhance service in northern Lynn Canal.

In addition, if the purpose of developing alternatives is to provide a sound, rational basis for comparing competing transportation proposals, consistent assumptions should be used regarding the use of mainline service north of Juneau.

To quote Judge Sedwick, we “cannot conclude that an alternative aimed at providing improved and more efficient ferry service was rigorously explored by the agencies.”

Exhibit A: Alternative 1B Optimized Crew and Fuel Costs

Alternative 1B Optimized is comprised of the following three vessels shown here with their respective routes and ASV's (Alaska Standard Vehicle) capacity:

- The MV Malaspina (HNS-SGY-ABY-HNS) with a vehicle capacity of 88 ASV (Alaska Standard Vehicles)
- ACF Day Boat 1 (ABY-HNS-ABY) 53 ASV
- ACF Day Boat 2 (SGY-ABY-SGY) 53 ASV

Below are calculations for crew and fuel costs that comprise approximately 87% of vessel operating costs. The data used in this analysis has been derived from Appendix GG of the Juneau Access DSEIS: Marine Segments Technical Report.

Malaspina

Summer Season: 153 Days (153 Operating Days)

Crew cost:

ALTERNATIVE 1B TOTAL \$19,609,863

ALTERNATIVE 1B OPTIMIZED TOTAL \$18,405,676

SAVINGS \$1,204,187 *

*We believe annual savings associated with Alternative 1B Optimized may be significantly more than this analysis indicates. On page 1 of Attachment A in the DSEIS, "AMHS Mainline Operating Costs," the methodology and results for the Comparison of Vessel Operating Days Chart appear to be incorrect. The chart lists a total of 40.9 Mainline Days for the number of days the mainliners operate in North Lynn Canal. It is difficult to see how this value was derived considering that under alternatives that use mainline ferries as a transportation component, the document states that two mainliners will run in summer and one in winter.

Summer is defined as approximately 22 weeks (44 mainline sailings) and winter is approximately 30 weeks (30 mainline sailings). These combine for a total of 74 mainline sailings a year. Even if you discount the running time in North Lynn Canal as not a full day (24 hours) and assume a run time of 18 hours (75 percent of a day), calculations render an operating days total of 55.5 days: 74 sailings x 0.75 days = 55.5 days. This is significantly higher than the 40.9 days listed in the DSEIS. This is important, as this number is used to calculate crew and fuel costs for the mainline component of a majority of the alternatives. This problem was brought to the attention of Gary Hogins, Project Manager. In an email exchange on November 3, 2014 he acknowledged that the document is in error and corrections would need to be made.

RESPONSE: DOT&PF and FHWA have examined this alternative and have determined that it is not reasonable for the following reasons:

- First, the Day Boat ACF cannot make a daily Auke Bay-Skagway run and meet United States Coast Guard (USCG) work/rest requirements. Without modification of the vessel or the loading and unloading facility at the Skagway Ferry Terminal to decrease the Day Boat ACF operating day, it would not be compliant with USCG requirements.
- Second, discontinuing mainline ferry service within Lynn Canal creates capacity problems at Auke Bay. During summer, on the 2 days per week that the mainliner sails, the amount of transferring traffic plus local traffic demand to/from Skagway would typically be greater than the capacity of the Auke Bay-Skagway Day Boat ACF proposed in Alternative 1B Optimized.
- Third, there is insufficient berth space and vehicle staging areas in Auke Bay to have the mainline vessel in port while accommodating all transferring vehicles, thus resulting in vessel and vehicle congestion and delays. To fully clear northbound and southbound connecting travelers onto the mainline vessel, it needs to remain docked in Auke Bay long enough for the two Day Boat ACFs and the *M/V Malaspina* to come and go. Moreover, the staging area at Auke Bay is insufficient to accommodate all the disembarking and embarking vehicles. The space is limited and was not designed or sized to handle the transfers of the volumes expected. A detailed analysis and evaluation of Alternative 1B Optimized can be found in Appendix II.

For the Draft SEIS, the data used to calculate the mainliner operation cost in Lynn Canal was incomplete, resulting in the operation cost being understated. For the Final SEIS, the methodology for estimating mainliner operation cost was modified and is described in Attachment A of Appendix GG –*Marine Segments Technical Report*.

This chart from the 2012 Annual AMHS Fiscal Report shows that fuel and crew comprise more than 87% of total costs for the ferry system.

Alternative 5: The All Alaska Class Ferry Alternative

November 18 2014

Skagway Marine Access Commission
Box 1076
Skagway, Alaska 99840

An improved marine alternative proposed by the Skagway Marine Access Commission as comments on the Juneau Access Improvements Project Draft Supplemental Impact Statement.

Alternative 5: The All Alaska Class Alternative

The new Alaska Class Ferry (ACF) Day Boat design creates the opportunity for a paradigm shift in the efficient use of labor for marine transportation in Lynn Canal.

Mainliners with their large crews and 24/7 crewing requirements, are very expensive to operate whether you calculate by hour or by mile. The Southeast Alaska Transportation Plan (SATP) calls for retiring one or more of the aging mainline vessels in the next few years. Plans for the new ACF day boat will go a long way toward creating a more efficient transportation model for our region.

According to the Alaska Marine Highway System 2013 Financial Report, crew and fuel costs comprise 87% of ferry operational costs: crew costs make up roughly 66% of the operating expenditures and fuel amounts to 21%. Vessel crewing provides the biggest opportunity for cost savings. It is in its crewing requirements that the Alaska Class Ferry (ACF) Day Boat realizes significant efficiencies compared to other vessels in the region.

According to the Day Boat ACF Design Study Report, prepared for the Alaska Marine Highway System by Elliott Bay Design Group, the new ACF boats will require a crew of nine for operating in Lynn Canal. In comparison, the Malaspina, which has traditionally sailed the Lynn Canal day boat route, requires a crew of 51. In other words, the ACF will require less than 1/5th the number of crew members that the Malaspina requires. When you combine the crew savings with the efficiencies achieved through modern engine and vessel design technologies, the savings are significant on a cost per mile basis.

In the Draft Supplemental Environmental Impact Statement for Juneau Access (DSEIS), these new developments in vessel design, have been incorporated into the marine alternatives as “existing assets.” However upon further evaluation of these marine alternatives we found them to be burdened unnecessarily by the inclusion of mainline vessels.

Alternative 5 calls for construction of a third ACF and the retirement of one aging mainliner. Our analysis shows that the traffic demand in Lynn Canal can be satisfied at a much lower operation cost per mile through the addition of a third ACF. The following are the key components of the All Alaska Class Alternative:

Acquiring a third ACF

Eliminating mainliner service north of Auke Bay

Implementing all capital improvements as outlined under Marine Alternative 4C:

- Auke Bay expanded to include new double stern berth
- Skagway expanded to include a new end berth
- New conventional monohull shuttle ferry constructed to operate between Haines and Skagway.

Savings

The construction cost of a new ACF day boat (approximately \$60 million) will be offset by the costs of road and terminal construction associated with other alternatives. Operating costs of this alternative will be offset by the savings associated with suspension of mainline service in Lynn Canal. The savings realized by the retirement of the aging mainliner are not quantified in this analysis but will be significant to AMHS and the State of Alaska.

The following quote and chart are excerpted from the North Lynn Canal Ferry Service Analysis prepared for the Municipality of Skagway by the McDowell Group in June 2014.

Deployment of the new AMHS day boat/ACF should result in an overall reduction in the cost of providing ferry service in Lynn Canal. Day boat/ACF costs are expected to average \$173 per-mile for Juneau-Haines service and \$336 per-mile for the Haines-Skagway service. In FY2012, all vessels serving Lynn Canal combined operated at an average per-mile cost of \$527. The Malaspina (providing 40 percent of all Lynn Canal service miles in FY2012) operated at a per-mile cost of \$649.

**Figure 2. AMHS North Lynn Canal Vessel Per-Mile Costs, FY 2012
And anticipated Day Boat ACF Per-Mile Costs**

Proposed Summer Schedule and Routes

- ACF One homeported in Haines and sails roundtrip from Haines to Auke Bay once a day seven days per week
- ACF Two homeported in Skagway and sails roundtrip from Skagway to Auke Bay once a day seven days per week
- ACF Three homeported in Auke Bay and sails roundtrip to Haines four days per week and Skagway three days per week.

This results in 11 roundtrips between Auke bay and Haines each week and ten sailings between Auke Bay and Skagway each week.

- Haines-Skagway Shuttle homeported in Haines and sails roundtrip to Skagway twice a day seven days a week

Proposed Winter Schedule and Routes

- ACF One is homeported in Auke Bay and sails roundtrip to Haines five days a week.
- ACF Two is homeported in Haines and sails to Skagway twice a day 5 days a week

Transit Times

The transit times for these routes and schedules are based on the transit times estimated for the projected ACF Day boat schedules proposed in Alternative 4C (Conventional Monohull out of Auke Bay) from the JAI Marine Segments Technical Report (Attachment C). See Exhibit B.

Capacity

The addition of a third ACF as outlined in Alternative 5 would produce an overall increase in summer and winter capacity between Auke Bay, Haines and Skagway compared to 4C. Alternative 5 would significantly increase the frequency of sailings between Auke Bay, Haines and Skagway.

Alternative 5 Schedules

Notional schedules are developed to verify number of round trips and determine crew times. Schedule start times are arbitrary. Notional schedules are not intended to show route connections or homeport locations. Final schedules and homeport locations will be based on system implementation.

Forecasted Summer Demand between Haines and Skagway (vehicles per day)	53	53
Summer Ferry Link Capacity between Haines and Skagway (vehicles per day)	72 (63) ⁴	72
Number of Ferry Round trips/Week Haines to Skagway (summer)	15 ⁵	14

¹Data derived from Appendix AA and Appendix GG, Juneau Access DSEIS, Marine Segments Technical Report.

²An additional four trips per week could be made ABY-SGY by taking the Day Boat ACF between Auke Bay and Haines and transferring in HNS to the shuttle.

³An additional four trips per week could be made SGY-ABY by taking the Shuttle southbound (daily) or transferring in HNS to the ACF

⁴Mainliner capacity

⁵includes two mainliners

Cost Comparison

The table below compares estimated yearly fuel and crew costs under AKDOT's Alternative 4C and our proposal, Alternative 5. As the table shows, Alternative 5 generates an estimated annual savings of more than \$1 million.

	Alternative 4C	Alternative 5	Savings with Alternative 5
Fuel costs	\$5.8	\$6.6	(\$0.8)
Crew costs	\$10.1	\$8.2	\$1.9
Total	\$15.9	\$14.8	\$1.1

Figures for Alternative 4C are from JAI DSEIS Appendix GG. Calculations for Alternative 5 can be found in Exhibit A.

ADVANTAGES OF AN ALL ALASKA CLASS ALTERNATIVE

Alternative 5 proposes the exclusive use of Alaska Class Ferry (ACF) dayboats in Lynn Canal. Construction of two ACF dayboats is currently underway at the Ketchikan Boat Yard. The proposal would require the acquisition of a third vessel by the Alaska Marine Highway System (AMHS). All northbound AMHS traffic would disembark in Auke Bay and board the smaller more efficient ferries bound for Haines and Skagway.

Lynn Canal route length is ideally suited to dayboat service; travelers on 4 ½ to 5 ½ hour sailings do not require the staterooms and other amenities needed for longer voyages. Each summer since 2008, the AMHS has used the mainliner MV Malaspina to provide day boat service between Juneau, Skagway and Haines. The ACF dayboat requires less than 1/5th the number of crew members that the Malaspina requires. These crew savings combined with the efficiencies achieved through modern design make the ACF dayboat a better fit for Lynn Canal.

The elimination of expensive mainliners from Lynn Canal allows the AMHS to redeploy those ships and/or retire an aging vessel. This has the potential to increase service in the Northern Panhandle at reduced cost. Other advantages of the three ACF dayboat system are:

- Can be scaled to the demand in Lynn Canal and in the region
- Provides multiple and flexible deployment options
- Builds redundancy into the Marine Highway system
- Provides direct access to Juneau from Skagway (10 sailings a week in the summer)
- Maximizes service in Lynn Canal and exceeds predicted demand

Unlike Juneau Access, this proposal is not Juneau-centric. The utility of these vessels allows them to serve any route in Southeast that can best be optimized by the ACF dayboat concept. This benefits not only the communities of Lynn Canal but the entire AMHS and southeast region as a whole. Unlike a road, the ACF is transportation infrastructure that can be deployed in any direction where the traffic demand exists. Flexible deployment would allow an ACF homeported in Auke Bay to serve Skagway/Haines, Gustavus, Angoon/Hoonah, and Tenakee on successive days, tailoring the service to the demand. The fact that these boats can be built in Ketchikan provides additional economic benefit to the region.

RESPONSE: DOT&PF and FHWA have examined this alternative and have determined that it is a variation of existing alternatives and therefore would be an unnecessary addition to the range of reasonable alternatives. It would attract fewer trips than Alternative 1B, provide similar capacity to Haines (and less to Skagway), and would have similar travel time as other alternatives studied (No Action, 1B, and 4C). It fits within the range of capital and operational costs (not the cheapest and not the most expensive of the ferry options). In short, it is not unique enough to constitute something outside the range of alternatives already studied. Further, sufficient information has been generated to confirm it is inferior to other alternatives already in the SEIS.

Additionally, during summer, discontinuing mainline ferry service within Lynn Canal could create capacity issues that may prevent some travelers from reaching their final destination via a direct ferry connection. Vehicles traveling through Juneau in either direction on mainline vessels would be required to transfer from the Lynn Canal vessels to the mainline vessel at Auke Bay. Mainline vessels hold between 88 and 134 vehicles. Depending on how many vehicles were passing through Juneau, there could be insufficient capacity on the days the mainliner arrives when local traffic would be added to the demand generated by these mainline vessels. Some Lynn Canal travelers would likely have to use the Haines/Skagway shuttle and travel via Haines or Skagway to reach their final destination, which increases their travel time and potentially their costs (if they need to stay overnight).

A detailed analysis of SMAC's Alternative 5 is found in Appendix II, *Alternative 1B Optimized and Alternative 5 Evaluation*.

In 1970, in an article about the Alaska Marine Highway System, Juneau economist George Rogers wrote: “The National Resources Committee reviewing Alaska’s natural resources development problems and potentials in 1937 stressed the importance of development of a highly flexible transportation system that would not involve heavy capital investment in fixed routes and would be able to overcome or go around the formidable land barriers separating Alaska’s several regions...” Alaska Review of Business and Economic Conditions, Vol. VII, No. 5

AUK-SGY-AUK Daily Schedules

Model Schedule

Notional schedules are developed to verify number of round trips and determine crew times. Schedule start times are arbitrary. Notional schedules are not intended to show route connections or homeport locations. Final schedules and homeport locations will be based on system implementation.

Summer					
Vessel 1	1st Dep	6:00 AM	1st Load	5:45 AM	
Total Crew Time	Circuit No.	Depart Auke Bay	Arrive Skagway	Depart Skagway	Arrive Auke Bay
11.63	1	6:00 AM	11:18 AM	11:50 AM	5:08 PM

Winter					
Vessel 1	1st Dep	6:00 AM	1st Load	5:45 AM	
Total Crew Time	Circuit No.	Depart Auke Bay	Arrive Skagway	Depart Skagway	Arrive Auke Bay
11.63	1	6:00 AM	11:18 AM	11:50 AM	5:08 PM

² This schedule requires both reduced startup and shutdown times and loading/unloading during startup/shutdown. Alternatively, the vessel speed can be increased to 16.5 knots resulting in increased fuel consumption and costs.

*“Route Operation and Schedule Model” in Attachment C of the Appendix GG Marine Segments Technical Report written by Coastwise Corporation Naval Architects Marine Engineers.

**RE: Comments on Juneau Access Improvements Project Draft Supplemental
Environmental Impact Statement**

Dear Ms. Holman and Mr. Haugh:

I have been asked by Jan Wrentmore, President of the Skagway Marine Access Commission, to address the Draft Supplemental Environmental Impact Statement (DSEIS) on the Juneau Access Improvements Project (JAI Project).

- A. It appears that problems with funding prevent FHWA from making a reasoned decision to approve a final SEIS for which the preferred alternative would include a road from the Glacier Highway to Katzehin.**

The 2012-2015 Statewide Transportation Improvement Program (STIP) describes the highway portion of the Preferred Alternative 2B of the JAI Project as follows:

Extend Glacier Highway/State Route 7 northward from its current terminus to the north side of the Katzehin River delta, in a series of stages, per the preferred

alternative in the Final Environmental Impact Statement (EIS) and construct terminal near Katzehin River.

The STIP states that this portion of the preferred alternative would cost approximately:

\$152 million in FFY2014, of which nearly \$105 million would be "equity bonus" funds;

\$58 million in FFY2015, of which nearly \$53 million would be funds from the National Highway Performance Program (NHPP); and

\$300 million after 2015, for which the sources are unidentified.

1. Equity Bonus funds appear to be no longer available.

Equity bonus funds were available under the former 23 U.S.C. § 105. It was repealed by MAP-21.

The last year in which equity bonus funds were made available appears to have been 2009.¹ Such funds remain available for four years.²

Therefore, equity bonus funds made available in FFY2009 had to be obligated by FFY2013 or FY2014. The current federal fiscal year is FFY2015. The equity bonus funds of approximately \$105 million, toward the planned expenditure 152 million in FFY2014, appear to be no longer available.

RESPONSE: The 2011 and 2013 Equity Bonus Funding identified in the Draft SEIS was available at the time the Draft SEIS was released, but now is no longer available to this project. Those funds had to be used within a certain period or they would be lost. Those funds have been used on other projects. If a build alternative is selected in the Record of Decision, the Equity Bonus Funding would be replaced with National Highway Performance Program (NHPP) funding/State match.

¹ FHWA, "A Guide to Federal-Aid Programs and Projects," pp. 54-55 in unpaginated PDF version, available at <http://www.fhwa.dot.gov/federalaid/projects.pdf>.

²Id.

2. NHPP funds are not available for a route not on the NHS.

According to the STIP, nearly \$53 million of the \$58 million in FFY2015 would be from the National Highway Performance Program (NHPP) established by section 1106 in MAP-21 and codified as 23 U.S.C. § 119. It provides that NHPP funds may only be used on projects on the National Highway System.

The road route from Auke Bay to Katzehin is not currently on the National Highway System. Therefore, the route is not currently eligible for the \$53 million in NHPP funds.

In order for the road route to become eligible, it would have to be made part of the National Highway System. In order for that to occur, both the State and FHWA must first comply with 23 U.S.C. § 103(b)(3). It governs the modification of the current National Highway System. It provides:

(3) Modifications to NHS. -

(A) In general. - The Secretary may make any modification, including any modification consisting of a connector to a major intermodal terminal, to the National Highway System that is proposed by a State if the Secretary determines that the modification -

(i) meets the criteria established for the National Highway System under this title after the date of enactment of the MAP-21 ; and

(ii) enhances the national transportation characteristics of the National Highway System.

(B) Cooperation. -

(i) In general. - In proposing a modification under this paragraph, a State shall cooperate with local and regional officials.

(ii) Urbanized areas. - In an urbanized area, the local officials shall act through the metropolitan planning organization designated for the area under section 134.

Under 23 U.S.C. § 103(b)(3), the State must first cooperate with local and regional officials, including those in Skagway who are opposed to the preferred alternative and this route. The State must do so *before* it proposes to the Secretary of Transportation that the route be added as a modification to the existing National Highway System.

Second, in order to determine whether such a proposed modification should be accepted, the Secretary of Transportation must determine whether the State's proposed modification meets the criteria for the National Highway System and enhances the national transportation characteristics of the National Highway System. Obviously, because the State has yet to propose such a modification, the Secretary and FHWA have yet to decide upon such a modification.

Nothing in the DSEIS indicates that the State has commenced cooperation with local or regional officials to propose that the route between Auke Bay and Katzechin be added to the National Highway System. Until such a proposal is made and approved by FHWA, it is without authority to obligate NHPP funds for the preferred alternative. Therefore, FHWA cannot reasonably approve a final SEIS that depends on using NHPP funds for the route until both the State and FHWA have complied with 23 U.S.C. § 103(b)(3).

RESPONSE: This project can use NHPP dollars because:

- 1) The current surface transportation system in northern Lynn Canal is eligible for NHPP funding. New roads as proposed under Alternatives 2B and 3 can be designated as NHS intermodal connectors and are eligible to receive NHPP funds. Modifications to intermodal connectors requires NHS modification. Approval of a modification to the NHS system is independent of an FHWA Final EIS/Record of Decision. An NHS modification would occur prior to requesting construction funding.
- 2) In the process of modifying the NHS system, DOT&PF would cooperate with local community officials.
- 3) DOT&PF plans to submit an asset management plan to FHWA in 2018.

3. Because the STIP does not identify a source of funds for the \$ 300 million needed after 2015, the road appears to be funded for construction only to the Kensington Mine. The road therefore does not meet the criteria at 23 U.S.C. § 103(b)(1) for inclusion in the National Highway System and contravenes 23U.S.C. § 101(d).

As said above, the STIP does not identify any source of funds for the \$300 million needed after 2015 to complete the road to Katzechin. Furthermore, I understand from those opposed to the project assert that the funds for FFY2014 and FFY2015 would result in construction of the road only to Kensington Mine, rather than to Katzechin.

If so, the road would not meet the criteria in 23 U.S.C. § 103(b)(1) for inclusion in the National Highway System. These criteria, in 23 U.S.C. § 103(b)(1), are that the National Highway System consists of the highway routes and connections to transportation facilities that shall -

- (A) serve major population centers, international border crossings, ports, airports, public transportation facilities, and other intermodal transportation facilities and other major travel destinations;
- (B) meet national defense requirements; and
- (C) serve interstate and interregional travel and commerce.

Here, based on the funds identified so far in the STIP, the road would simply serve Kensington Mine and could not meet the criteria for inclusion in the National Highway System.

As a partially-funded project, it amounts to expending Highway Trust Funds for Kensington Mine. Doing so is barred by 23 U.S.C. § 101 (d). It provides in part that "No funds authorized to be appropriated from the Highway Trust Fund shall be expended . . . on behalf of any . . . instrumentality other than the Federal Highway Administration" unless funds for such expenditure are identified and included as a line item in an appropriation Act. No appropriation Act has included expenditure of such funds to build a road to Kensington Mine.

RESPONSE: Currently, there are no funds shown in the Statewide Transportation Improvement Program (STIP), since the preferred alternative has been changed to Alternative 1 - No Action Alternative. However, during the period between the release of the 2014 Draft SEIS and the change of the preferred alternative to No Action, the completion of the design phase for Alternative 2B was shown in the 2016-2019 STIP. The funding for construction was after FFY 2019 because the initial construction stage would occur after 2019.

A build alternative would be constructed in stages, which is not segmentation. Showing the intent of fully funding the project in the years beyond the current STIP shows intent by DOT&PF to fund the project in its entirety and is accepted by FHWA. (See <http://dot.alaska.gov/stwdplng/cip/stip/index.shtml> for full details on the STIP.) The suggestion that FHWA or DOT&PF intend to build a road to Kensington Mine is unfounded and not supported by any information in the Draft SEIS.

4. These funding issues render any decision to approve the preferred alternative as arbitrary, capricious and an abuse of discretion for purposes of implementing NEPA, and for subsequently implementing 23 U.S.C. § 106.

These funding issues are fatal to approval of a final SEIS having Alternative 2B, containing the road to Katzehin, as the preferred alternative. Approving a preferred alternative that cannot be funded at this time simply means that the SEIS will go stale and result in additional NEPA analysis if the State ever decides to pursue the project again. Therefore, approving it would be arbitrary, capricious and an abuse of discretion. Moreover, that is also the case with respect to future implementation of 23 U.S.C. § 106(a). It requires the Secretary of Transportation to approve plans, specifications, and estimates for each proposed project. Approval of the preferred alternative will lead to subsequent decisions under 23 U.S.C. § 106 to approve, or not, such plans, specifications, and estimates. But it is already obvious that the funds for the entire project are not available. So, for purposes of 23 U.S.C. § 106(a), approval of the preferred alternative is again arbitrary, capricious and an abuse of discretion, and would result at best in completion of part of the project, to Kensington Mine. This would amount to unlawful segmentation of the project, because it would not meet the criteria for inclusion on the National Highway System and would not have independent utility for purpose of that System.

Furthermore, because of the funding issues, it will be impossible for the State to comply with 23 U.S.C. § 106(h). It applies to a recipient of Federal financial assistance for a project with an estimated total cost of \$500,000,000 or more. It requires the recipient to submit to the Secretary for each such project a "project management plan," and (B) "an annual financial plan, including a phasing plan when applicable."

The project management plan shall document: (A) the procedures and processes that are in effect to provide timely information to the project decision-makers to effectively manage the scope, costs, schedules, and quality of, and the Federal requirements applicable to, the project; and (B) the role of the agency leadership and management team in the delivery of the project.

The dubious funding means that the scope, costs, schedules and quality of the project are equally dubious.

The requirement for a financial plan goes directly to the dubious funding. Under the statute, the financial plan must be "based on detailed estimates of the cost to complete the project," and must provide for "annual submission of updates to the Secretary that are based on reasonable assumptions, as determined by the Secretary, of future increases in the cost to complete the project." The financial plan may include "a phasing plan" that identifies fundable "phases that will address the purpose and the need of the project in the short term in the event there are insufficient financial resources to complete the entire project." These requirements cannot be met if the funds are not available. In particular, the purpose and need cannot be met if the funds are available to build the route at best to Kensington Mine.

Finally, 23 U.S.C. § 106(h) provides that if a phasing plan is adopted for a project, then the project shall be deemed to satisfy the fiscal constraint requirements in 23 U.S.C. § 135, under which the STIP is prepared. This statute, 23 U.S.C. § 106(h), demonstrates that Congress considered the requirements for fiscal constraint to apply to *each project* in a STIP, and not only at the overall level of approval of a STIP under 23 U.S.C. § 135. Because the purpose and need cannot for this project be met by funding a partial project to Kensington Mine, and because even the STIP concedes that the source of the funds after 2015 cannot be identified, it follows that the requirement for fiscal constraint as applied to this project cannot be met. Therefore, FHWA should reject the preferred alternative because it cannot be said to be fiscally constrained.

RESPONSE: Approval of any of the alternatives is not arbitrary, capricious, or an abuse of discretion. A build alternative selected in the Record of Decision would be fully funded and completely built. There is no alternative that only goes to Kensington Mine. This project has been advanced by FHWA, as evidenced by a 2006 Record of Decision, continued efforts in the SEIS, and its approval of the STIP (consistent with 23 USC 135(g)). Additionally, it is common to have phased construction on large projects. Should an alternative be selected with an estimated project cost over \$500 million, it is considered a major project per 23 USC 106(h) and DOT&PF would be required to prepare a project management plan and financial plan for FHWA approval after the Final SEIS is completed.

- B. In deciding whether to approve the preferred alternative that would include a road from the Glacier Highway to Katzehin, FHWA should determine under 23 U.S.C. § 109 whether the route is safe.

The Skagway Marine Access Commission has submitted a document titled "How the Juneau Road Fails to Meet State and Federal Highway Safety Goals: An Analysis of Safety Issues in the Juneau Access Project DSEIS" (November 2014). It asserts that 43 avalanche

chutes and about 100 geologic hazards, such as rock falls and land slide areas, have been identified along the route. That document asserts that the route would create safety issues similar to those along the Seward Highway in the area of Turnagain Arm.

Under 23 U.S.C. § 109, the Secretary of Transportation's approval of plans for construction of a highway is conditioned upon a determination that the facility will adequately serve the existing and planned future traffic of the highway in a manner that is "conducive to safety, durability, and economy of maintenance." This statute requires the Secretary to make the determination as to the safety of the proposed highway *before* granting approval under 23 U.S.C. § 109. *D.C. Federation of Civic Associations v. Volpe*, 459 F.2d 1231, 1242 (D.C. Cir 1972); see also 49 U.S.C. § 13101 (federal transportation policy is to promote "safe, adequate, economical, and efficient transportation").

The safety determination should be in the context of comparing the preferred alternative to the existing facilities. Moreover, the time for that safety determination, or at least a preliminary determination, is when FHWA is faced with whether to approve the preferred alternative. The decisions about safety and a preferred alternative merge, at least to the extent that it makes no sense to do otherwise by approving the preferred alternative and later finding it unsafe after the State and FHWA have spent additional public funds further designing the project.

RESPONSE: All roads constructed under State and federal authority must follow State and federal design procedures and standards that have been adopted/established to support safe travel. FHWA will ensure that any build alternative selected for construction fulfills the standards identified in 23 USC 109.

- C. In deciding whether to approve the preferred alternative, FHWA should determine under 49 U.S.C. § 13101 whether the route promotes "safe, adequate, economical, and efficient transportation".

In the DSEIS, Appendix FF, titled "User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses," shows that none of the action alternatives are cost effective, and none created net positive benefits.³ In light of such findings in the DSEIS, FHWA must implement the policy at 49 U.S.C. § 13101 by finding that the preferred alternative does not comply with the federal policy of promoting "safe, adequate, economical, and efficient transportation".

³ See also comments submitted by Gregg Erickson, of Erickson & Associates, economic consultants.

RESPONSE: The cited 49 USC 13101 falls under Part B, "Motor Carriers, Water Carriers, Brokers, and Freight Forwarders" and is about overseeing transportation "carriers" rather than overseeing the roads that carriers may use. Regardless, it is DOT&PF and FHWA's intent in building and maintaining transportation infrastructure to promote safe, adequate, economical, and efficient transportation. Transportation in Southeast Alaska is heavily subsidized and may not 'pencil out' with a net benefit, because of high costs to operate ferries as well as roads for a relatively small population base. Alternative 2B would provide for more use at a lower unit cost

than the existing service. Selecting such an alternative would not violate the stated FHWA policy, or any FHWA policy.

The purpose of the economic efficiency and cost-effectiveness analysis conducted as part of the Draft SEIS was to determine which alternatives serve the largest number of travelers at the lowest possible cost.

A number of measurements are important in the selection of a preferred alternative. For example, the total number of travelers served is important. Alternative 2B serves substantially more travelers than any of the other alternatives (9.6 million vehicles versus 1.4 to 3.4 million vehicles for the marine alternatives). The cost to serve each traveler is another important measurement (Alternative 2B is lowest in terms of per user cost).

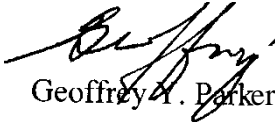

The fact that all benefit cost ratios calculated in Appendix FF, *Use Benefit, Life-cycle Cost, and Total Project Cost Analyses*, are less than 1 does not mean investment in better infrastructure is imprudent, it primarily means that transportation infrastructure costs are very high in Alaska, where populations are generally small, distances are long, terrain is often challenging, and sea conditions are often difficult.

Conclusion

The proposed Juneau Access project has generated endless controversy. That controversy has gone on long enough. It needs to end now.

Neither the State nor Highway Trust Fund has the financial resources to entertain such expensive and wasteful projects. If the State under the new governor and new leadership at ADOT&TF cannot end this project now, then FHWA should do so. It has many statutory authorities, under NEPA and under Titles 23 and 49 of the U.S. Code, that provide the legal basis for ending this project.

Sincerely,

Geoffrey A. Parker

Mark Rorick Chair

Subject: Comments on Juneau Access Draft SEIS.

Summary: TGSC (used to be the Juneau Group of Sierra Club) has been involved with the Juneau Access projects for more than 20 years. From the first proposed project, a west Lynn Canal road that would come down from Haines and connect to Juneau and Admiralty Island, to what DOT&PF is proposing now. TGSC is a sub-entity of the National Sierra Club and these comments represent the National Sierra Club and the AK Chapter of the Sierra Club.

These comments are here because the 2006 FEIS failed "to examine a viable and reasonable alternative to the proposed project," violating the National Environmental Policy Act (NEPA), which requires agencies to "rigorously explore and objectively evaluate all reasonable alternatives." Alternative 1b does not follow the court's ordered mandate to rigorously explore all reasonable alternatives, and is not designed to meet the stated purpose and need.

RESPONSE: Alternative 1B complies with NEPA and the Court's order. The Court's order was to develop an alternative that would improve surface transportation in Lynn Canal with existing Alaska Marine Highway System (AMHS) assets. Alternative 1B was carefully developed and analyzed in strict accordance with this order. DOT&PF and AMHS staff developed a new alternative based on direction from the Court, shared a draft of that alternative with the public during a new scoping effort, took input on the new alternative, and revised that alternative based on the scoping comments received. The new alternative took into account changes that had occurred to the "existing assets" in the AMHS fleet since the 2006 Record of Decision (ROD), the capabilities of the vessels in the fleet, and the needs and mission of

the fleet to the numerous communities served by AMHS. DOT&PF and FHWA fully disclosed the development and evaluation process in the Draft Supplemental Environmental Impact Statement (SEIS). Appendix CC, *Development of Alternative 1B – Enhanced Service with Existing Alaska Marine Highway System (AMHS) Assets*, of the Draft SEIS described the efforts undertaken to develop Alternative 1B and documented the data and analysis relied on to create as reasonable an alternative as possible for solving the transportation problems in the corridor using only existing assets.

Alternative 1B incorporated the following considerations:

- Existing AMHS assets reasonably available and feasible for use in Lynn Canal
- Programmed AMHS assets (decisions made by AMHS independent of this project that made new day boats available in the fleet)
- Enhancements that could be employed, as suggested by the Plaintiffs, that do not involve substantial initial capital investments

The resulting alternative, Alternative 1B, was developed and rigorously analyzed to the same level as all other build alternatives in the Draft SEIS. DOT&PF and FHWA took comments on Alternative 1B during the development of and public review period for the Draft SEIS, and have addressed those comments in the Final SEIS, including updating and refining it for current data.

Revised Appendix CC of the Final SEIS describes the development of Alternative 1B.

TGSC supports the no action alternative, a proposed alternative that uses Alaska Class Ferries (ACF) home based in Auke Bay and the M/V Malaspina home based in Haines (Alternative 1b optimized), and a proposed Alternative 5 using three ACFs and removing one mainliner from use in the Lynn Canal corridor.

Issues

Purpose and Need: Improved safety has been left out as one of the purposes and needs of the project and as a criterion for decision making it is nonexistence.

This biases the selection of DOT&PF's preferred alternative to the Alt 2b and Alt 3 roads. Improved safety is a criterion that needs to be analyzed and compared in all alternatives so the public can be informed on the issue.

Safety is one of the priorities put out by AASHTO for the construction of federal highways, which DOT&PF is supposed to follow. The AMHS has a record of no deaths in the Lynn Canal corridor and if safety was part of the purpose and need of the project the marine alternatives would rank as the best for safety.

RESPONSE: Safety is included in the purpose and need statement for a project only if there is a demonstrable safety problem on the transportation link being considered. An example would be when there is a higher number of accidents than the state average for similar transportation facilities. Safety is not a problem with the current transportation system; therefore, it is not a stated purpose for the proposed project. All roads constructed under State and federal authority must follow State and federal design procedures and standards that have been adopted/established to support safe travel. Therefore, all of the project alternatives are safe and reliable.

Mission Statement DOT Commissioner Malcolm Menzies. Our accomplishments are measured by:

Reduced injuries, fatalities & property damage.

Safe DOT&PF operations.

Our missions is accomplished by:

STATEWIDE DOT EMPLOYEES	SE REGION DOT EMPLOYEES
Average of 3000 employees	245 in SE Region (8% of total) plus 139 in HQ & 120 in AMHS operation
Alaska encompasses a geographic area of 656,425 sq. miles (570,374 sq. miles are land, 86,051 sq. miles are water)	42,000 sq. miles in SE Region (6%)
2005 Alaska's Population is 663,661	S.E. Alaska's population is 70,822 (10.7%)

Our Mission accomplishments are measured by:

- Reduced injuries, fatalities & property damage
- Safe DOT/PF operations
- Improved mobility of people and goods
- Increased private investment
- Provide the assets and facilities to enable delivery of State services.

DOT Commissioner Luiken said in a Joint Transportation Committee DOT hearing that the "Four E's of safety in all DOT projects, be them construction or maintenance, are "education, enforcement, **engineering, and emergency services.**" And that one of the four goals stated for the 2008 Southeast Alaska Transportation Plan is to "maintain or improve modal safety. DOT&PF has narrowed the Purpose and Need of the Juneau Access improvement Project by deleting safety, thereby producing a result in favor of road alternatives. There is no justification for deleting safety from the DSEIS's P&N and consequently it is arbitrary and capricious. Safety issues about the road alternatives are discussed in the safety section.

RESPONSE: Safety was not part of the 2006 EIS Purpose and Need and was, therefore, not “deleted” from the 2014 Draft SEIS. Not including safety in the project’s purpose and need is not “arbitrary and capricious.” As was previously discussed, safety is included in the purpose and need statement for a project only if there is a demonstrable safety problem on the transportation link being considered. An example would be when there is a higher number of accidents than the state average for similar transportation links. Safety is not a problem with the current transportation system; therefore, it is not a stated purpose and need for this project.

The Draft SEIS and the *Socioeconomic Effects Technical Report* (Appendix EE) presented information regarding public safety for each project alternative. Information on traffic related accidents and fatalities for the road alternatives is included in Sections 4.3.7 and 4.4.7 of the Draft SEIS and has been updated for the Final SEIS.

Travel Demand: The SDEIS says the road to Katzehin/Haines/Skagway will generate a travel demand that does not exist now and that DOT&PF's travel-use forecast is based on a thirty six year lifetime model. The farther an estimate is projected through time the more it becomes un-liable for predicting travel demand. DOT&PF's estimated demand model is missing any quantified measures of the uncertainty that are inherent in the model. It is just noted as a huge uncertainty. The travel demand forecast numbers are an assumption that is part of the base for calculating the comparative cost/benefit of the projects alternatives, how many fatalities and crashes, policing and emergency servicers that may be needed, the comparison of travel user costs between alternatives, and much more. If the demand forecast is inaccurate or based on flawed comparisons then many other parts of the SDEIS are wrong and the justification of the project has no merit. Travel Demand will also be brought up in various other sections of these comments.

RESPONSE: The travel demand model used for the Juneau Access Improvement Project is neither “inaccurate” nor based on “flawed comparisons.” The forecast numbers are not an “assumption” or “a huge uncertainty.” All traffic demand models attempt to predict future demand based on assumptions and data available in the present.

The total demand model used for this project was developed based on empirical data derived from actual travel conditions observed in communities with geographic characteristics similar to Juneau located in Alaska and Western Canada. The model starts by defining a condition that the modelers called “unconstrained demand.” This level of demand predicts how many people would want to travel between Juneau and Haines/Skagway if there were a road the entire distance. This predictive condition was based on the assumption that people in Juneau, Haines, and Skagway would exhibit similar travel patterns given the opportunity to travel by road like other similarly situated communities. Based on the project team’s research, there are no indicators that travel behavior in Juneau, Skagway, and Haines would differ substantially from that of other Alaskan and Canadian communities if full highway access were available. Based on the data collected, the project team is confident that Juneau residents would travel in a similar

manner to other Alaskan residents.

The forecast only used the unconstrained demand as an upper bound to bracket the overall demand in the corridor. Each forecast, for each of the alternatives, scales down from the unconstrained demand based on factors of cost, travel time, schedule convenience, etc. Using such factors to predict traveler's choices and behavior amongst competing alternatives is a common modeling practice and is used in nearly every traffic model. By factoring the demand down from the unconstrained demand based on costs, travel time, and convenience, the model predicts reasonable estimates of travel behavior based on the relative merits of the alternatives.

Contrary to the commenter's assertion, the modelers used quantitative methods to validate the model and estimated demand using more than one methodology to provide greater certainty that the forecast was grounded in real data and based on repeatable, valid methodologies/approaches. These approaches were developed by travel modelers at Fehr & Peers. This firm was specifically identified and hired for its expertise in the travel modeling field, and the approach and results were peer reviewed by an independent university professor with expertise in travel modeling and travel behavior prior to the results being accepted for use in the Draft SEIS. Two methods/models were selected as being most representative of likely conditions along Lynn Canal. Each of these models was developed independently and resulted in similar estimates of travel volume along Lynn Canal. The methodology and results of both approaches are fully disclosed in Appendix AA, *Traffic Forecast Report*, and summarized in the Draft SEIS. The traffic forecast was updated for the Final SEIS, taking into consideration input received on the Draft SEIS and updated base year information.

DOT&PF's assumption is that there is a large unmet travel demand in the Lynn Canal corridor, and that "low" Lynn Canal Ferry use (Average Annual Daily Traffic (AADT)) is an indication that the "AMHS is not meeting the travel demand in the Lynn Canal. This is a very strange assumption and defies logical thinking. DOT&PF says that by increasing the opportunity to travel and decreasing travel times and user costs in Alternative 2b, travel will increase by as much as 500% over 35 years. There is no data to support this huge increase in travel or the assumption that low ferry ridership means unmet demand. The logic behind this is irrational, and historically it is disputed using DOT&PF's Table 1-1 data which has the data of ferry sailings and ferry use year by year. Example, the numbers from year 2007 had a decrease of travel when more opportunities for travel increased. This is only one example. The year with the most volume, 1991, had only 66% of the travel opportunity provided in 2007, yet had 24% more vehicle volume and 46% more passenger volume. Even the year with the least travel opportunity, 1989 with 240 round trips, had more passengers and vehicles than 2007. Similar correlations disputing DOT&PF's assumption occurred between 2011 and 2012. There are many variables that can contribute to the flux in user use compared to opportunity in the AMHS's Lynn Canal corridor, including economic down- turns and up-turns, more

people using private boats, and population changes among others. To the point, there is no rationale to support DOT&PF's assumption that there is an unmet demand for travel and that the AMHS can't meet it. The reality is that the AMHS' ferries do and can meet Lynn Canal travel demand. Alaska Class Ferries (ACF) meets the current Lynn Canal travel demand and can do more: (McDowell Group North Lynn Canal Ferry Service Analysis 2014 PDF). Based on no assumptions a currently commissioned ferry use study has come to the conclusion that two ACF's doing the Juneau/Haines/Juneau route can meet the peak summer demand and more for Lynn Canal ferry travel, freeing up the M/V Malaspina for other routes, with a deduction of costs. No new ferry terminals will be needed.

RESPONSE: The commenter has not documented any “irrational” or “strange” assumptions. The commenter has selected a data set that is too small to make statistically valid correlations and presents it as a suggestion that the traffic forecast in Lynn Canal is faulty. It is not within accepted modeling practice or statistical analysis to rely on one or two years of data to surmise a statistically valid correlation (or the lack of one). It is just as invalid to pick individual years to demonstrate a positive correlation in the data. For example, between 1989 and 1991 round trips increased from 240 to 290 and passenger demand increased from 115,742 to 131,865; numerous other hand-picked years could be identified to suggest a different correlation. The reason this approach is invalid is that frequency of service is not the only factor in people’s decision to travel. Other factors include costs, schedule, or economic conditions in the given year cited. Each of these factors would need to be known to make an accurate assessment. Moreover, the supply in capacity varies from year to year. Because capacity is not consistent, trip planning can be difficult for the traveling public. Conclusions drawn from data over short periods using a variable that is not consistent long enough to see a correlation in the response are suspect.

As the commenter points out, there are many factors that can contribute to anomalies in 1 or 2 years of data that can be explained by factors such as the economy. The Purpose and Need chapter (Chapter 1) of the Draft and Final SEIS presents the data described by the commenter and also discusses the up-turns and down-turns. None of the past changes in frequency, cost, or travel time that were implemented by AMHS were done in a coordinated fashion or implemented for a long enough time to test their effectiveness. Nor were the changes of the magnitude proposed by Alternatives 2B and 3.

DOT&PF and FHWA did not rely on “faulty assumptions,” and they did present strong and convincing data of the overall demand in the Lynn Canal corridor in the SEIS. The total demand model used for this project was developed based on empirical data derived from actual travel conditions observed in communities with similar geographic characteristics as Juneau in Alaska and Western Canada. The commenter only reports a portion of the data collected. The model input analysis also included Anchorage, Fairbanks, and Whitehorse (as regional centers like Juneau) as well as similar coastal communities, including Prince Rupert and Port Hardy, British Columbia and Seward, Homer, Valdez, Haines, and Skagway, Alaska (see *Appendix AA, Traffic Forecast Report*).

The model used data from these communities to generate a trip dissipation model. Based on the results

from the communities listed above, a very strong correlation was found between the distance traveled from the edge of the community and the traffic volumes. This predictive model was used, among other sources, to develop an unconstrained demand model for Lynn Canal. It is based on the assumption that people in Juneau, Haines, and Skagway would exhibit similar travel patterns given the opportunity to travel by road as other similarly situated communities. Based on the project team's research, there are no indicators that travel behavior in Juneau, Skagway, and Haines would differ substantially from that of other Alaskan and Canadian communities if full highway access were available. Based on the data collected, the project team is confident that Juneau residents would travel in a similar manner to other Alaskan residents.

The forecast only used the unconstrained demand as an upper bound to bracket the overall demand in the corridor. Each forecast, for each alternative, scales down from the unconstrained demand based on factors of cost, travel time, schedule convenience, etc. Using such factors to predict traveler's choices and behavior amongst competing alternatives is a common modeling practice and is used in nearly every traffic model. By factoring the demand down from the unconstrained demand based on costs, travel time, and convenience, the model predicts reasonable estimates of travel behavior based on the relative merits of the alternatives.

Moreover, more than one approach to predicting future travel behavior was used by the project team. These approaches were developed by travel modelers at Fehr & Peers. This firm was specifically identified and hired for its expertise in the travel modeling field, and its approach and results were peer reviewed by an independent university professor with expertise in travel modeling and travel behavior prior to the results being accepted for use in the Draft SEIS. Two models/approaches were selected as being most representative of likely conditions along Lynn Canal. Each of these two models was developed independently and resulted in similar estimates of travel volume along Lynn Canal. The methodology and results of both approaches are fully disclosed in *Appendix AA, Traffic Forecast Report* and summarized in the Draft and Final SEIS.

Other Problems in DOT & PF's Demand Forecast:

Most of Skagway is within a mile of the ferry terminal and the DSEIS presents data that 700,000 - 800,000 per year visitors access Skagway by just a boat, about 100% more than by auto. There is virtually no need for people traveling from Juneau or Haines to Skagway to take a car with them. It makes no sense to take a car when you can access the city by a 5 minute slow walk from the AMHS ferry dock. The DSEIS is estimating an unconstrained demand of 275 vehicle roundtrips per day from Juneau residents to Skagway and a summer demand of an even higher 615 round trips per day. Why would they do this? Even if they wanted to visit Skagway as thousands do each summer, why would they take their vehicles?

RESPONSE: The numbers cited for unconstrained demand referenced by the commenter are incorrect. The correct numbers can be found in Table 7 of Appendix D of the *Traffic Forecast Report* (Appendix AA of the Draft SEIS). The commenter confuses unconstrained demand with the demand that is presented in the Draft SEIS for the reasonable alternatives. The unconstrained demand is not the demand predicted for any

of the proposed reasonable alternatives. The forecast only used the unconstrained demand as an upper bound to bracket the overall demand in the corridor. Each forecast, for each of the alternatives, scales down from the unconstrained demand based on factors of cost, travel time, schedule convenience, etc.

As to why the travelers would want to take their vehicles to Haines, Skagway, or Juneau through Lynn Canal, the Purpose and Need chapter (Chapter 1 of the Draft SEIS) documented the problems with the current service. It is time consuming, inconvenient, and expensive. By providing greater flexibility for when people can travel, reducing how long it would take to make the trip, and also reducing the cost of the trip, it is predicted that many people would choose to drive. Moreover, the trips forecasted to use the project alternatives are not just those “visiting Skagway.” The travel demand considered trips in both directions and included Skagway and Juneau residents, visitors, freight haulers, etc. who would use the alternatives, as well as other users just passing through (e.g., people traveling from Whitehorse or Anchorage to and from Juneau, or from even beyond these points).

Citing the 700,000 to 800,000 cruise ship passengers that visit Skagway by boat (and not needing a car) and comparing them to the demand for those wanting or needing to bring a car is misleading. First, the Draft SEIS did not include the over 800,000 cruise ship visitors as part of the demand for the proposed alternatives. Those visitors would continue to arrive in Skagway by boat (on the cruise ships), and the Draft SEIS did not predict that they would need a car when they get to Skagway. Second, it is not disputed that the AMHS ferry dock is within walking distance to downtown Skagway. However, Skagway is the only port of the three that is within walking distance to town. However, as noted above, not all travelers using the Skagway Ferry Terminal have an origin/destination within walking distance. For example, the highway through Skagway connects into Canada and provides an important overland route into and out of the region. In addition, Juneau and Haines require vehicle travel to reach those ferry terminals. The road alternatives (2B and 3) represent a shift in the way transportation would be provided in the corridor—away from a primarily public transportation mode that operates more like a public transit service, to a highway system where private vehicles provide most of the transportation (publicly-owned shuttle ferries would provide shorter links connecting the roadways).

There is a large discrepancy for the Skagway Route. Appendix FF takes the daily numbers in Appendix AA and turns them into annual numbers. For Skagway, the transportation model estimate for existing users is 9,954 vehicles per year. The average of the volumes for the past five years is 6,412 vehicles. Therefore, the model over predicts the existing usage by 55%. The model also over predicts the Haines route but by a lesser amount, 14%. Even if there were no other problems with the models such as those mentioned above, these discrepancies would suggest that future demand is overestimated.

RESPONSE: The commenter has used incorrect AMHS numbers in generating their calculation. The error is related to the two types of data reported by AMHS: (1) link volume data for city pairs, and (2) on-off data for each port of call, also known as “port-to-port volume data.” The link volume data includes all ‘local’ persons and vehicles beginning and ending in Juneau, Haines, or Skagway plus all passengers who passed through Juneau, Haines, or Skagway northbound or southbound on their way to destinations

outside Lynn Canal. In contrast, on-off data only includes trips that embarked or disembarked within Lynn Canal (i.e., no through travel).

The data reported in Appendices AA (*Traffic Forecast Report*) and FF (*User Benefit, Life-Cycle Cost, and Total Project Cost Analyses*) represent link volume data. These data are summarized as average daily traffic in Table 3-1 of Appendix AA (and are adjusted to annual traffic in Tables A-6 and A-10 of Appendix FF). Table A-10 shows the 9,954 total annual link volumes for Juneau-Skagway reported by the commenter (adding summer vehicle count of 6,732 to winter vehicle count of 3,222). The link volume number is the correct number for calculating the total travel between Juneau and Skagway, in that it includes the through-traffic.

It appears that the commenter used an average of 5 years of port-to-port volume data. Looking at on/off data only, Fehr & Peers examined the AMHS on/off data for Juneau-Skagway for 3 years: 2011, 5,825 vehicles; 2012, 6,586 vehicles; and 2013, 6,558 vehicles. This produces a 3 year average of 6,323 vehicles, which is close to the commenter's value of 6,412 vehicles. Therefore, we believe that the commenter used on/off data in the calculation. These port-to-port volume data do not account for the through-trips on the ferry within Lynn Canal. Similar comparisons account for the differences in the Juneau-Haines data.

The source of the daily link volume data was the AMHS *2011 Annual Traffic Volume Report*. Fehr & Peers reviewed comparable data from the 2010 through 2014 traffic reports. The passenger and vehicle counts are virtually unchanged on an annual basis over the last 5 years for which data is available. DOT&PF and FHWA are confident that the link volume data used in the analysis accurately reflects ferry usage within Lynn Canal. By relying on the port-to-port data, the commenter is incorrectly under representing the actual travel because the through-traffic is not included.

The Hypothetical "unconstrained demand" Model:

As noted above the farther an estimate is projected through time the more it becomes unreliable, and DOT&PF's estimated demands are missing quantified measures of their uncertainty.

DOT&PF uses other roads to validate the unconstrained model though there is no possibility of having an accurate comparison. An example of uncertainty is the cultural correction for the Whitehorse to Skagway road. A city edge trip rates per population number (Appendix AA, Fig 2,)

A second indicator is the comparison of the traffic growth within transportation corridors adjacent to Lynn Canal to traffic growth in Lynn Canal. (Pg 1-13) Table 1-3 shows that the lightly traveled Dyea Road to Skagway has traffic volumes almost double the traffic transported by AMHS. To say Dyea road and AMHS are comparable is not remotely true. Many shore side cruise tours travel Dyea road - a 4-ship day, which is common, can bring 10,000 tourists to Skagway. Also, Skagway summer hires take advantage of the closeness of Dyea for breaks from the grind of serving all those

cruise passengers. All of which doesn't begin to correlate with AMHS Lynn Canal travel.

The single validation done for a city pair is for the interchange between Anchorage and Fairbanks.

The model estimates about 3,000 trips per day between these cities and also found about 3,000 vehicles on the road. This ignores the large destination between these cities, Denali National Park! A large proportion of the traffic observed at the traffic count locations is related to the park and to people living between the two major cities, rather than all being accounted for by intercity travel.

The high rate of 4,682 selected on the basis of Fairbanks and Anchorage is iffy also (Pg 1-11).

RESPONSE: Fehr & Peers did not use other roads to “validate” the model. Fehr & Peers used other similarly situated communities in Alaska (both regional center communities like Juneau and other, more isolated coastal communities like Haines and Skagway) and Western Canada with similar geographic characteristics as Juneau, and examined their trip-making patterns on the highways leaving those communities. The analysis found a strong correlation between the distance traveled from the edge of the community and the traffic volumes. This predictive model was used, among other sources, to develop the total (unconstrained) demand model for Lynn Canal. That model was used to bracket an upper end (or total demand) for travel in Lynn Canal. Demand was then scaled down from the total demand based on constraints like cost, travel time, schedule convenience, etc. Using such factors to predict traveler’s choices and behavior amongst competing alternatives is a common modeling practice and is used in nearly every traffic model. By factoring the demand down from the unconstrained demand, the model predicts reasonable estimates of travel behavior based on the relative merits of the alternatives. The model was able to reasonably predict Lynn Canal travel with constraints applied, and was “validated” against a known existing data point in time for the existing ferry system in Lynn Canal (i.e., travel time, cost, convenience, etc. were applied to the model, and it was calibrated to be able to predict demand for an existing known data point). Such procedures are a standard step in every valid modeling process.

Regarding the commenter’s other critiques of the modeling:

- Contrary to the commenter’s assertion that the “estimated demands are missing quantified measures of their uncertainty,” the traffic model report does present such measures. See Table 4-6 in Appendix AA, *Traffic Forecast Report*, which quantitatively presents high and low total demand predictions. The traffic forecasts used a conservatively low range of ‘edge’ traffic rates (see Table 4-5 and Figure 4-1 of Appendix AA) for the Juneau traffic estimates. While the population of Juneau more closely matches some of the smaller communities shown in Table 4-5 (each of which have much higher edge traffic rates), the range of rates used in the forecasts were balanced between those of Whitehorse and Anchorage/Fairbanks. The forecasted rates for Skagway and Haines were based on their existing observed rates.
- The example cited as an “uncertainty” and described by the commenter as a “cultural correction for the Whitehorse to Skagway road” is actually the opposite. Rather than an uncertainty, the citation reflects a refinement to the model assumptions, to better reflect reality. As documented in Appendix C of the

Appendix AA, *Traffic Forecast Report*, Americans travel approximately 50% more than Canadians, which is why Whitehorse has a lower trip rate per population than American cities with similar characteristics. Whitehorse trip generation information was studied as part of the model development and validation process.

- The travel demand forecasts presented in Appendix AA are not based on the road to Dyea. The edge and dissipation modeling presented in Appendix AA is based on the Klondike Highway, The table cited from Chapter 1 of the Draft SEIS, is making the point that even rural roads that are not a part of the National Highway System see traffic volumes much greater than that experienced on the AMHS. The table from Chapter 1 is not a result of, nor the basis for, the traffic forecasts. To try to indicate that one is the result or basis for the other is inaccurate.
- It is inaccurate to infer that there was a “single validation” done for a “city pair between Anchorage and Fairbanks.” First, as was previously discussed, the information described by the commenter was not part of the “validation” of the traffic demand for the project alternatives forecasts. Validation has a very specific meaning within traffic forecasting different from that used by the commenter. Second, the model does not estimate or rely on trips interchanging “between” Anchorage and Fairbanks. As is explained in Appendix AA, three regional cities were used as example “regional centers” to gauge the edge effect of travel from these centers. Appendix AA describes this edge effect as “the point traffic volumes decrease exponentially until leveling off at a particular volume.” It is not, as the commenter suggests, about the interchange of traffic. As can be seen in Figure 4-3 of Appendix AA, the edge effect on the Parks Highway (from either Fairbanks or Anchorage) occurs at a much shorter distance than Denali National Park. Moreover, the commenter’s logic for ruling out these cities because they have a National Park some distance outside them is illogical, given that the commenter mentions the draw of the Klondike Gold Rush Historic National Park and Dyea located in Skagway. Such a draw could be considered analogous for the regional center of Juneau to the draw of Denali National Park to Anchorage and Fairbanks.
- The suggestion that only one community (or as the commenter erroneously suggests, a “single city pair”) is used for validation is incorrect. The analysis in Appendix AA clearly identified three regional hubs and seven coastal communities in Alaska and British Columbia, with similar highway-ferry connections terminating at these communities.

Alternatives

Alternative 1b: Alternative 1B has been designed with less capacity and higher costs than it could have been and therefore violates the court mandate to "rigorously explore an alternative aimed at providing improved and more efficient ferry service". The proof of this is in Alternative 1b Optimized and Alternative 5 detailed below.

RESPONSE: Alternative 1B did not violate the Court mandate and DOT&PF and FHWA rigorously explored an alternative aimed at providing improved and more efficient service. In response to the 2009 U.S. District Court ruling, DOT&PF and FHWA developed a new alternative, shared a draft of that alternative with the public during a new scoping effort, took input on the new alternative, and revised that alternative based on the scoping comments received. The new alternative took into account changes that

had occurred to “existing assets” in the AMHS fleet since the 2006 ROD, the capabilities of the vessels in the fleet, and the needs and mission of the fleet to the numerous communities served by AMHS. DOT&PF and FHWA fully disclosed the development and evaluation process in the Draft SEIS. Appendix CC of the Draft SEIS describes the efforts undertaken to develop Alternative 1B and documents the data and analysis relied on to create as reasonable an alternative as possible for solving the transportation problems in the corridor using only existing assets.

Alternative 1B incorporated the following considerations:

- Relied on existing ferry assets and terminals, without new construction
- Considered reassigning mainline vessels
- Provided additional capacity as compared to Alternative 1 – No Action
- Adjusted schedules and increased frequency as compared to Alternative 1 – No Action
- Reduced travel times as compared to Alternative 1 – No Action
- Considered system enhancements such as increasing the staff at the ferry terminals, increasing the reservation staff, upgrading the reservation website, producing and maintaining a reliable schedule 2 years in advance, increasing marketing, reducing fares, and improving the management structure.

The suggestion that Alternative 1B has been designed with less capacity than it could have been is misleading. Alternative 1B was developed to provide sufficient capacity to match the demand. Moreover, it did make an improvement in capacity as compared to Alternative 1 – No Action. As shown in Chapter 2 (Table 2-5 of the Draft SEIS), Alternative 1B evaluated in the Draft SEIS would have a summer capacity of 129 vehicles per day to Haines and a summer capacity of 201 vehicles per day to Skagway, compared to the summer capacities of 93 and 61 vehicles to Haines and Skagway, respectively, for the Alternative 1 – No Action (see Table 2-2 of the Draft SEIS). The Final SEIS, similarly, shows higher capacities for Alternative 1B as compared to Alternative 1. Regarding higher costs, Alternative 1B did not add any additional capital costs. Increasing service levels in Lynn Canal, however, cannot be accomplished using existing assets without increasing the cost of operations and maintenance.

The suggestion that Alternative 1B Optimized and 5 offer “proof” of a failure to satisfy the Court mandate is similarly incorrect. First, Alternative 1B Optimized is not a reasonable alternative because the Day Boat Alaska Class Ferries (ACFs) cannot make a daily Auke Bay-Skagway round trip and comply with U.S. Coast Guard (USCG) work/rest requirements. Second, Alternative 5 does not comply with the Court mandate because it requires a large up front capital investment. It was, however, rigorously explored and concluded that this alternative is a variation of existing alternatives and therefore would be an unnecessary addition to the range of reasonable alternatives..

DOT&PF has analyzed Alternative 1B Optimized and Alternative 5 proposed by the Skagway Marine Access Commission (SMAC) and have included the updated analysis and information in Appendix II, *Alternative 1B Optimized and Alternative 5 Evaluation*, of the Final SEIS. The two new alternatives were labeled by SMAC as “Alternative 1B Optimized” and “Alternative 5.” DOT&PF has retained this labeling for convenience, but use of these labels should not be interpreted as conferring stature or reasonableness.

**Alternative 1b Optimized: Prepared by the Skagway Marine Access Committee (SMAC).
Summarized by TGSC**

Alternative 1B/Optimized assumes the same vessel and terminal improvements as are proposed for Alternative 1B and requires no new construction of ships or berths

The optimization of 1B involves two major components:

- Reconfiguration of route segments and home porting the Malaspina in Haines
- Elimination of all "through" mainline service north of Juneau

Home porting the MV Malaspina in Haines would allow that vessel to be deployed on alternative routing of Haines/Skagway/Haines/ Auke Bay/Haines which would accomplish the following:

- Utilizes the large vehicle capacity of the Malaspina on the route segment with the most demand.
- Takes maximum advantage of the Malaspina's ability to run longer than 12 hours a day.
- Allows the Malaspina to assume the role of shuttling traffic between the two communities of Haines and Skagway freeing up an ACF day boat to run between Haines and Auke Bay.
- Matches the capacity of the smaller ACF vessel to the demand of the less frequently traveled route between Skagway and Auke Bay.
- Eliminates the need for the "through" mainliners and frees up a mainliner to be retired or deployed to other parts of the region such as Sitka.
- Saves the AMHS more than one million dollars in annual ferry operating costs.

Route Configuration

- The MV Malaspina would Homeport in Haines and run the HNS-SGY-HNS route once a day and the HNS-ABY-HNS route once a day, seven days a week
- ACF 1 would homeport in Skagway and run SGY-ABY-SGY route once a day, seven days a week
- ACF 2 would homeport in Auke Bay and run the ABY-HNS-ABY route once a day seven days a week

Nominal Summer Schedule

Malaspina: Home ported in Haines and sails HNS-SGY-HNS-ABY-HNS seven days a week. ACF1: home ported in Skagway and sails SGY-ABY-SGY seven days a week.

ACF2: home ported in Auke Bay and sails ABY-HNS-ABY seven days a week.

All departures are in the morning with the Skagway ACF departing early enough to free up the Skagway Terminal for the arrival of the Malaspina.

This provides improved capacity for the demand models. It increases number of sailings per week and provides an increased variety of departure times. The Malaspina homeports in Haines and each morning sails roundtrip to Skagway accomplishing the role of shuttling traffic between the two communities. The use of the Malaspina in this fashion allows for the user alternative routing between Auke Bay and Skagway if necessary or desired.

Mainliners terminate their northbound sailing in Auke Bay and can be utilized on alternative routes such as Sitka.

Nominal Winter Schedule

ACF1: Home ported in ABY and sails 5 days a week ABY-HNS-ABY ACF2: home ported in HNS and sails 5 days a week HNS-SGY-HNS

This provides slightly more capacity and more frequency of sailings per week. The ACF in Auke Bay would be available to provide additional sailing in Lynn Canal or surrounding communities such as Hoonah, Gustavus, Angoon, etc.

Mainliners terminate their northbound sailing in Auke Bay and can be utilized on alternative routes such as Sitka.

Advantages of Alternative 1B Optimized compared to Alternative 1B

The cost analysis for Alternative 1B Optimized is contained in Appendix A. Our preliminary work indicates that this proposal could save the state more than \$1million* in annual operating costs while increasing capacity and travel options. We believe it could be significantly more than this (see footnote on preceding page.) Eliminating "through" mainliners from Lynn Canal allows the AMHS to redeploy those ships and/or retire an aging vessel. This has the potential to increase service to other communities in Northern Panhandle.

Unlike Alternative 1B, under our proposal capacity is scaled to proven demand with room for growth. The capacity on the popular Auke Bay/Haines route is increased while capacity the Auke Bay/Skagway and the Skagway/Haines routes is more closely matched to demand. Other benefits

include:

- Multiple deployment options, especially in the winter.
- More flexibility and travel options to passengers.
- Utilizes the MV Malaspina in her traditional role of day boat in Lynn Canal. While this adds some slight fuel costs (owing to a longer route than the Malaspina route proposed under 1B) there are no additional crew costs because the Malaspina's crew is paid 24/7 whether it is tied up at the dock or sailing on a route.
- Gives Skagway residents and visitors direct access to Juneau seven days a week in the summer.

RESPONSE: DOT&PF and FHWA have analyzed the proposed changes to Alternative 1B and included the updated analysis and information in Appendix II of the Final SEIS.

DOT&PF and FHWA have examined this alternative and have determined that it is not a reasonable alternative for the following reasons:

- First, the Day Boat ACF cannot make a daily Auke Bay-Skagway run and meet USCG work/rest requirements. Without modification of the vessel or the loading and unloading facility at the Skagway Ferry Terminal to decrease the Day Boat ACF operating day, it would not be compliant with the USCG requirements.
- Second, discontinuing mainline ferry service within Lynn Canal creates peak-day capacity problems at Auke Bay. During the summer, on the 2 days per week that the mainliner sails, the amount of transferring traffic plus local traffic demand to/from Skagway would typically be greater than the capacity of the Auke Bay-Skagway Day Boat ACF proposed in Alternative 1B Optimized.
- Third, there is insufficient berth space and vehicle staging areas in Auke Bay to have the mainline vessel in port while accommodating all the transferring vehicles without vessel and vehicle congestion and delays. To fully clear northbound and southbound connecting travelers onto the mainline vessel, the mainliner needs to remain docked in Auke Bay long enough for the two Day Boat ACFs and the M/V Malaspina to come and go. Moreover, the staging area at Auke Bay is insufficient to accommodate all the disembarking and embarking vehicles. The space is limited and was not designed or sized to handle the transfers of the volumes expected.

It is our position that these factors should have been considered in any analysis of an enhanced marine alternative. The fact that they are missing from Alternative 1B would indicate that the Department did not do "due diligence" in seeking ways to reduce costs while improving service with existing assets. To quote Judge Sedwick we "cannot conclude that an alternative aimed at providing improved and more efficient ferry service was "rigorously explored" by the agencies."

RESPONSE: DOT&PF and FHWA dispute the assertion that they did not do "due diligence" in developing Alternative 1B. DOT&PF and AMHS staff developed a new alternative based on direction from the Court, shared a draft of that alternative with the public during a new scoping effort, took input on

the new alternative, and revised that alternative based on the scoping comments received. The new alternative took into account changes that had occurred to the “existing assets” in the AMHS fleet since the 2006 ROD, the capabilities of the vessels in the fleet, and the needs and mission of the fleet to the numerous communities served by AMHS. DOT&PF and FHWA fully disclosed the development and evaluation process in the Draft SEIS. Appendix CC of the Draft SEIS described the efforts undertaken to develop Alternative 1B and documented the data and analysis relied on to create as reasonable an alternative as possible for solving the transportation problems in the corridor using only existing assets. DOT&PF and FHWA took comments on Alternative 1B during development of the Draft SEIS and the public review period, and have addressed those comments in the Final SEIS, including updating and refining it for current data.

Alternative 3: The West Lynn Canal route has not been analyzed sufficiently for alternative comparisons. Notably the safety issues being brought up in these comments and the geo hazards. See our sections on: **Safety and Fatalities:**

Because of the terrain, not as steep and less blasting, and less avalanches to mitigate for, TGSC believes it is a less costly road to build than the alternative 2b road if the construction work is home based out of Haines rather than Juneau.

RESPONSE: The cost of construction and avalanche mitigation (Capital and Maintenance) is presented in the Final SEIS. Refer to Attachment E of the *2017 Update to Appendix D - Technical Alignment Report* in Appendix Z of the Final SEIS for detailed construction cost estimates and Attachment C for detailed annual maintenance costs for Alternatives 2B and 3. The cost estimates for Alternatives 2B and 3 include the cost of remote camp(s).

Other costs and meeting the flawed P&N's of JAI can be optimized by using the two AFC's home based in Auke Bay instead of Sawmill Cove which eliminates the need for a new terminal at Sawmill Cove and reduces the travel time to get there. A third AFC would provide service between Haines and Skagway and will free up the Malaspina for other uses.

RESPONSE: The comment essentially describes Alternative 4C, which was developed and analyzed in the Draft and Final SEIS. Using Auke Bay instead of Sawmill Cove would reduce capacity, increase travel time, and increase cost to the user. In combination, this would result in a reduction of traffic generated. Weekly summer round trips would be reduced from 32 (Sawmill Cove) to 18 (Auke Bay).

Alt 5: Alaska Class Alternative (ACA): Prepared by the Skagway Marine Access Committee.

Summarized by TGSC

Alternative 5 calls for construction of a third ACF and the retirement of one aging mainliner. Our analysis shows that the traffic demand in Lynn Canal can be satisfied at a much lower operation

cost per mile through the addition of a third ACF. The following are the key components of the All Alaska Class Alternative:

- Acquiring a third ACF
- Removing mainliner service north of Auke Bay
- Implementing all capital improvements as outlined under Marine Alternative 4C:
 - o Auke Bay expanded to include new double stem berth
 - o Skagway expanded to include a new end berth
 - o New conventional monohull shuttle ferry constructed to operate between Haines and Skagway.

Deployment of three AMHS day boats/ACF and the removal of mainline service will result in an overall reduction in the cost of providing ferry service in Lynn Canal. Even with the capital costs associated with it.

Proposed Summer Schedule and Routes:

ACF One home ported in Haines and sails roundtrip from Haines to Auke Bay once a day seven days per week

ACF Two home ported in Skagway and sails roundtrip from Skagway to Auke Bay once a day seven days per week

ACF Three home ported in Auke Bay and sails roundtrip to Haines four days per week and Skagway three days per week.

This will result in 11 roundtrips between Auke Bay and Haines each week and ten sailings between Auke Bay and Skagway each week, providing more opportunities to travel than the current system provides. This meets the P&N of the project.

Proposed Winter Schedule and Routes:

ACF One is home ported in Auke Bay and sails roundtrip to Haines five days a week. ACF Two is home ported in Haines and sails to Skagway twice a day 5 days a week

Capacity:

The addition of a third ACF as outlined in Alternative 5 would produce an overall increase in summer and winter capacity between Auke Bay, Haines and Skagway compared to 4C.

Alternative 5 would significantly increase the frequency of sailings between Auke Bay, Haines and Skagway.

Costs: An annual savings of more than 1 million a year than alt 4c

ALTERNATIVE 5 ANNUAL CREW AND FUEL COST See Exhibit A for Fuel and Crew Cost Breakdowns	\$8,179,847	\$6,618,992
--	-------------	-------------

ALTERNATIVE 4C FUEL AND CREW COSTS

Route /Vessel	Crew	Fuel
HNS-SGY-HNS SHUTTLE	\$1,160,654	\$2 12,276
ABY-HNS-ABY ACF	\$2,658,2 19	\$2,4 15,915
ABY-SGY-ABY ACF	\$2,658,2 19	\$2.686,227
ABY-HNS-SGY -HNS-ABY MAINLINERS	\$3,647,773	\$470,078
ALTERNATIVE 4C ANNUAL CREW AND FUEL COST	\$10,124,865	\$5,784,496
ALTERNATIVE 4C TOTAL		\$15,909,361
ALTERNATIVE 5 TOTAL		\$14,798,839
ANNUAL SAVINGS		\$1,110,522

A more specific break down on costs, capacity, number of sailings, is in attachment #

RESPONSE: DOT&PF and FHWA have analyzed the proposed alternative and included the updated analysis and information in the Final SEIS in Appendix II.

Alternative 5 is a ferry alternative that builds upon Alternative 4C from the 2014 Draft SEIS. It relies on using three Day Boat ACF vessels in Lynn Canal (the two programmed vessels and a new vessel that would be built for this alternative), plus the terminal improvements identified in Alternative 4C. Alternative 5 would eliminate mainline ferry service in Lynn Canal.

DOT&PF and FHWA have examined this alternative and have determined that it is a variation of existing alternatives and therefore would be an unnecessary addition to the range of reasonable alternatives. It would attract fewer trips than Alternative 1B, provide similar capacity to Haines (and less to Skagway), and have similar travel time as other alternatives studied (Alternatives 1 – No Action, 1B, and 4C). It fits within the range of capital and operational costs (not the cheapest and not the most expensive of the ferry

options). In short, it is not unique enough to constitute something outside the range of alternatives already studied. Further, sufficient information has been generated to confirm it is inferior to other alternatives already in the SEIS.

Additionally, during summer, discontinuing mainline ferry service within Lynn Canal could create capacity issues that may prevent some travelers from reaching their final destination via a direct ferry connection. Vehicles traveling through Juneau in either direction on mainline vessels would be required to transfer from the Lynn Canal vessels to the mainline vessel at Auke Bay. Mainline vessels hold between 88 and 134 vehicles. Depending on how many vehicles were passing through Juneau, there could be insufficient capacity on the days the mainliner arrives when local traffic would be added to the demand generated by these mainline vessels. Some Lynn Canal travelers would likely have to use the Haines/Skagway shuttle and travel via Haines or Skagway to reach their final destination, which increases their travel time and potentially their costs (if they need to stay overnight).

DOT&PF and FHWA have concluded this alternative is a variation of existing alternatives and therefore would be an unnecessary addition to the range of reasonable alternatives. A detailed analysis of Alternative 1B Optimized is found in Appendix II.

Wait Time: The DSEIS stresses the long waits that those with vehicles must wait today and would persist under the No Action and 1B alternatives:

- Travelers must make reservations for vehicles in advance; travel during peak summer season periods can require making reservations within days of the summer ferry schedule release in the preceding December.
- Changing reservations can be problematic and can include cancellation charges if made within 14 days of a reservation ...
- A 1- to 2-hour check-in time is required
- Reservation changes are limited to regular business hours.
- When ferries do not have vehicle space available, travelers may register at the ticket counter 2 hours before sailing for standby vehicle space; however, there is no guarantee of boarding. (DSEIS, p. 1-15)

The DSEIS assumes that all of these problems would disappear under Alternative 2B, stating:

The travel times for the ferries to and from Katzehin and between Haines and Skagway do not include check-in time because reservations would not be taken. Vehicles would be accommodated on a first-come, first-serve basis. An average waiting time is included in the travel time to account for a portion of drivers assumed to arrive well ahead of the loading schedule. (DSEIS, p. 2-15)

While Alternative 2B would offer more departures than the No Action and 1B alternatives, the

need for reservations is not because of the ferry frequency but because of the high level of demand relative to the available space. The DSEIS demand and capacity numbers show that the ferries would be just as crowded in the summer in Alternative 2B as for the No Action alternative and considerably more crowded than in Alternative 1B as shown in Figure 5.

RESPONSE: The ferries associated with the roadway alternatives (2B and 3) would operate differently from the rest of the AMHS and would be more like the shuttle ferry to the Ketchikan airport. People would drive a longer road with a relatively short transit on the ferry (about 27 minutes for the Katzehin-Haines shuttle under Alternative 2B). While it is possible that a traveler could arrive at the terminal only to find the ferry had just departed or to find the ferry full and unable to take another vehicle, such scenarios are anticipated to be rare and would involve a wait time of two to three hours for the next ferry. Once a pattern is established, it is likely that travelers would self-select to days or times anticipated to be less busy. Most of the time, space would be available. For business travelers with tight timelines and little flexibility, private air carriers are available. Even if such travelers missed their desired ferry, they would likely be able to catch the next one a short time later. Under such a scenario, the travel time would still be much less than the current system.

The first-come/first-served operations model would not provide schedule certainty in the same way a reserved ticket for a specific departure time would. However, the certainty would be similar to driving virtually anywhere that traffic or an accident could slow progress. The ferry capacities and number of sailings were calculated to provide for the projected summer average daily traffic on the road. It is anticipated that patterns would develop, and regular travelers would learn to avoid heavy traffic times/days. Enough people would avoid those times and those that do not would be delayed. Removing the need for a reservation system speeds up the overall travel time by removing the associated check-in process. The shuttle ferries would run frequently, reducing the inconvenience.

With the exception of the last sailing of the day, if a sailing is missed due to lack of space, it is a two to three hour wait for the next sailing.

Much of this can be rectified in Alt 1b optimized and Alt 5 by increasing ferry travel thus decreasing waiting time, and the travelers not using cars won't have the added wait time they would have under the road alternatives (discussed in the walk on section). Passenger's luggage will have to be checked for security reasons at the Katzehin, Haines, and Skagway terminals under Alternative 2b. It is done on all AMHS ferries for Homeland Security. This is part of the P&N for providing decreased travel time but is left out of the wait time comparison. And where is the time for paying for the ferry service under 2b? It often takes 20 minutes at the Ketchikan terminal from my experience and that's only one terminal.

RESPONSE: By AMHS policy, walk-on passengers would have the same two hour check-in time as

vehicles in Juneau and one hour in Haines and Skagway. For Alternatives 2B and 3, the remote terminals at Katzehin, Sawmill Cove, and William Henry Bay would be unmanned. Luggage check-in would not be required because the vessels would not stop at multiple ports. Security for vessel operations is the responsibility of the shuttle crew. The security for unmanned terminals is covered by the individual vessel security plans that are approved by the USCG. These procedures are covered in the wait/travel times assumed for Alternatives 2B and 3. Details of fare collection would be determined during project design. However, it is possible that fares would be collected on board and possible fares would be collected only in one direction.

Fares: There are three significant problems with the fare inputs to the model that bias the results toward Alternative 2B. First, the DSEIS assumes that the "user" is a vehicle with 3.3 persons and this is over averaged. As discussed in **Wait Time** and **Walk-on Ferry Service** sections, many of the real AMHS customers are walk-ons with no vehicles, about 45%.

Those with vehicles predominantly have fewer than 3.3 persons. This causes the DSEIS to overstate "User Costs" throughout the document including Table ES-1, p. ES-16. The numbers shown there are higher than actual costs for all customers except vehicles with 4 or more persons.

RESPONSE: The Draft SEIS does not assume that the "User is a vehicle with 3.3 persons." The travel model starts with the total demand for travel in Lynn Canal. This value is measured in person trips and includes travel made by both automobile/ferry and air. The results from this forecast were converted from person trips to vehicle trips using average vehicle occupancies based on the predominant mode of each respective alternative. The rates were not overstated and, in fact, were adjusted to match existing data respective to each mode.

For Alternatives 2B and 3, a highway vehicle occupancy of 2.3 persons per vehicle was assumed, since these are predominantly roadway alternatives. This rate was calculated based on highway vehicle occupancies from National Household Travel Survey data for Alaska. For Alternatives 1, 1B, 4A, 4B, 4C, and 4D (predominantly ferry alternatives), a vehicle occupancy of 3.3 persons per vehicle (i.e., the ratio of passengers to vehicles in Lynn Canal) was used based on the average summer occupancy on the Juneau-Haines and Juneau-Skagway ferry links as shown in Table 3-1 of the *Traffic Forecast Report* (Appendix AA of the Draft SEIS). This average vehicle occupancy is higher, precisely because of the numbers of walk-on passengers associated with ferry travel in Lynn Canal. In this way, the alternative forecasts account for the higher number of walk-on passengers anticipated with the ferry alternatives and the lower numbers of walk-on passengers anticipated with Alternative 2B.

The road alternatives (2B and 3) represent a shift in the way transportation would be provided in the corridor—away from a primarily public transportation mode that would operate more like a public transit service, to a highway system where private vehicles would provide most of the transportation (publicly owned shuttle ferries would provide shorter links connecting the roadways). It is true that DOT&PF and FHWA do not anticipate that walk-on passengers would continue to find it convenient to have someone

drive them to the ferry terminal at Katzeihin like they do today at Auke Bay. It is for this reason that a vehicle occupancy of 2.3 was used, because it is anticipated that Alternatives 2B and 3 would have operating characteristics closer to other highways in Alaska. Rather than traveling as a walk-on passenger, it is anticipated that most people would drive under Alternatives 2B and 3. User costs reflect this change, and the differences among the modes are reflected in the associated vehicle occupancy assumptions.

The commenter’s suggestion that the user costs shown would be “higher than actual costs for all customers except vehicles with 4 or more persons” is inaccurate. The user benefits in Appendix FF of the Draft SEIS used the same conversion (i.e., 2.3 persons per vehicle for the highway alternatives and 3.3 persons per vehicle for the ferry alternatives). Moreover, the user costs referenced (including in Table ES-1) are not computed based on vehicle occupancies. Of note, user costs for a family of four in a 19-foot vehicle were used only as an example in the Draft SEIS to illustrate the relative out-of-pocket costs of the alternatives. It was not the basis of calculating user costs or for the impact analysis. To help clarify, additional information about the anticipated fares for the various other travel markets (walk-on passengers, single drivers with a vehicle, etc.) has been added to the Final SEIS.

The fares for Alternatives 2B and 3 are not tied to the existing AMHS ferry fare structure, but all of the ferry alternatives are assigned current AMHS fares, with the exception of Alternative 1B, which affords a twenty percent discount on existing fares. The shuttle fares for the road alternatives are far lower than the least expensive current ferry fares. Alternative 2B sets fares of \$15 for vehicles and \$4.50 for adults to Haines and \$24 and \$8, respectively, to Skagway. Alternative 3 shows fares of \$20 for vehicles and \$7 for transfer from Sawmill Cove and William Henry Bay, and \$22 and \$7.50, respectively, for the shuttle between Haines and Skagway. By comparison, the current fares between Haines and Skagway, which are among the least expensive in the ferry system, are \$49 for vehicles and \$31 for adults.

There is no analysis contained in the fare memo or the DSEIS to explain why the road alternatives' fares are dramatically cheaper than the others, and the effect of this discrepancy is to skew the analysis of user costs toward the road alternatives. Leaving the cost of ferry delay out of the equation, if the existing Haines/Skagway fares are used to calculate total user costs for fares and vehicle, the costs of the road alternatives skyrocket. The cost for a trip from Skagway to Haines under Alt 2b would be twice as much as the current system, and a trip to Skagway from Haines would be roughly one-and-a-half times the current system.

Fares and costs as currently depicted in Table A-13 (AppendixFF):						
Alternative	vehicle fare	person fare	persons/vehicle	ferry fare	vehicle cost	total
1- Haines	\$86.00	\$37.00	3.3	\$63.06	\$4.48	\$67.54
1-Skagway	\$111.00	\$50.00	3.3	\$83.64	\$0.00	\$83.64
1B-Haines	\$68.80	\$29.60	3.3	\$50.45	\$4.48	\$54.93

1B- Skagway	\$88.80	\$40.00	3.3	\$66.91	\$0.00	\$66.91
2B - Haines	\$15.00	\$4.50	3.3	\$11.02	\$83.99	\$95.01
2B- Skagway	\$24.00	\$8.00	2.3	\$18.43	\$79.51	\$97.94
3- Haines	\$20.00	\$7.00	2.3	\$15.70	\$75.13	\$90.83
3- Skagway	\$22.00	\$7.50	2.3	\$32.76	\$79.61	\$112.37
Fares and costs adjusted to reflect current Haines/Skagway AMHS fares:						
2B- Haines	\$49.00	\$31.00	2.3	\$52.30	\$83.99	\$136.29
2B- Skagway	\$49.00	\$31.00	2.3	\$52.30	\$79.51	\$131.81
3 - Haines	\$49.00	\$31.00	2.3	\$52.30	\$75.13	\$127.43
3- Skagway	\$49.00	\$31.00	2.3	\$52.30	\$79.61	\$131.91

By using ferry fares that are not tied to the current AMHS fare structure, the agencies have skewed the analysis to make the road alternatives seem less expensive.

RESPONSE: For Alternatives 1 – No Action, 4A, and 4C, the fares were based on 2012-2013 AMHS rates in the Draft SEIS. For new routes that were shortened versions of existing AMHS routes, the AMHS fares were prorated by distance traveled. For new routes less than 20 miles, fares were based on a flat fee to board the vessel and a cost per mile for the transit for both passengers and vehicles. These fares were lower than the existing AMHS fares due to the efficiencies generated from using ferries designed as Day Boats with drive through loading and unloading and no reservation system expense, as well from the higher traffic volumes generated by frequent regularly scheduled service. Fares are commensurate with similar ferry systems in other locations operated in a similar fashion.

This fare structure is considered reasonable for alternative comparison purposes. The eventual fare structure used by AMHS for the chosen alternative may be different.

A memo documenting how the fares were developed has been added as an appendix to the Final SEIS at *Revised Appendix AA - Traffic Forecast Report*.

Walk-on Ferry Service: By eliminating walk on ferry services as a transportation mode DOT&PF has biased the alternatives in favor of a road. Near to 45% of Lynn Canal ferry users are walk-ons passengers and effect on these users is dramatic (McDowell 2000 report).

RESPONSE: DOT&PF would not eliminate walk-on service. Users under the road alternatives would be welcome to ride the ferries without vehicles. However, the road alternatives (2B and 3) represent a shift in the way transportation would be provided in the corridor—away from a primarily public transportation mode that would operate more like a public transit service, to a highway system where private vehicles

would provide most of the transportation (publicly owned shuttle ferries would provide shorter links connecting the roadways). DOT&PF and FHWA recognize that this shift would have had an effect on walk-on passengers. Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS described impacts to “Pedestrians and Bicyclists” for Alternatives 2B and 3, including walk-on passengers. As explained in Section 1.4.1.1 of the Draft SEIS, the State’s primary responsibility is to provide a transportation facility for vehicles, not the transportation itself.

The current walk-on cost (37\$ J to Haines-\$50 J to Skagway) as compared to the cost of getting public/private transportation to the Katzehin Terminal and the shuttle ferry costs adds up to \$150 more for a person using a taxi. For bus service or car rental its \$30 more per person.

RESPONSE: The Draft SEIS does describe the user costs for walk-on passengers. The road alternatives (2B and 3) represent a shift in the way transportation would be provided in the corridor—away from a primarily public transportation mode that would operate more like a public transit service, to a highway system where private vehicles would provide most of the transportation (publicly-owned shuttle ferries would provide shorter links connecting the roadways). DOT&PF and FHWA recognize that this shift would have had an effect on walk-on passengers. Sections 4.3.7.5 and 4.4.7.5 of the Draft SEIS described impacts to “Pedestrians and Bicyclists” for Alternatives 2B and 3, including walk-on passengers. The information included estimates of how many walk-on passengers might be affected and how they would be affected, including the anticipated changes in fares. Walk-on passengers are currently able to ride on a subsidized ferry for a long portion of the trip, and under Alternative 2B or 3 they would have needed to drive or take a cab, which would increase their total out-of-pocket cost. The fare for walking on would be less under Alternatives 2B and 3 than the current system because it would be a relatively short ride.

The travel time for passengers without a car will be longer under Alt 2B then on the no action Alt 1. This is based on the time getting a ticket, the time renting a car, the time waiting for a taxi and bus boarding, all the factors that are not part of traveling on a Lynn Canal Ferry.

RESPONSE: There are many factors that determine the travel time for a walk-on passenger. Under both Alternative 1 – No Action and Alternative 2B, walk-on passengers would need to purchase a ferry ticket and find a way to travel to/from the ferry terminal. AMHS policy is that passengers traveling without vehicles must check in 2 hours prior to departure in Bellingham and Juneau and 1 hour prior to departure at all other ports. Because of the drive through loading and unloading under Alternatives 2B and 3, travelers would not need reservations or arrive as early.

The commenter appears to overlook the time waiting for cabs or friends to drive them to the ferry terminal under the existing system, or any of the other alternatives, and seems to believe such waiting only occurs under Alternatives 2B and 3. Contrary to the commenter’s suggestion, walk-on passengers incur extra travel time for renting cars, waiting for cabs, etc. under any of the ferry alternatives because there is a road link at each end that necessitates a vehicle trip (only the Skagway Ferry Terminal is within reasonable walking distance of town, although if passengers have luggage or other carry-on goods it would be more

onerous). Under any scenario, walk-on passengers need to get to the ferry terminal, which requires them to find a ride or rent a cab, and they would be subject to the waiting time described by the commenter. If the commenter suggests that passengers walk to the ferry terminals, then considerable time would need to be added for walk-on trips for any of the alternatives.

Walk-on passengers who would rely on bus service to/from the Katzehin Ferry Terminal (if it develops) would have less flexibility and opportunity to travel compared to travelers who drive, as it is likely that bus service would not be available for every ferry sailing (i.e., walk-on passengers would need to time their travels with the bus schedule). It is anticipated that walk-on passengers relying on getting rides with others in private vehicles would have more flexibility and shorter travel times than those relying on the bus.

The mechanism for ticket sales for Alternatives 2B (Katzehin) and 3 (Sawmill Cove, William Henry Bay) would be determined during the design phase of the project. However, DOT&PF anticipates ticket sales would likely be on board the ferry and would not increase travel time.

DOT says public transportation will be available, ie. busses run by a private company. To make this cost effective for a 160 mile round trip (Auke Bay/Katzehin/Auke Bay) that company will have to run at a very high capacity or they will have to raise their rates. This idea (that's what it is) that a private bus service will be profitable raises a lot of questions. Will there be enough current foot passengers willing to pay more to use the busses if the ferry options are gone, and will Alt2b generate enough travel demand to make it profitable? Without definitive answers to these questions DOT&PF is making assumptions about private bus services being available. Given that 45% of ferry users are foot passengers and that they will have to pay more using the road alternatives some will cop out. If these passengers without vehicles continue to travel using Alternative 2b or 3, they will incur significantly increased out-of-pocket costs that are not considered in the DEIS. Deleting the option of getting on board a ferry, at lower cost than traveling by car or bus, has a huge effect on two of the Juneau Access Improvement Project's Purposes and Needs, reducing travel times and user costs. NEPA's requirement that an agency take a "hard look" at effects to the human environment has simply not occurred for 45% of existing AMHS walk-on passengers.

RESPONSE: The 45 percent walk-on rate used by the commenter is likely sourced in analysis by the McDowell Group reported in 2000. Based on AMHS information, DOT&PF believes the current percentage of walk-on passengers to be closer to 30 percent as the number of people walking on the ferry has declined over the past 15 years. Under Alternative 2B, a substantial segment of current walk-on traffic would be expected to convert to personal vehicle travel. Cost is currently the principal deterrent for ferry travel with a vehicle. As described in the *user benefit analysis* (Appendix FF), under the No Action and Enhanced Service (1B) alternatives, the round-trip cost for a driver and standard vehicle would be \$242. Under Alternative 2B, round-trip ferry costs for a driver and vehicle would be \$39 (Table A-13). Adding

vehicle operating costs to the comparison results in \$244 for No Action and Enhanced Service (1B) alternatives and \$80 for Alternative 2B. The substantially lower cost of travel under Alternative 2B would prompt many more travelers to take their own vehicles. Further, the substantial increase in vehicle traffic associated with Alternative 2B may increase opportunities for walk-on travelers to obtain a ride with family, friends, and acquaintances.

The vast majority of Lynn Canal region households have cars. For example, according to the U.S. Census Bureau's 2010-2014 American Community Survey 5-Year Estimates, 7.6 percent of Haines households do not have a vehicle available, 33 percent have one vehicle, 37 percent have two vehicles, and 23 percent have three or more vehicles. In Juneau, 8.5 percent of households do not have a vehicle available, 35 percent have one vehicle, 39 percent have two vehicles, and 18 percent have three or more vehicles.

More generally, the purpose of investment in public transportation infrastructure is to improve transportation opportunities for the largest number of people in the most cost-effective manner possible. It is not practical or reasonable to expect infrastructure improvements to enhance travel opportunities for all travelers, from all locations, and for all travel purposes. Replacing ferry service with a highway would require a change in travel behavior for some travelers, perhaps at some increased expense and inconvenience, while a much larger number of travelers would be able to travel at lower expense and greater convenience. The ten-fold increase in traffic from No Action to Alternative 2B would be the result of lower cost and more convenient travel opportunities for a much larger segment of the region's population.

DOT&PF and FHWA have evaluated the impacts to walk-on passengers and reported those in the Draft SEIS; including out of pocket costs. DOT&PF and FHWA find it likely (according to interviews with transit providers) that bus service would develop if there is sufficient demand and it is profitable to do so. DOT&PF and FHWA recognize that 91 percent of the households in Lynn Canal communities own vehicles. Many current walk-on passengers that own vehicles would likely choose to travel by car if a highway were available in the Lynn Canal corridor. The Draft SEIS described the impacts to those travelers who would choose to walk on. DOT&PF is not making an assumption that "private bus service will be available." The Draft SEIS indicated that a private ground transportation provider would be anticipated to offer service to the Katzehin Ferry Terminal if demand develops and it is shown to be profitable.

It reported that travelers without vehicles would be forced to rent or borrow vehicles, take a commuter flight, or travel on private carriers if they develop a service to accommodate this demand. Section 4.3.7.5 of the Draft SEIS and Section 3.1.4 of Appendix EE, *Socioeconomic Effects Technical Report* included an analysis of the potential for private ground transportation service to develop with Alternative 2B. To help clarify the out of pocket costs, additional information about the anticipated fares for the various travel markets (walk-on passengers, single drivers with a vehicle, etc.) has been added to the Final SEIS.

Safety: TGSC firmly believes that safety is a top priority for road building and DOT&PF needs to have it in the comparative alternative analysis. This is a social and economic issue and is directly related to NEPA's requirement to consider harm to the 'human' environment, ie. social and economic

harm.

RESPONSE: DOT&PF and FHWA agree with the commenter that safety is a top priority for road building. All roads constructed under State and federal authority must follow State and federal design procedures and standards that have been adopted/established to support safe travel. Many safety improvements have been added to Alternative 2B (e.g., avalanche mitigation) in the Draft and Final SEIS. Given the proposed roadway geometrics for Alternative 2B, there is no reason to believe that accident frequency on Alternative 2B would be statistically different than similar highways elsewhere in Alaska. Comparative safety analysis can be found in several locations in the SEIS. Information regarding traffic related accidents and fatalities was reported in Section 4.3.7 of the Draft SEIS. The safety of the alternatives were also disclosed for each of the alternatives in Chapter 4 of the Draft SEIS and Section 3 of Appendix EE, *Socioeconomic Effects Technical Report*; avalanche risks and mitigation can be found in Chapters 4 and 5 of the Draft SEIS and Appendix Z – *Update to Appendix J, Avalanche Technical Report*.

The existing AMHS system has had no fatalities since 1975, making the road alternatives appear to be less safe than the ferry alternatives. While the AMHS is safe, it does have the potential for catastrophic incidents due to the high number of people on a ferry and the hazards of ocean travel in Alaska. Ferry incidents tend to occur less frequently, but if they do they can be severe, making it difficult to compare the safety of highway and ferry alternatives. While travel in private vehicles tends to be less safe than some other modes of travel, Americans routinely select that mode of travel because of the advantages of convenience, cost, and travel time. Alternatives 2B and 3 would create a transportation system in Lynn Canal that provides these same advantages but with a safety risk inherent in private automobile travel.

Forty-one avalanche chutes line the road route that DOT&PF has chosen as the preferred Alternative. This is a major safety issue. Mitigation includes constructing snowsheds and using explosives to bomb avalanche paths with helicopters when it is clear and calm enough. What is missing in the SDEIS are the hazards from rock slides.

RESPONSE: The *2017 Update to Appendix D - Technical Alignment Report* in Appendix Z of the Final SEIS includes a discussion of geotechnical hazards. Each identified hazard was tabulated to show the associated mitigation condition based on the current design.

Rock Slides: The 2006 EIS identified 99 geological hazards on the east side route. On the current Juneau road system rock slides happen often, particularly where the road has a steep slope. The east road alternative is designed with steep slope alignments. This is not only a safety issue but also a maintenance cost issue that needs to be included in the EIS cost benefit analysis. Costs include moving the debris, rocks and boulders from the road and hauling them to disposal place. Leaving out the maintenance costs associated with rock hazards for Alternative 2b makes it look more cost efficient than the marine alternatives.

RESPONSE: Highway clean-up costs are typical highway maintenance costs that have been accounted for in alternative maintenance costs and are reflected in Attachment C of the *2017 Update to Appendix D - Technical Alignment Report*.

This is a NEPA flaw. Rock slide hazards can happen summer, fall, winter, and spring. This is a potential road closure issue that should be analyzed and put into the road closure numbers.

RESPONSE: Based on the current design, inadvertent road closures may occur over the lifetime of the project. It is expected that these closures would require less than half a day to clean up. It is also expected that in the event of a full width road closure, single lane traffic would be restored within 2 hours and 2-lane traffic would be restored within half a day. This is consistent with closures experienced on other Alaska highways with similar terrain.

If Alternative 2B had been selected in the Record of Decision, during the final design phase, hazard areas along the highway corridor that were not already avoided with alignment shifts and could potentially close the road would be examined in greater detail. With the goal of eliminating or minimizing road closures to the extent possible, detailed mitigation measures would be designed after more data and a refined understanding of each hazard could be obtained. There is, however, always the possibility of a large anomalous event. These rare events occur on highways through mountainous terrain common in states like Alaska, Washington, Oregon, Colorado, Montana, and Wyoming.

Shoulders: The 4 foot paved shoulder designed for Alt2B provides only minimal room for bicycle travel along the road. Any vehicles pulled over into the shoulder will block bicyclists, forcing them far into travel lanes creating possible fatalities and serious harm. Bicycling, particularly out the road, is a major recreation activity in Juneau. Safe bicycle paths, 6 feet wide, are being added to Juneau roads all over the road system, but not for the road to Katzehin. The 4 foot paved shoulder designed for Alt2B provides only minimal room for bicycle travel and pedestrians along the road. Any vehicles pulled over into the shoulder will block bicyclists, forcing them far into travel lanes. Conversely, bicyclists occupying the too narrow shoulder will increase the likelihood of vehicle-bicycle collisions. Wider lanes and shoulders would decrease the potential for accidents involving bicycles and pedestrians.

There is no discussion in the DSEIS of the AASHTO guidance based on 400 to 1,500 ADT for shoulder width. All projected Annual Daily Travels (ADT) for Alt2B are above 400, and the winter ADT of 1,345 approaches the upper limit for a 6 foot shoulder. AASHTO Standards are that rural arterials with average daily traffic (ADT) less than 400 that have travel lanes 11 feet wide and Design Speeds from 40 to 55 mph, a 6-foot-wide usable shoulder should be considered. (Apdx, D-p.5).

DOT&PF is putting construction costs before safety.

RESPONSE: The shoulder width for Alternatives 2B and 3 is an exception to the American Association of State Highway and Transportation Officials (AASHTO) recommended standard of 6 feet. A 4-foot-wide shoulder was determined to be best suited for the rugged terrain that the highway would cross. Cost was a consideration as well as the amount of use the shoulder would likely receive. Moreover, it would reduce impacts to wetlands while also satisfying the intended function of a shoulder. The typical section shows that wider shoulders would be created with excess material in upland areas. These widened areas, turnouts, and no parking signs in particular areas, would minimize parking on the paved shoulders. The widened shoulders have traversable slopes that would provide adequate space for vehicles to pull off the roadway onto the shoulder if necessary. The typical section for highway alternatives would match the width to be constructed on Glacier Highway from Amalga Harbor Road and Besse Creek. Given that there are no documented accidents over the 5 year period between 2011 and 2015 involving bicyclist and pedestrians on this stretch of Glacier Highway supports DOT&PF's assessment that a 4-foot-wide paved shoulder would be adequate to safely accommodate bicyclists and pedestrians on Alternative 2B and 3.

Note, the Draft SEIS reported the Alternative 2B summer average daily traffic (ADT) to be 1,345 and the winter ADT to be 460.

Policing and Emergency Response: Police try to control speed, drunk driving, and other safety issues. At the time of this DEIS there is zero commitment from Juneau, Haines, Skagway, and the State to provide policing. Apx EE *"As with any rural Alaska road system, emergency situations occurring far from downtown areas would create response challenges for fire, emergency medical service, and police departments. Personnel and equipment would be pulled away from normal duties, possibly for extended periods. The agencies with the most resources available - State Troopers, Juneau Police Department, and Juneau Fire Department - say they are already operating at minimal staffing levels given the extent of their current responsibilities and service areas."* If it is provided there will be needed more Troopers and police cars, a cost to the state and cities. There is no answer to who will pay for policing and what the cost will be, a flaw in the SDEIS. Emergency responders, ambulances volunteers, can't respond in hazardous conditions such as roads blocked by snow, ice and rocks in a prompt and safe way. DOT&PF has not put out a practical solution for this in the SDEIS because there is none.

Even in normal conditions the money to provide emergency services will have to come from somewhere and DOT&PF has not been specific about that cost. Cell phone access to report a problem will probably not be available in some parts of the Alt 2b road unless cell phone towers

are provided. This is based on the poor cell phone connections while traveling on the ferry. However the ferries have the best marine phone and internet connectivity.

RESPONSE:

Statewide, the Alaska State Troopers are responsible for general policing, patrols, and emergency response along rural roads, particularly outside the areas associated with individual local governments. Alternative 2B falls partially in the City and Borough of Juneau (about 30 road miles north of Echo Cove to Eldred Rock) and partially in the Haines Borough (from Eldred Rock northward). The Alaska State Troopers were contacted and indicated that, under Alternative 2B, the primary response would come from State Troopers based in Juneau. The Alternative 3 road on the west side of Lynn Canal lies within the Haines Borough. Under Alternative 3, the primary response would come from State Troopers based in Haines¹.

The SEIS indicates that it is likely that emergency medical response would come from these communities. Section 3.1.4 and sections in Chapter 4 corresponding to the socioeconomic impacts for each alternative provide basic information about services provided at each community and disclose the potential impacts to the service providers of having more road miles and more traffic within their areas of responsibility (see also Appendix EE, Section 3.3). Fire protection outside local fire service areas (i.e., along these road routes) is provided by the Alaska Division of Forestry and Tongass National Forest. Haines, Skagway, and Juneau all have search and rescue capabilities, either through separate organizations or through their fire/rescue departments, or both. Overall, staffing of public safety is anticipated to remain the same as it is today under all alternatives.

Icy roads: Icy roads are another safety and maintenance cost issue that is not dealt with adequately in the SDEIS. Every winter in Juneau numerous crashes happen because of icy roads but there is no correlation between what happens in Juneau and what could happen on the east road expansion. The cost of keeping the roads clean and safe from frozen road conditions needs to be in the cost/benefit analysis. Ice melt cost, sand cost, trucking costs, driver over time, fuel costs, how many new trucks will be needed because there's barely enough in Juneau to keep Juneau roads clean now. As with the rock hazards leaving this out of the road cost/benefit analysis makes the road alternative look more cost efficient compared with the marine alternatives.

RESPONSE: The cost of providing winter maintenance is presented in Attachment C of the *2014 Update to Appendix D - Technical Alignment Report* in Appendix Z of the Draft SEIS. Costs for avalanche mitigation were provided in Appendix 11 of the *2014 Update to Appendix J - Snow Avalanche Report* in Appendix Z of the Draft SEIS. The User Benefit Analysis includes maintenance and operations costs associated with winter maintenance, avalanche, and rock hazard mitigation.

The maintenance cost for the highway was estimated using actual costs incurred by DOT&PF for highway

¹ As of January 2018, the Alaska State Trooper position in Haines is vacant.

maintenance. Additional personnel, equipment, and materials were included in the estimate to provide for responses to avalanches and landslides. Because of the addition of extra resources to address conditions expected on the Juneau Access highway, the estimate shows the cost per mile to maintain the highway to be approximately 190 percent higher than DOT&PF's current average maintenance cost per mile in Southeast Alaska.

The project's planning process included extensive study of the geological conditions and weather on the proposed route. Highway design engineering would mitigate many of the hazards, if a roadway alternative were selected. Significant additional assets have been added to the maintenance concept to provide personnel and equipment to deal with potential road closures.

And besides the closure of the road due to avalanches and rock slides, icy road conditions will likely add to more road closures. Also very high velocity winds that roar down through the Lynn Canal corridor add to the risk of driving the 2b during icy road conditions.

RESPONSE: The project's road alternatives would be similar during adverse weather conditions to other highways in Southeast Alaska. Sufficient maintenance assets are included in the maintenance concept for Alternative 2B, including a maintenance station facility, which would improve response times under adverse weather conditions.

Divided Highway: Many lives have been lost on the Seward Highway, a road that shares similarities to the proposed Katzehin road. Since 2006, planners and residents at numerous public meetings have been calling for a divided highway as the best and most effective engineering enhancement on the Seward Highway. The DSEIS should analyze the cost/benefits of making the road to Katzehin a divided highway to improve safety.

RESPONSE: Safety comparisons to the Seward Highway outside of Anchorage are not applicable. While the Seward Highway traverses along the coast and has several avalanche zones, the comparison ends there. The Seward Highway has considerably higher traffic volumes (7,000-10,000 ADT) as compared to Alternative 2B (835 ADT [2020] reported in the Draft SEIS). This high level of traffic, coupled with limited passing opportunities, contributes to heavy congestion and causes travelers to make unsafe maneuvers. With less than one-tenth of the traffic, this project is not anticipated to cause similar driving behavior. The traffic forecast does not anticipate reaching anywhere near the levels necessitating a 4-lane highway facility.

TGSC says again safety should be in the Purpose and Need of the Juneau Access Project.

RESPONSE: Safety is included in the purpose and need statement for a project only if there is a demonstrable safety problem on the transportation link being considered. An example would be where

there is a higher number of accidents than the State average for similar transportation links. Safety is not a problem with the current system; therefore, it is not a stated purpose and need for this project.

The comparison of the Seward Highway for Alternative 2b road safety issues:

The thirty mile stretch of Seward Highway from MP17 to MP87 was designated a Traffic Safety Corridor (TSC) in 2006, leading to enhanced safety measures:

These included 12 foot lanes, center and shoulder rumble strips, high intensity reflectors installed on guardrails, divided highway sections, separate bike trails, passing lanes, emergency call boxes, six and eight foot shoulders that makes roads much safer for cars, bikes, and walkers, and increased police patrolling. Emergency response time is quicker because of adjacent emergency services from Anchorage and Girdwood.

Alternative 2b road to Katzechin: Two 11-foot lanes, with 4 foot paved shoulders, regular patrols of highway segments between Echo Cove and Haines not anticipated by State Troopers, Juneau PD, or Haines PD (Apx EE-p.207). Emergency response times will be higher especially at Katzechin which is far from Juneau and takes a ferry to get there from Haines. Specifically up to 50 miles away from Auke Bay, Juneau, or from Haines via boat, then up to 20 miles away. Unlike the Seward Highway cell phone access will probably not be available in some parts of the Alt 2b road unless cell phone towers are provided.

RESPONSE: Safety comparisons to the Seward Highway outside of Anchorage are not applicable. While the Seward Highway traverses along the coast and has several avalanche zones, the comparison ends there. The Seward Highway has considerably higher traffic volumes (7,000-10,000 ADT) as compared to Alternative 2B (835 ADT [2020] reported in the Draft SEIS). This high level of traffic, coupled with limited passing opportunities, contributes to heavy congestion and causes travelers to make unsafe maneuvers. With less than one-tenth of the traffic, this project is not anticipated to cause similar driving behavior. The traffic forecast does not anticipate reaching anywhere near the traffic levels experienced on the Seward Highway; therefore, it is incorrect to predict that upgrades would be necessary within the forecast period. Alternative 2B would be designed to meet appropriate safety standards.

Using Anchorage and Fairbanks as end points for an example of city pairing, unconstrained travel demand, and relating it to the Alternatives 2b and 3 is very misleading. Unlike the Juneau Road Alternative's 2b and 3 there is a major destination end point between Anchorage and Fairbanks, the Denali National Park, and town's in-between. Many travels are going from Anchorage to Denali and back to Anchorage and from Fairbanks to Denali and back to Fairbanks not from Anchorage to

Fairbanks or from Fairbanks to Anchorage. The only stop off point between Juneau and Haines for Alternative 2b is an unmanned ferry terminal where travelers wait in line.

RESPONSE: The unconstrained travel demand model did not use Anchorage and Fairbanks as “endpoints for an example of city pairing.” The forecast used other similarly situated communities in Alaska (both regional center communities like Anchorage, Fairbanks, and Juneau and other, more isolated coastal communities like Haines and Skagway) and Western Canada with similar geographic characteristics as Juneau, and examined their trip-making patterns on the highways leaving those communities. The model does not estimate or rely on trips interchanging “between” Anchorage and Fairbanks or between an intermediate stop like Denali Park. As is explained in Appendix AA, *Traffic Forecast Report*, the cities were used to gauge the edge effect of travel from these centers. The analysis found a strong correlation between the distance traveled from the edge of the community and the way traffic volumes dissipate. Appendix AA describes this edge effect as “the point traffic volumes decrease exponentially until leveling off at a particular volume.” It is not, as the commenter suggests, about the interchange of traffic. As can be seen in Figure 4-3 from Appendix AA, the edge effect on the Parks Highway (from either Fairbanks or Anchorage) occurs at a much shorter distance than Denali National Park.

As described in Appendix AA (and in more detail in its Appendix C), the model selected cities that were comparable in size and characteristics to Juneau, the primary difference being that each of these cities have a road connection. The model showed very consistent traffic dissipation patterns based on the distance removed from the city (see Figure 4-3 of Appendix AA). These patterns were similar for isolated communities such as Valdez and larger communities such as Anchorage and Fairbanks. Related to a comment regarding the possible effects of Denali National Park demands along the Parks Highway, the dissipation curve shows that the traffic patterns along the Parks Highway are very similar to those of the other highways, despite the location of the park.

The traffic forecasts used a conservatively low range of ‘edge’ traffic rates (see Table 4-5 and Figure 4-1 of Appendix AA) for the Juneau traffic estimates. While the population of Juneau more closely matches some of the smaller communities shown in Table 4-5 of Appendix AA (each of which have much higher edge traffic rates), the range of rates used in the forecasts were balanced between those of Whitehorse and Anchorage/Fairbanks. The forecasted rates for Skagway and Haines were based on their existing observed rates.

The discrepancies between the two roads in the safety comparison analysis makes it pretty much useless, and the Alt 2b road crash and fatality numbers a bad comparison, and perhaps flawed, and probably under estimated.

Fatalities: DOT&PF estimates 5 crash car deaths on the average of thirty years on the Alt 2b route. The numbers are from a comparison with the average fatalities on Alaska's Seward Highway. TGSC and other groups believe these numbers may be miss-calculated and some number crunching was done.

DSEIS total crashes per year = 22. Recalculated = 22.5.

DSEIS fatalities per project lifetime (30 years) = 5. Recalculated = 14.64

What is missing in DOT&PF's over generalized analysis is the increased risk of fatalities from specific hazards such as avalanches, icy conditions, and rock slides. It is impossible to get a hand on what deaths will be caused by what conditions and what hazards on the Juneau Road to Katzehin and then to do an evaluation of the numbers. Even in DOT&PF's over generalized fatality analysis TGSC believes the deaths have been under estimated. Not with intent but with internal bias within DOT&PF to favor the road. In Juneau alone in one year there are more crashes per year than DOT projects in the Alt 2b 36 year lifetime model, many by icy road conditions. The Juneau road system has full time maintenance, 24 hours a day when needed, and the weather conditions are not as harsh as the proposed expansion of the Juneau Road. Emergency services to deal with crashes are going to be very hard to serve out the road. This is not apples to oranges but anyone who drives Juneau roads when they are iced up has to speculate about DOT&PF's estimate. Fatalities are so important that morally and for the purposes of NEPA DOT&PF should have outside independent consultants analyze the issue.

RESPONSE: Information regarding Alternative 2B traffic related accidents and fatalities was discussed in Section 4.3.7 of the Draft SEIS. However, this information had some errors and has been updated for the Final SEIS. Section 4.3.7.5 discusses traffic safety impact associated with Alternative 2B. Alternative 2B is anticipated to have a similar accident rate to other rural Alaska highways. In 2025, Alternative 2B is anticipated to have approximately 39 crashes per year on the East Lynn Canal Highway. During the 30-year operating period (2025-2055), it is estimated that Alternative 2B would result in approximately 1,156 crashes and 14 traffic fatalities.

Alternative 2B includes an additional staffed maintenance station at approximately Mile Point 66. This station would have one full time foreman/operator and four seasonal positions (avalanche control). The Juneau Maintenance Station would be augmented with one full-time operator and one seasonal position, to assist in maintaining the highway from Juneau to Cascade Point. Juneau Station would also assist with avalanche clean up from time to time. This level of staffing provides 7-day per week winter maintenance, including avalanche control and clean up, as well as summer maintenance activities.

Up-Grades: Safety and construction up-grades are issues that should be dealt with in the SDEIS as it is a lifetime cost issue for Alt 2b and Alt 3. Construction up-grades include repairs and replacements. Alt 2B maintenance and operation (M&O) costs do not include repair or replacement costs as it should be. DOT&PF has repeating up-graded roads because of identified safety issues, sometimes designating them as a Traffic Safety Corridors (TSC) which triggers safety up-grades. The Glacier Highway (GH) which has been re-designed and extended (including the Cascade Point Road) to

connect to the Alt 2b road was recently up-graded to twelve foot lanes and five foot shoulders, or eleven foot lanes with six foot shoulders, out the road from Auke Nu to Echo Cove, the beginning of 2b. This up-grade is considered by the TGSC as part of getting ready for the JA project. It is highly probable that the 2b road will be made to conform to the GH up-grades and the cost should be part of the 36 year lifetime model. Otherwise DOT&PF should say it will not be done.

The Alt 2b road going from Echo Cove to Katzehin and the Seward Highway have the same problems identified in our safety section and the Seward Highway is a DOT&PF designated Traffic Safety Corridor (TSC). The Seward highway up-grades have cost \$35 million with \$410 million additional engineering improvements scheduled through 2018, pending available funds. It is highly likely that the Eastside Lynn Canal Rd. (Alt 2b) will become a TSC. That safety upgrades is left out of the lifetime cost model on a road that is designed at the lowest safety standards that DOT can possibly get away with before it's a TSC is disingenuous and should be rectified.

In Alt 2b five tunnels will be constructed, two will be blasted through the Kazhan Mountains, and three snow sheds will be constructed to protect drivers from avalanches. Snow sheds are by common sense at a high risk of being destroyed by avalanches. Tunnels are expensive to build and more expensive to replace. Up-grades of exiting tunnels and bridges are common when the connecting roads are being widened or re-routed. This is very likely to be needed in the 36 year time frame of Alt 2b. The likelihood of these structures having to be replaced and the cost therefore should be calculated and used in the user/cost benefit analysis. There are many examples that could be used, such as the current Brotherhood Bridge up-grade in Juneau which is basically a replacement, to calculate the potential costs and many more are in DOT&PF's data base. TGSC believes that not including up-grades in the cost benefit analysis is misleading the public on the long term costs of the road alternatives.

A highway is repaired and replaced as needed indefinitely with higher and higher costs well beyond 36 yrs. It's also worth noting that the average age of ferry vessel replacement is 60 years (App GG), considerably longer than 36 yrs.

RESPONSE: The upgrading of Glacier Highway is an independent project and should not be considered preparation for the Juneau Access Improvements project. The upgraded Glacier Highway has the same typical section as the Juneau Access Improvements project, with 11-foot lanes and a four-foot shoulder

(not the lane/shoulder configuration suggested by the commenter). The design geometrics being used on the Juneau Access Improvements project are appropriate for a rural highway with less than 2,000 ADT.

Regarding safety, comparisons to the Seward Highway outside of Anchorage are not applicable. While the Seward Highway traverses along the coast and has several avalanche zones, the comparison ends there. The Seward Highway has considerably higher traffic volumes (7,000-10,000 ADT) as compared to Alternative 2B (835 ADT [2020] reported in the Draft SEIS). This high level of traffic, combined with limited passing opportunities, contributes to heavy congestion and causes travelers to make unsafe maneuvers. With less than one-tenth of the traffic, this project is not anticipated to cause similar driving behavior. The forecast does not anticipate reaching anywhere near the levels experienced on the Seward Highway; therefore, it is incorrect to predict that upgrades would be necessary within the forecast period.

The highway alternatives (2B and 3) would be designed and constructed to meet appropriate safety standards within its design life. They would meet the AASHTO standards for rural arterials for the traffic volumes projected for the proposed project, with the exception of shoulder width for Alternatives 2B and 3. The highway design does include safety measures such as widened embankments, guardrail, recessed pavement markers, paint, and signage. The Alternative 2B 2050 traffic projection in the Draft SEIS is 825 ADT. The roadway design being used on the Juneau Access Improvements project are appropriate for a rural arterial highway with less than 2,000 ADT, substantially more traffic volume than forecasted. Extensive safety upgrades are not anticipated.

Essential Fish Habitat:

NEPA requires public officials to have high quality and accurate information prior to decision-making (See 40 CFR 1500.1(b)).

AppendixZ_UpdateN_EFHAssessment 4.2.1.3 Effects of Ferry Terminal Construction in Alt 2b:

"There would be no change in EFH impact associated with ferry terminal construction, as previously documented in Section 2.1.1 of the 2004 *Essential Fish Habitat Assessment* and the 2005 *Addendum to Appendix N -Essential Fish Habitat Assessment*." The 2004-2005 Essential Fish Habitat Assessment for ferry terminals was only for Berners Bay terminals. There is no data for the effects on Essential Fish Habitat from the Katzehin terminal.

To date there has been no data collection on Eulachon or Herring spot spawning and biomass at the Katzehin Delta such as has been done from Auke Bay to Comet Beach for years, mainly by ADFG and from a response to an ESA petition. The petition was submitted by the Juneau Group of the Sierra Club. The data could have been easily collected by expanding the area surveys that ADFG uses monthly to get data for fishing regulations in Lynn Canal. There has been more than enough time for DOT&PF to ask for the data from a cooperating agency such as ADFG. NEPA

requires that agencies gather and use relevant and available science before decision making 40 CFR 1500.1(b)). This gap of information makes it impossible to have a rigorous analysis of the effects of Alternative 2b on essential fish habitat at the Katzehin Delta. As noted before there was ample time to gather data on EFH, more than four years, to fill the gap.

An example of how data can be corrected is the monthly/weekly herring up-dates done by ADFG. Note that no surveys have been done at the Katzehin Delta.

RESPONSE: FHWA has coordinated with the National Marine Fisheries Service (NMFS) on the project since 1994, and continues to coordinate with the NMFS on the Essential Fish Habitat (EFH) assessment, Endangered Species Act (ESA) Section 7 consultation, and Marine Mammal Protection Act authorization (eulachon and herring are prey species for ESA listed species and marine mammals). NMFS provided comments on the Draft SEIS EFH Assessment, requesting minor clarifications. The EFH assessment is updated by errata and included in the Final SEIS. Section 4.3.13 of the Draft SEIS noted that EFH is present within the Katzehin River delta area. Surveys have been conducted at the site that confirmed the presence of Pacific herring and eulachon in the Katzehin River delta. The analysis in the Draft SEIS considered the presence of these species and the potential impacts from project activities on these species.

JUNEAU HERRING UPDATE #9

The department conducted aerial surveys of Seymour Canal, Tenakee Inlet, and Lynn Canal Monday, May 5, 2014. Survey conditions were good to excellent with calm to light winds and sunny skies.

Seymour Canal: Approximately 0.8 nautical miles of active spawn was observed inside Glass Peninsula north and west of Port Hugh. Two small schools of herring were observed in Blackjack Cove and one small school was observed outside Sorethumb Cove. 144 sea lions and 1 whale were observed with the majority of predators from Point Hugh to Blackjack Cove. The Seymour Canal herring gillnet fishery opened at 3:00 p.m., Wednesday, April 30, and active fishing was completed on May 4. The harvest is confidential due to less than three processors participating. The cumulative amount of documented spawn is currently 4.0 nautical miles.

Tenakee Inlet: No spawn or herring were observed on today's survey. A total of 7 sea lions and no whales were observed along the south shore of the inlet from South Passage Point to Crab Bay in good spotting conditions. The vast majority of SOK fishermen harvested their pounds on May 3 and the remainder finished harvesting on May 4. Thirty-three total pounds were fished by 71 permit holders. The cumulative amount of documented spawn is 2.0 nautical miles.

Lynn Canal: No spawn was observed on today's survey. One small school of herring was observed just outside Tee Harbor and two small schools were seen inside Auke Bay. 32 sea lions and three whales were observed with the majority of predators concentrated between Benjamin and Mabb Islands. Two small schools of what appeared to be eulachon were observed inside Echo Cove and gull numbers and activity had increased significantly from previous surveys on the Berners flats although no schools of eulachon were observed. The cumulative amount of documented spawn is 3.5 nautical miles.

2014 Juneau Area Survey Summary

Seymour Canal

April 14: No herring activity; 49 sea lions, 1 whale. April 18: No herring activity; 77 sea lions, 5 whales. April 22: No herring activity; 88 sea lions, 1 whale.

April 25: No herring activity; 166 sea lions, 9 whales.
April 27: 3 small schools of herring near Pt. Hugh Light; 215 sea lions, 7 whales. April 28: 2 small schools of herring near Sorethumb Cove; 241 sea lions, 9 whales. April 29: No herring activity; 83 sea lions, one whale.
April 30: 0.7 nm spawn; no herring schools; 128 sea lions, 7 whales _
May 1: 1.3 nm spawn; 120 sea lions, 6 whales
May 3: 0.3 nm spawn; scattered predators.
May 4: spot spawns, scattered predators
May 5: 0.8 nm active spawn, three small herring schools; 144 sea lions, 1 whale

Tenakee Inlet

April 14: No herring activity; 75 sea lions, 5 whales.
April 18: No herring activity; 63 sea lions, no whales.
April 22: No herring activity; 28 sea lions, no whales.
April 25: No herring activity; 69 sea lions, 6 whales.
April 27: Numerous schools of herring between Strawberry Island and Crab Bay; 46 sea lions, 2 whales.
April 28: Two spot spawns and one school of herring on east Kadashan; 62 sea lions, 3 whales.
April 29: 2.0 nm spawn, no herring schools; 62 sea lions, 3 whales. April 30: 0.25 nm spawn, no herring schools; 34 sea lions, no whale.
May 1: Spot spawn, no herring schools.
May 3: No herring activity.
May 5: No herring activity; 7 sea lions, no whales

Lynn Canal

April 14: No herring activity; 85 sea lions, 3 whales.
April 18: No herring activity; 61 sea lions, 3 whales.
April 22: No herring activity; 91 sea lions, 3 whales.
April 25: No herring activity; 115 sea lions, 7 whales.
April 28: 0.7 nm spawn, school of herring in Bridget Cove; 218 sea lions, 7 whales.
April 29: 2.0 nm spawn in Bemers Bay, no herring schools; 110 sea lions, 2 whales.
April 30: 1.0 nm spawn in Bemers Bay, herring schools in Indian Cove; 144 sea lions, no whales. May 1: 0.9 nm spawn; 132 sea lions, 1 whale.
May 2: No herring activity.
May 5: Herring schools outside Tee Harbor and inside Auke Bay; 32 sea lions, 3 whales.

<http://www.adfg.alaska.gov/index.cfm?adfg=commercialbyareasoutheast.herring#/static/applications/dcfnewsrelease/403191294.pdf>

Given the importance of the habitat to be filled at Katzehin River for fish, and the importance of fish for nearby Steller sea lion critical habitat at Gran Point, the DSEIS should analyze the effects of the increased fill at Katzehin River. However, this analysis is impossible to find.

The Wetlands Report avoids the analysis by stating that "[i]mpacts to fish habitat as a result of this fill are discussed in the *2014 Update to Appendix N-Essential Fish Habitat Assessment.*" DSEIS App. Z Update to O at 14 (Wetlands Report at 14). Turning to the Essential Fish Habitat Report, the only discussion of Katzehin River is in a section concerning effects to essential fish habitat at Slate Creek, where the "adverse effects on [Essential Fish Habitat] prey resources" are apparently mitigated by the fact that "Eulachon also use the Katzehin River for spawning." DSEIS App. Z Update to N, Attachment A at W- 217 (Essential Fish Habitat Assessment), Attachment A at W-217). Attachment C of Appendix N describes some potential impacts to eulachon generally, such as acknowledging that

bridge construction, maintenance, and use has the potential to degrade eulachon spawning habitat, App. N, Attachment C at ii, but there is no site-specific analysis of the long-term effects at the only estuarine habitat to be filled under current plans for Alternative 2B.

RESPONSE: The addition of fill, proposed since issuance of the 2006 ROD in intertidal and subtidal areas, was meant to address concerns related to scour at the Katzehin River bridge abutment for Alternative 2B. This would result in placement of additional materials and an overall increase of 0.64 acre of fill within the Katzehin River intertidal area, 0.55 acre of which would affect EFH. Construction and long-term effects to EFH from the ferry terminal north of the Katzehin River were evaluated in Sections 5.4.1.2, 5.4.2.3, and 5.4.2.4 of the 2004 *Essential Fish Habitat Assessment* and Sections 2.1.1 and 2.1.2 of the 2005 *Addendum to Appendix N -Essential Fish Habitat Assessment*. The site specific effects of the increased fill on EFH in this area have been added to Section 4.3.13 of the Final SEIS. The realignments of Alternative 2B since 2004 have reduced EFH impacts associated with highway fill and crossing structures for the Antler, Berners/Lace, and Katzehin Rivers. As stated in Section 4.2.2 of the 2014 *Update to Appendix N*, 25.5 acres of intertidal and subtidal fill is a small portion of the available habitat in Lynn Canal and would have minimal effects on the EFH available in Lynn Canal.

The only mitigation proposed for Katzehin River addresses construction, which will be timed to avoid sensitive life stages of fish. DSEIS App. N at 5-6; DSEIS App. Z Update to N, Attachment A at W-225 (EFH Assessment, Attachment A at W-225); DSEIS App. Z Update to App. S at 27 (SSL Report at 27).

RESPONSE: In the 2006 Final EIS, DOT&PF committed to \$780,000 in-lieu fee compensation to offset unavoidable adverse impacts to intertidal and subtidal marine waters (EFH). In 2008, DOT&PF provided \$324,000 to construct the Yankee Cove project, which established two artificial reefs to enhance habitat important to spawning and rearing fish, including Pacific herring and marine invertebrates. FHWA determined the balance remaining (\$456,000), in addition to the in-water work timing window to avoid sensitive life stages of fish (March 15 through June 15) and other measures described in Chapter 5 of the Draft SEIS, would provide adequate mitigation for Alternative 2B (preferred alternative in the Draft SEIS) impacts to marine resources. The No Action Alternative (preferred alternative in the Final SEIS) would not result in new impacts (i.e., the effects of ongoing operations would be the continuation of conditions described in the Affected Environment section of the SEIS); therefore, no mitigation is required or proposed under the No Action Alternative.

Furthermore, there are potential cumulative impacts on the Katzehin River and nearby eulachon which have not been explored. Sanitary wastewater will be discharged at the nearby Katzehin ferry terminal. DSEIS App. Z Update to N, Attachment at W-217 (EFH Report, Attachment A at W-217).

RESPONSE: Sections 4.3.13, 4.4.13, and 4.6.13 of the Draft SEIS considered discharges of sanitary wastewater from new ferry terminals as well as marine vessels, leakage of fuels and lubricants from

marine vessels, and the potential effects on fish. They also described effects on habitat from the shoreline development of the ferry terminals. Water quality effects and shoreline development are not expected to affect overall populations of aquatic species.

"Because their habitat distribution and use of near shore areas is unclear, it is unknown whether eulachon would be affected by habitat alterations associated with ferry terminal construction activities at the Katzehin site." DSEIS App. N at 5-14.

By avoiding analysis of the site-specific effects of filling estuarine habitat at Katzehin River on salmon, eulachon, and the Steller sea lions which depend on them, the DSEIS fails to ensure that there are no unacceptable environmental effects similar to those which caused the agencies to rule out Alternative 3 as a practicable alternative.

RESPONSE: Construction and long-term effects to EFH from the ferry terminal north of the Katzehin River are evaluated in Sections 5.4.1.2, 5.4.2.3, and 5.4.2.4 of the 2004 *Essential Fish Habitat Assessment* and Sections 2.1.1 and 2.1.2 of the 2005 *Addendum to Appendix N -Essential Fish Habitat Assessment*. The site specific effects of the increased fill on EFH in this area have been added to Section 4.3.13 of the Final SEIS.

Because the DSEIS is intended to satisfy the agencies' NEPA obligations for the Clean Water Act § 404 permit, the analysis for the impacts to wetlands caused by the preferred alternative should be at least as rigorous as the analysis for effects caused by discarded alternatives.

RESPONSE: The analysis for wetland impacts in the Draft SEIS was sufficiently rigorous and provided an appropriate level of information for comparison of all alternatives. The analysis presented in the 2014 *Update to Appendix O – Wetlands Technical Report* in Appendix Z of the Draft SEIS described the potential impacts to wetlands from all current project alternatives. The wetland mapping refinements that occurred to Alternative 2B after the 2006 ROD were minimal and did not change the order of magnitude of wetlands present. The minor refinements made to the Alternative 2B alignment during the U.S. Army Corps of Engineers permitting process were based primarily on other environmental constraints (e.g., bald eagle nests, geotechnical surveys, etc.). Due to the abundance of wetland resources in the region, these changes do not alter the degree of wetland impacts. Small-scale refinements that may result from additional ground surveys of wetlands for Alternative 3 (as completed for the permitting process for Alternative 2B) would not substantially change the practicability or degree of wetland impacts for Alternative 3.

Apdx EE: The Socio Economic Effects Report is unreliable

ES 1.1 Alternative 1-No Action

According to the 2014 Juneau Access *Traffic Forecast Report* (Appendix AA of the 2014 JAI Project Draft SEIS), the No Action Alternative is anticipated to generate 90 annual ADT in 2020 *ES 1.3 Alternative 2B -East Lynn Canal Highway to Katzehin, with Shuttles to Haines and Skagway*

ES 1.3.1 General Effects

Transportation: The East Lynn Canal Highway would improve Lynn Canal transportation and would generate traffic in Lynn Canal of between 835 vehicles per day (annual average) in 2020, more than five times more traffic than would occur with the No Action Alternative.

The up-tick of vehicle travel use between the no action alternative and the 2b alternative is based on the uncertain unconstrained travel forecast model and therefore there is no verification of the numbers.

RESPONSE: All traffic demand models attempt to predict future demand based on assumptions and data available in the present. To the extent that they are predicting a future, unknown condition, all demand models have “uncertainty.” As explained in the Draft SEIS and Appendix AA, *Traffic Forecast Report*, there are a number of reasons that Alternative 2B would have greater travel demand than Alternative 1 – No Action. Alternative 2B offers more opportunities to travel and provides greater flexibility in arrivals and departures, which coincides more closely with the time of the traveler’s choosing. It provides this opportunity at a greatly reduced user cost in terms of both time and money.

Visitor industry: The East Lynn Canal Highway would bring approximately 164,500 new visitors (including non-Alaskans, Haines and Skagway residents, and others) to Juneau annually by 2020. This number would increase over time, as markets and travelers adjust to the improved access. This is once again an un-verified assumption by DOT&PF based on a flawed travel demand model.

RESPONSE: The impact analysis is not based on mere assumption. The analysis is done by professionals with expertise doing this type of analysis, is based on sound methodologies, and uses updated base data. Section 3.1.4.2 of Appendix EE, *Socioeconomics Effects Technical Report*, of the Draft SEIS described the methodology used to estimate the number of new visitors.

TGSC will argue that do to comfort, convenience, and the costs of not having a car, most outside visitors would prefer the scenic AMHS's Lynn Canal route. It is noted by DOT&PF that Skagway is

one of the most profitable ports in Alaska for the cruise lines and passenger satisfaction ratings are very strong for Skagway. AMHS is for many visitors both inside and outside the state an option for cruise ship travel.

RESPONSE: The effects on visitors due to the changes anticipated from the alternatives are fully described in the Draft SEIS. For visitors that currently walk on to the ferry in Auke Bay, they would need to obtain a ride to the ferry terminal at Katzebin, rent a car, or take a plane. The Draft SEIS does not anticipate cruise ship visitors would be part of the demand that would use the proposed alternatives. Those passengers would continue to arrive in Skagway by boat (on the cruise ships), and Skagway would continue to be one of the most profitable cruise ports in Alaska. The proposed project alternatives are expected to have little impact on the cruise ship industry in Lynn Canal.

Independent visitors: Skagway would benefit from increased independent visitor traffic with the East Lynn Canal Highway. New visitor traffic to Skagway with the East Lynn Canal Highway is expected to total approximately 105,400 new visitors in 2020. This does not include Skagway resident traffic or current baseline traffic (the volume of traffic that already travels to or through Skagway).

As noted before few people are likely to take a car with them to visit Skagway: Most of Skagway is within a mile of the ferry terminal and the DSEIS presents data that 700,000 – 800,000 per year visitors access Skagway by just a boat, about 100% more than by auto.

There is virtually no need for people traveling from Juneau or Haines to Skagway to take a car with them. It makes no economic sense to take a car when you can access the city by a 5 minute slow walk from the AMHS ferry dock.

RESPONSE: The vast number of visitors who arrive in Skagway by boat, as cited in the comment, represent cruise ship visitors. The proposed alternatives are expected to have little effect on the cruise ship industry in Lynn Canal. Those visitors are not part of the demand that would use the proposed alternatives and would continue to arrive in Skagway by boat (i.e., on cruise ships).

Regarding the concern that there is “virtually no need for people traveling from Juneau or Haines to Skagway to take a car with them,” the Draft SEIS does discuss walk-on passengers. The road alternatives (Alternatives 2B and 3) represent a shift in the way transportation would be provided in the corridor—away from a primarily public transportation mode that would operate more like a public transit service, to a highway system where private vehicles would provide most of the transportation (publicly owned shuttle ferries would provide shorter links connecting the roadways). DOT&PF and FHWA recognize that this shift would have had an effect on walk-on passengers. Sections 4.3.7.5 and 4.4.7.5 of

the Draft SEIS describe impacts to “Pedestrians and Bicyclists” for Alternatives 2B and 3, including walk-on passengers.

It is true that DOT&PF and FHWA do not anticipate that walk-on passengers would continue to find it convenient to have someone drive them to the ferry terminal as they currently do. Walk-on passengers are currently able to ride on a subsidized ferry for a long portion of the trip, and under Alternatives 2B or 3, they would need to drive or be driven for most of the route. The Draft SEIS anticipated that many current walk-on passengers that own vehicles would likely choose to travel by car if a highway were available in the Lynn Canal corridor. In part, this is because of the cost of travel to the user. Both the ticket for the ferry and the overall out of pocket cost would be less than Alternative 1 – No Action. Travelers without access to a vehicle would have needed to rent a vehicle, take a commuter flight, or travel on private carriers (if they develop) to accommodate this demand.

Local tax revenues: Additional visitor spending in Juneau would total approximately \$12.7 million annually in 2020, generating approximately \$630,000 in additional sales tax revenues. The CBJ could also expect some increase in property tax revenues and bed tax revenues. This is once again an unverified assumption by DOT&PF based on a flawed travel demand model.

RESPONSE: The impact analysis is not based on mere assumption. The analysis is done by professionals with expertise doing this type of analysis, is based on sound methodologies, and uses updated base data. Section 3.1.4.2 of Appendix EE, *Socioeconomic Effects Technical Report*, in the Draft SEIS described the methodology used to estimate additional visitor spending. The increased visitor spending would be expected to result in an increase in hotel/motel room tax revenues for the City and Borough of Juneau. Due to improved access, Alternative 2B would increase the value of private property along the highway, though the extent of that increase is difficult to estimate. The City and Borough of Juneau would have an increase in property tax revenues because of this increase in property values.

ES 1.3.3 Haines

Transportation: The East Lynn Canal Highway would not result in a substantial change in barge service to Haines. Freight that is now shipped to Haines on the ferry would be trucked from Juneau, at a lower cost than is now possible with ferry service.

That freight from Juneau to Haines would be a lower cost has been disputed in TGSC's user/benefit section i.e.: AMWS has no need of having a driver for every container to get to Haines and Skagway of from Juneau to them. The Alternative 2b road would have the opposite causing more cost. This is a cost burden on the 2b road and the added cost would be put onto the cities of Skagway and Haines who receive about 16 vanloads per week by ferry. (*Department of Administration, State of Alaska, Division of Motor Vehicles*) Percentage of trucks versus passenger vehicles is about twice as high in Skagway (62%) and Haines (72%) as in Juneau (38%).

RESPONSE: Additional information has been added to the Final SEIS in Section 4.3.5 regarding the numbers of unaccompanied vans that are currently shipped on the AMHS and the implications of this change.

ES 1.4.2 Juneau

Independent visitors: The West Lynn Canal Highway would bring an estimated 129,700 new visitors to Juneau in 2020. This includes additional non-Alaskans and residents of Haines, Skagway, and Whitehorse.

That the WLCH would bring in 129,700 new visitors to Juneau in 2020 seems unlikely when airline service is faster and cheaper.

RESPONSE: As stated above, the impact analysis is not based on mere assumption. The analysis is done by professionals with expertise doing this type of analysis, is based on sound methodologies, and uses updated base data. Alternative 3 would increase access to Juneau from other Lynn Canal communities. Airline service is not cheaper, and many visitors are traveling by vehicle on the Alaska-Canada Highway or are visiting Juneau and would now likely choose to rent a car and go to Haines or Skagway (or points further up the road system) because of the improved frequency of service and lower costs and travel time of making the trip. Note, that all travelers who are currently on the mainliner in Lynn Canal would now board/disembark the ferry in Juneau and travel up Lynn Canal on Alternative 2B or 3.

Conclusion:

The Social Economic Report is based on an unconstrained forecast model that is flawed at its base because of its uncertain assumptions and therefore everything it is based on is uncertain also.

Documents such as the McDowell Group house hold surveys done in 2003 are blatantly outdated.

RESPONSE: The traffic forecast model was developed based on empirical data derived from actual travel conditions observed in communities with similar geographic characteristics as Juneau in Alaska and Western Canada. The model was validated against existing travel demand by ferry within Lynn Canal. To forecast traffic demand for each of the alternatives, the model considered various factors relating to travel time, cost, and convenience of travel.

The results of the 2003 household survey were not used in developing the model.

No committed Funding to Complete the Alt 2b Road to Katzehin and to build the Marine Segments in Alt 2b:

This is a Federal Highway Administration (FHWA) project. FHWA is the lead agency. DOT&PF is a cooperating agency and the applicant for federal aid. Alternate 2B highway construction cost will be about 20% state and 80% federal-aid. (\$523,000,000) (Pg 2-34) Missing is any discussion of the funding guidelines of the U.S. Department of Transportation or the probability of increased or decreased funding from the Federal Government. (Apdx D – Technology Alignment Report).

RESPONSE: DOT&PF is not a cooperating agency, however, it is the State applicant for Federal-aid.

The actual State/federal-aid funding split is 9.03 percent State and 90.97 percent federal.

Environmental documents typically do not include information on U.S. Department of Transportation funding guidelines. However, "A Guide to Federal-aid Programs and Projects," which discusses federal-aid funding types and associated requirements may be found on FHWA's website at: <http://www.fhwa.dot.gov/federalaid/projects.cfm>.

Highway capital construction costs (\$523,000,000) are based on 2012 unit costs with a majority of the construction priced at 5% contingency for construction expected to run into 2020. Five (5) per cent seems rather ordinary for a project of this nature going through un-developed harsh terrain. This flags the risk of cost overruns. To better inform the public a draft memorandum of understanding between the U.S. Department of Transportation and the state laying out financial responsibility for overrun should be made.

RESPONSE: The construction costs have been updated for the Final SEIS and developed in the *2017 Update to Appendix D - Technical Alignment Report*.

The construction contingency for Alternative 2B was appropriate given the level of design development. The segment from Echo Cove to Sweeny Creek was developed through final design in 2006 after the 2006 Record of Decision, which justifies the 5 percent contingency amount.

A geotechnical investigation that identified all geologic hazards for Alternative 2B within the segment from Independence Creek to the south bank of the Katzehin River was completed in 2006, and was subsequently updated in 2012 in support of the Draft SEIS. Preliminary geotechnical recommendations were developed to address all identified geologic hazards in response to comments and are reflected in the updated cost estimate in Attachment E of the *2017 Update to Appendix D - Technical Alignment Report* in the Final SEIS. Although additional costs due to geotechnical hazard mitigation have been included in the cost estimate, the final design has not been completed, so a 10 percent contingency is appropriate.

From the south bank of the Katzechin River to the proposed Katzechin Ferry Terminal, the contingency amount of 5 percent is appropriate because this section of roadway is located on relatively flat terrain and the potential for unforeseen circumstances is low. The greatest portion of the cost for this segment is the Katzechin Bridge, which amounts to over 70 percent of the cost estimate for this segment. Bridge superstructures are well defined with a low potential for unforeseen conditions that would impact cost. The bridge piling size and length estimates were based on preliminary geotechnical results within the corridor. In addition, there is substantial historic cost data throughout the State that was used to estimate bridge construction costs. This further justifies the 5 percent contingency amount.

The original survey data collection for Alternative 2B was completed in 2002. DOT&PF elected to collect updated survey data for the entire Alternative 2B alignment in 2013 and 2014 to strengthen final design activities. Since 2002, there have been substantial improvements to LiDAR sensors and collection/processing techniques that improve the bare earth surface modeling for design. This updated data collection effort further validated the estimated quantities included in the construction cost estimate for Alternative 2B. For this reason, the contingency amounts were left unchanged from the Draft SEIS.

Justified construction overruns are eligible for federal-aid funding.

Also the Federal Spigot of highway funding is un-certain and has been not keeping up with basic national transportation needs for years. ASCE says:

Current federal funding is insufficient to sustain America's existing highway system. The American Society of Civil Engineers 2013 report card for infrastructure nationwide reads "Roads: Targeted efforts to improve conditions and significant reductions in highway fatalities resulted in a slight improvement in the roads grade to a D this year. However, forty-two percent of America's major urban highways remain congested, costing the economy an estimated \$101 billion in wasted time and fuel annually. While the conditions have improved in the near term, and federal, state, and local capital investments increased to \$91 billion annually, that level of investment is insufficient and still projected to result in a decline in conditions and performance in the long term. Currently, the Federal Highway Administration estimates that \$170 billion in capital investment would be needed on an annual basis to significantly improve conditions and performance

(<http://www.infrastructurereportcard.org/a/#p/overview/executive-summary>)

It is unlikely that Alaska is getting any increase in annual FHWA funding and it may go down. The Juneau Access Improvement project (JAI) does not appear to rise to a necessary let alone an urgent need for Federal funding compared to maintaining and repairing current infrastructure both state and national.

RESPONSE: On December 4, 2015, the Fixing America's Surface Transportation (FAST) Act, a 5-year transportation bill that will provide stability in funding over the life of the bill, was signed into law. The FAST Act slightly increased annual highway funding for Alaska.

User Benefits:

DOT&PF SDEIS pdf page 7 of appendix FF User Benefit, Life-cycle Cost, and Total Project Life Cost Analyses:

The user costs included in calculating user benefits are the costs of traveler's time, AMHS fares, vehicle operating, maintenance, ownership costs and vehicle accident costs.

This does not include the term "freight." It is noted in the Socioeconomic Effects Technical Report that under 2b there would be a small use of the road for freight transportation to the lower 48 or North (nothing specific about this) based on time of transportation. There is nothing to back up this assumption, such as how much time does it take to drive a freight truck from Skagway to the Alaska Highway through British Canada and to the lower 48 states. Also, the time for driving freight trucks on the east side road, which is not designed for that kind of transportation. There is also no quantified analysis or data about the heavy use of AMWS for getting goods to Haines and Skagway. AMWS has no need of having a driver for every container to get to Haines and Skagway. The Alternative 2b road would have the opposite causing more cost. This is a cost burden on the 2b road and the added cost would be put onto the cities of Skagway and Haines who receive about 16 vanloads per week by ferry. (*Department of Administration, State of Alaska, Division of Motor Vehicles*) Percentage of trucks versus passenger vehicles is about twice as high in Skagway (62%) and Haines (72%) as in Juneau (38%).

The negative effect to Haines and Skagway is not quantified in the SDEIS's user benefit analysis.

RESPONSE: Effects on Haines and Skagway Freight Service: Weekly barge service is the primary mode of surface freight transportation for Haines and Skagway. According to AMHS data, Haines had a total of 201 van arrivals in 2014, an average of approximately four per week. Skagway had 85 van arrivals in 2014, an average of less than two per week. Under Alternative 2B, the capacity to move freight, especially time-sensitive goods, to Haines and Skagway from Juneau would be greatly increased with multiple shuttle ferry trips daily. Businesses that now rely on third-party trucking companies to transport freight on the AMHS may find it advantageous to use their own vehicles and staff to transport freight more frequently from Juneau suppliers, at a lower cost than now possible with third-party service providers. For those businesses that choose to continue relying on third-party shippers to move freight

from Juneau, or from Seattle through Juneau, any changes in freight costs would depend on how trucking companies modify their services and operations to efficiently work within the new Lynn Canal transportation infrastructure (associated with Alternative 2B). The current model for Juneau-Haines and Juneau-Skagway ferry freight service, where vans are transported on the ferry without driver and tractor, may be replaced in part with a model where smaller, lower-cost vehicles provide more frequent scheduled or on-demand service, with the driver accompanying the vehicle during the round trip. A number of factors dictate how the private sector would respond to Alternative 2B, particularly the cost of driver/tractor/trailer on the shuttle ferry (versus the cost of unaccompanied van transport from Auke Bay). The shuttle ferry fare structure for heavy trucks and other commercial vehicles has not yet been determined.

Freight to/from the Lower 48: Long-haul trucking along the Alcan Highway is a proven mode of Alaska and Yukon freight transportation. More than 100,000 tons of freight is trucked into Alaska each year, and approximately 60,000 tons of freight is annually trucked into Whitehorse. With improved Lynn Canal access, Juneau would be better positioned to benefit from the trucking capacity and services already established on the Alcan Highway. The cost and range of trucking services to/from Juneau would evolve over time as volumes increase and markets expand.

With improved highway access, northern Southeast Alaska could develop relationships with supply centers other than Seattle. Overland shipment of freight from Canadian or United States Midwest commercial centers, for example, may be competitive with Seattle barge service or Bellingham ferry service, particularly if some of the supplies moving through Seattle originate outside of the Puget Sound area. The communities of Haines and Skagway would also benefit from this overall increase in freight trucking activity.

Whitehorse is supplied by truck from several key commercial centers such as Edmonton (1,286 miles away), Calgary (1,421 miles away), and Vancouver (1,492 miles away). Trucking to Juneau from various Canadian supply centers would require approximately 2 hours more than is required to reach Whitehorse.

With improved access, over the long term Juneau would experience increased use of overland trucking of basic goods into Juneau, as more businesses take advantage of the scheduling flexibility trucking provides. As described in the Draft SEIS, highway access would give businesses and consumers the opportunity and versatility to choose a shipping mode that best meets their specific needs, particularly for time-sensitive goods. Further, shipment of time-sensitive products out of Juneau, such as fresh fish, would create lower-cost back-haul opportunities for the region's communities. Some fresh fish is currently ferried from Juneau to Skagway, then trucked to Lower 48 markets.

In Executive Summary, Appendix EE - Socioeconomic Effects Technical Report, DOT&PF explains:

"The handling and ferry costs associated with barging freight to Juneau, then trucking to Haines or Skagway, would limit transshipment in Juneau of freight moving from Seattle to Haines or Skagway.

Barges will remain the mode by which most freight is shipped to Juneau. However, an improved highway connection would provide minor to substantial benefits to the fishing industry or other manufacturers producing time-sensitive goods. Shipment of time sensitive products out of Juneau would create lower-cost back-haul opportunities. Over the long term, Juneau would experience increased use of overland trucking of basic goods into Juneau, as more individual businesses consider the scheduling flexibility trucking provides. The cost and inconvenience associated with a ferry would be constraints on truck use.

Neither statement is supported by any financial or analytical data. And as explained before, the AMWS has no need of having a driver for every container to get to Haines and Skagway and back to Juneau.

RESPONSE: Additional information has been added to Section 4.3.5 of the Final SEIS.

There is lack of analysis on the out of pocket expenses for that the current walk-on ferry passengers will occur when having to travel by car, bus, or taxi. The 45%.

RESPONSE: Additional information about the anticipated fares for the various travel markets (walk-on passengers, single drivers with a vehicle, etc.) has been added to the Final SEIS. Anticipated walk-on passenger costs have been added in the "State and User Costs" subsection of each alternative's impact evaluation in Chapter 4. For Alternative 2B this is found in Section 4.3.7.4.

Net Present Value: No alternative except for the no action is in the public interest in terms of cost

When evaluating whether to schedule new highways in the state transportation plan, DOT&PF is required to consider the "cost-effectiveness" of project. *See* AS 44.42.050(e). As noted in appendix FF (at 18), "Generally, the present value of user benefits minus project cost is the best measure of economic efficiency."

One of the purposes behind the Alaska State Legislature's making of DOT&PF responsible for development and maintenance of the state highway system is to "improve the economic and general welfare of the people of the state" (AS 19.05.125). None of the "action" alternatives are worth more than they cost, considering all resources (State and federal) required to build and to operate the project. This is true under all sensitivity cases, as well as the base case (page 7 of appendix FF). All alternatives except the no action will have more than a 1 billion life time cost.

Alternative 2b in a negative 309 million cost/benefit lifetime.

Alternative 4D – Monohull Berners Bay has the smallest loss in net present value (NPV) in all cases- \$25.6 million in the base case.

Alternative 4C - Monohull Auke Bay has the second smallest loss.

Conclusion: It is obvious that the preferred Alternative 2b is not in the Public, State or National interests in terms of costs vs economic benefits and efficiency which is part of DOT&PF's SDEIS's P&N. Reducing State and public costs over the long term.

RESPONSE: Cost-benefit ratios described in the Draft SEIS were not intended to represent a full measure of all benefits and costs associated with project alternatives. In fact, cost-benefit ratios described in Appendix FF of the Draft SEIS were narrowly based on user (traveler) benefits alone and did not consider a wide range of other potential household, commercial, industrial, and community benefits associated with improved Lynn Canal access.

The purpose of the economic efficiency and cost-effectiveness analysis conducted as part of the Draft SEIS was to determine which alternatives serve the largest number of users (travelers) at the lowest possible cost. The fact that all cost-benefit ratios calculated in Appendix FF are less than 1 does not mean investment in better infrastructure is imprudent. It primarily shows that transportation infrastructure costs are very high in Alaska, where populations are generally small, distances long, terrain often challenging, and sea conditions often difficult.

SAFETEA-LU did not grant specific rights-of-way or easements or exempt them from environmental requirements.

The DSEIS contends that Section 4407 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users, Pub. L. 109-59 (2005) (SAFETEA-LU) overrides several applicable requirements, including those in the Roadless Rule. The DSEIS explains that "[i]f for some reason [the Alaska DOT] could not use all or a portion of this easement or the alignment was shifted outside this easement, [the FHWA] would secure a transportation easement across Tongass National Forest through a federal land appropriation process authorized by 23 [U.S.C. §] 317." *Id.* at 4-35.

According to the DSEIS, "[t]he State of Alaska believes an analysis under the Roadless Rule (of whether other reasonable and prudent alternatives exist that do not use Inventoried Roadless Areas) is not required for this project because Congress authorized the granting of the SAFETEA-

LU 4407 transportation easements." (DSEIS at 4-3). The DSEIS explains that "[t]he Roadless Rule prohibits road construction in inventoried roadless areas, unless road construction is conducted under an exempted circumstance, including when a road is "provided for by statute or treaty." *Id.* at 3-6 (quoting 36 C.F.R. § 294.12(b)(3)). The DSEIS asserts that Congress granted transportation and utility easements to the State of Alaska for each side of Lynn Canal and "[b]ecause the [Juneau Access] Project easement is provided by statute, an analysis of other "reasonable and prudent" alternatives need not be conducted prior to the Forest Service's issuance of the 4407 easement.

As an initial matter, Section 4407 of SAFETEA-LU references a map of state and federal easements and rights-of-way in southeast Alaska; it does not unambiguously grant any particular rights-of-way or easements. *See United States v. Union Oil Co.*, 549 F.2d 1271, 1273 n.5 (9th Cir. 1977) (Where the conveyance of federal land is at issue, "nothing passes except what is conveyed in clear language") (quoting *United States v. Union Pac. R.R.*, 535 U.S. 112, 116 (1957)). Here, the language in Section 4407 offers no legal descriptions of the purported conveyances (e.g., township, section, and range). After SAFETEA-LU's enactment, the Forest Service and State of Alaska executed a memorandum of understanding, which memorialized the parties' interpretation of SAFETEA-LU; the memorandum of understanding directly contradicts the interpretation advanced in the DSEIS. According to the memorandum of understanding, the Forest Service and the State interpret Section 4407 largely as a measure to streamline the process for granting rights-of-way needed by both the State and the Forest Service. The memorandum of understanding specifically recognizes, contrary to the assertions in the DSEIS that the provision does not displace other laws and that the parties can only grant the easements and rights-of-way identified if the conveyance is "consistent with their respective obligations to protect scenic, archaeological, recreation, and fish and wildlife values, resources and habitats on National Forest System lands and State of Alaska lands." Indeed, the Alaska U.S. District Court has ruled Section 4407 "does not identify any easement with specificity" and that the memorandum of understanding was negotiated due to the statute's "vague nature." *Se. Alaska Conservation Council v. Fed. Highway Admin.*, 1:06-CV-00009 JWS, 2013 WL 5532835 (D. Alaska Oct. 3, 2013).

RESPONSE: Since this comment was submitted in November 25, 2014, Section 4407 of SAFETEA-LU, was amended by Congress in Section 1446 of the 2015 transportation authorization legislation known as

the FAST Act. As amended, Section 4407 expressly grants rights-of-way and easements to the State. Congress reserved no discretion to the U.S. Forest Service (USFS) to limit the use of those rights-of-way and easements, through the Roadless Rule or other USFS processes and requirements.

In the FAST Act, Congress provided technical corrections to Section 4407 of SAFETEA-LU to clarify the transportation and utility rights-of-way and easements are granted. As amended, Section 4407 reads: “Notwithstanding any other provision of law, the reciprocal rights-of-way and easements identified on the map numbered 92337 and dated June 15, 2005, are granted.”

Section 4407’s Map 92337 depicts the locations of transportation and utility corridors connecting the communities of Southeast Alaska. The lines on the map depicting the transportation and utility corridors scale to approximately 1 mile wide. After the congressional establishment of the Section 4407 transportation and utility corridors, the United States and the State of Alaska executed a memorandum of understanding (MOU) that provides a process for precisely locating a 300-foot-wide highway and utility easement within the identified transportation and utility corridors. The precise location of the highway facility is determined through environmental review and permitting for construction of the highway. Once a project receives construction authorizations from State and regulatory agencies (other than the U.S. Forest Service [USFS]), then USFS must issue the Section 4407 easement for construction and operation of the highway facility. This process was recently summarized in the Congressional directive accompanying the Section 4407 amendment:

“As soon as possible, the Committee intends the Secretary of Agriculture (Secretary) to prepare and deliver to the State of Alaska an easement for the construction and operation of each highway located in a transportation and utility corridor identified on Map 92337 where the State of Alaska has already secured all necessary Federal and State permits for the construction of each highway facility. ... The Committee intends that the Secretary of Agriculture will not withhold or deny the issuance of an easement for a proposed transportation or utility project that otherwise has all necessary construction permits and authorizations from other State and Federal agencies.” (Senate Report 114-80:23-24 [July 15, 2015])

The Roadless Rule excepts classes of road projects from its general prohibition, including an exception when the Secretary of Agriculture determines that a road is provided for by statute or treaty (36 Code of Federal Regulations [CFR] 294.12(b)(3)). Transportation and utility rights-of-way and easements along the east and west sides of Lynn Canal were granted to the State of Alaska by Congress in SAFETEA-LU's Section 4407. Thus, the Secretary of Agriculture need only to make an affirmative finding that Congress provided a highway easement by statute in order to fulfill the requirements of the Roadless Rule.

Additionally, the DSEIS's contrary interpretation focuses entirely on the portion of Section 4407 that reads "notwithstanding any other provision of law." The DSEIS, however, ignores the fact that "notwithstanding" phrases are not dispositive and courts regularly interpret similar language to be narrower than the potential scope of the phrase. *See United States v. Novak*, 476 F.3d 1041, 1046-47 (9th Cir. 2007) (noting that "notwithstanding any other provision of law" phrases are "not always construed literally" and must be read in context) (citations omitted); *Nw. Forest Res. Council v.*

Pilchuck Audubon Soc’y, 97 F.3d 1161, 1167 (9th Cir. 1996) (finding that similar "notwithstanding" language did not preempt National Forest Management Act regulations where nothing in the language indicated an intent to preempt those regulations). Courts consider the language and structure of the statute and the relevant legislative history in interpreting the scope of such phrases. *See, e.g., Nw. Forest Res. Council*, 97 F.3d at 1166-67 (considering language of Rescissions Act); *In re Glacier Bay*, 944 F.2d 577, 582-83 (9th Cir. 1991) (examining structure of provisions of conflicting laws); *Miller v. United Food & Commercial Workers Union*, 708 F.2d 467, 470-71 (9th Cir. 1983) (considering legislative history).

In sum, the DSEIS erroneously suggests that Section 4407 of SAFETEA-LU grants the State specific rights-of-way or easements. SAFETEA-LU does not exempt conveyances from other applicable requirements like the Roadless Rule because Section 4407 affords the Forest Service considerable discretion in approving those conveyances, including requiring the State to comply with all applicable Federal laws and regulations for all federally funded highway projects.

RESPONSE: Section 4407 does not explicitly “afford” the USFS any discretion in approving the conveyances. It is silent on the matter, except to state that Congress granted the easements within a certain area, and the area includes Inventoried Roadless Areas. The Draft SEIS does not “suggest that Section 4407 of SAFETEA-LU grants the State *specific* rights-of-way or easements” (emphasis added). Rather, SAFETEA-LU and the FAST Act granted general easements defined by a wide corridor on an accompanying map. Because Congress enacted wide areas from which to define the specific easement, the State of Alaska and USFS developed an MOU to specify how the easements would be made specific. Language in the Final SEIS has been reviewed and revised as necessary for clarity on these points.

Conclusion: The SDEIS is so biased to the preferred alternative, full of assumptions, lacking data, and uncertain in its assumptions, it should be thrown into the re-cycle bin and DOT&PF should start over.

Resource Documents:

Most if not all resources cited are already in the project's public record. Documents and tables for the Alternative's 1 b optimized and Alt 5 are in the public record by submission from the Skagway Marine Access Committee, as with the McDowell Group studies.

Alaska Wilderness League

Form Letter 1

Note: All communications were received as a spreadsheet from Alaska Wilderness League. The form letter is as follows:

Attached are public comments from roughly 3,900 individuals requesting that the Department of Transportation reject Alternative 2B, known as the East Lynn Canal Highway that would construct a new road through the Tongass National Forest along the steepest and deepest fjord in North America. Please consider each signature a unique comment. The signatures include the name, city and state of the signee and in many cases a personal comment above and beyond the aforementioned request.

According to your own analysis, this road will cost more per year than existing ferries and take more lives. That's not including the \$574 million it will take to bulldoze a 48-mile dead-end that forces drivers to traverse 40+ active avalanche chutes.

All commenters request that you make the right decision and save lives and dollars by abandoning this wasteful project idea.

Earthjustice

Form Letter 2

Note: All communications were received as a spreadsheet from Earthjustice. The form letter is as follows:

I support community-to-community ferry service, and oppose the Alternative 2B, an East Lynn Canal Highway to Katzehin with shuttles to Haines and Skagway, the State of Alaska's preferred alternative in the Juneau Access Improvements Project Draft Supplemental Environmental Impact Statement.

The State of Alaska's plan to build this 50-mile, \$574 million road will not connect Juneau to the State road system. Instead the route will dead-end at the uninhabited Katzehin River delta where travelers would board a ferry to reach Haines or Skagway. Building a new ferry terminal 90 miles from downtown Juneau makes travel more expensive, time consuming, and dangerous. Alaska's ferry system already connects Juneau to Haines and Skagway in a safer and cheaper fashion.

Alternative 2B, the Katzehin road, also is the most environmentally damaging of all alternatives described in the Draft Supplement Environmental Impact Statement. The road would cut through and permanently compromise Berners Bay, which is one of the most important marine and estuarine ecosystems in Alaska. The area is renowned for spring runs of both eulachon and Pacific herring, which attract record numbers of marine mammals, including humpback whales and Steller sea lions, and tens of thousands of waterbirds. Berners Bay is so spectacular that Congress designated it one of twelve roadless areas in the Tongass National Forest, which were "chosen for special management because of their critical importance for fish and wildlife habitat and their high value to tourism and recreation." All of what is special about this place could change with this dangerous, ill-planned, and terribly expensive project.

I encourage you to reject the State of Alaska's proposal to build this dead-end road and instead protect the roadless areas in the Tongass. Thank you for considering my comments.

Care2

Form Letter 3

Note: All communications were received via email from individual commenters. The form letter is as follows:

I strongly oppose construction of the new Juneau Access Road. Local residents have made it clear that the road is a bad idea, and would prefer better ferries instead. This is a colossal waste of half-a-billion dollars, puts our pristine wildlands and precious wildlife at risk, and exposes drivers to an enormous avalanche risk. There are better ways to spend our money!

Southeast Alaska Conservation Council (SEACC; Version 1)

Form Letter 4

Note: All communications were received via email from individual commenters between September 24 and November 4, 2014. The form letter is as follows:

The State’s plan to build a road half-way up the Lynn Canal is more dangerous, more expensive, more divisive and more damaging than existing ferry service. I support community-to-community marine service, and oppose the alternative 2B, an East Lynn Canal Highway to Katzechin with shuttles to Haines and Skagway, the State’s preferred alternative in the Juneau Access Improvements Project Draft Supplemental Environmental Impact Statement.

DOT’s draft Southeast Alaska Transportation Plan (SATP) should also be revised to focus on maintaining proven marine transportation throughout the archipelago rather than focusing inappropriately on constructing costly and controversial new roads.

The draft SATP suggests the three fifty year-old mainline ferries should be replaced in the next ten years “if the funding becomes available”. With the \$574 million the State plans to spend on constructing a road to the Katzechin we could construct TWO mainline ferries or address the half-billion dollar backlog in deferred maintenance for all of Alaska’s existing roadways.

In addition to the outrageous capital costs associated with constructing a road, the operating costs will also be higher. The EIS states “both the capital and operating costs for Alternative 2B [road] would be greater than those associated with the No Action [ferry] Alternative” (page 4-61). In fact, the state will have to pay \$5 million more each year to keep the fifty-mile avalanche-prone road open. That is \$5 million that could go toward urgent State needs, including our schools, every single year.

The Katzechin road is an abnormally expensive proposal because of the extreme geography of the Lynn Canal. Six thousand foot mountains plunge into the steepest, deepest fjord on North America. The study identified 41 avalanche chutes and even more landslide, rockslide, and rock fall areas. Three bridges, each more than four times longer than Juneau-Douglas Bridge, would span five glacial rivers. Some sections of the road would be built below mean-high tide. Other sections would be carved into the mountainside and in at least two areas tunnels would be blasted through the cliffs. Three additional tunnels in the form of snowsheds along with extensive avalanche blasting will be needed to keep the route open in the winter.

DOT anticipates over 22 crashes per year – over 600 crashes and 5 fatalities over the next thirty years on this type of two-lane road (page 4-63). Those estimates don’t even take into account the added dangers of avalanches, rockslides, and icing that exist with this particular road. No deaths have occurred aboard the Alaska Marine Highway System in over 50 years of service.

Placing a new ferry terminal 90 miles from downtown Juneau will make travel far more complicated, especially for walk-on passengers. The Katzechin road alternative would actually cost travelers more money than walking aboard the existing ferry system. Today it would cost a traveler in Juneau \$37 to get to Haines and \$50 to get to Skagway. DOT estimates that under its

road scenario the out-of-pocket costs would be \$47 to get to Haines and \$67 to get to Skagway (page 2-16).

Furthermore, DOT's assertion that travel in the Lynn Canal corridor will increase by a factor of ten if the Katzehin road is constructed is unfounded and disingenuous.

Alternative 2B, the Katzehin road is the most environmentally damaging of all alternatives described in the EIS, crossing ten anadromous streams and, destroying 130 acres of wetlands, tidal areas, and fish habitat. Increasing access to Berners Bay would likely compromise hunting opportunities for moose, bear, and goat by increasing competition. Road access would make it incredibly challenging to protect vital salmon and eulachon spawning habitat in the bay from Off Road Vehicles. Berners Bay is also culturally significant as the ancestral land of the Awk Kwan Thlinget and has numerous burial sites that could be disturbed.

Alaska must be smart about how we spend our dwindling transportation dollars. Please cancel the Katzehin road proposal and opt for community-to-community ferry service. Please also revise the SATP to reflect the region's top priorities of maintaining our existing roads and replacing our aging mainline ferries.

Thank you for including these comments in both the draft 2014 SATP and Juneau Access Improvement Project Supplemental Environmental Impact Statement SEIS records.

SEACC (Version 2)

Form Letter 5

Note: All communications were received via email from individual commenters between November 4 and 18, 2014. The form letter is as follows:

The State's plan to build a road half-way up the Lynn Canal is more dangerous, more expensive, more divisive and more damaging than existing ferry service. I support community-to-community marine service, and oppose the alternative 2B, an East Lynn Canal Highway to Katzehin with shuttles to Haines and Skagway, the State's preferred alternative in the Juneau Access Improvements Project Draft Supplemental Environmental Impact Statement.

The draft SATP suggests the three fifty year-old mainline ferries should be replaced in the next ten years "if the funding becomes available". With the \$574 million the State plans to spend on constructing a road to the Katzehin we could construct TWO mainline ferries or address the half-billion dollar backlog in deferred maintenance for all of Alaska's existing roadways.

In addition to the outrageous capital costs associated with constructing a road, the operating costs will also be higher. The EIS states "both the capital and operating costs for Alternative 2B [road] would be greater than those associated with the No Action [ferry] Alternative" (page 4-61). In fact, the state will have to pay \$5 million more each year to keep the fifty-mile avalanche-prone road open. That \$5 million could go to any number of State needs, including funding about 50 teachers.

The Katzehin road is an abnormally expensive proposal because of the extreme geography of the Lynn Canal. Six thousand foot mountains plunge into the steepest, deepest fjord on North America. The study identified 41 avalanche chutes and even more landslide, rockslide, and rock fall areas. Three bridges, each more than four times longer than Juneau-Douglas Bridge, would span five glacial rivers. Some sections of the road would be built below mean-high tide. Other sections would be carved into the mountainside and in at least two areas tunnels would be blasted through the cliffs. Three additional tunnels in the form of snowsheds along with extensive avalanche blasting will be needed to keep the route open in the winter.

At least fifteen people are expected to die while driving between Auke Bay and the Katzehin over the next 30 years. Those estimates don't even take into account the added dangers of avalanches, rockslides, and icing that exist with this particular road. No deaths have occurred aboard the Alaska Marine Highway System in over 50 years of service.

Placing a new ferry terminal 90 miles from downtown Juneau will make travel far more complicated, especially for walk-on passengers. The Katzehin road alternative would actually cost travelers more money than walking aboard the existing ferry system. Today it would cost a traveler in Juneau \$37 to get to Haines and \$50 to get to Skagway. DOT estimates that under its road scenario the out-of-pocket costs would be \$47 to get to Haines and \$67 to get to Skagway (page 2-16), and even more for people who don't own or can't travel with a vehicle.

Furthermore, DOT's assertion that travel in the Lynn Canal corridor will increase by a factor of

ten if the Katzehin road is constructed is unfounded and disingenuous.

Alternative 2B, the Katzehin road is the most environmentally damaging of all alternatives described in the EIS, crossing ten anadromous streams and, destroying 130 acres of wetlands, tidal areas, and fish habitat. Increasing access to Berners Bay would likely compromise hunting opportunities for moose, bear, and goat by increasing competition. Road access would make it incredibly challenging to protect vital salmon and eulachon spawning habitat in the bay from Off Road Vehicles. Berners Bay is also culturally significant as the ancestral land of the Awk Kwan Thlinget and has numerous burial sites that could be disturbed.

Alaska must be smart about how we spend our dwindling transportation dollars. Please cancel the Katzehin road proposal and opt for community-to-community ferry service.

Thank you for including these comments in the Juneau Access Improvement Project Supplemental Environmental Impact Statement SEIS records.

SEACC (Version 3)

Form Letter 6

Note: All communications were received via email from individual commenters between November 18 and 25, 2014. The form letter is as follows:

The Walker administration and the Federal Highway Administration should reject the Juneau road extension because it is too dangerous, too divisive, and has costs that far exceed the benefits. I support community-to-community marine service, and oppose alternative 2B, an East Lynn Canal Highway to Katzechin with shuttles to Haines and Skagway, the State's preferred alternative in the Juneau Access Improvements Project Draft Supplemental Environmental Impact Statement.

Industry standards dictate that a project with benefits to cost ratio of less than 1 should be dismissed. DOT's own study shows that the benefits to cost ratio of constructing a road is a startlingly low 0.28 (Append. FF, page 66). In other words, the cost of constructing and maintaining the 50-mile road and new ferry terminal is roughly four times higher than any economic benefit that could result from this project.

For anyone who has spent time in the Lynn Canal looking at the proposed road route, this finding isn't so surprising. Six thousand foot mountains plunge into the steepest, deepest fjord on North America. The study identified 43 avalanche chutes and even more landslide, rockslide, and rock fall areas. Three bridges, each more than four times longer than Juneau-Douglas Bridge, would span five glacial rivers. Some sections of the road would be built below mean-high tide. Other sections would be carved into the mountainside, and in at least two areas tunnels would be blasted through the cliffs. Three additional snowshed tunnels, along with extensive avalanche blasting, will be needed to keep the route open in the winter.

At least fifteen people are expected to die while driving between Auke Bay and the Katzechin over the next 30 years. Those estimates don't even take into account the added dangers of avalanches, rockslides, and icing that exist with this particular road. No deaths have occurred aboard the Alaska Marine Highway System in over 50 years of service.

Placing a new ferry terminal 90 miles from downtown Juneau will make travel far more complicated, especially for walk-on passengers. The Katzechin road alternative would actually cost travelers more money than walking aboard the existing ferry system. Today it costs a traveler in Juneau \$37 to get to Haines and \$50 to get to Skagway. DOT estimates that under its road scenario the out-of-pocket costs would bump up to \$47 to get to Haines and \$67 to get to Skagway (page 2-16), and even more for people who don't own or can't travel with a vehicle.

Furthermore, DOT's assertion that travel in the Lynn Canal corridor will increase by a factor of ten if the Katzechin road is constructed is unfounded and disingenuous. Relying on this overblown traffic forecast also puts the entire Alaska Marine Highway System further at risk – when traffic doesn't meet DOT's overblown projections, revenue will fall, putting the ferry system further in the red.

Alternative 2B, the Katzehin road, is the most environmentally damaging of all alternatives described in the EIS, crossing ten anadromous streams and destroying 130 acres of wetlands, tidal areas, and fish habitat. Increasing access to Berners Bay would increase hunting pressure for moose, bear, and goat, likely leading to reduced success rates and potentially new hunting restrictions. Road access would make it incredibly challenging to protect vital salmon and eulachon spawning habitat in the bay from Off Road Vehicles. Berners Bay is also culturally significant as the ancestral land of the Awk Kwan Tlingit and has numerous burial sites that could be disturbed.

The fiscal, social, and environmental costs are simply too high to consider proceeding with this project, especially considering that Alaska has numerous other transportation priorities. For example, DOT planning documents suggest the three fifty year-old mainline ferries should be replaced in the next ten years “if the funding becomes available.” With the \$574 million the State plans to spend on constructing a road to the Katzehin we could construct TWO mainline ferries or address the half-billion dollar backlog in deferred maintenance for all of Alaska’s existing roadways.

Alaska must be smart about how we spend our dwindling transportation dollars. Please cancel the Katzehin road proposal and opt for community-to-community ferry service.

Thank you for including these comments in the Juneau Access Improvement Project Supplemental Environmental Impact Statement SEIS records.

Sierra Club

Form Letter 7

Note: All communications were received via email from individual commenters. The form letter is as follows:

I strongly oppose Alternative 2B, the currently plan to build an East Lynn Canal Highway through the Tongass National Forest, the State of Alaska's current preferred alternative in the Juneau Access Improvements Project Draft Supplemental Environmental Impact Statement.

This current preferred alternative will result in the destruction and clearcutting of 53 miles through pristine roadless areas in the Tongass National Forest, destroying key wetlands and tidal areas, to ultimately arrive at a dead-end at an unmanned ferry terminal, not connected to any other Alaskan roadways.

The costs associated with this project will be entirely too high. The current plan will place drivers alongside the steepest, deepest fjord in North America, with an identified 41 avalanche chutes, and even more landslide, rockslide and rock fall areas. And in addition to the already hefty \$574 million it will take to build the highway initially, it will take an estimated additional 5 million annually, just for upkeep.

This plan will put Alaska's iconic wildlife in great danger as well, with the planned road to nowhere destroying and disrupting the habitats and wildlife corridors for iconic species like the bald eagle, moose, bear, and the Alexander Archipelago Wolf. Certain areas, like Berner's Bay, are world-renowned for spring runs of eulachon and Pacific herring, and attract record numbers of marine mammals like humpback whales and Stellar Sea Lions, areas which have even been designated by Congress as special management areas because of their critical importance to wildlife and human recreation; this plan will put that all in jeopardy.

Instead, I support a community-to-community ferry service, which will allow for transportation between the areas the highway seeks to connect, with much less impact on our crucial wild lands and animals, a lower cost to commuters, and a much less sizable burden on taxpayers.

I strongly encourage you to reject the State of Alaska's proposal to build this costly dead-end highway through roadless areas in the Tongass National Forest, and adopt a plan that will work best for the citizens and the natural integrity we so value in Alaska. Thank you for considering my comments.
